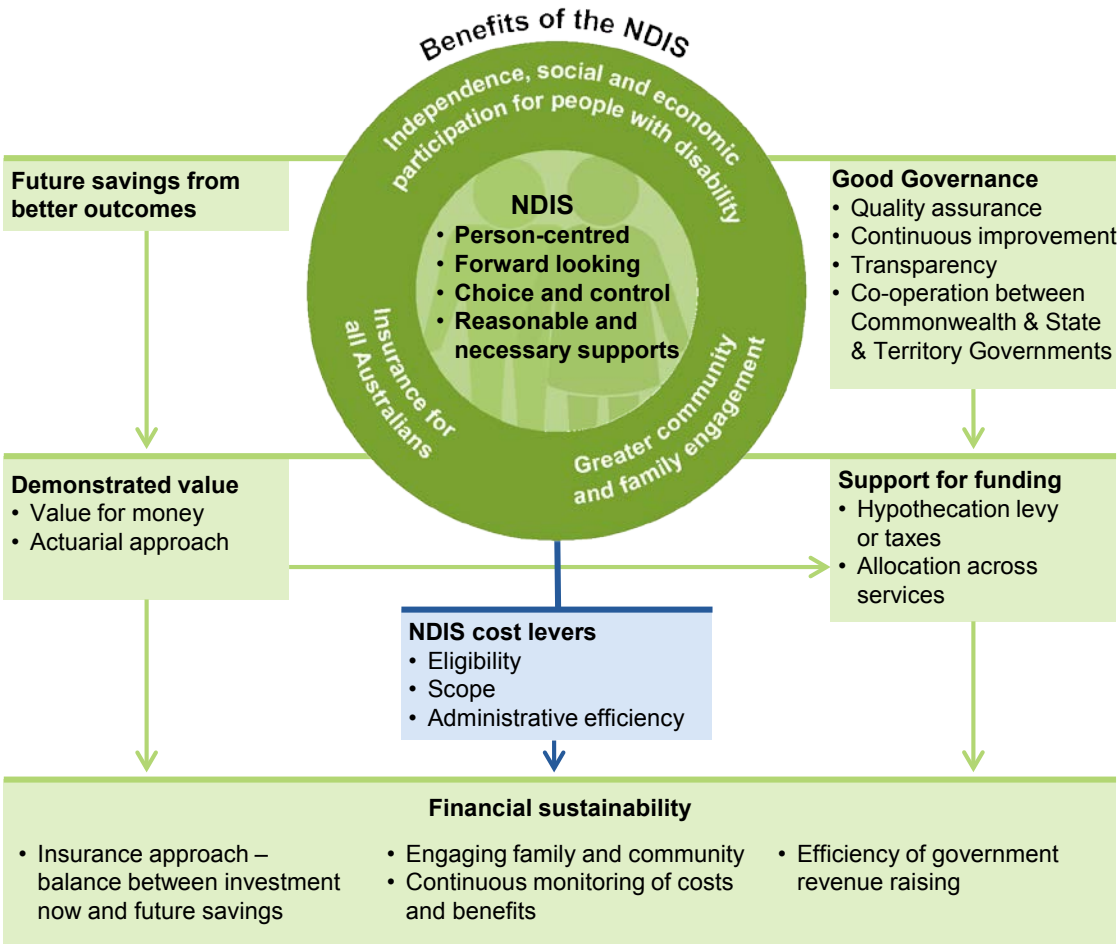
While the NDIS is sometimes described as an 'uncapped scheme', the ultimate cap — and test of financial sustainability — is taxpayers' continuing willingness to pay for it. Cost overruns could lead to pressure to reduce the scope and certainty of care and supports provided under the NDIS, or require governments to provide more funding at the expense of other programs.

Figure 1.5 **Wellbeing framework for considering costs and benefits**



The NDIA's actuarial estimates of long-term costs (which reflect the experience of the scheme and management responses to cost pressures) play an important role in demonstrating to the Australian community that the scheme represents value for money.

Perceptions about the effectiveness of governance arrangements for the NDIS are also important. For example, the community expects planning processes to be in line with the objectives of the scheme and services to meet quality standards. Governments also need to demonstrate that the funds for the NDIS are dollars well spent from a limited tax revenue bucket and funding the scheme is not to the detriment of other important expenditures.

Assessing the financial sustainability of the NDIS also involves looking at interrelated systems. This includes, but is not limited to, the efficiency and effectiveness of the NDIA, the readiness of participants, the readiness of providers, and the integration of the NDIS with mainstream services. Only a system that is integrated and holistic in its focus will bring the benefits to people with disability that the scheme is expected to deliver.

Transitional issues can become entrenched problems

It is no surprise that, given the size, speed and complexity of the reform as noted above, there have been considerable transitional issues with the rollout of the NDIS. All major reforms are followed by a (sometimes protracted) period of disruption and adjustment.

Many of these transitional issues are expected to be ironed out as the scheme rollout is completed and the scheme matures. It is evident to the Commission through consultation with the NDIA, and from its submission to this study, that the Agency is devoting resources to addressing implementation issues. The NDIA said:

> The NDIS is still in its infancy and delivering the Scheme will evolve and improve over time. The NDIA is intent on learning from experience and improving systems, processes and practices as quickly as possible to ensure the success of the Scheme. (sub. 161, p. 14)

However, if transitional issues are not dealt with quickly and effectively, they can become entrenched problems that endure in the longer term and affect the success and sustainability of the scheme.

It is still early days

The Commission is mindful that, while significant benefits are expected to result from the new approach to providing disability care and support, like any major reform it will be many years before the full extent of the benefits are realised or reflected in objective measures.

Even once the scheme is fully implemented by mid-2019, the transition to a mature market will be gradual, and participants, carers and providers will need time to adjust to the new system. According to an Australian National Audit Office report, the disability services market under the NDIS is expected to take up to ten years to develop, and perhaps longer in some market segments (ANAO 2016, p. 19). The NDIA, in its Market Approach Statement 2016–2019, said that:

> Developing a strong, contestable marketplace for disability supports is a long term project. All stakeholders in the marketplace will require time to build capability, confidence and systems to support the market mechanisms. Participants, possessing greater consumer power, are learning to make choices and explore different service options. Providers are building an understanding of their customer base and preferences, positioning service offers and transforming their operations. (2016k, p. 12)

The Commission is also mindful that, because the scheme is not yet fully rolled out and there are some transitional issues, the experience to date may not be reflective of the underlying long-term outlook (chapter 2 discusses in more detail the limitations of the trial and transition data).

1.5 A guide to this paper

This position paper outlines the Commission's early thinking on the sustainability of NDIS costs. The purpose of this position paper is to seek feedback on the Commission's preliminary conclusions, and on any additional issues that should be considered before the public release of the final study report in September 2017. The Commission welcomes written comment on this paper, and will undertake further consultation to facilitate feedback from participants to inform the preparation of the final study report.

The Commission is aware that more data and information will be available before the study's final report is released. As such, the draft recommendations in this paper should be viewed as indicative.

In conducting this study, the Commission has drawn on a range of evidence. It consulted widely, including with NDIS participants, advocacy groups, peak bodies, service providers, disability care and support workers and academics. It also met with Australian and State and Territory Government departments and agencies, including extensive liaison with the NDIA and the Department of Social Services. There have also been a number of other reviews of various aspects of the NDIS since the trial began and the Commission has drawn on these where relevant.

The Commission has used the information and evidence provided in the 206 submissions it received in response to the issue paper released in February 2017 (a full list of submissions and consultations is provided in appendix A). The Commission wishes to thank study participants for their input.

Submissions on this paper are due by 12 July 2017.

Structure of this paper

Chapter 2 looks at how the scheme is tracking based on scheme experience to date. Two of the key drivers of cost are then discussed in more detail in chapters 3 and 4 — the scheme eligibility (which determines the number of participants in the scheme), and the supports NDIS participants receive (as determined by the planning process). These components essentially form the demand for NDIS services.

Chapter 5 looks at how the NDIS interfaces with non-NDIS disability services and mainstream services and the ways in which this impacts on the financial sustainability of the scheme.

Chapters 6 and 7 look at the supply side of the equation. Chapter 6 assesses whether providers will be capable of meeting demand for disability services and chapter 7 analyses workforce readiness. Chapter 8 looks at whether participants have the knowledge and skills to successfully engage with the scheme. Governance arrangements are discussed in chapter 9 and chapter 10 looks at funding arrangements.

2 How is the scheme tracking?

Key points

- Tracking scheme costs and participant outcomes (and making adjustments in response to scheme experience) is critical to ensuring that the National Disability Insurance Scheme (NDIS) achieves its objectives and is financially sustainable.
- The NDIS was launched a year earlier than recommended by the Commission in 2011 and the scope of the trials was broadened. The changed timing and scope of the planning phase meant that some aspects of the scheme were being built and tested over the trial period, including assessment tools and ICT systems.
- The rollout schedule of the NDIS is highly ambitious. To reach the estimated 475 000 participants at full scheme, the National Disability Insurance Agency (NDIA) will need to approve hundreds of plans a day — in 2018-19, about 500 plans a day will need to be approved and hundreds more reviewed.
- It is inevitable that there will be transitional issues with the rollout of the NDIS given the size, speed and complexity of the reform, but already there are signs that the rollout schedule risks the NDIA not being able to implement the NDIS as intended.
  - The focus on getting participants into the scheme has come at the expense of the quality of plans. Some key planning supports for participants have not been in place and this has affected participant readiness. And the supply side of the market has had very little time to adjust.
- The NDIA's projection of full scheme costs ($22 billion) is broadly consistent with the Commission's 2011 modelling. The Commission has not updated its own projection of scheme costs. Early scheme data have too many limitations to update assumptions on prevalence rates and package costs.
- Based on trial and transition data, NDIS costs are broadly on track with the NDIA's long-term modelling. While there are more children entering the scheme than expected and higher than expected package costs, these factors are offset by lower levels of utilisation than expected.
- The NDIA has put in place initiatives to address emerging cost pressures, including the Early Childhood Early Intervention approach and the first plan process to reduce variability in the level of support provided to participants.
- The benefits of the NDIS are becoming apparent. The early evidence suggests that many (but not all) scheme participants are receiving more disability supports than previously, and they have more choice and control. There is also evidence that the NDIS is improving the wellbeing of participants and their families and carers.

Tracking scheme costs and participant outcomes is critical to ensuring that the National Disability Insurance Scheme (NDIS) achieves its stated objectives and is financially sustainable over the longer term. In 2011, when the Commission estimated full scheme

costs for a national insurance scheme, it noted that insights from the early experience of the scheme should be used to provide a more precise estimate of the long-term scheme costs, given the uncertainties at the time around the costings of the scheme (PC 2011, p. 932).

The National Disability Insurance Agency (NDIA) estimates that at full scheme about 475 000 participants will have individualised supports and the scheme will cost $22 billion in the first year of full operation (NDIA 2017o, p. 5, 2016b, p. 18). The number of participants is higher than what is reported in the NDIA's publications because the NDIA only reports the number of scheme participants under the age of 65 years.[5]

These estimates are consistent with the Commission's 2011 estimates of scheme costs (discussed further below). The Commission has not calculated its own estimate of long-term scheme costs for this position paper. There are too many limitations with the early scheme data to update the modelling assumptions. That said, early scheme data can be used to assess where cost pressures may be emerging.

The first section (section 2.1) of this chapter looks at the NDIS rollout schedule. Section 2.2 looks at the assumptions that drive the NDIA's long-term estimates of scheme costs. Section 2.3 provides an overview of scheme participants and costs to date, and looks at how they compare with the NDIA's assumptions. Section 2.4 looks at the early evidence on the benefits of the scheme to participants and their families and carers.

2.1 The rollout of the scheme so far

The NDIS was trialled from 2013 in different jurisdictions across Australia. Trials commenced in July 2013 in New South Wales, Victoria, South Australia and Tasmania (table 2.1). The trial sites varied in size and scope. For example, the trial sites in:

- South Australia and Tasmania covered the whole jurisdiction but were restricted to certain age groups (children aged 0-14 years for South Australia and 15-24 years in Tasmania)
- Victoria and New South Wales were limited geographically (the Barwon and Hunter regions) but had no age restrictions (apart from the NDIS-wide restriction that participants must be aged under 65 years to enter the scheme).

The transition to full scheme began in all states and territories in July 2016, with the exception of Western Australia (which will transition from July 2017). The Bilateral Agreements between the Australian and State and Territory Governments set out the timeframes for the transition in each jurisdiction, including quarterly estimates of the number of participants who will enter the scheme. Jurisdiction-specific Heads of Agreements signed by the Australian and the State and Territory Governments outline that

5 The NDIA project that in 2019-20, the NDIS will include 460 000 participants under the age of 65 years and 15 000 participants aged 65 years and over. The NDIA reports 460 000 participants in its publications.

the full scheme is scheduled to be rolled out nationally by 2019-20, with the timeframes for the transition to differ across jurisdictions (NDIA ndb) (table 2.1).[6]

Table 2.1 **NDIS transition arrangements by jurisdiction**

	Trial period			Transition to full scheme			Full scheme
	2013-14	2014-15	2015-16	2016-17	2017-18	2018-19	2019-20
NSW	Hunter area trial		Early Transition in Nepean Blue Mountains area (children aged 0-17 years)	Transition to full scheme (by region)		Full scheme	
Vic	Barwon area trial			Transition to full scheme (by region)			Full scheme
Qld			Transition to full scheme from July 2016 (by region). Early Transition from January 2016 in Townsville, Charters Towers and Palm Island				Full scheme
SA	Statewide trial (children aged 0-14 years)			Transition to full scheme (by age and region)		Full scheme	
Tas	Statewide trial (people aged 15-24 years)			Transition to full scheme (by age)			Full scheme
NT		Barkly region trial		Transition to full scheme (by region)			Full scheme
ACT[a]		Territorywide trial		Full scheme			
WA[b]		Perth Hills area trial MyWay trial			Transition to locally-administered NDIS		Full scheme

a The Bilateral Agreement for the NDIS launch between the Australian Government and the ACT Government notes that from 2016-17 the ACT will be in 'transition to full scheme'. This transition has been categorised as 'full scheme' because all residents who meet the eligibility criteria will have access to the scheme. **b** In February 2017, the Australian Government and Western Australian Government signed a Bilateral Agreement for a nationally consistent, but locally-administered, NDIS.

Sources: Adapted from ANAO (2016, p. 79); NDIA (ndb); Porter, Barnett and Faragher (2017).

The speed of the rollout is creating problems

In 2011, the Commission recommended that the NDIS commence in July 2014 in two geographic regions (PC 2011, p. 938).[7] But the scheme was launched a year earlier, and

6 The Bilateral Agreements covering the trial phase (signed between 2012 and 2014) included the planned intake of participants and the balance of cash and in-kind contributions to the scheme. A second set of Bilateral Agreements cover the arrangements for transitioning the NDIS to full scheme. These were signed in 2015 and 2016. The ACT reached full scheme at the completion of the trial period so a second bilateral agreement was not required.

the scope of the trials was broadened significantly. The changed timing and scope of the trials compressed the planning phase for the scheme. Some aspects of the scheme were being built and tested over the trial, for example:

- the NDIS commenced without an assessment tool to help determine reasonable and necessary supports and had to build one over the first three months of operation (in 2011 (NDIA, sub. 161. p. 3). The Commission acknowledged that there was no ideal assessment tool to use in the NDIS, but also said that the scheme should not be delayed in the absence of 'perfect' tools (PC 2011, pp. 338–339)
- the ICT system used during trial was an interim system that would not scale to full scheme (a new system was put in place in 2016 for full scheme) (NDIA, sub. 161. p. 3).

A review of the capabilities of the NDIA described the Agency as being 'like a plane that took off before it had been fully built and is being completed while it is in the air' (Whelan, J., Acton, P. and Harmer, J. 2014, p. 7).

The rollout schedule is highly ambitious given the magnitude of the reform. To reach the estimated 475 000 participants at full scheme by 2019-20, the NDIA will need to approve hundreds of plans a day (figure 2.1). In the March 2017 quarter, the NDIA approved about 14 000 plans, or roughly 160 plans a day (NDIA 2017o, p. 12). In 2018-19 (the final year of transition), NDIA modelling indicates that about 500 plans a day will need to be approved, and hundreds more reviewed.

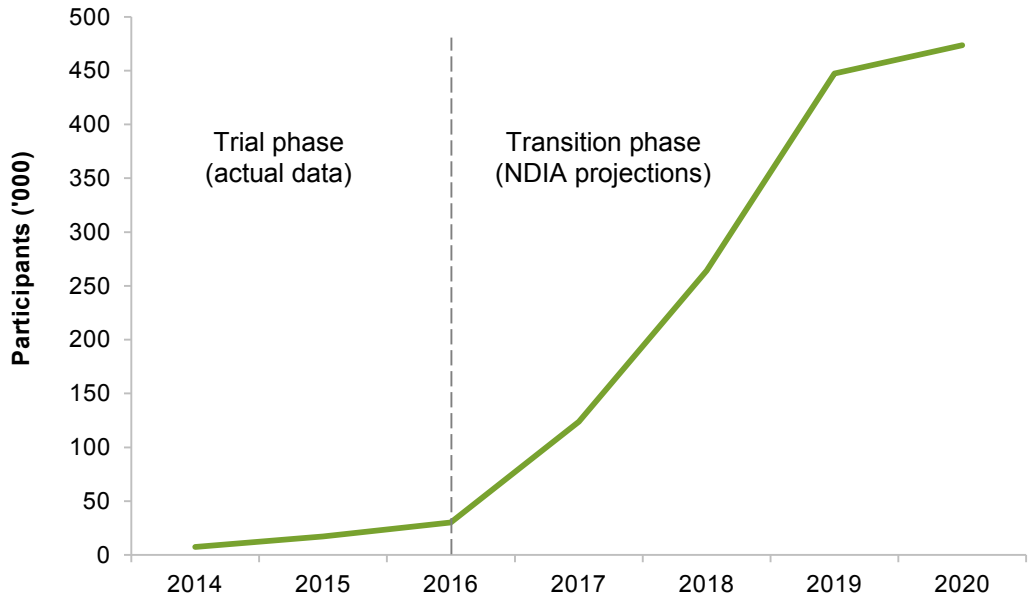
As JFA Purple Orange said (sub. 186, p. 7), the NDIS transition arrangements 'mean a tsunami of new participants will be processed into the scheme over the next two years'. Associate Professor Helen Dickinson of the Public Service Research Group at the University of New South Wales (2017) also recently commented that 'this vast reform is being implemented at break-neck speed'.

The NDIA is already struggling to keep up with the participant numbers included in the Bilateral Agreements — at the end of March 2017, there were 78 000 participants with approved plans, which was just 82 per cent of the bilateral estimates (table 2.2).[8] If the number of people approved to enter the scheme but awaiting a plan (23 000) are added to scheme participant numbers, then the bilateral estimates have just been reached.

7 The Commission also recommended that the scheme would be national by July 2015 and reach full scheme by 2018-19.

8 The 78 000 participants with an approved plan reported by the NDIA includes children who have entered the Early Childhood Early Intervention pathway but who *do not* have an approved plan.

Figure 2.1 **Growth in number of participants in the scheme[a]**



[a] The projections of scheme participants were prepared by the Scheme Actuary for the NDIA's 2015-16 Annual Financial Sustainability Report using data at 30 June 2016. They do not incorporate actual participant numbers beyond June 2016.

Table 2.2 **NDIS participants and bilateral estimates**

	Participant cohort with approved plans				*Bilateral estimate*	*Per cent of estimate*
	Existing disability service clients	*New*	*ECEI[a]*	*Total*		
End of 2015-16	16 112	14 169		30 281	36 307	83
End of 2016-17 Q1	21 473	16 395		37 868	56 573	67
End of 2016-17 Q2	38 516	22 694	2 267	63 477	74 833	85
End of 2016-17 Q3	48 391	27 176	2 439	78 006	95 148	82

[a] 'ECEI' denotes the number of children who have entered the Early Childhood Early Intervention pathway but who *do not* have an approved plan.

Source: NDIA (2017o, p. 16).

The NDIA, commenting on the bilateral estimates, said:

> The transition to full scheme commenced on 1 July 2016 and immediately there were problems. The new systems and process, coupled with the scale of intake and issues with the ICT portals saw the NDIA fall behind both in terms of the bilateral estimates and the quality of the participant and provider experience.

> The NDIA was able to recover against the bilateral estimates, but problems emerged during this time with the quality of plans and concerns were expressed about aspects of the planning process and the impact on the participant experience. These are matters that the NDIA is now actively addressing. (sub. 161, p. 4)

The NDIA indicated that there appear to be fewer clients in existing programs than the national minimum dataset suggested, and compared to the estimated number of transitioning participants in Bilateral Agreements (noting that the numbers in the Bilateral Agreements are estimates, not hard targets). And while this is expected to affect the mix of transitioning and new participants, at this stage the NDIA has not revised the overall expected number of participants in full scheme (sub. 161, p. 76).

Given the size, speed and complexity of the reform, it is inevitable that there will be transitional issues with the rollout of the NDIS. It needs to be recognised that the scheme is still in its infancy and it will take time to get it right. As the Australian Federation of Disability Organisations (AFDO) said:

> We acknowledge that there have been many issues during trial and the transition to full scheme implementation. But we also recognise that this is a unique period in the life of the NDIS. Never again will the scheme have to grapple with the multiple challenges posed by bringing in a large number of participants in such a short period of time. Once this period of transition is over, growth will be limited to a small number of new participants. AFDO understands that there are significant operational challenges in ensuring hundreds of thousands of people enter the scheme in a short period of time. (sub. 180, p. 5)

But already there are signs that the rollout schedule is compromising the NDIA's ability to implement the NDIS as intended, and risking the financial sustainability of the scheme — and the number of participants entering the scheme is only just starting to ramp up. Many of the concerns raised with the Commission in this study relate to the rollout schedule and the risks of focusing on participant numbers (box 2.1). The NDIA is also aware of the risks, noting that:

> … bilateral estimates can and do impact upon the way in which the Scheme is delivered. This can put sustainability at risk and impact on the way in which early intervention and investment initiatives are implemented in the short term. It may also have adversely impacted the quality of plans. (sub. 161, p. 109)

While the NDIA has been set a challenging task of generating plans for tens of thousands of participants each quarter, it is important that it also undertakes the planning process in a way that achieves the objectives of the scheme (chapter 4).

Box 2.1 Risks from the rollout schedule are highlighted

House with No Steps:

> … the Scheme has aggressive ramp-up targets. These are putting pressure on the NDIA's capacity to develop quality plans for participants. Unfortunately, the need to achieve high growth in participant numbers appears to be outweighing considerations of plan quality and consistency. (sub. 104, p. 5)

Community Mental Health Australia:

> If the focus purely becomes about signing as many people up as quickly as possible and preventing cost-overruns, then the intent of what the NDIS was actually meant to deliver starts to become lost. (sub. 11, p. 2)

Maurice Blackburn Lawyers:

> We believe the roll-out timeline of the NDIS is highly ambitious and increases the serious risk of inadequate delivery of services to participants. It also poses significant financial risks to the scheme as a whole. (sub. 58. p. 6)

Blind Citizens Australia:

> While we understand the agency is under intense pressure to meet the targets that have been agreed upon under the bilateral agreements between state and territory governments, meeting these targets should not come at the expense of the basic rights and freedoms of people with disability. (sub. 130, pp. 2–3)

Australian Federation of Disability Organisations:

> The need to bring in a large number of participants into the scheme to meet bilateral targets has during transition led to practices which have not always been consistent the original vision of the scheme. (sub. 180, p. 5)

Young People in Nursing Homes Alliance:

> Trying to meet the very demanding targets in the bi-lateral agreements has been torturous for both the scheme and for its partners. The NDIS has had to divert resources away from core commitments to manage these urgent imperatives … (sub. 187, pp. 26–27)

Plan Management Partners:

> … the volume of plans to be completed in order for the scheme to achieve its milestone rollout targets is ultimately generating more work for LACs and plan reviewers due to the variability in quality of resultant plans. (sub. 126, p. 11)

Catholic Social Services Australia:

> The speed of the NDIS rollout will put considerable pressure on processing participants' eligibility, assessment and planning. This pressure will be exacerbated by annual plan reviews that are required for those already in the scheme (sub. 166, p. 7)

The Department of Social Services:

> … there are risks arising from the scale and pace of roll-out that has potential to place strain on the NDIA, and on agreed transition timeframes. (sub. 146, p. 24)

A further problem resulting from the rollout schedule is that parts of the supporting infrastructure that are essential to the objectives of the scheme are not operating as intended. For example, Local Area Coordinators (LACs), which play a key role in delivering information and linking individuals to disability services, were supposed to be 'on the ground' in rollout areas six months before participants joined the scheme (chapter 5). But this did not occur and some areas were still without a LAC months after

they joined the scheme. The need to meet bilateral targets has also resulted in LACs being asked to divert resources away from Information, Linkages and Capacity Building (ILC) tasks to undertake planning-related activities. ILC is important for containing scheme costs and reducing reliance on individualised supports (chapter 5).

The NDIA (sub. 161, p. 16) acknowledges that its 'systems and processes are not at peak efficiency and are not ideal in terms of dealing with the speed and scale of the intake challenge'. Also that:

> While the NDIA remains committed to meeting the bilateral estimates, it recognises that the systems and processes that underpin delivery must continue to improve to meet the scale of the challenge while delivering appropriate high quality individual outcomes. The achievement of the bilateral estimates must be done in a manner that maintains the commitment in all jurisdictions to quality, safety, improved outcomes and sustainability. (sub. 161, p. 16)

The rollout schedule has also meant that the market for disability care and support (including providers, workers and participants and their families) has had very little time to adjust to the new scheme (chapters 6–8). As One Door Mental Health said:

> The speed with which the roll-out has occurred has placed significant financial strain on providers, particularly small providers, as a result of needing to move from the relative stability of block-funding arrangements to the uncertainty of unknown revenue through fee-for-service. (sub. 179, p. 11)

Without time to allow for the demand side to become better informed and active, and for the supply side to adjust and grow, there is a risk that participants will be unable to utilise their supports, either because the services are simply not there, or because participants are not sufficiently well equipped to navigate the scheme.

Chapter 9 explores the issue of whether a slowdown in the rollout schedule is required.

DRAFT FINDING 2.1

The scale and pace of the National Disability Insurance Scheme (NDIS) rollout to full scheme is highly ambitious. It risks the National Disability Insurance Agency (NDIA) not being able to implement the NDIS as intended and it poses risks to the financial sustainability of the scheme. The NDIA is cognisant of these risks.

2.2 Projections of scheme costs

One of the NDIA's insurance principles is to develop actuarial estimates of long-term costs (chapter 1). Actuarial estimates are compared with the actual scheme experience, so that the NDIA can identify cost pressures, and track and monitor responses put in place to address those pressures.

However, estimating future scheme costs presents a number of challenges. For example, while there is information on the number of potential participants who are currently receiving support from existing State and Territory Government programs, there is only survey data (which is subject to sampling error) on the number of potential participants not receiving support from government programs.

There is also uncertainty about the support needs of potential participants. While there is comprehensive data on the catastrophic injuries that are covered by compensation schemes (mostly spinal cord, brain and burn injuries), for most disabilities, comprehensive data on the level of funding required to achieve good long-term outcomes are not available. The NDIA has constructed reference packages for different disabilities with the help of expert reference groups (chapter 4). These packages will be refined over time as data are collected from the NDIS on the effectiveness of different supports and their cost.

In 2011, the Commission estimated a national disability insurance scheme would cover 411 000 participants at a gross cost of $13.6 billion at full scheme (PC 2011) (box 2.2).

The NDIA (2017o, p. 5) projects that by 2019-20 the NDIS will cover 475 000 participants and cost about $22 billion each year.[9] These estimates are broadly consistent with the Commission's 2011 modelling after taking into account inflation (including the effects of pay rises awarded to social and community services workers by the Fair Work Commission in 2012), population changes, and costs associated with participants aged over 65 years (who enter the scheme prior to 65 years) (box 2.3).

The NDIA's methodology is more refined than that used by the Commission in 2011 (the Commission has been supplied with the long-term cost projection model developed by the NDIA to produce the 2015-16 Annual Financial Sustainability Report). The key differences are:

- participant numbers are modelled for 14 separate disability groups (apart from psychosocial disability, there was no distinction between disabilities in the Commission's 2011 modelling)
- average package costs assumptions are based on reference package data developed by expert reference groups (the Commission in 2011 used data from injury and accident schemes that operate in Australia)
- epidemiological data on incidence and mortality rates for different disabilities were used to model participant numbers over time (the Commission did not explicitly model entry and exit rates in 2011).

9 Both the Commission's and the NDIA's projections of scheme costs include Western Australia. While the gross cost of the NDIS is estimated to be $22 billion in 2019-20, the scheme is expected to reduce the funding required for a range of government programs. A review by the Australian Government Actuary in 2011 estimated these offsets to be about $11 billion (NDIA, sub. 161, p. 29).

Box 2.2 The Commission's modelling approach in 2011

In its 2011 report on *Disability Care and Support*, the Commission estimated that the National Disability Insurance Scheme would cover 411 000 participants and would have a gross cost of $13.6 billion (and a net cost of $6.5 billion) at full scheme. The costings were based on three calculations:

- the number of people who would be eligible for the scheme
- the level of support that these people would require
- the average per person cost associated with each level of support — four types of support were costed: care and support, aids and appliances, home modifications and transport.

No single data source contained all the information required.

- The primary data source for numbers of people and level of support was the 2009 ABS Survey of Disability, Ageing and Carers. The number of participants entering with psychosocial disabilities was calculated by consulting with experts who had previously examined the prevalence of enduring psychiatric disability.
- A variety of sources were used to estimate the average per person costs for different types of support, including data from the Victorian Transport Accident Commission, the NSW Lifetime Care and Support Scheme, and the Multiple Sclerosis Longitudinal Study.

The Commission also estimated that when the National Disability Insurance Scheme matures (around 2050), the *net* cost would be $4.4 billion. The long-term savings were attributable to assumptions regarding early interventions and community capacity building (for example, more people with disability are able to live in the community with intensive supports rather than in supported accommodation).

A further offset of about $720 million was assumed when the National Injury Insurance Scheme matured.

The Commission recognised that there were significant uncertainties about the cost estimates because of the nature and quality of the data, and undertook a number of sensitivity analyses to explore these uncertainties.

Source: PC (2011, pp. 748–780).

The NDIA has made some adjustments to their long-term cost projections using some trial data, but have not yet made more extensive changes to cost projections based on all trial and transition data. This is because these data have too many limitations to update assumptions about prevalence and package costs, and reflect a period of the scheme prior to management responses implemented by the NDIA to address early cost pressures (discussed below). As the scheme rolls out, the transition data collected will be used to better inform estimates of full scheme costs, and to assess the effectiveness the NDIA's responses to address cost pressures.

Box 2.3 Comparing NDIA's estimates and the PC's 2011 estimates

While the National Disability Insurance Agency (NDIA) uses a different methodology to that used by the Commission in 2011 to estimate costs, the differences in projected costs are mainly attributable to incorporating population projections, industry-specific wage increases and costs associated with participants aged 65 years and older (table below).

Population

Between 30 June 2012 and 30 June 2020, Australia's residential population aged under 65 years is projected to increase by 12 per cent. Applying this increase to the Commission's estimate of 411 250 scheme participants (aged under 65) results in 461 000 participants aged under 65 years — this in line with the 458 368 participants estimated by the NDIA. Incorporating population projections adds about $1.5 billion to the Commission's estimates of scheme costs.

Wage increases in the disability sector

In February 2012, the Fair Work Commission found that employees in the community and disability sectors were underpaid compared to public service workers doing similar jobs. The subsequent Equal Remuneration Order applies adjustments ranging from 23 per cent (for employees at the lowest level) to 45 per cent (for employees at the highest level) in nine instalments between December 2012 and December 2020. These adjustments are applied on top of increases from the annual wage review undertaken by the Fair Work Commission.

The NDIA's modelling of scheme costs assumes that average cost of care in the disability sector will increase 29 per cent between 30 June 2014 and 30 June 2020. If Australian Government Actuary assumptions regarding cost increases from the Department of Social Services' funding model are applied between 2011-12 and 2013-14, the total increase in average costs to 2020 is 44 per cent. The NDIA assumptions imply an increase in average costs from $31 183 to $45 018 per participant. These cost increases would add about $6.4 billion to the Commission's estimates of scheme costs.

Participants aged 65 and older

The NDIA modelling projects that there will be 15 000 participants aged over 65 in 2019-20 and that they will add an extra $1.09 billion to scheme costs (with an average cost of $71 000 per participant). The Commission's 2011 estimates of costs did not include participants over 65 years on the basis that they did not represent a net increase in costs to the Australian Government (as their support was funded under the aged care system).

Comparing the NDIA's costings and the PC's costings

	Participant numbers	*Scheme costs*
		$b
Productivity Commission estimates 2011[a]	**411 250**	**12.82**

DRAFT FINDING 2.2

While a different methodology is used, the National Disability Insurance Agency projections of scheme costs are broadly consistent with the Productivity Commission's modelling of the scheme in 2011, after accounting for sector-specific wage increases, population changes, and costs associated with participants aged over 65 years (who were not included in the Commission's estimates).

Some key assumptions behind the NDIA's cost projections

There are a number of key assumptions that drive the NDIA's long term projections:

- *prevalence and incidence rates* — the estimate of participant numbers at full scheme (prevalence) is derived using the Survey of Disability, Ageing and Carers and epidemiological data. Estimates of entry (incidence) and exit rates used to make long-term projections also use these data.
- *long-term prices* — inflation of 4.3 per cent per year is assumed in the short term based on current wage rates (including the Social, Community, Home Care and Disability Services Award), with a long-term assumption of 4 per cent per year.
- *utilisation* — there is no explicit assumption regarding underutilisation in the NDIA's projections. The projections assume that participants are allocated, and completely spend, a reference package of supports (the expected level of support required by participants given their age, disability and level of function).
- *early intervention and early investment* — the NDIA's projections assume that early investment will reduce costs by 0.35 per cent per year. This assumption was originally developed for the Commission's modelling in 2011.
- *technology* — advances in technology can both increase and decrease costs. The NDIA does not make any assumptions about the effect of technological advances on scheme costs.

No new projections of scheme costs

The Commission has not revised its own projection of scheme costs for this position paper. There are a number of reasons for this.

- The early scheme data have too many limitations to update assumptions about prevalence and package costs (as noted above, the NDIA made a similar assessment)
- The prevalence and package cost estimates made by the Scheme Actuary (and reviewed by the Australian Government Actuary) involved a significant amount of work — assumptions about package costs are directly linked to reference packages, which were developed over many months by expert reference groups including representatives

from industry, government and academia. Any Commission modelling would need to be based on this information which is already incorporated in the NDIA modelling.

In any case, point estimates of total scheme costs do not tell the whole story. Financial sustainability is about both costs and benefits, and risks to financial sustainability cannot always be modelled, or easily identified from scheme data. A long-term focus, both within and outside of the NDIS, is therefore important. While the NDIA is responsible for monitoring scheme costs and responding to the cost pressures that it can control, all governments have a responsibility to ensure the success of the scheme and its financial sustainability.

2.3 Key insights from trial and transition data

This section provides some insights from the early experience of the NDIS (from July 2013 to March 2017). It looks at participant characteristics, package costs, and utilisation of supports. These three factors determine the year to year cost incurred by the NDIA on individualised supports.

The first point to note is that data from the trial and transition phase need to be interpreted with caution. This is because:

- differences in trial sites and phasing schedules mean that the data cannot necessarily be used as a guide to anticipate full scheme experience (for example, the average level of committed support by a jurisdiction will reflect the trial cohorts for each jurisdiction)
- early scheme data are often subject to small sample sizes — minimal weight should be placed on disaggregated results where sample sizes are small
- the number of scheme participants in a region is likely to be an underestimate of the full scheme number because it takes time for potential participants to approach and gain access to the scheme. (Conversely, the number of exits due to successful early intervention are likely to be lower in the first years of the scheme as it can take some years for the benefits of early intervention to accrue.)
- it can be difficult to determine whether observed cost pressures are transitional or whether they are likely to persist
- during transition, about 20 per cent of committed support is expected to be provided in-kind (Commonwealth or State/Territory Government programs delivered under existing block-funding arrangements) (DSS, sub 146, p. 22) and these supports tend to be more expensive than standard supports (NDIA, sub. 161, p. 101).
- there have been some data integrity concerns that may impact upon the analysis, arising in part as a result of the NDIA transitioning to a new ICT system in July 2016, and in part from gradual improvements in the way that scheme data are collected in response to any identified data integrity concerns.

What do the early data tell us about participants?

At the end of the trial phase in June 2016, the number of participants with an approved plan (30 821) was 83 per cent of bilateral estimates (36 307) (NDIA 2016g, p. 42). (There were another 5500 participants who had been determined as eligible, but who did not yet have an approved plan.)

By the end of March 2017 (the most recent quarterly report), an additional 63 000 people had been found eligible for the scheme (this took the total number of scheme participants who had ever been active to 99 092) (NDIA 2017o). About 75 000 participants are currently active (they have not exited the scheme) and have an approved plan (NDIA 2017o, p. 16).

Participants by disability

Almost two-thirds of current scheme participants either have an intellectual disability (37 per cent) or autism (28 per cent) as their primary disability (figure 2.2). Psychosocial disability is the next most common disability, accounting for about 6 per cent of scheme participants.[10]

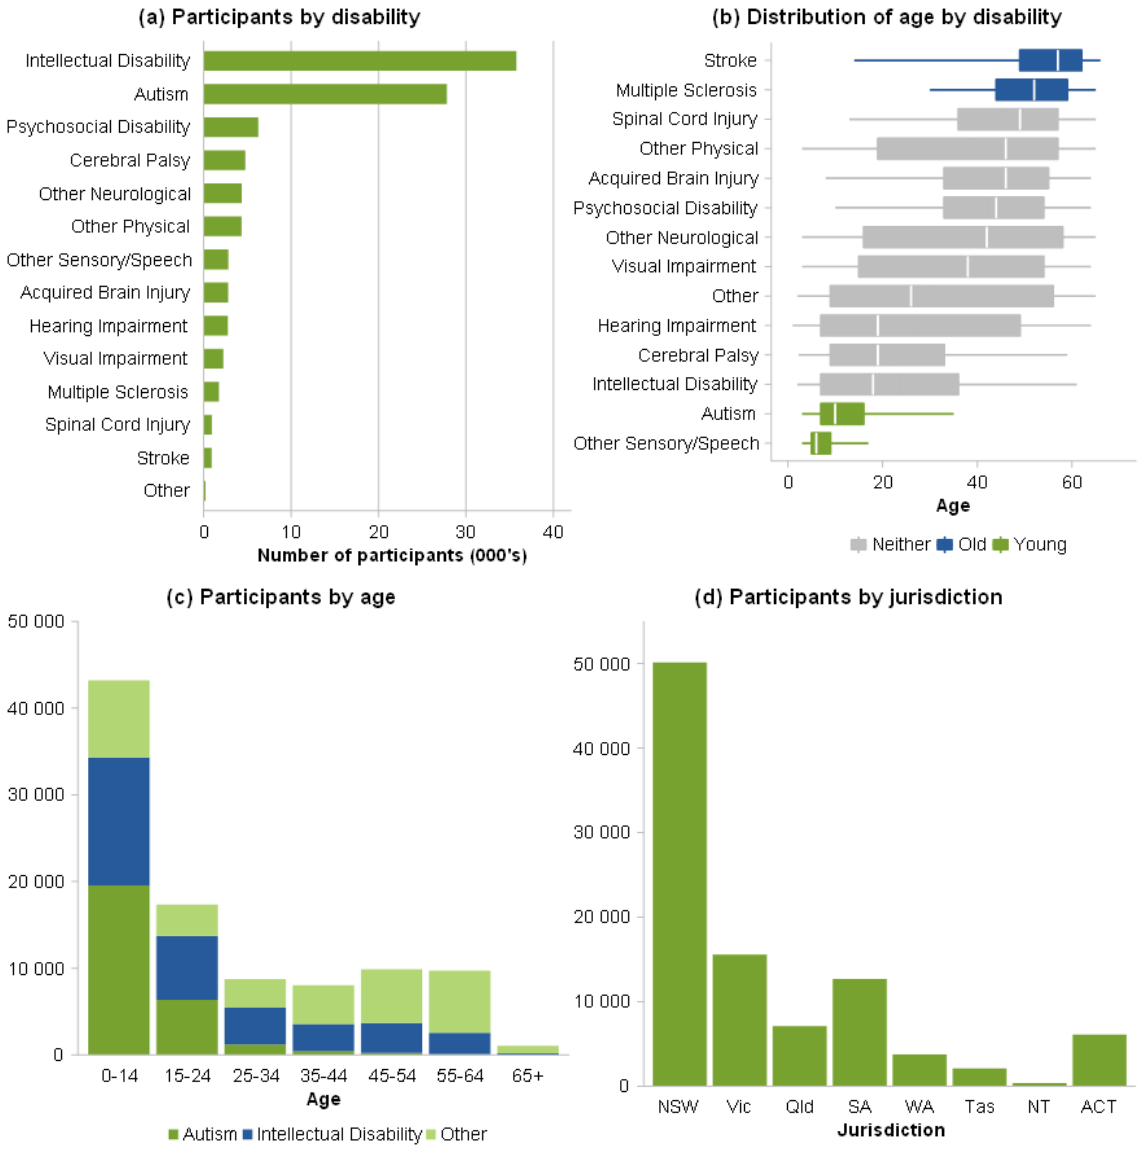
Participants with some disabilities (like stroke and multiple sclerosis) tend to be older, while participants with autism and other sensory/speech disabilities are relatively young (figure 2.2). Most participants with autism enter the scheme under early intervention requirements (and early intervention is most effective at younger ages). In recent years there has been an increase in the number of autism diagnoses — likely in part due to a growing awareness of autism and more sensitive screening tools leading to higher prevalence rates for younger ages (Gothe-Snape, J. 2017).

Disability-specific prevalence rates at the Barwon and Hunter trial sites broadly match those assumed in the NDIA's long-term modelling for all but the largest disability groupings (figure 2.3) (box 2.4). Prevalence rates were higher than the NDIA's long-term modelling assumptions for:

- autism, where prevalence rates were significantly higher in both trial sites (the NDIA has implemented initiatives in response, discussed below)
- intellectual disability, where prevalence rates were much higher in the Barwon region, but not the Hunter region. The higher prevalence rate for intellectual disability in the Barwon region was most pronounced in participants aged under 18 years.

[10] The NDIA (sub. 161, p. 82) noted that, in addition about 4 per cent of participants have a psychosocial disability that is not considered their primary disability.

Figure 2.2 **Some insights: NDIS participants[a,b,c]**



a All figures include data on active eligible participants at 31 March 2017. **b** Figure (b) shows box plots of the distribution of the age of participants for different disability groups. The white dash represents the median and the box shows the interquartile range (quartiles 1 and 3). The box plot tails show the 2.5 and 97.5 percentiles. **c** In figure (d), the number of participants in Western Australia includes the Perth Hills NDIS trial site, but not the WA NDIS MyWay trial.

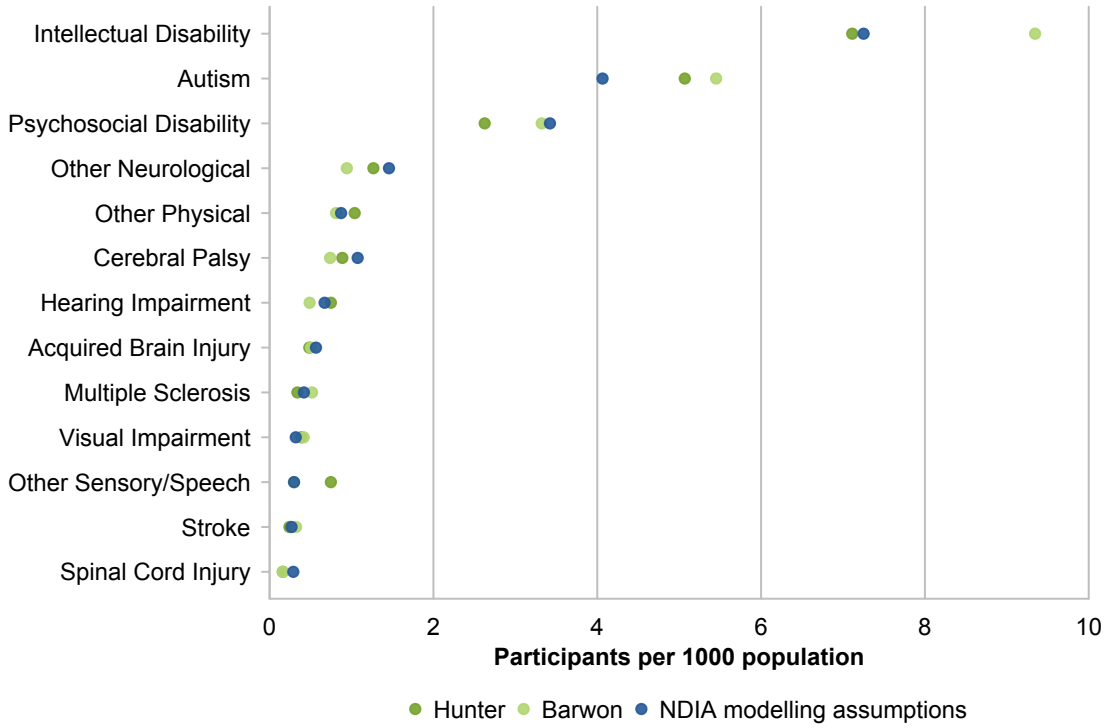
Source: Commission estimates based on unpublished NDIA data.

Box 2.4 Calculating prevalence rates

It is difficult to assess how participant numbers are tracking compared to the National Disability Insurance Agency's long-term modelling assumptions, as it takes time for potential participants to approach and gain access to the scheme. To address this issue, the Commission used data from the Barwon and Hunter trial sites. Both these sites have been in operation since July 2013 and are open to everyone under the age of 65 years.

One significant limitation of this approach is that these trial sites may not be representative of the broader Australian population. Another limitation is that the NDIA have found that participants are continuing to approach the scheme at mature trial sites at a rate that is above that expected if only participants with newly acquired disabilities were approaching the scheme (though this latter factor would suggest prevalence may be even higher relative to the modelling assumptions than the numbers so far collected would indicate). Similarly, the number of exits from the scheme due to successful early intervention is likely to be lower than would be expected at full scheme, as it can take some years for the benefits of early intervention to accrue.

Figure 2.3 Prevalence rates by disability — trial compared to the NDIA's long-term estimates[a]



[a] Prevalence rates for a region are calculated as the number of active eligible participants with the selected disability per 1000 of the population aged 0-64 years at 30 June 2016. Data on the population for the Barwon and Hunter trial regions were sourced from ABS (*Data by Region, 2011–16*, Cat no. 1410.0) with 2015 data projected to 2016 using data from ABS (*Australian Demographic Statistics, Sep 2016*, Cat. no. 3101.0).

Source: Commission estimates based on unpublished NDIA data.

There is a lot of uncertainty around the number of participants with psychosocial disability at full scheme.

- Modelling work undertaken by the Department of Health in 2016, using the National Mental Health Service Planning Framework, estimated that about 92 000 people (18-64 years) have severe and complex psychosocial disorders that would closely align with the NDIS eligibility criteria for individualised supports (sub. 175, p. 4).
- David McGrath Consulting estimated that 'approximately 289 000 people with a severe mental illness will need individualised, intensive 'NDIS-like' community supports in any 12-month period' in work conducted for Mental Health Australia in 2015 (sub. 155, p 10).
- The NDIA (2016g, p. 26) expects that there will be about 64 000 participants with a primary disability of psychosocial disability in the scheme in 2019-20. According to the NDIA, at this stage of the rollout, the number of participants with psychosocial disability is tracking broadly in line with their modelling assumptions in mature trial sites (Scheme Actuary 2016).

The Commission is very aware that estimating the number of participants with psychosocial disability is difficult because a robust and comprehensive data base from which to draw is lacking. However, given that a range of estimates have been prepared by stakeholders and agencies, it would be beneficial if the methodology used was made fully transparent, so that these estimates could be assessed and considered in relation to projections of numbers of participants with psychosocial disability at full scheme.

Participants by age

The largest share of scheme participants at the end of March 2017 were children aged 14 years and under (about 43 000 or 44 per cent of total participants) (figure 2.2). About 45 per cent of children in the scheme have autism, while 34 per cent have an intellectual disability (including development delay).

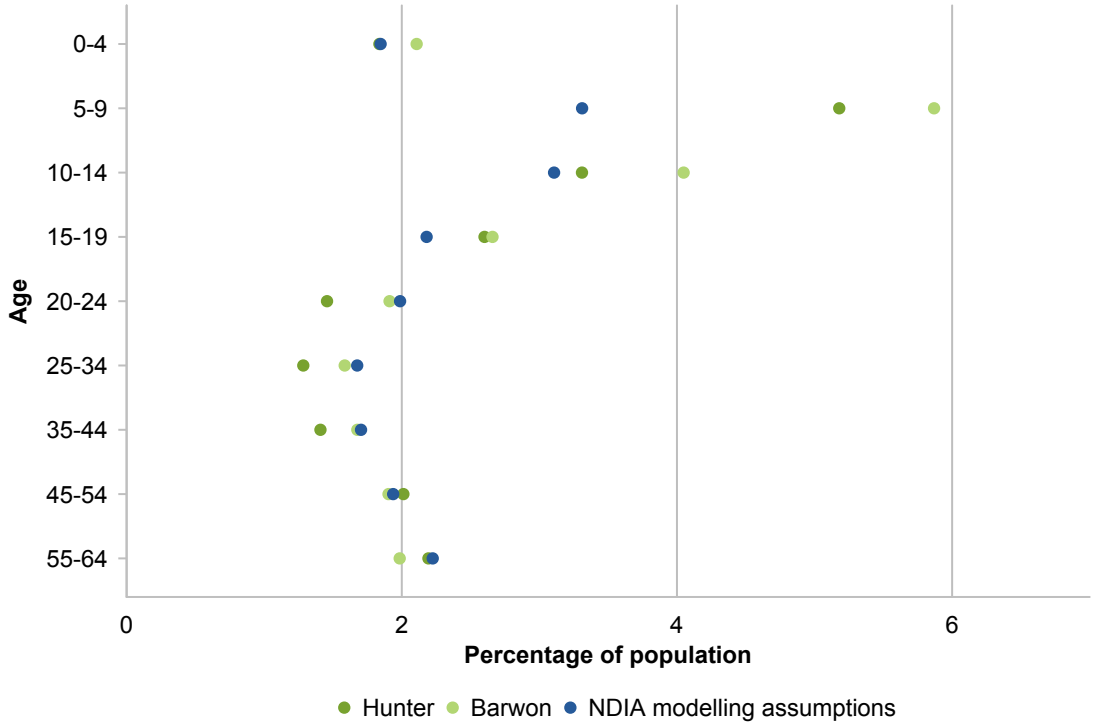
There are more children in the scheme than originally expected — this is even after accounting for the fact the number of children in the scheme is skewed by the South Australian trial site, which only contained children. The NDIA analysed the experience of trial sites and found that the prevalence rates for children aged 0 to 6 years:

- exceeded the Commission's 2011 estimates in South Australia, Barwon and ACT trial sites
- were in line with the Commission's 2011 estimates in Western Australia and the Hunter trial sites (sub 161, p. 78).

Looking at the data from the Barwon and Hunter trials sites, the Commission has reached a similar conclusion. The largest gaps between actual and expected prevalence rates (based on the NDIA's long-term modelling) are for children aged 5 to 9 years followed by

children aged 10 to 14 years. There are larger gaps for the Barwon region than the Hunter region (figure 2.4).

Figure 2.4 **Prevalence rates by age group — trial compared to the NDIA's long-term estimates[a]**



[a] Prevalence rates for a region are calculated as the number of active eligible participants in a given age group per 1000 of the population in the age group at 30 June 2016. Data on the population for the Barwon and Hunter trial regions was sourced from ABS (*Data by Region, 2011–16*, Cat no. 1410.0) with 2015 data projected to 2016 using data from ABS (*Australian Demographic Statistics, Sep 2016*, Cat. no. 3101.0).

Participants by level of function

Since July 2016, participants have been assessed for their level of functional capacity when they enter the scheme (box 2.5). There is level of function data available for just over 70 per cent of participants. At the end of March 2017, of those who had been assessed:

- 39 per cent of participants had a high level of function
- 38 per cent had a medium level of function
- almost a quarter had a low level of function.

Box 2.5 Assessing level of function

As part of the planning process, the National Disability Insurance Agency assesses each participant's level of function. This is one of many pieces of information that it uses to develop plans to help participants progress towards their personal goals and aspirations.

The National Disability Insurance Agency currently uses different assessment tools for 11 key disability types and the World Health Organization Disability Assessment Schedule version II (for adults) and the Paediatric Evaluation of Disability Inventory-Computer Adaptive Test (for children) where no specific tool is identified. The scores of each assessment tool are mapped to a scale of 1 (high functional capacity) to 15 (low functional capacity), which provides a common measure across different types of disability.

To simplify its analysis, the Commission aggregated levels of function into three groups: high (levels 1-5), medium (levels 6-10) and low (levels 11-15).

Source: NDIA (sub. 161, p. 10).

Compared to the NDIA's long-term modelling assumptions, the distribution of participants by level of function to date is more heavily weighted towards the medium and low levels of function. This difference reflects, in part, the scheme's phasing schedules — participants with the greatest support needs are typically the first to enter the scheme in a region (figure 2.5). This is supported by the fact that the distribution of level of function for mature trial sites (Barwon and Hunter) is closer to the modelling assumptions.[11] (The distribution of level of function for the Hunter trial site is not expected to match modelling assumptions as it included a number of large residential facilities.)

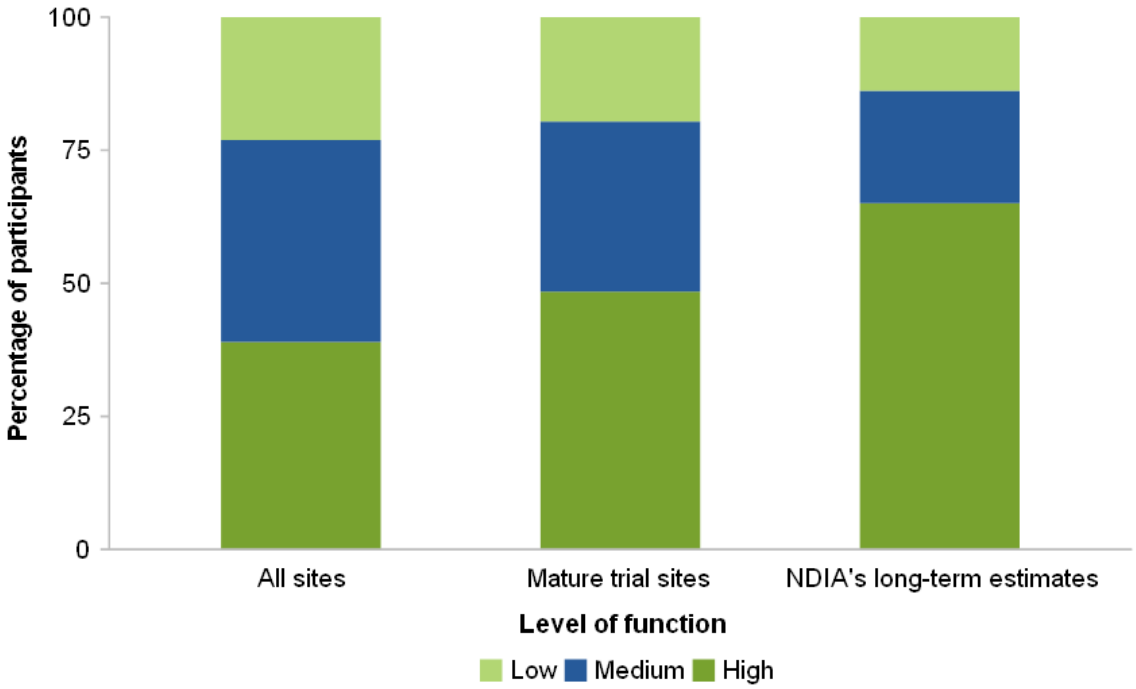
That said, scheme costs will be higher than estimated if the early trend of participants having lower levels of function than expected persisted at full scheme.

Participants by jurisdiction

About half of current NDIS participants are located in New South Wales (figure 2.2) — in comparison the state accounts for 32 per cent of Australia's total population. This overrepresentation is because New South Wales had two trial sites while other jurisdictions had one. New South Wales is also further along the transition to full scheme (NSW is scheduled to reach full scheme by the July 2018 — a year earlier than all the jurisdictions except South Australia and the ACT) (table 2.1).

[11] Data on level of function have not yet been collected for all trial participants.

Figure 2.5 **Distribution of participants by level of function at 31 March 2017 compared to the NDIA's long-term estimates[a]**



[a] 'All sites' denote all eligible scheme participants at 31 March 2017 for whom level of function data are available. 'Mature trial sites' denotes all eligible scheme participants at 31 March 2017 who were trial participants at the Barwon and Hunter trial sites and for whom level of function data are available. 'NDIA long-term estimates' denote the distribution of level of function implicitly assumed in the NDIA's projections of scheme costs.

What do the early data tell us about package costs?

The level of committed support (or a participant's package cost) is the dollar amount of support in a participant's plan. However, it is not necessarily the amount of support that a participant receives — there are a range of reasons why supports may be underutilised (discussed below).

Over the course of the trial, the average annualised package cost was $36 049.[12] This is slightly below long-term modelling assumptions of average package costs ($38 360 in 2015-16 dollars).

[12] This figure excludes the cost of three large residential centres — Stockton and Kanangra (in the Hunter area trial site) and Colanda (in the Barwon area trial site) — which include a high concentration of high cost participants in one geographical area. The average annualised package cost increases to $39 065 when they are included (NDIA 2016g, p. 46).

However, making this comparison is of limited value because it does not account for the composition of participants included in the trial. Notably, the trial included a higher proportion of children (who typically receive less funded support than other participants because they receive more informal care). While participants with lower levels of function typically entered the scheme first during the trial — which would increase package costs — this was more than offset by the number of children entering the scheme.

To address this limitation, the Commission compared annualised package costs to the reference package amounts for each participant where level of function data were available. Reference packages represent the average expected package amount for a participant given their age, disability and level of function, and are a building block for the NDIA's modelling of scheme costs (box 2.6). Importantly, the package cost of a single participant is *not* expected to be equal to the reference package amount (factors such as scope for informal support and requirements for aids are important inputs into a participant's plan and can generate large differences between individual packages and reference package amounts), but package costs can be compared to reference packages at an aggregate level.

Box 2.6 Reference packages — fundamental to assessing financial sustainability, not individual packages

To acquit the study's terms of reference, it is necessary to examine the assumptions of the NDIA's financial sustainability modelling, and to consider the reference packages used to project costs for different cohorts of people with different disabilities over the long term. Reference packages form a key part of understanding long-term costs, and whether the scheme is 'on track' in aggregate. That said, reference packages (and the data presented in this chapter) should not be conflated with what an individual might expect to receive in an individualised funded package at any given time. This is because a package received by an individual is determined by much more than a reference package (chapter 4), and the reference package amount does not account for an individual's particular goals, nor what supports may be reasonable or necessary in a particular individual's circumstances.

Comparing annualised package costs to the reference package amounts is further complicated by participants in Shared Supported Accommodation (SSA). SSA is accommodation for people who require specialist housing solutions and intensive support needs. SSA is designed for participants with extreme functional impairment. As such, package costs for participants in these facilities are substantially higher than other scheme participants (typically about $200 000).

At 31 March 2017, 11 per cent of participants with plans approved from July 2016 were in SSA. While the Commission's estimates include participants in SSA, there are reasons why the package costs of these participants may be lower as the scheme matures. First, there are a number of participants with relatively high levels of function in SSA who will potentially require significantly less support if they receive appropriate capacity building supports early in their lives. Second, SSA services are currently delivered under in-kind

arrangements and for this reason may not be priced correctly (states and territories determine the price of in-kind services, chapter 10).

Using the above approach, the average annualised cost of packages effective after 1 July 2016 is higher than expected given the characteristics of participants ($60 000 compared to $56 000). (Unless otherwise stated, the Commission has used plans effective after 1 July 2016 when analysing package costs.)

Packages by disability

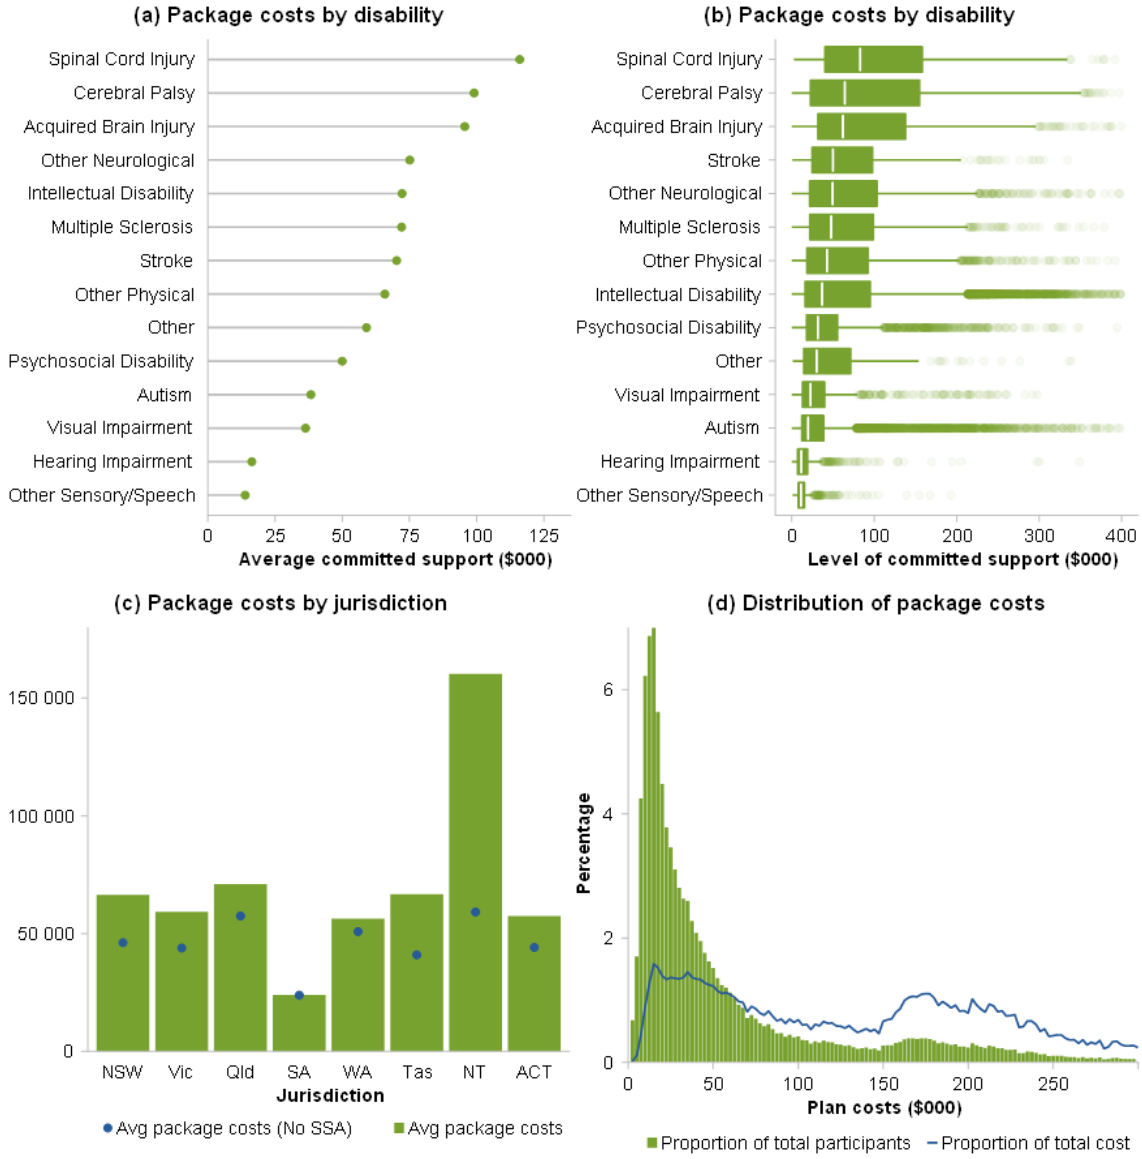
Scheme participants with spinal cord injuries have the highest annualised average level of committed support ($120 000), followed by those with cerebral palsy ($99 000) and acquired brain injury ($96 000) (figure 2.6). If participants included in SSA are excluded, the averages fall to $110 000, $78 000 and $74 000 respectively.

There is significant variation in the amount of committed support received by participants with high cost disabilities. The distribution of committed support for these disabilities is skewed towards some very high cost participants, many of which are in SSA (figure 2.6). Disabilities with lower average levels of committed support (like autism and visual and hearing impairment) exhibit less variation in costs. Some participants with high cost packages may have comorbidities that increase the level of support required, but are classified into a single disability group for reporting purposes.

Average annualised package costs are significantly lower than the NDIA's long-term modelling assumptions for five of the high-level disability groupings (figure 2.7). However, package costs for participants with intellectual disability (the most common disability grouping) and visual impairments are significantly higher than long term modelling assumptions (though the number of participants with visual impairment is much lower than the number with intellectual disability so the aggregated impact is much lower). Average annualised package costs are broadly in line with long-term modelling assumptions for the remaining disabilities.

Figure 2.6 **Some insights on annualised package costs[a,b,c]**

Plans effective from 1 July 2016

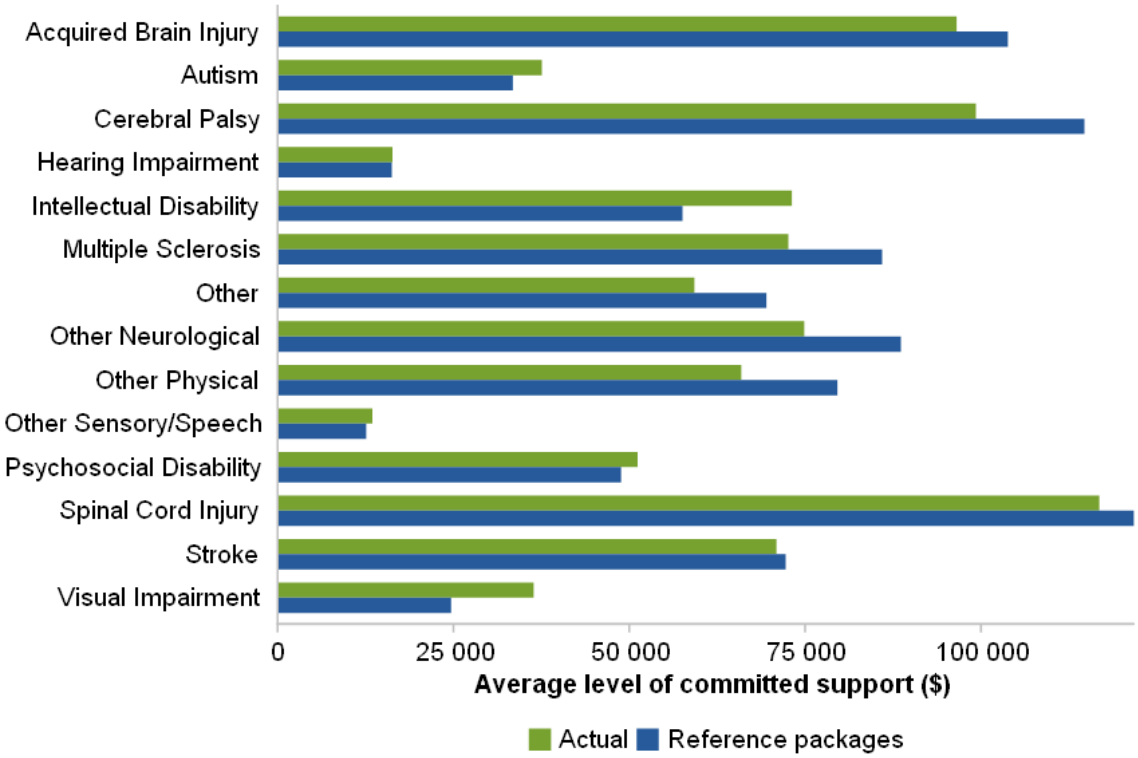


[a] For participants with multiple plans over the time period, the latest plan is used. [b] Figure (b) shows box plots of the distribution of the level of committed support for different disability groups. The white dash represents the median and the box shows the interquartile range (quartiles 1 and 3). The box plot tails show the minimum and maximum observations (though points that deviate by more than 1.5 times the interquartile range from the box are considered outliers and are denoted by a dot point). [c] In figure (c), Western Australia includes the Perth Hills NDIS trial site but not the WA NDIS MyWay trial.

Source: Commission estimates based on unpublished NDIA data.

Figure 2.7 **Average annualised level of committed support compared to reference packages, by disability[a,b,c]**

Plans effective from 1 July 2016



[a] Reference packages are the average package cost assumed in the NDIA's long term modelling based on age, disability and level of function. They *are not* what an individual should expect to receive in an individualised funded package at any given time. [b] For participants with multiple plans over the time period, the latest plan is used. [c] Reference packages are linked to assessment tools. Therefore, participants who are assessed using the generalised assessment tools (including all participants with psychosocial disability) are linked to a 'generalised' reference package.

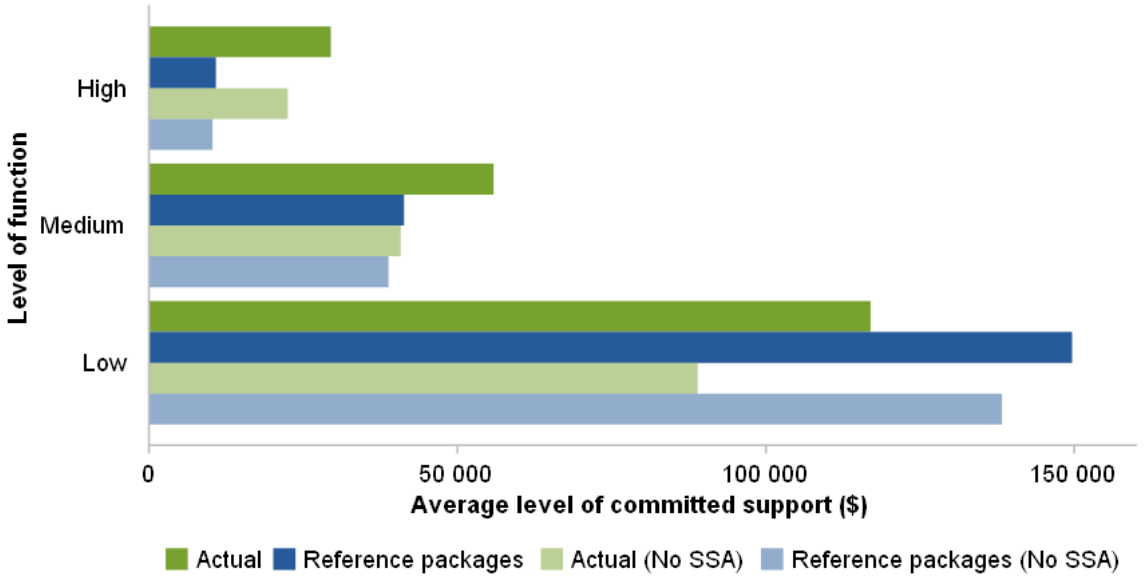
Source: Commission estimates based on unpublished NDIA data.

Packages by level of function

As expected, the average annualised package cost is highest for participants with the lowest level of function (figure 2.8). The average level of committed support for plans associated with low levels of function is almost $120 000, just under four times the amount for participants with high levels of function (about $31 000).

Figure 2.8 **Average annualised level of committed support compared to reference packages, by level of function[a,b]**

Plans effective from 1 July 2016



[a] Reference packages are the average package cost assumed in the NDIA's long-term modelling based on age, disability and level of function. They *are not* what an individual should expect to receive in an individualised funded package at any given time. [b] For participants with multiple plans over the time period, the latest plan is used.

Source: Commission estimates based on unpublished NDIA data.

There are significant differences between average annualised packages costs and the NDIA's long-term modelling assumptions by level of function (figure 2.8).

- The average level of committed support for participants with low levels of function (who require more support) is less than expected (about $120 000 compared to $150 000). One explanation for this result may be that reference packages are underestimating the amount of informal support provided by families and carers.
- The average level of committed support for participants with medium levels of function is higher than modelling assumptions ($56 000 compared to $41 000).
- Participants with high levels of function (who require less support) are obtaining higher packages on average than the modelling assumes ($29 000 compared to $11 000).[13] The NDIA noted that fewer participants than expected are entering the scheme with small package amounts (less than $10 000), and indicated that this is in part due to problems with planning processes (NDIA 2016b, p. 40).

[13] The average annualised package cost for participants with high levels of function presented here ($29 000) only includes participants for whom reference package data are available. Average annualised package costs equal $31 000 when all participants with high levels of function are included.

Participants in SSA are a significant driver of average costs for the high and medium levels of function cohorts (figure 2.8). Given that SSA is designed for people with low levels of function, this suggests that there may have been issues with how SSA has been managed in the past. Such historical experience suggests that investing in capacity building supports early to keep participants with high and medium levels of function out of SSA is critical for minimising scheme costs in the future.

Packages by jurisdiction

The average package cost is highest in the Northern Territory ($160 000) followed by Queensland ($71 000), and lowest in South Australia ($24 000) (figure 2.6(c)). These differences are driven by the phasing schedules. About 39 per cent of Northern Territory participants with an approved plan are in SSA with an average package cost of $320 000.[14] The NDIS only began operating in Queensland at the beginning of 2016 and therefore has a disproportionate number of participants with low levels of function. In contrast, because of the scope of their trial, almost all the scheme participants in South Australia are children who tend to have lower levels of committed support than older participants.

The distribution of total committed supports

The distribution of committed supports (for plans effective from July 2016) is heavily weighted to low cost packages with the most common package costing between $10 000-$15 000 (figure 2.6(d)). The distribution of committed supports weighted by total cost of packages is flatter, peaking at $10 000-$15 000 and $175 000. The second of these peaks is attributable to participants in SSA. A significant proportion of scheme costs is attributable to high cost participants — while only 18 per cent of packages cost more than $100 000, these account for 56 per cent of total committed supports.

Types of support provided

Over half of committed supports are earmarked to help scheme participants with their daily life — usually through support for daily activities (figure 2.9) (box 2.7).[15] A significant proportion of support is also allocated to help participants become more involved in social and community programs (19 per cent), and to improve their daily living skills (11 per cent).

[14] Scheme participants in SSA in the Northern Territory tend to be in the most complex types of SSA.

[15] Participants have some control over how they allocate their support budget depending on the support category (that is, they do have some scope to deviate from the support described in their plan).

Box 2.7 Types of support

Supports provided under the National Disability Insurance Scheme fall into one of fifteen *support categories,* which in turn can be grouped into three *support purpose categories*:

- Core supports — support that enables participants to complete activities of daily living, and enables them to work towards their goals and meet their objectives.
- Capital supports — an investment, such as assistive technologies, equipment, home or vehicle modifications, and funding for capital costs associated with specialised housing.
- Capacity building supports — support that enables participants to build their independence and skills.

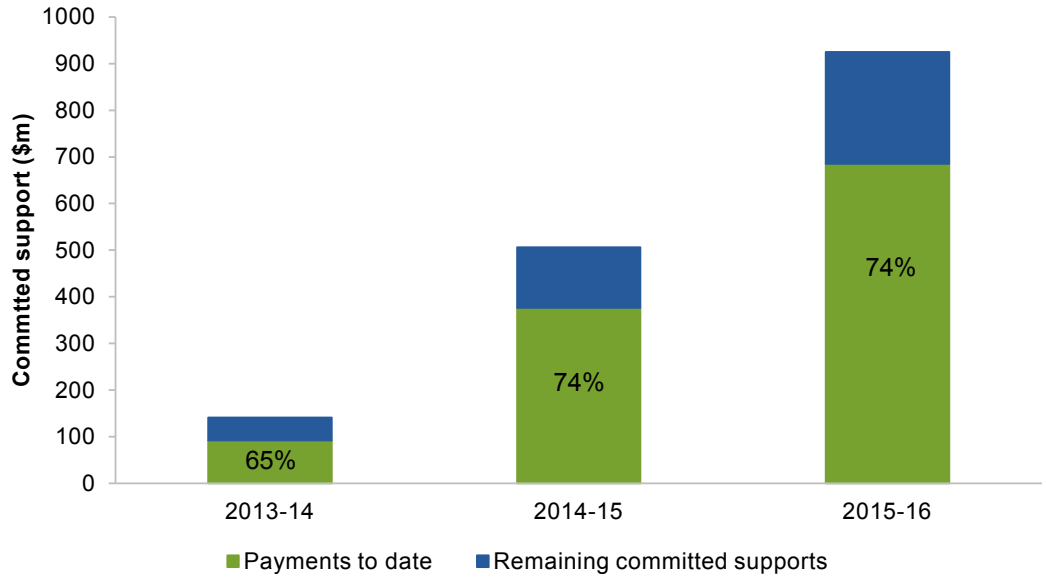
Utilisation

There has been significant underutilisation of committed supports in the scheme so far — in 2015-16, 74 per cent of committed supports have been utilised to date (figure 2.10).

Figure 2.10 **Utilisation of committed supports**



Source: NDIA (2017o, p. 34).

According to the NDIA (and supported by comments from other study participants), on-the-ground experience indicates that the reasons for the utilisation rates being below full utilisation vary by the individual and their circumstances. Some reasons include:

- insufficient supply of supports to meet demand, especially for specific supports (such as short-term accommodation) and in particular markets (such as remote and very remote areas) (PDCN, sub. 29; Public Service Research Group, sub. 56; Jeff Scobie, sub. 57; APA, sub. 93; Commonwealth Ombudsman, sub. 137)
- participants experiencing difficulties navigating the system, which can mean they are unable to implement a plan once it has been approved (PDA, sub. 38; ABF, sub. 48; Jeff Scobie, sub. 57; CSSA, sub. 166)
- scheme participants not needing all the supports they are entitled to (planners overestimating the amount of funded support that will be needed, or including supports that do not meet the needs of participants) (Jeff Scobie, sub. 57)
- the market for plan supports (such as support co-ordination and plan management) being relatively immature and therefore limiting the help that participants can obtain (Anglicare Australia, sub 157)
- some participants cannot easily access information about how much of their supports are available (Public Service Research Group, sub. 56).

Some underutilisation of supports could be expected in the early stages of the scheme as participants and providers adapt to a new system for providing disability care. While the NDIA's estimates of scheme costs implicitly assume that all committed supports are

completely spent when the scheme is fully implemented the NDIA said (sub. 161 p. 70) that 'in a person-centred system the utilisation rate will never be 100%'. The NDIA also noted experience in other schemes suggests a utilisation rate of between 80 and 95 per cent could be expected.

Some emerging cost pressures

Bringing the analysis of these three components of scheme costs together, the Commission is of the view that the early scheme data suggests that NDIS costs are broadly in line with the NDIA's long-term modelling estimates. While more children are entering the scheme than expected and package costs are higher than expected, these factors have been offset by lower levels of utilisation than expected.

However, it is critical that emerging cost pressures are managed as utilisation rates are expected to rise. The Department of Social Services (sub. 146, p. 20) echoed this sentiment, noting that 'better management of cost pressures should reduce the impact of increasing utilisation rates'. That said, if the cost pressures emerging from the trials and transition are not addressed, the financial sustainability of the scheme will be at risk.

The NDIA is tasked with ensuring that the NDIS is delivered within the funding envelope, and this involves identifying and managing emerging cost pressures. The Scheme Actuary compares the experience of the NDIS to projections on an ongoing basis and reports to the Board quarterly. If cost pressures are detected early, management responses can be put in place before problems become entrenched.

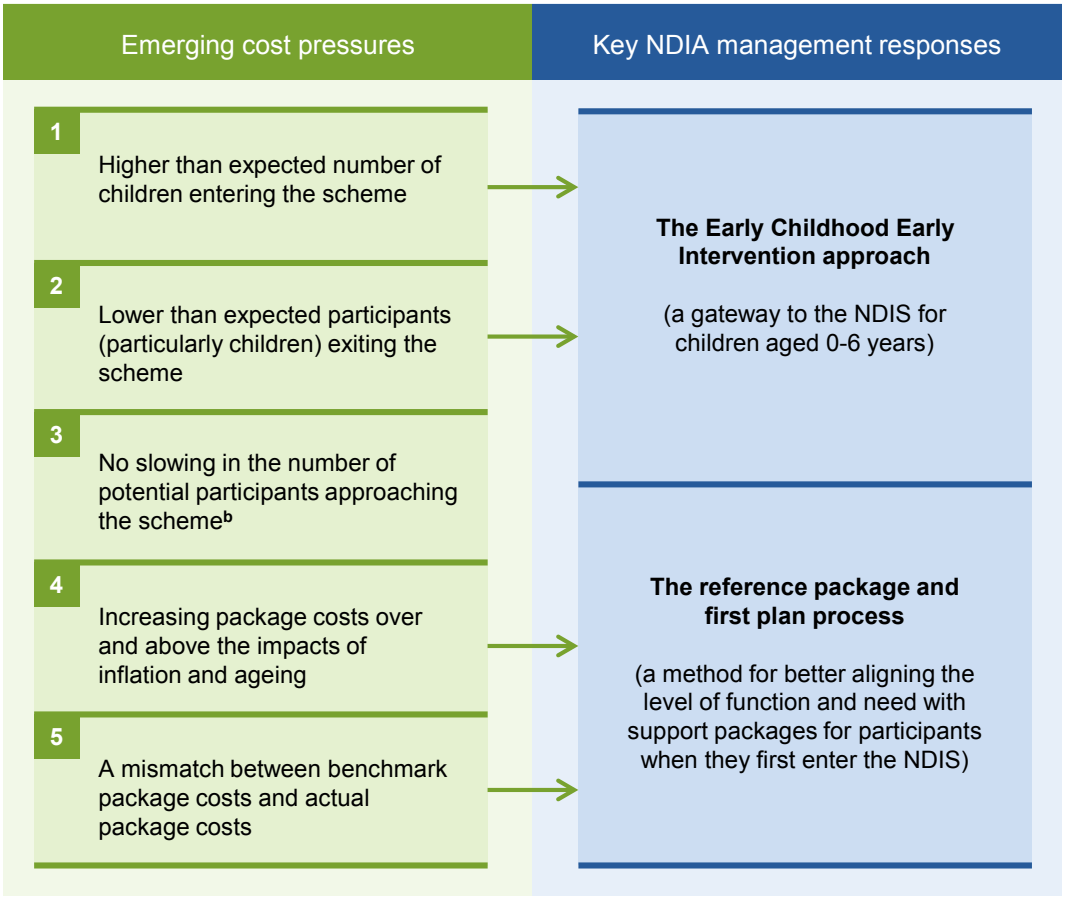
In the NDIA's most recent annual report, the Scheme Actuary identified five cost pressures from the trial sites that need to be managed for the full scheme, including:

- a higher than expected number of children (especially in the trial sites of South Australia, Victoria and the ACT)
- increasing package costs over and above the impacts of inflation and ageing (as plans are reviewed)
- potential participants continuing to approach the scheme (the number of people approaching the scheme in some trial sites that have been operating since 2013 is more than would be expected if only people with newly acquired disabilities were approaching the scheme)
- a lower than expected number of participants exiting the scheme (particularly children who entered the scheme under the early intervention requirements)
- a mismatch between benchmark package costs and actual package costs. There is a greater than expected level of variability in package costs for participants with similar conditions and levels of function (NDIA 2016g, pp. 16, 144).

In line with the insurance approach to identifying risks early and putting in place management responses, the NDIA has put in place initiatives to address these cost pressures

(figure 2.11). The responses include the Early Childhood Early Intervention approach (chapter 3), and the reference package and first plan process (chapter 4) (NDIA 2016g, pp. 16–17, 56–57). It is too early to assess the effectiveness of these initiatives.

Figure 2.11 **The NDIA's responses to emerging cost pressures**[a]



[a] This figure includes the NDIA's two main responses to emerging cost pressures. The NDIA has initiated several smaller projects to address emerging cost pressures, such as an analysis of reasonable and necessary costs across the lifespan of participants. These are detailed in the NDIA's 2015-16 Annual Report (NDIA 2016g, pp. 145–146). [b] Potential participants continuing to approach the scheme is not a cost pressure that can easily be addressed by the NDIA.

Source: NDIA (2016g, pp. 144–146).

DRAFT FINDING 2.3

The National Disability Insurance Scheme, at the end of trial, came in under budget. This was in large part because not all committed supports were used (in 2015-16 the utilisation rate was 74 per cent).

Based on trial and transition data, scheme costs are broadly on track compared to the National Disability Insurance Agency's (NDIA) long-term modelling. At this stage, early cost pressures (such as greater than expected numbers of children and higher than expected package costs) have been offset by lower than expected levels of utilisation.

The NDIA has put in place initiatives to address emerging cost pressures. It is too early to assess the effectiveness of these initiatives.

2.4 Are scheme benefits being realised?

Realising the benefits of the scheme is critical for the wellbeing of people with disability and for ensuring that the community continues to be willing to pay for the NDIS.

Comparing the benefits of the scheme relative to expectations is more difficult than making the same comparison for costs. Some of the benefits are difficult to calculate because they are intangible (for example, the benefits that people with disability receive from having greater choice and control) which makes it more challenging to compare actual and expected benefits.

Outcomes for participants, families and carers

Both the NDIS Outcomes Framework (box 2.8) and an evaluation undertaken by the National Institute of Labour Studies (box 2.9) provide some early insights on outcomes for participants.

- The NDIA has developed a NDIS Short Form Outcomes Framework for measuring the outcomes of scheme participants and their families and carers over time. Most questions ask participants to reflect on their life at the moment to form a baseline for assessment of the ongoing effects of the NDIS. However, there are some questions that ask participants how their life has improved after becoming a participant that can be used to assess scheme benefits to date.
- The intermediate report of the NDIS evaluation undertaken by the National Institute of Labour Studies uses both quantitative (from surveys) and qualitative data (from interviews) to assess the outcomes of the NDIS.

Box 2.8 NDIS Short Form Outcomes Framework

The National Disability Insurance Scheme Short Form Outcomes Framework is an approach to measuring the outcomes of the support experienced by scheme participants and their carers. It includes eight indicators of participant experience (known as participant domains) as well as outcomes related specifically to families (table below). It was piloted in the first three months of 2015 and is now being rolled out scheme wide. (At June 2016, over 23 000 questionnaires had been received — over 13 000 participant surveys and 10 000 family surveys.)

The Framework will allow tracking of participant and scheme progress over time, and demonstrate how participants are faring relative to other Australians and other OECD countries. It will also contribute to an understanding of what types of supports lead to good outcomes for people with disability, their families and carers.

Domain	*Description*
Choice and control	Improved choice and control over participant goals, as well as the planning and delivery of their supports.
Daily activities	Increased ability to undertake daily activities with adequate levels of support.
Relationships	Increased levels of social inclusion and reduced experiences of loneliness.
Home	Improved satisfaction with participants' home environment now and five years into the future.
Health and wellbeing	Improved health and wellbeing and increased ease of access to health services.
Lifelong learning	Increased opportunities to learn new things.
Work	Increased uptake of paid employment opportunities (as well as the associated feelings of social inclusion from being part of the workforce).
Social, community and civic participation	Increased participation in community activities chosen by the participant, and reduced negative experiences associated with being excluded.

Sources: NDIA (2015d, 2016g, p. 60).

Box 2.9 **NDIS Evaluation**

In 2013, the Australian Government Department of Social Services commissioned a consortium led by the National Institute of Labour Studies to conduct an evaluation of the trial of the National Disability Insurance Scheme. The study monitors and evaluates the experience of participants, and their families and carers, service providers and their workforces in the trial sites of the ACT, Victoria, New South Wales, Northern Territory, South Australia and Tasmania.

An initial report, which described how the evaluation was being conducted, was delivered to the Department of Social Services in December 2015.

An intermediate report presented a synthesis of the quantitative and qualitative evidence collected to date and was released in December 2016.

- The qualitative evidence was sourced from in-depth interviews of people with disability, their families and carers (62 interviews), disability service providers (5), disability workforce stakeholder organisations (15) and National Disability Insurance Agency staff (46).
- The quantitative evidence is based on a survey of about 4500 people with disability and about 3500 families. Survey participants are split into two groups — those covered by the NDIS trial and those not covered — and their experiences are compared.

A final report is scheduled to be completed in 2017. It will incorporate an additional wave of survey data. Unless otherwise stated, data presented in this chapter are from the intermediate report.

The NDIS is providing benefits to many

Data from the NDIS evaluation and NDIS Short Form Outcomes Framework suggest that the NDIS has provided a range of benefits to participants, their families and carers. The Commission also received many submissions supporting this finding (box 2.10). The NDIS is:

- providing participants with increased supports (more hours of support, a wider range of support and greater access to equipment) — on average more supports were available than under the previous system.
  - 88 per cent of carers with children aged under five years said the NDIS had improved their child's access to specialist services (NDIA, sub 161, p 36).
  - About two thirds of scheme participants aged 15 years and over said the NDIS had helped with daily living (64 per cent for participants aged 15-24 years and 71 per cent for participants aged 25 years and above) (NDIA, sub 161, p 38).
  - The NDIS evaluation found that 'the majority of respondents receive increased supports as a result of becoming NDIS participants' (Mavromaras, Moskos and Mahuteau 2016, p. xi). The average number of different supports accessed by participants increased from 2.02 to 3.3 under the NDIS (Mavromaras, Moskos and Mahuteau 2016, p. 32).
- improving the wellbeing of scheme participants and their families and carers.

  - 89 per cent of carers with children aged under five years said the NDIS had improved their child's development (NDIA, sub 161, p 36).
  - Almost two thirds of participants aged 15 years and over said the NDIS helped with health and wellbeing (62 per cent of participants aged 15-24 years and 65 per cent of participants aged 25 years and over) (NDIA, sub 161, p 38).
  - 49 per cent of participants said the quality of care had improved with the NDIS (although 15 per cent said quality had declined) (Mavromaras, Moskos and Mahuteau 2016, p. 38).
  - The NDIS evaluation notes that the qualitative evidence 'makes clear that on the whole the NDIS has improved the wellbeing of scheme participants and their family members and carers' (Mavromaras, Moskos and Mahuteau 2016, p. xv). Scheme participants attributed this increase in wellbeing to having better services than previously, and increased independence.
  - Carers reported an 'increased sense of positivity and wellbeing' because their NDIS participants were more involved in activities they enjoyed and were able to participate in wider interests outside of the home. (However, the greater administration burden associated with the NDIS was a cause of stress for some families.) (Mavromaras, Moskos and Mahuteau 2016, p. xv).
- giving participants more choice and control over the supports they receive (the types of supports they receive, the timing of those supports and who provides them).
  - The NDIS evaluation found that 44 per cent of participants surveyed had a greater say over the supports they received, while 46 per cent also had more choice over who provided their supports (Mavromaras, Moskos and Mahuteau 2016, p. 60).
  - The NDIS Short Form Outcomes Framework data suggest that 73 per cent of scheme participants aged 15 years and over had more choice and control over their life (NDIA, sub 161, p 38).
- increasing the social participation of scheme participants and their carers.
  - The NDIS evaluation shows that many participants can now take part in activities independently and are able to follow interests and social activities that had previously been inaccessible (Mavromaras, Moskos and Mahuteau 2016, p. xvi).

Box 2.10 **The NDIS has changed lives**

Anne Hansen:

> … I have seen the life changes in people with disability who now have NDIS funding. They are now accessing community, have a good life and have hope for their futures. The burdens are off the family, some aged carers, and there is job creation. Broken wheelchairs are now being replaced and people who never had wheelchairs, now have and can access the community. I now see happy people. (brief sub. 2)

Lorraine Rodrigues:

> The NDIS to me is knowing that my son will have a future of his own to look forward to if I am unable to care for him for whatever reason. (brief sub. 3)

Merle Searle:

> The NDIS has made such a huge difference to us and our young man on a day to day basis … Please keep up the NDIS it is so appreciated in our households. (brief sub. 17)

Julanne Sweeney:

> The strain on our busy family would be almost unbearable without NDIS … With NDIS help she [granddaughter Isi] is learning skills to equip her for independent living and employment in the future. (brief sub. 21)

Karen Wakely:

> We began implementing our plan in Jan 2016. In a little over 12 months, the change it has facilitated has been extraordinary. For the first time we have been able to access meaningful therapeutic supports. (brief sub. 43)

Lynne Foreman:

> … I can now choose who cares for me, as I now have a choice. I have the hours I need to live my life and also because of flexibility in my plan, I am now an employee … (brief sub. 71)

The stories of Oni and Harry provided by the National Disability Insurance Agency:

> 'I've been working with a speech therapist to get my speech up and it's really helping. I can say a few more words and actually pronounce them properly and all that,' Oni remarked … 'He's only been in one year and the changes have been remarkable. I've seen his confidence improve out of sight. I've heard him be able to speak and say words that we didn't even know he knew,' Chelinay remarked.
>
> 'The NDIS has definitely improved our lives – Harry's and ours as a family,' she said. 'We've been able to get funding to purchase Harry a manual wheelchair … now he can access places he could never in his electric wheelchair, so he now has more flexibility. He was recently able to go the beach with his classmates – something he had never been able to do before!' (sub. 161, pp. 41–43)

But not all are having a positive experience

Some people with disability, however, are experiencing poorer outcomes under the NDIS. And they tend to be some of the most vulnerable people with disability.

Qualitative evidence suggest that some people with disability are experiencing poorer outcomes under the NDIS and are receiving fewer services than previously (Mavromaras, Moskos and Mahuteau 2016, p. xi). According to the NDIS evaluation, participants who were receiving less support are often those who are unable to effectively advocate for services on their own behalf, including those with psychosocial disability, and/or

participants who struggle to understand the sometimes complex NDIS processes (Mavromaras, Moskos and Mahuteau 2016, p. xi).

About 15 per cent of participants reported feeling that they had less choice and control of their supports under the NDIS, while about one quarter of participants are accessing fewer distinct supports (Mavromaras, Moskos and Mahuteau 2016, pp. 60–61). Both the qualitative and quantitative data from the NDIS evaluation indicate that people with psychosocial disability are more likely to report less choice and control over supports since becoming NDIS participants.

The qualitative data also suggested that:

> … vulnerable families, those unable to navigate the NDIA website to find what services and providers were available, and those less able to articulate support needs, are less likely to experience greater choice over their supports. (Mavromaras, Moskos and Mahuteau 2016, p. xiii).

Many participants are not realising the benefits of the NDIS because they are finding it difficult to access disability supports for which they are receiving funding. The NDIS evaluation attributes this to lengthy waiting lists for some providers or types of support, a lack of local providers, and lack of quality provision. Unmet demand is more common for those living in rural and remote areas (15 per cent more likely than those in urban areas), and for older participants (Mavromaras, Moskos and Mahuteau 2016, p. 31).

There has also been a significant fall in participant satisfaction with the scheme since the scheme has entered the transition phase — the percentage of participants reporting they were satisfied or very satisfied dropped from an average of 95 per cent to around 85 per cent between 2015-16 and 2016-17 (first three quarters) (NDIA 2017o, p. 26). This could be linked to changes to planning processes over that period (discussed in chapter 4).

Recent surveys find consistent results

Every Australian Counts and the Melbourne Social Equity Institute have also surveyed participants to gauge the impact of the NDIS (box 2.11). And while the sample sizes are small and less representative than the NDIS Outcomes Framework and NDIS evaluation, the survey conclusions are broadly consistent.

Box 2.11 **Consistent results from recent surveys on the impact of the NDIS**

'NDIS Report Card' — Every Australian Counts

From November 2016 to January 2017, over 2100 Every Australian Counts supporters completed an online survey to gauge their views on the National Disability Insurance Scheme. About 30 per cent of respondents were participants (or carers of participants), while 23 per cent were workers employed in the sector. The remaining participants were either people expecting to be participants in the future (37 per cent) or supporters of the NDIS (11 per cent).

The survey found that:

- 71 per cent of participants and 61 per cent of carers had average or above satisfaction with the NDIS
- 78 per cent of participants and 74 per cent of carers had the same or more support than before the NDIS
- 64 per cent of participants and 61 per cent of carers said their life was the same or better with the NDIS.

Choice, control and the NDIS — Warr et al. (2017)

Researchers interviewed 42 NDIS participants and carers of participants who were part of the Barwon trial. The report found that:

- participants' expectations and experiences of the NDIS were strongly influenced by their circumstances
- resources to help people to exercise choice and control over their support was not always available
- in some cases service users had limited choice over what was available for them to purchase with their funding package, especially in regional areas
- participants feel like their views are often overlooked in planning processes
- participants who do not fully understand the system tend to feel disadvantaged.

Sources: Every Australian Counts (2017); Warr et al. (2017, pp. 7–8).

The broader benefits of the NDIS

The NDIS is expected to generate a number of broader benefits beyond the improved outcomes of people with disability and their families and carers. Based on the Commission's 2011 estimates of benefits, and a number of more recent studies, the NDIA's preliminary estimates suggest that:

- the NDIS will reduce costs for the health system by between $140-$300 million each year (by reducing hospitalisations for people with disability and limiting the need for people with disability to remain in hospital due to a lack of more appropriate arrangements)

- the NDIS will reduce justice system costs by between $350-$850 million each year (by reducing incarceration rates of those with mental disabilities)
- as a result of the NDIS, between 103 000–218 000 people with disability will be able to increase their hours worked or join the workforce
- as a result of the NDIS, between 56 000-104 000 carers will be able to increase their hours worked or join the workforce (sub. 161, pp. 29–31).

At this early stage of the rollout, it is difficult to measure whether these broader benefits are being realised.

The jury is out on economic participation

It is too early to tell whether the NDIS will lead to the economic participation benefits that were expected. While the NDIS evaluation and study participants provided individual examples of scheme participants and their carers entering the workforce (box 2.12), the (limited) quantitative evidence is less rosy. In the Outcomes Framework pilot, 13 per cent of respondents aged 25 to 55 indicated that the NDIS had helped with employment, the lowest of any domain (NDIA 2016g, p. 35).

Box 2.12 The NDIS has helped some scheme participants enter or remain in the workforce

Karene Gravener:

> I have improved physically, emotionally and mentally because of the support of the NDIS. We, as a family, have been able to live life, and pursue our dreams. My husband has been able to be in full-time employment without the stress of being a carer, and we are building our own home. (brief sub. 96)

Lauren McGowan-Slee:

> My condition got worse about seven years ago, and at my worst, I couldn't get out of the house and sometimes even bed. Last week I started full time work, a feat that was once seen as impossible. It's not easy. I get fatigued and crash out most evenings and end up in bed quite early, but I don't mind because I am living a meaningful life!
>
> Because of the NDIS, I have supports that mean I can do a job that works with my disability and have the physical home tasks I can't do taken care of. I can sit and use my brain with no worries, so that is what I do for work, but I struggle to do physical tasks so I get help for that. (brief sub. 52)

Richelle Carta:

> I was struggling to sustain my lifestyle with very minimal funding but due to the NDIS I can continue to be a wife, mum, work full time and have a life with my family by having ongoing funding to provide me with morning and night personal care support seven days a week. (brief sub. 111)

Susanna Goodrich:

> My son Toby is sixteen. He has Down Syndrome. He's had a rough few years with an autoimmune condition … The NDIS has provided funding that has changed Toby's life. His week has opened up from a routine of school, family life and the occasional social event, to a week that looks much like his other teenage brothers: he plays sport, goes out with peers, works in a part time job and will soon be learning how to catch the bus to the local shopping and entertainment hub. (brief sub. 39)

There are a number of reasons why increased economic participation flowing on from the NDIS may take some time.

- NDIS-funded initiatives to engage community and businesses to improve employment outcomes for people with disability have not occurred yet (ILC funding was not part of the NDIS trial).
- The NDIS is most likely to be effective for people entering the system for the first time and will thus have a greater effect as time goes on (PC 2011).[16]

DRAFT FINDING 2.4

Early evidence suggests that the National Disability Insurance Scheme is improving the lives of many participants and their families and carers. Many participants report more choice and control over the supports they receive and an increase in the amount of support provided.

However, not all participants are benefiting from the scheme. Participants with psychosocial disability, and those who struggle to navigate the scheme, are most at risk of experiencing poor outcomes.

16 In 2011, the Commission noted that those who have been in the system for a while often 'have missed opportunities for early intervention, had poor educational experiences, been dogged by low expectations by others, faced a community culture not strongly conducive to their employment and had long breaks from employment that erode skills and confidence'(PC 2011, p. 960).

3 Scheme eligibility

Key points

- The eligibility requirements of the National Disability Insurance Scheme (NDIS), as set out in the *National Disability Insurance Scheme Act 2013* (Cwlth), are consistent with the principles of the scheme.
- However, eligibility is broader than what the Commission recommended in 2011 in two key areas: the inclusion of people with substantially reduced functional capacity to undertake learning or social interaction; and children with developmental delay. This broader criteria have cost implications for the scheme. These groups were not included in the Commission's 2011 costings.
- Data are not available to assess the cost implications of adding learning and social interaction to the eligibility criteria for disability requirements. The National Disability Insurance Agency (NDIA) should improve its data collection in this area.
- Trial site data show that a significant number of children are entering the NDIS with developmental delay.
  - Early intervention for children with developmental delay can yield benefits, which suggests that including these children is consistent with the insurance principles of the scheme. The NDIA should monitor research in this area and build its evidence base on what early intervention supports work for children.
  - The definition of developmental delay, as prescribed in the NDIS Act, sets a high standard for children to be eligible for individualised supports. However, a high proportion of children in the scheme do not have a significant functional deficit relative to their peers.
  - The recently introduced Early Childhood Early Intervention (ECEI) pathway is a tighter gateway in principle, and should result in better enforcement of the eligibility criteria for children aged 0-6 years (in all areas, including developmental delay). However, it is too early to assess the effectiveness of the ECEI approach in practice.
- The Commission is seeking further information on the magnitude of the benefits and risks associated with maintaining lists that allow for automatic entry into the NDIS on the basis of a diagnosis.
- There is broad support for people with psychosocial disability being included in the NDIS. A high proportion of people with psychosocial disability who apply for support under the NDIS have been found to be eligible, despite concerns that demonstrating a condition is permanent could be a barrier to access.
  - The investment approach of the NDIS and the recovery model of treatment are both about building capacity and appear well aligned.
  - Reforms to the planning process should improve the way that people with psychosocial disability engage with the scheme. A specialised psychosocial gateway could be considered if planning reforms are not effective in improving engagement.

For the National Disability Insurance Scheme (NDIS) to deliver cost effective outcomes and remain financially sustainable, it is important that the eligibility criteria are aligned

with the objectives of the scheme. The legislated eligibility criteria, as they currently stand, do appear to target those people with disability who the Commission intended the scheme to cover. That said, the criteria are broader than that proposed by the Commission in 2011 (PC 2011, pp. 174–175), and this has cost implications for the scheme.

There are a number of factors that affect scheme participant numbers, including the:

- size and age profile of the Australian population
- prevalence, incidence, nature and severity of disability within the population
- eligibility criteria
- effectiveness of entry pathways in upholding the eligibility criteria
- effectiveness of exit pathways when people no longer meet the eligibility criteria for individualised supports.

This chapter looks at the eligibility criteria (section 3.1) and entry and exit pathways (section 3.2) — the two factors relevant to the design of the NDIS. One of the key eligibility issues raised in this study was the inclusion of psychosocial disability in the NDIS. This issue is discussed in section 3.3.

3.1 The eligibility criteria

The NDIS is for all Australians. It provides insurance against the costs of support in the event that a person acquires a significant disability. And anyone with, or affected by, a disability can approach the NDIS for information, linkages and capacity building. Individualised supports under the NDIS, however, are targeted at people with permanent and significant disability or those who meet early intervention requirements. In this context, 'eligibility criteria' refers to access to these individualised supports.

The eligibility criteria are critical in an uncapped scheme

The NDIS is a new way of providing disability services. When services were block-funded, governments had tight control of how much money was provided for disability services. Individualised supports provided under the NDIS are uncapped — so long as an individual meets the eligibility criteria, and the supports provided are 'reasonable and necessary' (chapter 4), an individual will receive the support that they need for as long as they need (often for their whole lifetime). This means that from a budgetary perspective, the NDIS is less certain than previous models of disability support.

The eligibility criteria are the main instrument available for determining how many people will receive individualised support through the NDIS. It is important that these criteria are clear, aligned with the objectives of the scheme, and rigorously upheld.

Eligibility differences when compared with the 2011 recommendations

When the Commission designed the NDIS in 2011, it recommended that the eligibility criteria for individualised supports uphold the following principles:

- individuals should have a disability that is, or is likely to be, permanent reflecting the irreversible nature of disabilities; and
- individuals would meet one of the following conditions:
  - have significantly reduced functioning in self-care, communication, mobility or self-management, and require significant ongoing support (restricting access to people with significant, ongoing support needs — rather than anyone with disability — reflects the objective that the NDIS embody a risk-pooled insurance scheme, which focuses on minimising the impact of high cost, low frequency events)
  - qualify for an early intervention group (covering people for whom there is good evidence that early intervention would be safe, cost-effective and significantly improve outcomes — box 3.1) (PC 2011, pp. 13–14).

The Commission also recommended that participants meet residence and age requirements.

Box 3.1 Why early intervention is important

An important recommendation in the Commission's 2011 *Disability Care and Support* inquiry was that individualised supports be available to 'an early intervention group, comprising of individuals for whom there is good evidence that the intervention is safe, significantly improves outcomes and is cost effective' (PC 2011, p. 63).

A key tenet of the NDIS is that it takes a lifetime approach to providing care and support. Early intervention is one way to embody this. Early intervention seeks to incur expenditure during the early stages of a person's disability in order to improve (or maintain) their functioning later on, or reduce the volume of supports that they need later in life.

Providing early intervention support through the NDIS can mean:

- a better quality of life for scheme participants by addressing many of their needs early, and building or maintaining their functional capacity
- a delay in the need for care (or a lower cost of providing care) in later stages of a participant's life, which contributes to a more financially sustainable scheme.

The eligibility criteria for the NDIS (as set out in ss. 21–25 of the *National Disability Insurance Scheme Act 2013* (Cwlth) (NDIS Act)) are broadly in line with what the Commission recommended in 2011 (table 3.1). However, there are two key differences:

- a person can receive individualised supports under the disability requirements if they have substantially reduced functional capacity to undertake the activities of *learning or social interaction* — the activities proposed by the Commission were restricted to mobility, self-care, self-management and communication (PC 2011, p. 198)

- a child can receive individualised supports under the early intervention requirements if they have developmental delay.

Table 3.1 **A summary of the NDIS eligibility requirements**[a]

Age requirements	Residence requirements
Aged under 65	• Australian citizen • Permanent resident • Hold a protected special category visa
And meet either:	
Disability requirements	**Early intervention requirements**
Disability attributable to one or more: • intellectual • cognitive • neurological • sensory • physical impairments; or • an impairment attributable to a psychiatric condition; and	• Has one or more identified intellectual, cognitive, neurological, sensory or physical impairments, and likely to be **permanent**; or • Has one or more identified psychiatric conditions, and likely to be **permanent**; or • Is a child who has developmental delay; and
The impairments are, or are likely to be, **permanent**; and	The early intervention support is likely to benefit the person by **reducing the person's futures needs** for supports in relation to disability; and
Impairments substantially reduce **functional capacity** or **psychosocial functioning** to undertake one or more of the following activities: • communication • social interaction • learning • mobility • self-care • self-management	The early intervention support is likely to benefit the person by: • **mitigating or alleviating** the impact of the person's impairment on their functional capacity • **preventing the deterioration** of such functional capacity • **improving** functional capacity • strengthening the **sustainability of informal supports** available to the person, including through building the capacity of the person's carer.

[a] This figure represents an overview of what the Commission considers to be the main aspects of the eligibility criteria. The NDIS Act prescribes that more requirements are met than those outlined here.

Source: NDIS Act, ss 21-25.

Both these differences allow more people to qualify for individualised supports under the NDIS than the Commission included when costing the scheme. The extent to which the less restrictive eligibility criteria is contributing to scheme participation, and consequently, scheme costs, is a key question for this study.

Based on the eligibility criteria proposed in its 2011 report, the Commission estimated that approximately 410 000 people would be eligible for individualised supports under the NDIS (PC 2011, p. 160). Using the Commission's estimates as a basis, the NDIA has increased the estimated number of scheme participants to 460 000 (or 475 000 including those aged over 65 years, as discussed in chapter 2).

Adding learning and social interaction to the disability requirements — what is the effect?

Data are not available to make an assessment about the impact on scheme costs of adding learning and social interaction to the eligibility criteria for the disability requirements. However, Speech Pathology Australia said advice from their members who are NDIS providers is that:

> … they have not been providing services to children whose only disability relates to learning and literacy — thus, it is our conclusion that the increased numbers of people entering the Scheme is not due to the eligibility of people whose *only* functional disability relates to learning and/or social interaction. (sub. 136, p. 15)

It seems reasonable to assume that relationships across domains exists, however, the Commission understands that the NDIA does not collect data specifically on which, or how many, of the six activity domains specified in the Act that scheme participants enter through. This means that assessing the extent to which one particular domain is driving entry into the scheme, or how common it is for scheme participants to have reduced functional capacity across multiple domains, is not possible.

Collecting data at entry on which domains apply to each participant would not only inform what parts of the eligibility criteria are having a large impact on participant numbers (and therefore scheme costs), but also allow for more granular analysis of who is in the scheme and what their needs are likely to be. Such information may also be useful to the NDIA in its monitoring and forecasting roles.

DRAFT RECOMMENDATION 3.1

When determining that an individual is eligible for individualised support through the National Disability Insurance Scheme under the disability requirements, the National Disability Insurance Agency should collect data on which of the activity domains outlined in section 24 of the *National Disability Insurance Scheme Act 2013* (Cwlth) are relevant for each individual when they enter the scheme.

Including developmental delay in the early intervention requirements — what is the effect?

A child has developmental delay if it takes longer for them to reach age-specific milestones than other children. The term developmental delay is used in the absence of a diagnosed condition — that is, there is usually a more specific condition causing the developmental delay, including disability, but this condition is not yet able to be formally identified. This can be because it is difficult to reach an accurate diagnosis given the age and capabilities of the child.

The 'developmental trajectory' of children with developmental delay varies. In some cases, children may 'catch up' to their peers either with or without support. Others may need more substantial support for a longer period, which is often the case if the underlying condition causing the developmental delay is a significant disability.

The effect of including developmental delay as a condition eligible for individualised support was explored in detail by Dyson, Cutter and Moore (2015). The review, which was commissioned by the Department of Social Services (DSS), found that:

- about 11 600 children with developmental delay or global developmental delay would be eligible for support under the scheme (p. 15) (box 3.2), with an estimated annual cost of $155 million
- the vast majority of children in the scheme with developmental delay or global developmental delay could be expected to progress to full scheme participation — in part because of the high access requirements for developmental delay, and in part because developmental delay and global developmental delay is 'often predictive of the future diagnosis of intellectual disability' (p. 87)
- ' … the costs associated with including children correctly identified as having [developmental delay or global developmental delay] is of immaterial consequence to the sustainability of the NDIS' (p. 9)
- given the likelihood that a child with developmental delay would progress to the full scheme, early intervention could reduce costs to the scheme in the longer term by reducing future need (p. 17).

Box 3.2 Developmental delay and Global developmental delay — what is the difference?

Definitions for developmental delay and global developmental delay vary. The Commission looked at many definitions to draw out the key features that tend to define the conditions.

A child has *developmental delay* when they take longer than other children to meet age specific milestones in a specific area (or domain). Since children develop at different rates, and some will inevitably reach a milestone before others, most definitions require that a child be substantially or significantly behind their peers before they are identified as having developmental delay.

In contrast, a child is considered to have *global developmental delay* if they take longer to meet specific milestones across multiple domains. Some definitions require only more than one domain to be affected, while others require all domains to be affected. The definition of global developmental delay published by COAG in 2012, required a delay across a majority (out of five) domains.

Different definitions also outline different domains to be considered. However, they often include:

- motor skills (both gross and fine)
- speech and language skills
- social and/or emotional skills
- cognitive ability.

The definition of developmental delay for the purposes of the NDIS is set out in section 9 of the Act, and is spelled out in full in box 3.4.

Sources: COAG (2012a, p. 4); Disability Services Commission (2011, p. 12); Queensland Government (2017a).

Including developmental delay is consistent with the objectives of the scheme

The evidence base on the effectiveness of early intervention in improving the trajectories for children with developmental delay, or reducing the future costs of their care, is still being developed. Nevertheless, there is general acceptance that for children with developmental delay, access to early intervention leads to improved outcomes (box 3.3).

Such evidence suggests that there is a firm rationale for children with developmental delay to be eligible for individualised supports under the early intervention requirements of the NDIS. In 2011, the Commission recommended that the NDIA build an evidence base on early intervention, in part to inform what forms of intervention are beneficial and therefore warrant potential funding through the scheme (PC 2011, p. 632).

The evidence on early intervention for children with developmental delay should be a particular focus, given the developing evidence base, and given the higher than expected number of children entering (and the fewer than expected number of children leaving) the scheme.

Box 3.3 Evidence supports early intervention for developmental delay

Evidence points to children with developmental delay benefiting from early intervention supports. For example, when summarising the evidence, KPMG said:

> For children already exhibiting developmental delay, effective early intervention strategies can both alter the course of their developmental trajectories and prevent the onset of secondary complications … The earlier a child is identified as having a developmental delay or disability, the more likely they are to benefit from strategies targeted towards their needs. The success of early intervention strategies not only assists families through the provision of extra support for their child, but also decreases costs to schools and community in the later years as children transition to school. (2014, p. 3)

Dr Michael Guralnick — Director of the Center on Human Development and Disability in the University of Washington — presented a similar conclusion:

> Early intervention for children at risk and for those with established intellectual disabilities is now firmly embedded in the context of general early childhood development. An overarching developmental framework has been advanced and has achieved a high level of consensus; one that is relevant to typically developing young children and to those vulnerable to a range of developmental problems, particularly intellectual disability (2005, p. 318).

Guralnick also noted that:

> … long-established intervention science indicating that comprehensive early intervention programmes can, at a minimum, help prevent the substantial decline in intellectual development that generally occurs across the early childhood period for children with developmental delays. (2017, p. 11)

Early intervention for children with developmental disability was also described to be 'of clear benefit' by the Royal Australasian College of Physicians (2013, p. 2), while the World Health Organization (WHO) notes that early intervention for children with disability can enhance developmental competencies, minimise secondary complications and build the effectiveness of support networks (2012, p. 12).

Numbers in the scheme to date

Trial site data (to June 2016) show that just under 4000 individuals (or roughly one-third of the 11 600 estimate by Dyson, Cutter and Moore (2015)) entered the scheme with a primary health condition recorded as being either developmental delay or global developmental delay (NDIA 2016t, table 2.1.11(c)). If the prevalence rate experienced in trial sites was observed nationally, there would be more children with developmental delay in the scheme than Dyson, Cutter and Moore's estimate.

However, trial site prevalence rates may not be reflective of prevalence rates expected on a national level. Further, the NDIA has recently redesigned the entry pathway for children aged 0-6 years with the introduction of the Early Childhood Early Intervention (ECEI) approach (discussed below). This changes how the eligibility of children is assessed, and is designed to better ensure that the eligibility requirements for individualised supports are upheld.

Two possible explanations for higher numbers of children

There are two possible reasons why there may be more children with developmental delay in the scheme to date than expected:

- more children meet the eligibility criteria than expected or
- assessment processes allow children who do not meet the eligibility criteria to enter the scheme.

This section looks at the eligibility criteria for developmental delay. The extent to which assessment processes could be contributing to higher than expected numbers is discussed in the next section.

The definition of developmental delay for the purposes of the NDIS is outlined in box 3.4. A child with developmental delay must meet this definition to be eligible for individualised supports under the early intervention requirements (as well as meeting residency requirements).

Box 3.4 How does the NDIS define developmental delay?

The definition of developmental delay is set out in section 9 of the NDIS Act. It states that developmental delay means a delay in the development of a child under 6 years of age that:

(a) is attributable to a mental or physical impairment or a combination of mental or physical impairments; and

(b) results in substantial reduction in functional capacity in one or more of the following areas of major life activity:

  (i) self-care

  (ii) receptive and expressive language

  (iii) cognitive development

  (iv) motor development; and

(c) results in the need for a combination and sequence of special interdisciplinary or generic care, treatment or other services that are of extended duration and are individually planned and coordinated.

Source: NDIS Act.

Some study participants raised concerns about the adequacy of the developmental delay definition in the NDIS Act. However, most of the evidence presented to the Commission on developmental delay suggests that the current definition requires a significant threshold to be met. For example, Dyson, Cutter and Moore (2015, p. 11) found that the definition of developmental delay prescribed in the NDIS Act sets 'a high access hurdle', particularly the requirements for there to be a substantial reduction in functional capacity, and the exclusion of children who only require uni-disciplinary intervention.

The ACT Government also said that a delay across one domain was in itself generally insufficient to qualify for individualised supports through the NDIS:

> … the NDIA has recently changed the operational guidelines relating to eligibility to the scheme for developmental delay. Specifically, the 'need for a combination and sequence or special interdisciplinary or generic care, treatment or other services that are of extended duration and are individually planned and coordinated' is being interpreted to mean children with only one area of delayed development are not eligible. As a result, the NDIA access team deems children with one area of delay not eligible for the scheme because they do not require interdisciplinary care and these children are no longer receiving (or renewing) packages or early intervention supports. (sub. 156, p. 9)

In making this point, the ACT Government expressed concern that this pushes the cost of providing support to people with a delay in only one area back onto State and Territory Governments. The fact that the NDIS sets a high access hurdle — which the Commission considers to be important — means that some children will require support outside of the scheme. Consequently, there is a need for all governments to work together to ensure that there are supports outside of the NDIS for children who do not meet the eligibility requirements.

Since the criteria that children must meet to qualify for individualised supports under the scheme is high, this suggest that it is the process by which children are entering the scheme (not the eligibility criteria) that is resulting in higher than expected numbers. This is consistent with evidence provided by the NDIA that a significant proportion of children in the scheme to date have little or no reduction in their functional capacity compared to their peers (discussed in the next section).

The number and cost of children with developmental delay in the scheme should continue to be monitored by the NDIA. Should changes to assessment processes be made, but children who do not meet the definition of developmental delay, as outlined in the Act, continue to enter the scheme, there is a strong case for changing the definition of developmental delay in the Act so that it is clearer under what circumstances a child would qualify for individualised supports.

3.2 Are entry and exit pathways effective?

Effective entry pathways are imperative to the successful functioning of the NDIS. They uphold the eligibility criteria of the scheme and only allow people who meet these criteria to qualify for supports. Excessively porous pathways may allow people who do not meet eligibility requirements to access the NDIS, placing cost pressures on the scheme.

There are two main pathways for people to enter the NDIS:

- the Early Childhood Early Intervention (ECEI) pathway for all children aged 0-6, including those with a disability or developmental delay (NDIA 2016i)
- a general pathway for people aged 7-65 years (NDIA 2016i, 2016q).

Entry into the NDIS can be self-initiated, or facilitated by the NDIA (the NDIA contacts people receiving disability services that are being phased into the NDIS when the NDIS becomes available in their area).

The NDIA also has a list of defined programs. People receiving supports through these programs do not need to show that they meet the disability requirements, as the requirements for the programs and the NDIS are considered 'equivalent' (NDIA 2016q). As an entry pathway, these lists are relevant during the transition phase of the scheme.

The Early Childhood Early Intervention pathway

In response to the higher than expected number of children entering the scheme in the trials, the NDIA established the ECEI pathway for children to enter into the scheme (NDIA 2016g, p. 16). Prior to the introduction of the ECEI pathway — which commenced in 2016 and is being rolled out in line with the full scheme — children entered the scheme via the general pathway — through the lodgment of an access request and subsequently an assessment of eligibility and need.

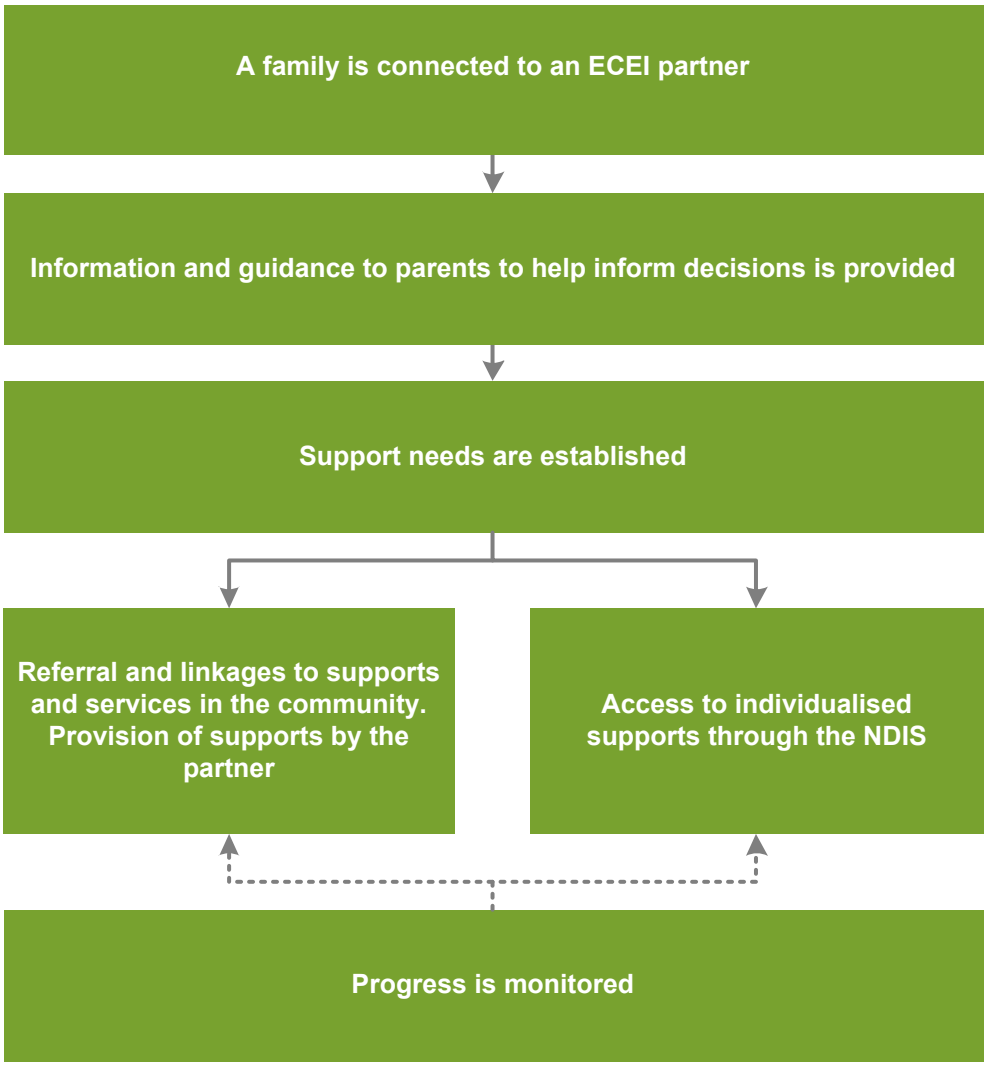
A summary of how the ECEI pathway works is provided in figure 3.1.

Under the ECEI approach, a family with a child with a disability or developmental delay seeking support is connected to an ECEI 'partner' in their local community. To be a partner, an organisation must be approved by the NDIA and have experience in early childhood intervention.

Partners assess the support needs of a child with disability and their family and, based on the assessment, determine the supports and services the child needs. Early childhood partners can provide:

- information and linkages to mainstream supports and services
- 'timely short to medium early childhood early intervention supports'. Examples of these supports include: information, family based education, parenting support services and therapy (DSS 2016a, p. 11)
- access to an NDIS plan. If it is considered that a child is best supported by a NDIS plan, it remains a NDIA delegate who determines whether a child is eligible and approves a plan, although the ECEI partner is responsible for providing information that will inform a decision on access and assisting with plan development (DSS 2016a, pp. 11–18).

Figure 3.1 **The ECEI process**



Source: Adapted from on NDIA (2017c).

On paper, the ECEI approach does not appear to be very different to how people enter the NDIS under the 'general' pathway. However, the specialised nature of ECEI partners, and the fact that they can provide short- and medium-term support, and refer children to mainstream services, means that the ECEI approach places significant emphasis on upholding eligibility while supporting less severe cases outside of the scheme. The ECEI approach seeks to reduce the number of children with milder levels of disability from entering the scheme, thereby reducing cost pressures.

Study participant's views on the likely effectiveness of the ECEI approach are largely positive (box 3.5).

Box 3.5 General support for the ECEI approach, but some concerns

Lifestart Co-operative Limited:

> Over time, if implemented correctly with experienced and well credentialed Early Childhood Partners, outcomes for children, their families and the scheme will be positive. [The ECEI approach] should ensure that children get the right support, in a timely manner and in the right amount. It should see the number of children requiring individualised plans decrease. This trend has emerged with the introduction of ECEI Partners in the Nepean Blue Mountains where Lifestart has provided children with supports and assistance where these children and families were able to be well supported without a plan. (sub. 97, p. 4)

The New South Wales Government:

> NSW believes that the ECEI process represents best practice for children under 7 years … A version of the ECEI approach was part of the early NDIS transition in the Nepean Blue Mountains, which commenced from July 2015 for children and young people under 18 years. Anecdotal evidence from this process suggests the effectiveness of the model in diverting children from specialist disability supports funded by the NDIS to mainstream and community based support options. (sub. 60, pp. 17-18)

National Disability Services:

> NDS … supports the concept of the ECEI approach. The broad gateway of ECEI enables some children with lesser needs to receive short-term assistance … It also allows time to see how a child responds to short-term early intervention before making a decision on eligibility, while still giving immediate access to an NDIS package to those with obvious significant and long-term disability. (sub. 51, p. 4)

The Department of Social Services:

> The early indications are that the inclusion of developmental delay in the NDIS and the Early Childhood Early Intervention (ECEI) gateway approach is effective in supporting children. It is expected a number of these children will meet their development goals and will not require long-term NDIS supports. (sub. 146, p. 3)

Allied Health Professions Australia:

> AHPA and its members support the role of early intervention but note that the early childhood early intervention (ECEI) approach may risk excluding children with a need for support, increasing the burden on other systems and schemes. If the scheme doesn't meet the child's needs there is the risk that this may result in higher levels of support in the future negating the purpose of early intervention programs. (sub. 37, p. 10)

Royal Institute for Deaf and Blind Children:

> Models such as the ECEI have resulted in a cost shift from the Agency to providers, with little specificity around specific abilities. The ECEI process has imposed significant and redundant elements for children with hearing impairment, and if strictly implemented would actually delay access to services. (sub. 95, p. 7)

Prior to the introduction of the ECEI approach, the number of children receiving individualised supports through the NDIS without having a substantial functional deficit relative to their peers was significant. The NDIA pointed to their analysis of PEDI-CAT scores which found that:

> … the aggregated scores indicated that, overall, around 40% of participants had scores of 30 or more ('average') across each of the four domains. *That is, these participants did not seem to have any identified deficits, compared to the normal range for their age.* (sub. 161, p. 78, emphasis added)

Some study participants questioned the appropriateness of the PEDI-CAT tool and how it was applied by the NDIA for some types of disability (chapter 4), and this may go some way to explaining the apparent anomaly. However, to have children with mild or no deficits in the NDIS clearly runs counter to the objectives of the scheme, and depending on the volume of supports that these children receive, could have significant cost and equity implications. As such, a tighter gateway that better assesses eligibility is necessary.

The ECEI approach can be this tighter gateway. Using specialised organisations with experience in identifying and treating developmental delay and childhood disability should result in more accurate assessments of whether children meet the criteria for individualised supports under the NDIS. The emphasis on providing timely short- and medium-term supports and support through mainstream services to children with needs, but not severe enough to warrant entry into the NDIS, is also positive.

However, it is too early to tell if the ECEI approach has been successful in upholding the eligibility criteria of the NDIS, and contributing to beneficial outcomes for children who are ineligible for individualised support. The DSS (sub. 146, p. 13) observed that the 'gateway's actual success will be dependent on services outside the NDIS being available, and the management of family expectations about how children's needs are better met'.

The NDIA has developed an evaluation and monitoring framework for the ECEI approach. In time, this framework should assist with monitoring children's pathways (including entry and exit from NDIS via the gateway) and evaluating the effectiveness of the ECEI approach.

Brotherhood of St Laurence commented on the importance of ECEI being evidenced-based:

> As the initial roll-out of the NDIS nears completion, children with developmental delays will be the largest group of people with disability entering the NDIS. Understanding what works for children who gain access to the NDIS is vital to manage costs. To ensure the NDIS provides value for money and can reduce the life-long impact of developmental delays on children, ECEI needs to be underpinned by a strong evidence-based practice, policy and research agenda. Most importantly, ECEI staff need access to the latest research and evidence to inform service design and practice. This is especially important given the emerging findings that some interventions and/or programs can be harmful and/or have limited evidence regarding their efficacy. (sub 189, p. 12)

The NDIA is also developing an early intervention approach for the 7-14 years cohort (sub. 161, p. 26).

Streamlined entry for early intervention

Under the NDIS Act, when assessing whether a potential participant is eligible for individualised supports under the early intervention requirements, the NDIA must be satisfied that the supports will benefit the child by reducing future need (s. 25(1)(b)) and

benefit the child in one of the ways prescribed in s. 25(1)(c) (table 3.1). If a child has a condition that is on List D (a list maintained under the NDIA's operational guidelines on access (NDIA 2016q)), the presence of the condition is deemed sufficient to satisfy s. 25(1)(b) and s. 25(1)(c).

List D contains about 130 conditions, including global developmental delay (NDIA 2016q). Developmental delay (as defined in the Act) is not contained in the list, however it is effectively given the same streamlined entry arrangements under the *National Disability Insurance Scheme (Becoming a Participant) Rules 2016* (Cwlth) (r. 6.10).

Maintaining such a list represents a trade-off. The appeal of such a list is that it places less onus on families to demonstrate eligibility, reduces the administrative burden on the NDIA, and provides a degree of certainty for the families of children with these conditions.

However, such lists can be problematic. They can affect incentives, or can represent an overly generous entry gateway if set too expansively. Further, making assumptions that children will benefit from early intervention risks providing entry for children who, given their individual circumstances, may not benefit from individualised support — something that runs counter to the concept of early intervention.

A list can also stifle exits from the scheme. If diagnosis, rather than expected benefits, form the basis of early intervention, a child may remain eligible so long as their condition is present even if early intervention has been applied and expected benefits have been realised (or are unlikely to be realised).

The Commission is seeking feedback on the advantages and disadvantages of retaining List D, with a view to determining whether it should continue to be a pathway for children to enter the scheme under the early intervention requirements.

INFORMATION REQUEST 3.1

The Commission is seeking feedback on the advantages and disadvantages of maintaining 'List D — Permanent Impairment/Early Intervention, Under 7 years — No Further Assessment Required' *in the National Disability Insurance Agency's operational guidelines on access. Feedback is sought on the extent to which the list:*

- *reduces the burden on families to demonstrate that their child will benefit from early intervention and/or provides certainty that support will be provided*
- *reduces the burden on the National Disability Insurance Agency of assessing whether children are eligible for early intervention support under the* National Disability Insurance Scheme Act 2013 *(Cwlth)*
- *may be contributing to supports being provided to children who are unlikely to benefit from such supports*
- *may be discouraging or inhibiting exit from the scheme.*

The 'general' pathway

For people aged 7-65 years, entry to the NDIS begins with the lodgment of an access request. This can be lodged through a form, but is increasingly being completed by telephone. In lodging an access request, a potential scheme participant provides information on their age and residency status (the first two components of the eligibility criteria), as well as information about their disability.

To demonstrate their disability, an applicant is typically required to provide evidence of the condition from their treating doctor or specialist. The NDIA may also require evidence from an applicant's health professional on the impact of the disability on the applicant's ability to undertake tasks related to mobility, communication, social interaction, learning, self-care and self-management. For some conditions (contained in a list maintained by the NDIA), the impact of the disability on a person's functional capacity is assumed and further evidence is not required (NDIA nda).

The NDIA has 21 days to either decide whether the prospective participant meets the eligibility criteria, or to request additional information (NDIS Act s. 20). The additional information may require the potential participant being assessed or examined, and the NDIA has the authority to nominate where this occurs (s. 26(1)).

The Commission has been presented with little evidence to suggest that the entry pathway for people under disability requirements is having an undue influence on scheme costs.

The NDIA maintains a list of conditions designed to streamline access for people with disability (List A). If a person has a condition on List A, the permanence of their condition and the impact of their condition on their functional capacity is assumed, and the individual is deemed eligible for individualised supports under the NDIS without further assessment of their eligibility (NDIA 2016q, nda).

Maintaining List A offers benefits to both the NDIA and participants, but there is some risk that, in providing for that streamlining, it effectively lowers the hurdle to access the scheme to a level that is too low.

The Commission would value additional feedback on the effects of List A.

INFORMATION REQUEST 3.2

The Commission is seeking feedback on the benefits and risks of maintaining 'List A — Conditions which are Likely to Meet the Disability Requirements in section 24 of the NDIS Act'. *In particular:*

- *to what extent does List A reduce the burden for people with permanent and significant disability of entering the National Disability Insurance Scheme under the disability requirements?*
- *is there any evidence that people who do not meet the disability requirements are entering the scheme under List A?*

As discussed in chapter 2, a cost pressure identified by the NDIA is the lower than expected rate at which people are exiting the scheme. At the end of March 2017, just under 700 participants had exited the scheme. Over 90 per cent of these exits were people who had permanent disability plans, while only 10 per cent of exits were people with early intervention plans (NDIA 2017a, p. 15). The NDIA is monitoring exit rates and should continue to consider actions that will arrest trends in exit rates that do not appear to be consistent with the aims of the scheme.

3.3 Psychosocial disability and the NDIS

Support for including psychosocial disability in the NDIS is generally high

In 2011, the Commission recommended that people with permanent psychosocial disability with significant long-term support needs be supported through the NDIS (PC 2011, p. 189). The recommendation was made on the basis that:

- the day-to-day support needs for people with significant and enduring psychiatric disability are effectively the same as people who have an intellectual disability or an acquired brain injury
- some important parts of the care that is needed to be provided to people with psychosocial disability — namely community-based supports such as outreach or day programs — are best met through the NDIS
- providing supports to people with psychosocial disability through the NDIS provides them with the wider benefits of the scheme, including personalisation of supports to meet the needs of the individual, more choice over what supports are provided, when and by who, and greater access to early intervention supports (PC 2011, pp. 186–189).

These points remain salient, and lend support to people with psychosocial disability being supported through the NDIS. And, while the Commission heard a range of views about whether the NDIS represents the 'right' vehicle to provide support to people with psychosocial disability, the majority of submissions to this study were optimistic and/or

supportive about the role the NDIS is playing in meeting needs of people with psychosocial disability (box 3.6).

Box 3.6 Strong support for the NDIS from the mental health sector

Flourish Australia:

> Flourish Australia strongly supports the NDIS and the opportunity it provides for greater certainty, choice and control, and economic and social participation for people with disability who require life-long support. We are also strongly supportive of the inclusion of psychosocial disability within the Scheme's remit, and have seen firsthand the benefits of the Scheme for the people we support and their families. (sub. 74, p. 1)

Mental Health Community Coalition of the ACT:

> MHCC ACT views the NDIS with great hope. It holds promises for a better more integrated life for people living with disability. (sub. 135, p. 2)

The National Mental Health Commission:

> The NMHC considers the NDIS to be an important initiative with its promise of individualised care and choice for eligible people with psychosocial disability. It is a potentially very important element in addressing the long standing unmet needs of people with mental illness for effective community and disability supports. (sub. 153, p. 1)

Mental Health Australia:

> The National Disability Insurance Scheme (NDIS) is an historic opportunity to improve the lives of people who have for far too long missed out on the support they need to live contributing lives in the community. Mental Health Australia strongly supports the policy intent underpinning the Scheme, and hopes to work with government over the long term to maximise choice and control for people living with mental illness and psychosocial disability. (sub. 155, p. 3)

The Department of Health:

> There is broad stakeholder support for the inclusion of psychosocial disability in the NDIS, with feedback suggesting that participants are receiving better and more effective support and assistance under the NDIS than what was available to them before accessing the scheme. (sub. 175, p. 2)

That said, there is evidence that some people with psychosocial disability are experiencing less positive outcomes than others in the scheme. For example, people with psychosocial disability are more likely to report less choice and control over supports since becoming a NDIS participant compared to other groups of participants in the scheme (Mavromaras, Moskos and Mahuteau 2016) and are more at risk of experiencing poor outcomes (chapter 2).

Boundaries are important

Several study participants suggested that the requirement that an impairment be permanent is incompatible with the recovery models used in supporting people with mental health conditions. For example, the Royal Australian and New Zealand College of Psychiatrists said that:

> The RANZCP is concerned about the centrality of disability 'permanence' in the eligibility criteria for the NDIS as the language of 'permanence' does not fit with the recovery-oriented

> approach of the mental health sector … Eligibility criteria that relies on permanence may therefore contribute to many individuals not seeking, or opting out of, treatment if that treatment is predicated on their acceptance of the lifelong nature of their illness (sub. 158, p. 2)

The New South Wales Government also said that:

> The recovery focus in contemporary mental health practice does not align neatly with the NDIS requirement that psychosocial disability is considered a permanent disability. (sub. 60, p. 14)

Similar arguments were presented by the Butterfly Foundation (sub. 78, p. 3), Top End Association for Mental Health Inc (sub. 102, p. 9), Anglicare Tasmania (sub 145, p. 24), Mental Health Australia (sub. 155, p. 8) and VICSERV (sub. 169, p. 7).

The Victorian Council of Social Services (sub. 176, p. 11) argued that a recovery framework is widely accepted as best practice, and requiring people to identify as having a permanent psychosocial disability can 'create stigma, distress and limit people's hope and optimism'.

However, others, such as the National Mental Health Commission, argued that that the concepts of permanence and recovery are not necessarily mutually exclusive:

> The NDIS requirement for Tier 3 participants to establish a 'permanent impairment' can appear to be somewhat at odds with the more strengths-based concept of 'recovery' used in mental health. 'Recovery' is not synonymous with the absence of illness. Rather, it means people who are living with, or have experienced, mental illness can nevertheless lead contributing and meaningful lives, in which they feel safe and secure, have connections with community and family, are engaged in social and economic participation (whether paid or not), and are physically and mentally thriving (not just surviving).
>
> From this perspective, recovery is not inconsistent with the philosophical underpinnings of the NDIS that aim to support people with lifelong disability to live an ordinary life so they can engage in education, employment and community activities. (sub. 153, pp. 2–3)

The investment approach of the NDIS and the recovery model of mental health are both about building capacity, and appear to be well aligned.

While demonstrating permanence may be more difficult for people with psychosocial disability than for people with other types of disability, permanence is about the irreversible nature of a disability which may be of a chronic episodic nature. The NDIS Rules and operational guidelines accept that a permanent condition may be episodic in nature, requiring different amounts of support at different times.

Scheme participant numbers show that people with psychosocial disability have been able to demonstrate that their condition is, or is likely to be, permanent. At the end of March 2017, about 5000 people with psychosocial disability had approved plans, accounting for six per cent of scheme participants (NDIA 2017o, p. 18). And data (to December 2016) also indicate that 81 per cent of people with psychosocial disability who lodged an access request to the NDIS have been found eligible for the scheme (although this is a lower acceptance rate compared to other conditions) (NDIA 2016v, p. 56).

The Commission cautions against changing the eligibility criteria to relax or loosen the definition of permanency and how it relates to psychosocial disability. The requirement that a condition be permanent is a key tenet of the NDIS. Removing or relaxing this requirement would represent a significant risk to the financial sustainability of the scheme.

The NDIS is not meant to support everyone with psychosocial disability, and even for those who do qualify for individualised supports, other systems need to play their part (for example, the health system meeting clinical needs). Many people will not meet the eligibility criteria for individualised supports and therefore will need to be supported outside of the scheme. Clarity about the specific services that will be funded and/or provided by all governments once the rollout of the NDIS has been completed is essential (chapter 5).

A 'psychosocial gateway' is an option

Many participants to this study expressed frustration that people with psychosocial disability were subject to phone planning conversations and inconsistent or inequitable outcomes in plans. There were also concerns that a specific assessment tool for psychosocial disability is not being used and planners lack experience in understanding the needs of people with psychosocial disability (chapter 4).

While framed around people with psychosocial disability, these concerns are broadly in line with observations others have made about the planning process more generally. A discussion of planning — including reforms to improve the process — is provided in chapter 4. Such reforms may improve outcomes for people with psychosocial disability, or allay concerns about how the eligibility criteria are being applied.

That said, a case can be made that psychosocial disability is sufficiently different from other types of disability that a unique, specialised gateway could be of value. It was put to the Commission that people with psychosocial disability may not engage with the system effectively, may be hard to reach, may view the system with distrust, or may have particular difficulty identifying and articulating their goals and needs. It was also argued that more beneficial outcomes for scheme participants could be achieved if planners were familiar with psychosocial disability and had greater knowledge of the types of supports that could be provided within and outside of the scheme.

The finding that people with psychosocial disability are more likely than other scheme participants to report less positive outcomes from their involvement in the scheme suggests that the scheme might not be working as well for people with psychosocial disability as it could.

While a specialist gateway provides no guarantee of improved outcomes, it is something that could be explored if wider reforms to the planning process do not result in better engagement with the scheme for people with psychosocial disability.

Reforms to the wider planning process (chapter 4) should be the priority and may be sufficient to improve outcomes for people with psychosocial disability. However, the NDIA could also consider a unique entry pathway for people with psychosocial disability. This could build on the strengths of the ECEI approach, that is, a connection with partners who have considerable expertise in psychosocial disability, and linkages to supports outside of the scheme for people with needs that will not be supported through the NDIS.

4 Scheme supports

Key points

- The National Disability Insurance Scheme (NDIS) is designed to cover individualised disability supports that are reasonable and necessary. This includes supports that help people with disability to pursue their goals, live independently and participate in the community and employment. The NDIS is meant to complement other mainstream or specialist services available to the wider population, not replace them.
- The extent of supports coverage matters — over-coverage of supports could create cost pressures and pose a risk to the financial sustainability of the scheme, but under-coverage could mean that the benefits of the NDIS are not fully realised.
- The overall costs and benefits of the NDIS are affected by the volume of supports covered under the scheme, as well as how supports are allocated — that is, the planning process.
  - The touchstone of what is reasonable and necessary directly impacts the quantity and types of supports funded. The concept of 'reasonable and necessary' is malleable, and allows scheme participants the flexibility to exercise choice and control.
  - The quality of planning processes is a key determinant of the long-term sustainability of the NDIS, because it influences what costs are incurred; the predictability of costs; and the integrity of, and community support for, the scheme as a whole.
- The planning process is about matching scheme participants with supports. It involves conversations between the participant and the National Disability Insurance Agency to determine, for each participant: their goals and aspirations, their level of function and appropriate supports.
- The challenge for the planning process is finding the right balance between individualisation and good outcomes for scheme participants on the one hand, and ensuring equity among participants and the financial sustainability of the scheme on the other.
- Planning processes are not operating well. The speed of transition and performance indicators that focus on participant numbers have placed pressure on the National Disability Insurance Agency to finalise plans quickly, and the quality of plans has been compromised.
  - Planning conversations with scheme participants are said to be rushed and superficial. Most plans are prepared by phone, which limits engagement with participants and can mean that planners do not get the 'full picture'.
  - The planning process is not clear, transparent and accessible. Nor are processes inclusive or sufficiently flexible to accommodate differing needs, particularly for participants with complex needs or from culturally and linguistically diverse backgrounds.
  - There is variability in planner skills, experience and training. Planners often lack knowledge about different types of disability, which can hinder their ability to formulate a good plan. Planner performance could be improved by using specialised planning teams for some disabilities and better leveraging industry expertise.

The quantity and types of supports funded by the National Disability Insurance Scheme (NDIS) are key drivers of scheme costs. Supports are also important for realising many of the benefits of the NDIS (box 4.1) because they help scheme participants:

- pursue their goals, objectives and aspirations and increase their independence
- increase their social and economic participation (and increase the social and economic participation of carers)
- reduce their need for other supports and services
- develop their capacity to actively take part in the community.

For this reason, striking the right balance is crucial: over-coverage of supports could create cost pressures and pose a risk to the sustainability of the scheme, but under-coverage could mean that the benefits of the NDIS are not fully realised.

The overall costs and benefits of the NDIS are also affected by *how* supports are allocated to scheme participants. Good planning processes are important for matching scheme participants with the supports that will result in improved outcomes and help maintain the integrity of, and community support for, the scheme as a whole. Poor planning processes can increase the likelihood of cost blowouts and undermine the accuracy of cost projections, compromising the ability of governments to plan for the future of the scheme.

The *National Disability Insurance Scheme Act 2013* (Cwlth) (NDIS Act) provides for two types of supports for people with disability.

- Specialist disability supports funded by the NDIS are called *reasonable and necessary supports*. The types of supports that may be funded include: assistance with daily personal activities and household tasks; therapeutic supports (such as occupational therapy, speech therapy and behavioural support); mobility equipment; home and vehicle modifications; and services that enable employment and participation in community and social activities (NDIA ndf).
- The National Disability Insurance Agency (NDIA) may also provide *general supports* to people with disability, even if they are not eligible for the NDIS. General supports include: coordination, strategic and referral services and activities, to help people with disability access mainstream services, such as health, education and transport services (Commonwealth of Australia 2013, p. 8).

This chapter is about the specialist supports that are funded under the NDIS — that is, reasonable and necessary supports. The rules governing the scope of supports covered by the NDIS are covered in section 4.1. Section 4.2 gives an overview of the process for allocating supports to individual scheme participants — the planning process. Section 4.3 discusses the key concerns raised by study participants about the planning process and considers what implications these have for scheme sustainability. Section 4.4 looks at the evidence on the effectiveness of supports. The interface between the NDIS and other services is discussed in chapter 5.

Box 4.1 Many of the NDIS's benefits are realised through supports

Brenda Gillett:

> My adult son James (39 years old) who has an intellectual disability, lived at home until almost two years ago, when we then decided it was time for him to try to live as independently as possible without our total support … James just loves his own 'unit' and his new (and much loved) support person who is enabling James to become more independent each day; and is helping him to become more inclusive in his community … James also has used funding specifically set aside for a speech pathology assessment and is looking forward to catching up with the 21st century and the rest of his generation by buying an iPad with which to look at his photos and use a communication app to help him express his needs and wants. (brief sub. 15)

Sally Shackcloth:

> My adult daughter's life has improved in many ways since she was a member of the trial group in Tasmania. An occupational therapist found that her bed was unsafe both for her and for the support workers dressing her. The physio review recommended a hip x-ray because of increasing mobility problems. The result is she is now having preventative treatment so her condition doesn't deteriorate … Very importantly, she is now participating in an ongoing speech pathology program with an expert speech pathologist as she needs a communication system tailored to her needs. Up to now she has no reliable way to communicate. (brief sub. 19)

Karen Wakely:

> For the first time we have been able to access meaningful therapeutic supports. Previously therapy was only once a month, and was inadequate for gaining any momentum. Now we access either psyc or occ therapy every week, and it has been far more effective in developing the social and practical skills needed for independent living. For the first time, my child is beginning to successfully participate in mainstream community activities. (brief sub. 43)

Lauren McGowan-Slee:

> Because of the NDIS I have supports that mean I can do a job that works with my disability and have the physical home tasks I can't do taken care of … I am excited to be a taxpayer again, it fills me with so much pride to be giving back again. With the NDIS I can afford to get to work, the transport contributions mean I don't have to reduce my work days to afford taxis. I have adaptive technology which means I can do things by myself and be safe. I am also blind and I can finally read again and I used funding to get me to a functional level so I could work. … I can afford to buy healthier food and get help preparing it instead of having to buy pre prepared meals so I have had less digestive problems, and I don't see the doctor as often. I have a person who can be with me when I do exercise so I can exercise effectively without being afraid of falling over or getting injured when I lose muscle control. (brief sub. 52)

Graham Lawrence:

> Under her NDIS approved plan, Michelle has the ability to purchase a 5 day/week community access program with a group of her peers, with arranged leisure, craft and life education activities … [this] makes it possible for the Government to save an estimated $300,000 -$400,000 p/a. This is the typical net cost of providing care (equivalent to their own home), for people with the severe levels of disability which Michelle has. (brief sub. 78)

Sonya & Stephanie Nicolaides:

> My Daughter Stephi has been on the NDIS for three months now and it has made a dramatic change to her life. She now has the same life opportunities other Australians take for granted. She is able to have regular physio and hydro therapy now, which helps with all her tight muscles. Stephi seems to be a lot happier within herself and able to move a lot easier without much pain. We were able to get ramps to the front and rear of the house, making it very easy to get Stephi in and out of the house in her wheelchair now. (brief sub. 132)

4.1 What supports are funded under the NDIS?

The NDIS is designed to cover individualised disability supports that are 'reasonable and necessary' (Gillard 2012; PC 2011, pp. 257–261).

This includes supports that help people with disability to:

- pursue their goals and maximise their independence
- live independently and be included in the community as fully participating citizens
- participate in the community and in employment (NDIS Act s. 4(11)).

However, the NDIS is not meant to replace mainstream or other specialist services available to the broader population, and does not fund supports that are covered by other areas of government (including hospital and GP visits, and school teacher aides).

In addition, the NDIS Act s. 34(1) specifies criteria for determining whether supports (general or individualised) may be provided to scheme participants. This includes whether the support:

- will assist the participant in achieving their stated goals and aspirations
- will facilitate the participant's social and economic participation
- represents good value for money
- will (or is likely to) be effective and beneficial for the participant
- should (within reasonable expectations) be provided by families, carers, informal networks or the community
- is most appropriately funded or provided through the NDIS.

The *National Disability Insurance Scheme (Supports for Participants) Rules 2013* (Cwlth) and operational guidelines maintained by the NDIA provide additional rules and guidance for deciding what supports may be approved.

What is reasonable and necessary?

Individualised support funding under the NDIS is bounded by the touchstone of what is reasonable and necessary. However, the concept of 'reasonable and necessary' is not specifically defined in the legislative framework. Notably, the NDIS Act 'does not prescribe the types of supports that would be considered 'reasonable and necessary' across all participants' (EY 2015, p. 9), nor does it provide direct guidance on how to determine whether a support is reasonable and necessary.

As the court in *McGarrigle v National Disability Insurance Agency* observed:

> Although the phrase 'reasonable and necessary supports' is used throughout the legislative scheme, including in the objects and principles provisions, it is not defined. Its meaning can be

> derived from the context in which it is used, especially in my opinion s 4(11), which sets out what reasonable and necessary supports should enable and empower people with a disability to do, read with s 14 which sets out the purposes for which funding for reasonable and necessary supports is provided. ([2017] FCA 308 at [41])

As such, the bounds of what is reasonable and necessary will ultimately be shaped by court and tribunal decisions over time, having regard to the text of the legislation, rules and operational guidelines. These decisions will affect what will be funded under the NDIS, and therefore overall scheme costs. On this basis, the NDIA identified 'decisions by the Administrative Appeals Tribunal (AAT) or court system in interpreting the boundaries of … reasonable and necessary supports' (sub. 161, p. 45) as a policy lever affecting the financial sustainability of the NDIS that is outside of its control (box 4.2).

Box 4.2 **McGarrigle v National Disability Insurance Agency**

Mr Liam McGarrigle is a scheme participant with autism spectrum disorder and intellectual disability. Each week, he attends a group program for three days and is employed for two days. Transport to and from these activities is by taxi or provided by a support worker. As part of his third plan, Mr McGarrigle was allocated $11 850 for 'transport to access daily activities'. This represented about 75 per cent of his total transport costs ($15 850).

Administrative Appeals Tribunal decision

Mr McGarrigle sought a review of this decision in the Administrative Appeals Tribunal, seeking to have his transport costs fully funded. The Tribunal found that, while transport is a reasonable and necessary support for Mr McGarrigle, it was open to the National Disability Insurance Agency (NDIA) to decide to fund less than the full cost of the support. The Tribunal said, 'I am satisfied that the decision to fund 75 per cent of his weekday transport costs strikes an appropriate balance between what is reasonable and necessary for him and the overall financial sustainability of the NDIS' [64].

Federal Court decision

On appeal, the Federal Court of Australia overturned the Tribunal's decision. It reasoned that the imperative language of the NDIS Act (specifically, the words 'will be funded' in s. 33(2)(b)) does not permit partial funding of supports. That is, if a support has been determined to be a reasonable and necessary support, the support must be fully funded. The Court also noted that the Act does not refer to contributions from the participant towards the cost of supports.

Appeal to the Full Federal Court

The NDIA has lodged an appeal of this decision to the Full Federal Court. Mr David Bowen, Chief Executive of the NDIA, said:

> The appeal is an important test case which arises from a set of circumstances in the trial phase of the NDIS. It could affect the future of the whole NDIS … We have, therefore, decided to ask the court for the fullest clarity, given the serious implications for the future sustainability of the Scheme for many thousands of present and future participants.

Sources: *McGarrigle v National Disability Insurance Agency* [2016] AATA 498; *McGarrigle v National Disability Insurance Agency* [2017] FCA 308; NDIA (2017l).

In 2011, the Commission made recommendations about various criteria for determining whether a support is reasonable and necessary (PC 2011, pp. 258–259). These criteria were adapted from the Lifetime Care and Support Scheme in New South Wales and are echoed in the NDIS Act s. 34(1) (discussed above).

However, the NDIS's legislative regime is different to that of the Lifetime Care and Support Scheme — and the scheme contemplated in PC (2011) — in two subtle ways.

- While the NDIS Act repeatedly refers to 'reasonable and necessary supports', it does not explicitly state that individualised supports funded under the NDIS must be or assessed to be 'reasonable and necessary'. (That said, such a requirement may be implied by the text of the legislation.) By contrast, the Lifetime Care and Support Scheme explicitly requires a direct assessment of what treatment and care needs are reasonable and necessary in the circumstances (*Motor Accidents (Lifetime Care and Support) Act 2006* (NSW) ss. 11A, 23).
- The considerations outlined in the NDIS Act s. 34(1) are not framed as criteria exclusively for deciding whether a support is reasonable or necessary. Instead, they are considerations for deciding whether *any* type of support (that is, general *or* individualised) may be provided to scheme participants. The NDIS Act does not explicitly provide a schema for determining whether a support is reasonable and necessary.

On this basis, there may be scope for additional and specific legislative guidance on whether and how the NDIA should apply the 'reasonable and necessary' test.

INFORMATION REQUEST 4.1

Is the National Disability Insurance Scheme Act 2013 *(Cwlth) sufficiently clear about how or whether the 'reasonable and necessary' criterion should be applied? Is there sufficient clarity around how the section 34(1) criteria relate to the consideration of what is reasonable and necessary?*

Is better legislative direction about what is reasonable and necessary required? If so, what improvements should be made? What would be the implications of these changes for the financial sustainability of the scheme?

Putting 'reasonable and necessary' into practice

Some study participants identified issues with operationalising the concept of 'reasonable and necessary'. One particular concern is that there are different perceptions about what supports are reasonable and necessary (Flourish Australia, sub. 74, p. 5; PDA, sub. 38, p. 9). Alzheimer's Australia, for example, said:

> In our experience, there are large variances in what is considered 'reasonable and necessary' in relation to assessment planning. For example, one person with younger onset dementia was

> assessed and given horse riding lessons, while another person was not allowed bathroom aids. There also needs to be an oversight and improvement process that monitors how an assessor or planner determines what is considered 'reasonable and necessary'. (sub. 10, p. 13)

The NDIA (sub. 161, p. 92) also acknowledged that 'there is still confusion within the sector and the community, and to some extent within the NDIA, around the scope of reasonable and necessary supports'.

Flexibility around the concept of 'reasonable and necessary' allows scheme participants to exercise choice and control, and to be innovative in terms of supports. As the NDIA explained:

> Decisions around reasonable and necessary supports require balancing the need to empower participants to explore different ways of achieving increased participation with the need to spend taxpayers' money consistent with legislation and in a way that minimizes risk of misuse or fraud. (sub. 161, p. 92)

However, Physical Disability Australia argued:

> … what is 'reasonable and necessary' also needs to be elucidated with many benchmark examples so that planners and participants can approach planning conversations with similar frames of reference. (sub. 38, p. 8)

The NDIA has operational guidelines, practice guides, work practices and task cards to help planners exercise their judgment about what is reasonable and necessary. The NDIA indicated that it intends to update these to reflect outcomes of court and tribunal decisions and planners' experiences.

4.2 About plans and the planning process

Supports are allocated to scheme participants through a plan, which is prepared through conversations between a planner and the participant. As the NDIS Act (s. 31) states, where practicable, the development of a plan should be individualised, directed by the participant and maximise participant choice and control.

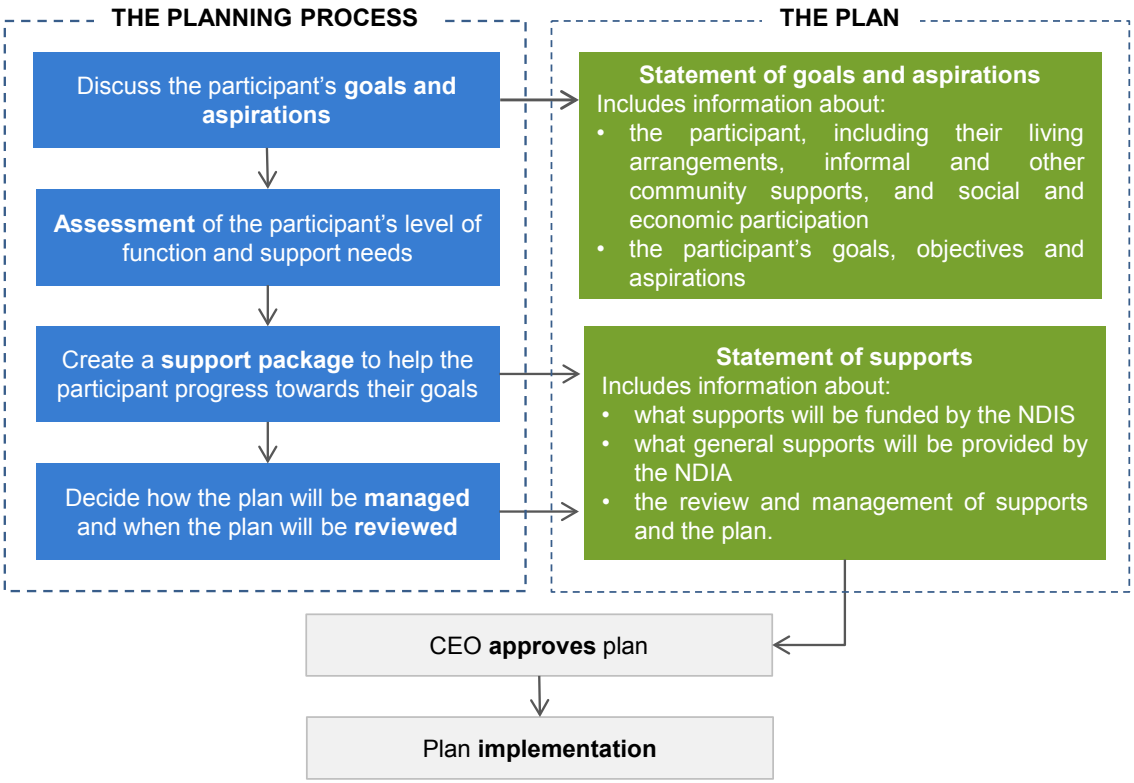
The planning process involves several steps (figure 4.1), designed to elicit information about the scheme participant, which is used to inform the content of the plan.

1. The participant and planner discuss the participant's goals and aspirations. This conversation is used to help put together a statement of goals and aspirations, which includes information about the participant, including: their living arrangements, informal and other community supports, and social and economic participation, as well as their goals, objectives and aspirations.
2. The NDIA conducts or considers assessments of how the participant is performing in different areas of their life ('level of function' or 'functional capacity'), including their 'activity limitations, participation restrictions and support needs arising from [the]

participant's disability' (*National Disability Insurance (Supports for Participants) Rules 2013* (Cwlth) r. 4.1), and identifies areas where the participant requires support.

3. A support package is put together to help the participant progress towards their goals. The support package may include general supports, as well as reasonable and necessary supports, and is set out in a statement of supports.
4. The planner and the participant decide when or under what circumstances the plan will be reviewed. They also decide how the plan will be managed (such as self-management, management by the NDIA, or using a plan management provider), including whether support coordination is required. (Plan management and support coordination are discussed in chapter 8.) This information is also included in the statement of supports.
5. Before the plan is finalised, it must be approved by the CEO of the NDIA (or a delegate).

Figure 4.1 **Making a plan**



For most people, their first plan is completed over the phone, although some planning conversations do take place face to face (NDIA 2016e, p. 1).

Assessment and tools

The assessment process is about evaluating the scheme participant's level of function and identifying the supports that will allow them to progress towards their personal goals and aspirations. Choosing the right tools for the job is challenging, as there is no universally agreed assessment tool for evaluating the care and support needs of people with disability. There are, however, several features that an assessment tool should have (box 4.3).

Box 4.3 Desirable features of assessment tools

To ensure the sustainability of scheme costs, it is important that assessment tools are:

- *valid* — the tools should test what they purport to and provide a basis for accurately identifying the nature, frequency and intensity of a person's support needs. Assessment tools that are not appropriate could threaten scheme sustainability.
- *reliable* — the tools should yield consistent measures across time, individuals and situations; results should not be influenced by when or where the assessment is undertaken, who is undertaking the assessment, or the identity of the individual per se.
- *accurate* — the tools should reduce the risk that assessors and individuals overstate or understate their support needs.
- *efficient* — an efficient tool is one that collects sufficient information to assess support needs in the least costly manner.

Assessment tools also need to be continually monitored and refined to ensure that they remain in line with scheme objectives, and keep pace with evolving best practice and community expectations.

Source: PC (2011, pp. 315–320).

Since the commencement of the NDIS, the NDIA has used several different assessment tools as part of the planning process (box 4.4).

Feedback about the NDIA's use of assessment tools was mixed.

- Some study participants were critical of the NDIA's assessment tools, but it was sometimes unclear which specific tools they were referring to (ABF, sub. 48; Alzheimer's Australia, sub. 10; Belinda Jane, sub. 80; Macarthur Disability Services, sub. 57; Queensland Advocacy Incorporated, sub. 115).
- Other study participants were critical of how certain tools were used, particularly in relation to early childhood and early intervention (chapter 3). For example, the AEIOU Foundation (sub. 32, p. 8) said that PEDI-CAT is not appropriate for children with intellectual disability. The Shepherd Centre (sub. 107, p. 12) made a similar observation about young children with hearing loss. Others questioned whether NDIA staff had been adequately trained to apply the PEDI-CAT tool (Early Intervention Australia Victoria/Tasmania, sub. 129, p. 10; Noah's Ark, sub. 108, pp. 10–11).

Box 4.4 The evolution of NDIS assessment tools

The National Disability Insurance Agency (NDIA) has undertaken significant work to identify appropriate assessment tools for identifying the support needs of scheme participants.

- *Mid-2013*: the NDIA commenced delivering the National Disability Insurance Scheme without an assessment tool, as none was available.
- *Late 2013*: adoption of the Support Needs Assessment Tool (SNAT). The SNAT attempted to identify functional support needs through a planning discussion, and provided the participant with a detailed, personalised support plan. After the first year of trial, it became apparent that the SNAT was not fit for purpose.
- *Late 2014*: further work on identifying appropriate assessment tools. This entailed a survey of functional assessment tools used around the world, and evaluating these tools for relevance, usability and reliability. The cost of acquiring and using these tools was also a crucial consideration. The process included extensive consultation and engagement with key stakeholders and experts across the key disability types, including clinical experts and researchers, and disability associations.
- *Mid-2015*: identification and testing of a new suite of assessment tools. This included different tools for 11 key disability types, and the World Health Organization Disability Assessment Schedule version II (WHODAS II) where no specific tool was identified.
- *Mid-2016*: adoption of the new suite of assessment tools. The NDIA has the capability to administer some of these assessments tools in house, but they can also rely on assessments performed by specialists.

Considerable work around assessment tools remains to be done. For example, the NDIA still has no tool for evaluating the support needs of people with psychosocial disability. Engagement with representatives in the mental health sector on this point is ongoing.

Source: NDIA (sub. 161, pp. 9–11).

But many study participants said that they were unable to obtain information about what assessment tools the NDIA uses (including tools for assessing level of function). Physical Disability Australia said this made it difficult to comment on the appropriateness of assessment tools.

> Information about assessment tools is scarce on the NDIS website … Furthermore, there is no mention of them on the pages dealing with planning processes and planning conversations. It is therefore difficult for [Physical Disability Australia] (or anyone) to comment on them as it is not clear which assessment tools are being used and by whom. (sub. 38, p. 7)

The Centre for Disability Studies also said:

> A major barrier to the on-going improvement and implementation of the NDIS is the lack of access to, or public domain information on the assessment tool(s) in use by the National Disability Insurance Agency … we do not see why the assessment tool itself is not public domain, unless for commercial copyright reasons. Many support needs assessments in use across jurisdictions are in the public domain, or are available upon purchase or enquiry. (sub. 49, p. 2)

The NDIA is required to specify what assessment tools it uses in its operational guidelines (*National Disability Insurance (Supports for Participants) Rules 2013* (Cwlth) r. 4.4), which must be published and kept accurate, up-to-date and complete (*Freedom of Information Act 1982* (Cwlth), ss. 8, 8A, 8B). But, in practice, study participants' knowledge about what assessment tools the NDIA uses appears to be sourced indirectly, through word of mouth or via experiences with the planning process. Information about the role of assessment tools in the planning process could also help participants understand how or to what extent assessment tool results influence the supports that they receive.

The first plan process

As discussed in chapter 2, the NDIA has identified increasing package costs (over and above the impacts of inflation and ageing) as a source of cost pressures. The NDIA developed reference packages to assist with monitoring scheme experience and assessing cost pressures (box 4.5). Reference packages are based on age, disability type and level of function. Reference packages can also help improve equity in the scheme by giving clearer guidance on 'typical' arrangements.

Box 4.5 Reference packages

Reference packages are an 'indicative' support package, developed as a way to identify typical support needs and funding for different cohorts of scheme participants.

The National Disability Insurance Agency currently uses a suite of assessment tools for evaluating scheme participants' level of function, covering 11 key disability types (box 4.4). The reference package cohorts are based, in part, on these 11 disability types. They are also based on age and level of function.

Reference package data were tested and validated using:

- back-captured data — that is, data about previous support packages
- expert groups in each of the 11 disability categories — these groups included academics, consumers and providers.

Back-captured data and the work of expert groups were also used to identify how different variables impact the value of support packages. This information allowed the Scheme Actuary to validate the assessment tools, and develop a basis for determining 'reasonable and necessary' funding at an aggregated level.

Work to refine reference packages is ongoing. For example, no reference package is currently available for people with psychosocial disability. Reference packages also have limited utility where a person has more than one disability and the secondary disability is an important contributor to support needs. As more data are collected, reference packages will become more sophisticated and better informed by actual experience.

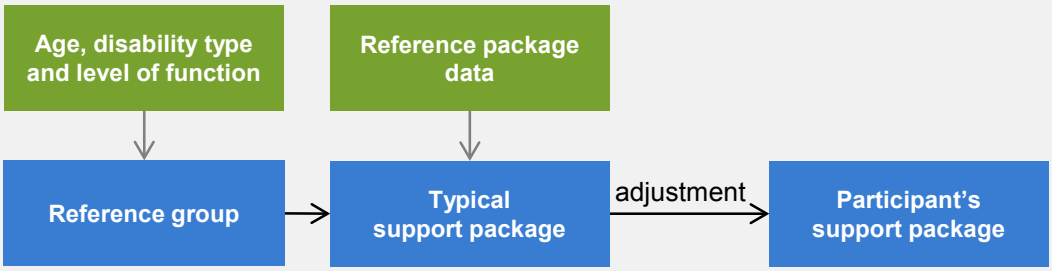
Source: NDIA (sub. 161, pp. 10–11).

Based on the learnings from trial, the NDIA adopted a new approach to determining support packages — the 'first plan process'. The first plan process uses reference package

data to assign scheme participants a 'typical support package' based on their age, disability type and level of function. This is adjusted to account for the individual support needs of participants to create the participant's plan (box 4.6).

Box 4.6 The first plan process

The first plan process was introduced on 1 July 2016. Scheme participants are first allocated a 'typical support package', based on their reference group (which is determined by their age, disability type and level of function). The typical support package may include funding across the following eight core domains: daily activities; social participation; consumables; transport; home modifications; assistive technology; capacity building; and support coordination.



For each participant, the level of funding is adjusted according to the participant's circumstances. This is done using a questionnaire, which asks the participant about each of the domains, including what supports they already have in place and whether these are sufficient and sustainable. For example, where it is reasonable that sustainable informal, community or mainstream supports continue to assist the participant, or where the participant believes that other informal, community or mainstream supports may provide a better outcome, funding is adjusted in the participant's support package.

Source: NDIA (sub. 161, pp. 10–11).

Balancing different considerations

A number of study participants argued that the use of reference package data is at odds with person-centred planning and that it limits choice and control during the planning process (AASW, sub. 124, p. 4; Down Syndrome Australia, sub. 121, p. 7; Flourish Australia, sub. 74, p. 13; Lifestart Co-operative, sub. 97, p. 9). ACT Disability, Aged and Carer Advocacy Service (sub. 87, p. 14) said that the approach 'carries inherent risks that planners (and assessment tools) will overly rely on reference plans as opposed to taking a person-centred approach'.

A person-centred or individualised approach to planning is central to the NDIS. The scheme is about matching participants with the supports that are right for them; however, this needs to be done in the context of the sustainability of the scheme and achieving a consistent approach to funding packages.

During the first year of trial, a highly detailed and person-centred approach was taken to planning, but according to the NDIA it was found not to be fit for purpose.

> [The] Support Needs Assessment Tool (SNAT) was a construct that attempted to identify functional support need and through a planning discussion using the tool to provide the participant with a detailed personalised support plan. The SNAT was used throughout the first year of trial. However, at the end of this period, it had become apparent that the SNAT was not fit for purpose. While the SNAT delivered an individualised outcome, there was no correlation of the SNAT to the reference packages upon which the funding of the Scheme was based. (sub. 161, pp. 9–10)

While some scheme participants expressed greater satisfaction with processes during trial (for example, Down Syndrome Australia, sub. 121), according to the NDIA (sub. 161, p. 10), it led to 'highly prescriptive plans that provided detail at the daily and sometimes the hourly level minimising the flexibility for participants to exercise choice and control'.

The first plan process, introduced in 2016, sought to improve the approach taken at trial by enabling people greater flexibility in how they used their funds against goals and outcomes that they identified. It also sought to address the issues of consistency between support packages by providing guidance to planners about what support packages for different groups should look like.

The challenge for the future of the planning process is to find the right balance between individualisation and good outcomes for scheme participants on the one hand, and ensuring equity among participants and the financial sustainability of the scheme on the other. It is likely to be some time before the right balance is struck.

A dynamic process

As with all insurance-based schemes, the tools and processes for handling and assessing claims are a matter of ongoing refinement. This is necessary to ensure that the insurance scheme remains 'on track' and is viable in the long term. Dynamic processes are also important to allow the scheme to adapt to changing circumstances or incorporate information that becomes newly-available over time.

Part of this process is ongoing monitoring and evaluation (chapter 9). The NDIA undertakes internal monitoring of its processes.

> The first plan process is a dynamic process which will include ongoing refinement as more data and information becomes available. The process allows continuous monitoring of committed support and utilised support, with benchmark costs. As the NDIS moves through transition, the NDIA is continually monitoring and seeking opportunities to enhance the planning process from a participant, provider and staff perspective. The NDIA is currently reviewing the plan review process to streamline the process and ensure it continues to meet the needs of both the participants and Scheme sustainability. (sub. 161 p. 89)

The COAG Disability Reform Council has also undertaken to review the first plan process at the end of June 2017 (DRC 2016). This review should consider whether the first plan process strikes the right balance between individualisation and ensuring equity across participants, and whether the process helps ensure that the scheme is sustainable in the long term.

Information about how the planning process works is important

Many study participants were unsure or unaware of how the first plan process operates. Scope Australia (sub. 72, p. 15) suggested that this was because 'communication from the Agency and its contractors has been inconsistent and at times poor'.

A number of study participants were unsure or mistaken about:

- what the first plan process was
- the rationale for adopting the first plan process
- whether or to what extent support packages were adjusted for individual circumstances
- whether or how supports received under legacy programs were taken into account.

With evolving processes, it is important that scheme participants and their families and carers can access accurate and up-to-date information about the planning process. ACT Disability, Aged and Carer Advocacy Service (sub. 87, p. 14) said, 'we would encourage a transparent and rigorous approach to consideration of benchmarking and reference plan topics'. Clear messaging about how and why things are changing is also important for maintaining the credibility of evolving planning practices.

Plan reviews

Usually, plan reviews occur as part of the planning cycle — that is, at the expiry of a scheme participant's previous plan (usually after 12 months). However, unexpected plan reviews can be triggered if the scheme participant changes their statement of goals and aspirations or requests a plan review (NDIS Act, ss. 47–48). Often plan reviews are initiated by the scheme participant because their supports do not, or cease to, meet their needs or expectations. Changes to a plan may also be required if information in the plan is incorrect or missing.

Currently, any changes to a plan require a full plan review. Several study participants advocated to allow plans to be amended or varied without triggering a full review (Blind Citizens Australia, sub. 130, p. 5; MND Australia, sub. 45, p. 3; Woden Community Service, sub. 159, p. 10).

Full plan reviews can be time-consuming and costly, and scheme participants may also be unable to access the supports they need while they wait for their plan to be reviewed (CPSU, sub. 76). A process for amending or adjusting plans would improve the cost effectiveness of review processes, especially when the proposed changes to the plan are minor (Jacqueline Pierce and Associations, sub. 147, p. 5).

Some also suggested that amendment processes could be used to manage supports for participants when needs change quickly — such as in the case of episodic or degenerative disorders (ABF, sub. 48; MND Australia, sub. 45). However, where there has been a

significant change in the participant's circumstances, it may be most appropriate to undertake a full plan review (provided it is undertaken with sufficient expediency).

The role of Local Area Co-ordinators in the planning process

In some areas, planning discussions are conducted and plans are prepared by Local Area Co-ordinators (LACs). However, under current legislative arrangements, LACs do not have the power to approve plans; that is, plans prepared by LACs must still be approved by the NDIA.

The NDIA (sub. 161) suggested that there may be some benefits to allowing approval functions to be delegated to LACs. This could lead to efficiencies in plan administration as it would reduce double-handling of plans by LACs and the NDIA. The NDIA also said that delegating approval functions could lead to greater certainty for scheme participants.

> More importantly, it would improve the experience of participants by allowing the LAC, while in discussion about support needs and within defined parameters and agreed reporting and monitoring arrangements, to be able to confirm the level of reasonable and necessary funding and move straight to a discussion on plan implementation. (sub. 161, p. 13)

However, there are risks associated with allowing the NDIA to delegate its plan approval functions to LACs.

- Delegating plan approval functions could reduce the NDIA's control and oversight over plans and allocated supports. This could compromise scheme sustainability and the realisation of outcomes within the scheme.
- Transferring additional functions to LACs may limit their capacity to perform other important functions, due to time and resource constraints. It could also lead to conflicts of interest (real or perceived) between different roles — for example, it may compromise LACs' ability to provide impartial pre-planning support.
- Sharing approval functions between the NDIA and LACs may reduce clarity and transparency around roles and responsibilities, particularly if approval functions are delegated to some LACs but not others. There is also a risk that it could reduce or obfuscate the NDIA's accountability for plans and allocated supports.

The Commission is seeking feedback on whether the NDIS Act should be changed to allow the NDIA to delegate plan approval functions to LACs — and, if so, how the risks of doing so might be managed.

INFORMATION REQUEST 4.2

Should the National Disability Insurance Agency have the ability to delegate plan approval functions to Local Area Coordinators? What are the costs, benefits and risks of doing so? How can these be managed?

4.3 How is the planning process tracking?

Good planning processes are essential for the success of the scheme and long-term sustainability, as the quality of the planning process has a bearing on what costs are incurred in the scheme, the predictability of scheme costs and the integrity of the scheme (box 4.7). The Northern Territory Government said it considers the planning process to be one of the most important elements of the scheme.

> The quantity of supports received by participants is a key driver of costs, and therefore a consideration for the ongoing financial sustainability of the Scheme. However, without a high quality planning process which supports participants to identify and work towards their goals and aspirations, choice and control for participants will not be achieved. (sub. 205, p. 3)

The planning process has not been operating well. The Commonwealth Ombudsman (sub. 137, p. 7) reported that the planning process is one of the main sources of complaints to the office.

Participants to this study also expressed dissatisfaction with planning processes. In particular, participants expressed concern about:

- the lack of consultation and engagement with scheme participants
- the accessibility and transparency of processes and planners
- the quality of planners (including LACs undertaking planning functions).

Study participants overwhelmingly considered that poor planning processes have compromised the quality of plans. As a result, plans are not meeting scheme participants' needs or expectations, and sometimes include supports that they do not want or need (Macarthur Disability Services, sub. 57, p. 4). Several study participants also reported that there was considerable variability in plans for scheme participants with similar needs (Macarthur Disability Services, sub. 57, p. 4; Neami National, sub. 63, p. 3; PDA, sub. 38, p. 8; PDCN, sub. 29, p. 3). For example, Brain Injury SA said:

> Brain Injury SA is aware of one household with multiple children with similar needs. Each child had a different planner and each plan provided funding for different services. In another instance, involving twins with developmental delays and similar levels of need, the plan for one child included support coordination while the plan for the other child did not. (sub. 116, p. 5)

The NDIS is a major reform and the NDIA has been given a monumental task under highly ambitious timeframes and a resource-constrained environment. Many of the NDIA's decisions about how to operationalise the planning process have been influenced by bilateral estimates and community expectations around reaching new participants quickly. In addition, planning processes have had little time to mature.

However, there is real concern that some of the practices adopted to address the pressures of rollout will become entrenched in practice and in the culture of the NDIS, with implications for the long-term costs and benefits of the scheme.

Box 4.7 Why are good planning processes important?

Outcomes, benefits and equity

As discussed in chapter 1, financial sustainability is not just about costs. It is also about whether outcomes are being realised, and whether those who are paying for the scheme remain willing to do so (NDIA 2016j).

Poor planning processes can mean that scheme participants are allocated supports that are not right for them. This can mean that many of the benefits of the scheme (such as increased quality of life, greater social and economic participation, and reduced need for other or future supports) are not fully realised. Poor planning processes can also result in greater variability in plans and outcomes for scheme participants with similar needs, compromising equity within the scheme. Together, these factors can undermine the credibility of, and community support for, the scheme as a whole — and hence its long-term sustainability.

Costs associated with reviews

Poor planning processes can result in plans that do not reflect the needs or expectations of scheme participants. This can place greater stress on review processes.

Increased requests for plan reviews can add to the workload of planners. Review processes can also place greater stress on scheme participants and providers. As Occupational Therapy Australia said:

> … reviews can take months to complete, resulting in added frustration for families and potentially affecting the relationship between participant and provider. (sub. 15, p. 5)

Greater use of review processes can increase the administrative costs of the National Disability Insurance Agency, as well as costs in other areas. For example, appeals to the Administrative Appeals Tribunal or the Federal Court of Australia place a greater burden on the justice system (chapter 9).

Certainty about costs

Poor planning can introduce additional uncertainty about scheme costs (New South Wales Government, sub. 60, p. 15; PDA, sub. 38, p. 9).

- Poor planning processes can be unreliable — that is, they do not yield consistent results across time, individuals and situations. This increases the variance in the value of support packages, increasing the unpredictability of scheme costs overall.
- Poor planning increases the likelihood that participants' plans do not match their needs and expectations. This can contribute to underutilisation of plans, driving a wedge between committed and actual support funding.

Greater uncertainty around scheme costs can undermine the accuracy of cost projections, which can make it difficult for governments to plan for the future of the scheme. High variability of scheme costs also increase the risk of cost blowouts.

The following sections discuss the key concerns raised by study participants, and policy options for ensuring poor practices do not become structural issues that continue to affect the operation of the NDIS in the medium and long term.

Engagement with scheme participants

Engaging with scheme participants during the planning process is important not only for ensuring that they receive the supports that are right for them, but also for the long-term success of the NDIS. Physical Disability Australia suggested that engaging with scheme participants is particularly important in the early stages of planning.

> Given that many planners are new to this type of work and may have limited lived experience of disability, the validity, reliability and accessibility of the processes they use to determine what constitutes an appropriate support package depends on deep engagement with participants, their families and supporters. (sub. 38, p. 7)

The planning process needs to be sufficiently 'deep' so that planners can obtain sufficient information about a participant for them to make a decision about reasonable and necessary supports that minimise lifetime costs, while also making the process person-centred and convenient for scheme participants and their carers. Involving families, carers, support workers and advocates in the planning process can also improve understanding of the functional impact of the participant's disability, their needs and the supports that they require (VCOSS, sub. 176, p. 16).

Concerns about rushed planning

The speed of transition, as set out in Bilateral Agreements, has placed a lot of pressure on the NDIA to finalise plans quickly. This has detrimentally affected the quality of the planning process. SCIA Australia said:

> The rush to get new participants into the scheme against bilateral agreements is proving to be a major headache for the Agency and is severely affecting the quality of first plans. (sub. 61, p. 3)

Similarly, United Voice said:

> Workloads and inadequate time to do the job is one of the most often cited concerns of our members. United Voice members are concerned that [planners] do not have time to do their job properly, that they rush from client to client preventing them from providing quality support. (sub. 118, p. 8)

Study participants also reported feeling that planning meetings are rushed (Flourish Australia, sub. 74, p. 3; Hannah Potapczyk, sub. 26, p. 1; Leadership Plus, sub. 128, p. 2; Maurice Blackburn Lawyers, sub. 58, p. 13; New South Wales Government, sub. 60, p. 15; University of Sydney, sub. 55, p. 3). Engagement with scheme participants during the planning process appears to be fairly superficial, and the NDIA accepted that the focus on throughput during the first two quarters of transition has contributed to poorer plans (sub. 161, p. 11).

Phone planning

Most planning conversations are now taking place over the phone, although face to face meetings are accommodated if required. The NDIA (sub. 161, p. 12) explained that this was a deliberate decision to allow people to enter the scheme as quickly as possible, with provision for scheme participants to consider how they will use their supports and amend their goals over the first year.

This decision was based on trial experience that recognised that people want to join the scheme as soon as they can, but also want time to think about their goals, supports and how they will use them. While it is recognised that this approach is not perfect, it was designed as a short-term measure to meet both of these objectives (NDIA, sub. 161, p. 10).

Study participants overwhelmingly expressed dissatisfaction with this approach to planning,[17] and many provided examples of poor experiences (box 4.8).

Carers Australia Victoria also identified issues with:

> … limited access to supporting documentation whilst on the phone; limited time to properly consider goals and aspirations; confusion about who they are being contacted by and for what; whether the plan will be as comprehensive as it could have been if the participant had the opportunity for a face-to-face meeting; the ability for the planner to recognise opportunities for capacity building. (sub. 131, p. 8)

Some felt that phone planning limits engagement with the scheme participant and does not allow the planner to see the full picture. For example:

> [Phone planning] is a transactional and blunt approach at a critical stage of a participant's navigation and interaction with the scheme … We feel utilization of phone-planning also creates assumptions of living situation by planners, who are unable to adequately capture the requirements and considerations of participants and respect the role of family, carers and other persons who are significant in the life of the participant. (Social Support & Precarious Workforce Research Discussion Group, sub. 71, pp. 2–3)

[17] Study participants who were critical of phone planning included: ADACAS (sub. 87); AHPA (sub. 37); Alzheimer's Australia (sub. 10); Brain Injury SA (sub. 116); Carers Australia Victoria (sub. 131); CMHA (sub. 9); ECCV (sub. 31); Flourish Australia (sub. 74); Jacqueline Pierce and Associates (sub. 147); Macarthur Disability Services (sub. 57); Mental Health Community Coalition of the ACT (sub. 135); OTA (sub. 15); PDCN (sub. 29); PDA (sub. 38); The Shepherd Centre (sub. 107); Social Support & Precarious Workforce Research Discussion Group (sub. 71); VCOSS (sub. 176); VMIAC (sub. 167).

Box 4.8 Experiences with phone planning

Alzheimer's Australia:

> Annie called the Parkinson's 1800 support line as she worried about an over the phone NDIS planning session that had taken place earlier that day. Annie's volume and quality of speech has been impaired due to Parkinson's and she also requires longer to respond to questions. She felt rushed and because her response is delayed she felt that the assessor didn't get a clear indication of her needs. Annie and a Parkinson's Nurse Specialist were able to take the time [to] put information together in order to apply for a review for Annie's plan. (sub. 10, p. 8)

Ethnic Communities' Council of Victoria:

> … anecdotal evidence from advocates and providers in the North Eastern Melbourne Region indicates that some participants are not being adequately informed about the purpose of phone contact by the NDIA or their LAC. These participants are having plans being completed without realising that they are engaging in the process or providing informed consent. (sub. 31, p. 1)

Carers Australia Victoria:

> I received a telephone call from an NDIA representative and requested a face-to- face meeting … The planner requested information regarding my son and said there were notes from his case manager which would be used to help create his plan. I inquired about the case manager, as I was not aware my son had one. The name given was of a man I had spoken to about 20 years ago. The planner said they have all his needs documented. I reiterated the need for a face-to-face meeting to discuss our changing circumstances and the support that my son needs to live independently and future support needs. I was offered a meeting three days later, 90 km from my home, which was not possible for me to attend. When I received a follow up call, I thought it was to schedule another time for a meeting, instead it was to tell me that a plan had been created for my son and that I should login to the Portal to see it. A week later I received a copy of the plan in the mail. The plan contained information about my son from over 20 years ago. (sub. 131, p. 9)

And:

> … an assessment completed by phone does not take the person's disability into account and fails to provide the added awareness and accommodation that are possible in a face-to-face meeting. Planners ask questions over the phone, which sometimes assume ability that does not exist. However, this is not evident to the planner because they are not with the person being assessed. They also lack the ability to make observations about the situation of the participant at the time of the phone call, which may involve distractions. (Brain Injury SA, sub. 116, p. 9)

Blind Citizens Australia (sub. 130, p. 3) also said that conducting meetings over the phone 'severely compromises the ability of people who are blind or vision impaired to demonstrate the difficulties they may face with completing tasks like reading, navigating the environment or household chores'.

Others expressed concern that phone planning takes scheme participants by surprise or does not allow participants to be supported by family, carers or advocates (Flourish Australia, sub. 74, p. 12). Physical Disability Council of New South Wales said:

> Phone plans to do not allow for participants to be supported simultaneously by carers or other important parties; physical sharing of important resources such as weekly planners or aspirational plans; equal access for peoples with specific communication needs; or allow

> planners to observe physical cues and surroundings for possible supports or equipment needs. (sub. 29, p. 3)

Phone planning is especially problematic for scheme participants with particular accessibility requirements (discussed below), such as mental illness (CMHA, sub. 11, p. 6; Flourish Australia, sub. 74, p. 3), cognitive impairment and neurodegenerative diseases (Alzheimer's Australia, sub. 10, p. 5) or people of culturally and linguistically diverse backgrounds (ECCV, sub. 31, p. 1; VCOSS, sub. 176, p. 11).

The Commonwealth Ombudsman reported that the bulk of complaints he had received about the planning process were from people who participated in phone planning. The Ombudsman suggested that it would be useful to compare the outcomes, satisfaction and review rates of face to face and phone planning discussions, noting that:

> While phone meetings likely provide the most cost effective method for planning when only simple administrative overheads are considered, there may be merit in considering whether — if participants who have phone meetings are likely to subsequently complain or seek review — the time spent on those subsequent interactions detracts from the cost effectiveness of planning by phone. (sub. 137, p. 8)

Consulting with participants about plan content

Consulting with scheme participants and their family, carers and advocates is essential to the success of the planning process. However, the Commission heard that, in many instances, scheme participants were not consulted about the content of their plan.

In particular, scheme participants were not permitted to view plans before they were finalised. National Disability Services explained:

> During the trial phase of the NDIS, participants were invited to comment on their draft plan before it was finalised. That practice has largely ceased. The consequence is that participants can end up with a plan that doesn't reflect their needs and goals. Some participants receive plans they don't recognise. Consistent with the NDIS's focus on choice and control, participants should always have the opportunity to comment on their plan before it is finalised. (2017a, p. 7)

And Community Mental Health Australia said:

> Clients are generally not permitted to see a plan before it is finalised, which anecdotally providers state is hindering clients understanding of their plan … There are incidents where people don't know what they are going to get until the plan is submitted — and there is currently no opportunity to take time to consider the plan before it is finalised. (sub. 11, pp. 3, 11)

The lack of participant involvement is not confined to first plans. Several study participants said that consultation around subsequent plans was also inadequate, and reported that first plans were simply being 'rolled over' (CPSU, sub. 76, p. 9; Health Services Union,

sub. 132, p. 12). For example, the Summer Foundation recounted a mother's experience with her child's third plan.

> No actual review took place and her daughter received a 'form' letter advising that her plan would continue 'as was' for the next 12 months and if she required any changes to apply for an internal plan review within 3 months of receiving this letter! This letter was not even signed! (sub. 113, p. 21)

Conversely, others said that requests to have a plan rolled over were ignored.

> In February I was contacted by an NDIA employee to have my plan review early. I tried to ask for it to be rolled over as I had not been able to fully activate the plan. I explained about the portal being down for months which was experience[d] by a large number of service providers. This person would not consider this and proceeded to state I was to be reviewed by phone. (Tricia Curley, sub. 140, p. 4)

Under the current timetable, the NDIA is required to complete a large number of plans in a relatively short period of time, and this has influenced how planning processes are undertaken. However, it is essential that the NDIA undertakes its planning function adequately and in a way that does not undermine the objectives of the scheme. An increased focus on the quality of the planning process will no doubt make it more difficult for the NDIA to keep to the timetable set out in the Bilateral Agreements. But if the quality of plans is compromised because of a focus on participant numbers, this will undermine the effectiveness of the scheme and have implications for long-term costs.

For this reason, in the medium to long term, it is important that the NDIA's performance is measured in relation to whether and how effectively it is realising outcomes under the NDIS, rather than participant numbers alone (chapter 9). A greater emphasis on reporting on the quality of planning processes would help shift the focus towards better quality plans and give the NDIA the incentive and latitude to focus on participant experience and outcomes.

Accessibility of the planning process

A lack of clear and transparent information

Study participants expressed frustration about the lack of clarity and transparency around the planning process (Autism Aspergers Advocacy Australia, sub. 178, p. 19; DPO Australia, sub. 165, p. 13; Flourish Australia, sub. 74, p. 11; Mamre Association, sub. 47, p. 1; Mental Health Community Coalition of the ACT, sub. 135, p. 19; Noah's Ark, sub. 108, p. 10; SWAN Australia, sub. 86, p. 1). Limited information is publicly available to help scheme participants and their families, carers and advocates to navigate the system. Noah's Ark, for example, said:

> … there is no information about the planning process and how it is supported in the public domain. There has been a significant change in how plans have been written. These changes have not been documented or an explanation provided. (sub. 108, p. 9)

Mamre Association also identified problems with:

> The lack of consistency with clear, concise and factual information. It is often left up to the general disability sector to try to navigate their way through 'forensic' investigation as to what the information means. There simply is very little capacity within the sector itself to invest in something so time consuming. (sub. 47, p. 1)

Poor information can be especially stressful for scheme participants who do not have the time or capacity to navigate a complex and confusing system.

Scheme participants are also often not aware or informed about their rights and options. For example, some participants did not know that they could request a face to face planning meeting instead of phone planning (ADACAS, sub. 87, p. 15; Social Support & Precarious Workforce Research Discussion Group, sub. 71, p. 3).

Participants were also often unaware of their entitlement to have an advocate present at their planning meeting, which can negatively affect outcomes for participants with limited ability to self-advocate (ABF, sub. 48, p. 9; New South Wales Government, sub. 60, p. 15). Brain Injury SA also identified problems with the failure to provide information about review processes.

> … information provided to participants about review is unclear and inadequate. There is minimal information about the process and no information about how or where participants can get help with a review … Further, Brain Injury SA has received anecdotal evidence from parents and guardians that NDIA has not been informing participants of their right to an internal review or external merits review through the [Administrative Appeals Tribunal]. (sub. 116, pp. 9–10)

Planners are not easily reachable

Study participants also felt that planners were not identifiable and accessible to scheme participants (AHPA, sub. 37, p. 14; Disability Services Commissioner, sub. 35, p. 5; OTA, sub. 15, pp. 4–5). The Disability Services Commissioner said:

> Planners are not clearly identifiable and accountable. A participant told us that the planner got his plan wrong and he couldn't call the planner directly to talk about the issue. He raised further concerns that no one at the NDIA records his calls, so he feels he cannot escalate his complaint, as there is no record of his previous contact. (sub. 35, p. 5)

Brain Injury SA also said:

> The 1800 phone number is the only number provided to participants and service providers. Anyone wanting to speak to a planner, even in response to a message that has been left by the planner, must use this number … there is usually a 45 minute wait for calls to be answered. When the call is answered, there is no certainty that the call will be transferred to the relevant office or planner. (sub. 116, p. 10)

Planning processes are not inclusive for all

It is important that planning processes are accessible, inclusive, and sufficiently flexible to accommodate the needs of different scheme participants. This is especially true for participants with complex needs or from culturally and linguistically diverse backgrounds. For example, the New South Wales Government said:

> Many NDIS participants that are participants of other state services (justice, mental health) do not have the capacity or capability to interact with the NDIS without intensive support. They may have no natural supports, like family or friends in their lives; they may have family that do not support their best interests; or they may have limited experience as consumers generally and may not be able to exert their rights as participants in the NDIS. Some people with complex needs may not be able to define their needs or understand what reasonable and necessary supports they would need to support them. (sub. 60, p. 17)

Planning processes also need to be sensitive to the intersection between disability and other social issues, such as homelessness, family violence, and alcohol and other drug use. Study participants also highlighted the importance of providing gender-responsive services (ACT Government, sub. 156, pp. 28–9; DPO Australia, sub. 165, p. 15; Leadership Plus, sub. 128, p. 2; Richard Kennedy, sub. 2, p 2; VCOSS, sub. 176, p. 10; Women with Disabilities Victoria, sub. 111, p. 2).

Needs arising from disability

Many study participants said that planning processes are not inclusive and overlook the needs of people with disability. Sharing Places said:

> People with intellectual disabilities and very high and complex support needs are not understood by NDIA. People with high and complex needs would greatly benefit from a more in depth assessment and planning process. (sub. 53, p. 2)

Communication accessible processes are also important for people with vision or hearing impairment (ABF, sub. 48, p. 9; Deafness Forum of Australia, sub. 127, pp. 16–7; Speech Pathology Australia, sub. 136, pp. 28–9). But Australian Blindness Forum said:

> … participants in the NDIS cannot access any NDIS information in alternative formats. This means that people who are blind or vision impaired cannot independently register themselves with the NDIS or read their own plans. (sub. 48, p. 9)

Planning can also be challenging for people whose needs can change quickly — such as episodic or progressive disorders. Study participants identified psychosocial disability (box 4.9) and degenerative disorders (box 4.10) as particular problem areas.

Box 4.9 Mental illness and psychosocial disability

The National Disability Insurance Scheme is designed to cover disabilities that are permanent, including those of a chronic episodic nature, such as mental illness and psychosocial disability.

> 'Permanent' refers to the irreversible nature of the disability, even though it may be of a chronic episodic nature. For example, this would include people with significant and enduring psychiatric disabilities, who periodically rely exclusively on support from the clinical services of the mental health system, but at other times are able to live in the community provided they have appropriate supports. (PC 2011, p. 14)

However, the episodic nature of mental illness can mean that some scheme participants' needs are unpredictable. To some extent, this runs contrary to the planning process, which, in broad terms, requires a forecast of the participant's support needs over the life of the plan.

This problem is exacerbated by 'inflexibility in changing arrangements in response to fluctuations in support need because of escalating illness' (Mind Australia, sub. 144, p. 8). This can create incentives for participants to overstate their support needs, so that they can be sure that they have access to adequate support during times of high need.

Due to the nature of their disability, people with psychosocial disability may at times find it difficult to articulate or disclose their support needs during the planning conversation (Anglicare Tasmania, sub. 145, p. 32; VMIAC, sub. 167, p. 7; VICSERV, sub. 169, p. 4). For this reason, such participants 'may need more than one meeting to develop plans due to [the] fluctuating nature of conditions' (Social Support & Precarious Workforce Research Discussion Group, sub. 71, p. 6).

Box 4.10 Progressive and degenerative disorders

Study participants said that certain progressive or degenerative disorders sat poorly with the 'investment approach' of the scheme. For example, Neurological Alliance Australia said:

> … the progressing and complex needs of people with neurodegenerative diseases have been overlooked due to lack of understanding of these diseases or for the sake of expediency … People with a progressive neurological disease run counter to the 'traditional' trajectory of someone on the NDIS: that is, an ability to enhance independence and re-ablement through a more effective engagement of services. For someone with a neurodegenerative disease, however, care needs inevitably increase over time. (sub. 30, pp. 1–2)

In addition, current planning processes do not account for the changing needs of people with progressive or degenerative disorders. Calvary Health Care Bethlehem said:

> For people with progressive disorders, the person's needs can change more rapidly than expected, so there needs to be sufficient flexibility in the plan being reviewed and amended to accommodate unforeseen needs arising. This needs to happen in a timely manner. (sub. 64, p. 2)

Similarly, MND Australia said:

> Plans are based on the 'now' and do not take account of the rapid and increasing needs caused by the progressive degenerative nature of [motor neurone disease], requiring review planning earlier than is necessary. (sub. 45, p. 9)

MND Australia (sub. 45, p. 7) also reported that between June 2016 and January 2017, all plans for people with Motor Neurone Disease in New South Wales and the ACT required review, primarily due to a poor understanding by planners of degenerative diseases.

Language and cultural barriers

Study participants observed that planning processes do not adequately cater for people of different cultural and linguistic backgrounds (Companion House, sub. 84, p. 2; Jesuit Social Services, sub. 117, p. 7; Neami National, sub. 63, p. 6; Northern Territory Government, sub. 205, p. 7; Social Support & Precarious Workforce Research Discussion Group, sub. 71, p. 6; VCOSS, sub. 176, p. 9; VMIAC, sub. 167, pp. 6–7).

For many, language barriers can prevent meaningful engagement with planning processes. Neami National (sub. 63, p. 6) said that 'consumers without English as their first language describe difficulties in participating in planning and in getting plans that they can fully implement on account of their language needs'. This is an issue which disproportionately affects Aboriginal and Torres Strait Islander communities:

> English is a second language for many Indigenous people in remote communities. The majority of participants in Barkly identify as being Aboriginal or Torres Strait Islander and for 67% English is not their first language. Many have limited capacity to understand or read it. This has a significant impact on their ability to have genuine input into the formulation of their plans and also impacts on decision making and choice. (Brain Injury SA, sub. 116, p. 3)

and those of refugee background:

> People with disability from a refugee background are often not well equipped to navigate the NDIS in planning meetings and to negotiate a package of supports from providers. Many have little or no understanding of the context of the broader social support system in Australia. (Companion House, sub. 84, p. 2)

Cultural barriers can also make accessing and interacting with the planning process difficult. In particular, there may be confusion as to the purpose of planning conversations and there is a risk that scheme participants do not communicate their needs due to different cultural or social norms. (Social Support & Precarious Workforce Research Discussion Group, sub. 71, p. 6). There may also be greater mistrust of government services or an aversion to sharing personal information (VCOSS, sub. 176, p. 9).

Access can be especially difficult for some Aboriginal and Torres Strait Islander communities. Brain Injury SA said:

> Many Aboriginal people can be transient in nature and to uphold their cultural requirements. Therefore, participants are not in regular receipt of mail or telephone communication. In the Barkly region there is no mail delivery to homes and most people do not regularly check their PO Box. If they do not receive a hard copy of their plan they are advised to go onto the portal and get it online. However, many do not have access to computers, nor the awareness of how to use them. Consequently, many participants do not know they have a plan or, if they do, what is in it. (sub. 116, p. 3)

The Australian Medical Association emphasised the need to have culturally appropriate processes and cited evidence of poor planning practices.

> … we were told that in one Aboriginal community, NDIA assessors did not leave their vehicle, instead they yelled questions of Aboriginal people regarding their disabilities … there was no verification of the person's identity other than to ask their name and conduct a conversation from a driveway. Another reported case was that Aboriginal people with disability were asked to leave their homes and find their way to a waiting vehicle for an assessment; this included an Aboriginal person in a wheelchair. (sub. 120, p. 5)

The role of pre-planning support

For many scheme participants, pre-planning support can assist them in navigating a confusing and complex system. Pre-planning support is directed at helping the participant prepare for the planning conversation, including:

- thinking about their goals and aspirations
- preparing documentation to support the assessment process
- thinking about what supports are available and can help them.

Demand for pre-planning support services is influenced by how accessible and complex planning processes are, as well as the scheme participant's capacity (including their ability, willingness, skills and resources) to navigate those processes (chapter 8). At present, pre-planning support is provided by a range of different organisations, including advocacy groups and service providers.

Several study participants noted that pre-planning assistance is costly to provide (House with No Steps, sub. 104, p. 5; Mamre Association, sub. 47, p. 2). Some participants said that the NDIA should play a greater role in providing pre-planning support (ADACAS, sub. 87, p. 16; CMHA, sub. 11, p. 10; Cohealth, sub. 50, p. 10). Others called for governments to provide additional funds to facilitate pre-planning support (Amaze, sub. 160, p. 5; Cohealth, sub. 50, p. 10; NSW Disability Network Forum, sub. 18, p. 3; Social Support & Precarious Workforce Research Discussion Group, sub. 71, p. 9; VICSERV, sub. 169, p. 4).

Providing pre-planning services is one of the core functions of LACs. It was intended that, during transition, LACs would be 'on the ground' in each area six months before the NDIS was rolled out in that area, in part to provide pre-planning support. However, the speed of the rollout has meant that this was not possible and LACs have not been performing their pre-planning functions as envisaged (NDIA, sub. 161, p. 56). The NDIA should also ensure that LACs are able to perform their pre-planning functions properly.

In addition, the Commission considers that there is considerable scope for the NDIA to improve transparency and clarity around planning processes. This includes providing clear and up-to-date information about what to expect during the planning conversation, when it will occur, and how the information gathered during that conversation will be used. There

is also considerable scope for improving the accessibility of planning processes, especially in relation to people with complex needs and those of different cultural and linguistic backgrounds.

These advancements could go a long way to mitigating the need for extensive pre-planning support, and relieve some of the pressure on advocacy groups and service providers to provide such services. It is likely that there will always be some scheme participants for whom more pre-planning support is necessary, and so it may be necessary in the future for government or the NDIA to play a greater role in providing that support. However, the first steps in helping scheme participants navigate the NDIS must be to ensure that LACs are able to properly perform their pre-planning functions and improve the transparency, clarity and accessibility of planning processes.

The NDIA is currently undertaking a review of the participant pathway to identify what changes or improvements should be made to planning processes (while achieving the number of completed plans as specified in Bilateral Agreements) to achieve plans that:

- maximise choice and control for scheme participants and contribute to improved participant outcomes
- are of a high quality in terms of a positive participant experience, compliance with all statutory requirements and consistency
- are financially sustainable so that the aggregate value of all plans remains within the funding envelope (sub. 161, p. 4).

However, the NDIA is operating under demanding time and resource constraints, and there are trade-offs between the quality of planning processes and how quickly the scheme can reach new participants. As noted earlier, better planning processes could involve compromises in terms of participant throughput.

DRAFT RECOMMENDATION 4.1

The National Disability Insurance Agency should:

- implement a process for allowing minor amendments or adjustments to plans without triggering a full plan review
- review its protocols relating to how phone planning is used
- provide clear, comprehensive and up-to-date information about how the planning process operates, what to expect during the planning process, and participants' rights and options
- ensure that Local Area Coordinators are on the ground six months before the scheme is rolled out in an area and are engaging in pre-planning with participants.

Planners

Planners are an essential part of the planning process and exert considerable influence on scheme participants' experiences within the NDIS. Sufficiently skilled and impartial planners can improve the quality of the planning process and outcomes for scheme participants. As ACT Disability, Aged and Carer Advocacy Service said:

> It is crucial that the NDIA continue to recruit planners with the right combination of skills, experience and passion, that they offer good training and that workload pressures for NDIA staff are managed. Planners need the skills to be able to tailor the planning approach, and their communication style to participants with different needs. (sub. 87, p. 13)

Conversely, planners with less experience, skill or training can have a detrimental effect on the quality of plans and outcomes. This is because they may have less knowledge about what supports are appropriate, meaning that plans may include inappropriate supports or fail to include appropriate ones (Brain Injury SA, sub. 116, p. 5).

Impartial planners are also important for scheme participants' experience of the planning process and the quality of plans.

> The planners can have a great impact both positive and negative on the resulting plans. The planners biases also have an impact on both the discussion and resulting plan of a participant. For two years, the planner I had, put me in a box and thought she knew what and how I wanted supports. She would not listen until I had a panic attack in the meeting. It was only then she started listening. (Hanna Potapczyk, sub. 26, p. 1)

Skills, training and knowledge of specific conditions

A number of study participants were critical of the skills, experience and training of planners as a whole (Carers Australia Victoria, sub. 131, p. 12; DAA, sub. 119, p. 3; Matt Burrows, sub. 7, p. 3; Mental Health and NDIS Facebook Support Group, sub. 8, p. 3; Macarthur Disability Services, sub. 57, p. 4). The Public Service Research Group reported feedback that:

> There's not adequate induction support and supervision training provided to the people who are doing the planning … If we can't get the planning right we're not going to get the scheme right. (sub. 56, p. 6)

Others said that there was considerable variability in the skills, knowledge and competency across planners (including LACs undertaking planning functions), leading to uneven outcomes for scheme participants (AHPA, sub. 37, p. 8; Autism Aspergers Advocacy Australia, sub. 178, p. 20; Companion House, sub. 84, p. 2; New South Wales Government, sub. 60, p. 15; OPG, sub. 143, p. 3; Summer Foundation, sub. 113, p. 4; PDCN, sub. 29, p. 3; VCOSS, sub. 176, p. 12; South Australian Government, sub. 203, p. 11). Speech Pathology Australia (sub. 136, p. 28) also noted that information about the level of qualifications and training required of planners is not publicly available.

Study participants overwhelmingly agreed that planners performed better when they understood what needs arise from a person's disability. As Community Mental Health Australia said:

> If a planner understands the depths of a person's disability and what is needed to support the individual, the package developed will suit them over a longer term. This reduces the need for a plan to be amended in the future, thereby reducing administrative burden on the NDIA and building confidence in the process for the consumer. (sub. 11, p. 4)

However, many participants expressed concern about planners' limited disability knowledge.[18] For example, the Australia Physiotherapy Association said:

> Our members report that service planning is being undertaken by staff who have little competence in the specific field of disability relevant to the participant's needs and thus that service plans are at odds with the needs which the NDIS is designed to meet. (sub. 93, p. 13)

In particular, study participants expressed concern that planners had limited knowledge about specific conditions, such as motor neurone disease (MND Australia, sub. 45, p. 8), multiple sclerosis and dementia (Alzheimer's Australia, sub. 10, p. 16), Prader-Willi Syndrome (PWSAA, sub. 112, p. 4), and mental illness and psychosocial disability (CMHA, sub. 11, pp. 9–10; Cohealth, sub. 50, p. 10; Macarthur Disability Services, sub. 57, p. 4; Mental Health Carers Australia, sub. 181, p. 10; Neami National, sub. 63, p. 6). The Commonwealth Ombudsman reported that:

> Some stakeholders have told us about planners who asked parents when their child was likely to 'recover' from a life-long disability, and others who told people with psychosocial disabilities they should 'try to be more positive'. (sub. 137, p. 8)

Others also said that planners had limited knowledge of appropriate supports for certain conditions, such as the role of occupational therapists (Occupational Therapy Australia, sub. 15, pp. 4–5) and podiatry (Australian Podiatry Council, sub. 52, p. 2). For example, VCOSS (sub. 176, p. 12) gave the example of 'a deaf participant with cochlear implants [being] allocated two hearing aids in their package, despite hearing aids being ineffective for people with cochlear implants'. The Commission also heard that planners are ill-equipped to connect scheme participants with employment supports (House with No Steps, sub. 104, pp. 5–6; Round Squared, sub. 170, pp. 5–6).

[18] Study participants who commented on planners' limited knowledge of disabilities included: ABF (sub. 48); ACIA (sub. 141); AHPA (sub. 37); Alzheimer's Australia (sub. 10); Anglicare Tasmania (sub. 145); APA (sub. 93); Australian Podiatry Council (sub. 52); Belinda Jane (sub. 80); Cheryl McDonnell (sub. 79); CMHA (sub. 11); Cohealth (sub. 50); Commonwealth Ombudsman (sub. 137); DPO Australia (sub. 165); Macarthur Disability Services (sub. 57); Macular Disease Foundation Australia (sub. 75); Mental Health Australia (sub. 155); Mental Health Community Coalition of the ACT (sub. 135); Mind Australia (sub. 144); MND Australia(sub. 45); Neami National (sub. 63); OPA (sub. 46); OTA (sub. 15); PWSAA (sub. 112); VMIAC (sub. 167).

Improving planners' performance

Planners should, at a minimum, have a general understanding about different types of disability. Several study participants called for planners to receive more education on specific conditions and supports (Alzheimer's Australia, sub. 10, p. 13; Cheryl McDonnell, sub. 79, p. 2; CMHA, sub. 11, p. 4; Cohealth, sub. 50, p. 5; Neami National, sub. 63, p. 6; PWSAA, sub. 112, p. 4).

Others saw a role for specialised planners, especially for people with psychosocial disability (Cohealth, sub. 50, p. 10). The Office of the Public Advocate argued that these specialised planners should hold professional certifications.

> NDIS planners and support coordinators should be required to hold professional certifications. If assisting a participant with a primary psychosocial disability, for example, planners and coordinators should be trained mental health professionals. (sub. 46, p. 2)

The Commission also considers that there is value in having specialised planning teams for some types of disability. This is in line with industry practice for insurance companies. For example, Allianz Australia (sub. 42, p. 6) submitted that, in the context of workers' compensation claims, it employs specific psychological claims teams, given the unique nature of mental health related claims. However, specialised planners may not be appropriate for all types of disability, especially where:

- the person does not have a diagnosis
- the benefit of having a specialised planner is minimal
- the group affected is small, such that the cost of specialisation is not justified.

An alternative (or complementary) approach would involve leveraging expertise from the disability support sector. Macular Disease Foundation Australia advocated better use of existing resources.

> Whilst it is acknowledged that it is not physically or logistically possible for planners with specialist disability knowledge to be matched with every NDIS participants' disabilities and conditions on a national scale, the NDIS appears to not be effectively leveraging existing expertise from specialist disability organisations. (sub. 75, p. 5)

In many cases, providers may also have valuable knowledge about the scheme participant's needs. Anglicare Australia said:

> Many of our agencies have experienced reluctance from the NDIA to involve sector providers in the planning stage, and believe it is a major weakness that needs to be addressed … Service providers, due to their many years' experience (including vital rapport with scheme participants, particularly necessary for people with a psychosocial disability), are often better placed to accurately identify the scope and cost of an appropriate plan. (sub. 157, pp. 8–9)

Similarly, National Disability Services said:

> The quality of planning would improve if disability service organisations were involved. Providers of specialist supports have deep knowledge of disability – and they know their

> clients. Using this knowledge to inform planning would make sense. This is particularly true for people with complex needs … Planning partnerships between the NDIA and specialist providers should be extended. (2017a, pp. 6–7)

While leveraging expertise from the sector could give rise to potential conflicts of interest, these could be managed or mitigated by ensuring that such organisations only have an advisory role, with final decision-making powers exercised by an impartial planner. This approach would also mean that the NDIA would not need to compete with others in an already thin market to recruit planners with specialist qualifications or experience.

Over the longer term, satisfaction with planners could also be improved through monitoring and assessing their performance (OTA, sub. 15, p. 5; PDA, sub. 38, p. 7). According to the NDIA (sub. 161, pp. 89–90), planner performance is currently monitored through:

- participant satisfaction measures
- complaints, accounting for the volume and substance of complaints
- the National Quality Framework, where monthly audits are conducted on planner records and feedback provided through coaching and supervision.

Regular and public reporting around planner performance could help increase the accountability of planners, and improve community confidence in planners and the planning process.

DRAFT RECOMMENDATION 4.2

The National Disability Insurance Agency should ensure that planners have a general understanding about different types of disability. For types of disability that require specialist knowledge (such as psychosocial disability), there should be specialised planning teams and/or more use of industry knowledge and expertise.

4.4 Linking supports and outcomes

Supports are one of the core mechanisms through which the benefits of the NDIS are realised. In the short term, many of these benefits arise because supports can help address the care and support needs of people with disability (chapter 2).

However, many benefits will only be realised over a longer time horizon. This is due to the NDIS's insurance approach to funding supports, which takes a lifetime view of participant needs and seeks early investment opportunities, in order to optimise long-term outcomes (chapter 1). This includes capacity building for scheme participants to:

- maximise participant independence
- increase social and economic participation (of scheme participants and their carers)

- reduce scheme participants' support requirements.

Examples of capacity building supports include: therapeutic supports; transport to enable participation in community and social activities; and employment supports to help a participant obtain and keep a job.

It is still too early to fully evaluate whether, and to what extent, these long-term benefits will be realised, although the NDIA has developed an Outcomes Framework to allow outcomes of scheme participants, their families and carers to be measured over time (chapter 2). However, the Commission heard that supports directed at capacity building and early investment are under-represented in participants' plans.

In particular, some study participants pointed to early signs that scheme participants are not being supported to work, meaning that economic participation outcomes may not be realised (chapter 2). This is because plans do not include or do not make adequate provision for employment supports. Westhaven Association said:

> The evidence from the plans being produced to date shows NDIA has failed to ensure that NDIS participants are supported to gain productive employment. Without the employment outcomes expected from the scheme, NDIS may not achieve the return originally projected by the Productivity Commission. (sub. 81, p. 2)

And National Disability Services argued:

> A broad spectrum of employment options should be open to people with disability, including Supported Employment Enterprises … More must be done to boost demand for, and access to, NDIS employment supports. NDIS planners and LACs should adopt a 'work first' approach which motivates and assists an increased proportion of NDIS participants to connect with work. (2017a, pp. 8–9)

In part, this stems from community attitudes towards disability and employment embedded in legacy support systems. These attitudes have persisted despite the move to an early investment approach to disability care and support arrangements, and can mean that scheme participants are unaware of or do not seek employment supports. As Epic Employment Service said:

> After four years of the NDIS trial and full scheme roll out, EPIC believes the small amount of plans focusing on employment is due to widely-held beliefs … . We believe the Australian community broadly accepts that NDIS participants will not primarily be seeking employment through their NDIS packages … Furthermore, participants and their families are often led to believe open employment is simply not a viable option. (sub. 70, pp. 2–3)

However, some study participants said that planners do not have a good understanding of what employment supports are appropriate for scheme participants (House with No Steps, sub. 104, pp. 5–6; Roundsquared, sub. 170, pp. 5–6). As a result, scheme participants are not offered employment supports, or encouraged to think about how they might increase their economic participation.

Going forward, the challenge for the NDIA will be to develop a planning process that fosters capacity building, independence, and social and economic participation. Community attitudes about disability and community involvement are unlikely to change without evidence that people with disability can be supported to work and participate in the community. Therefore, as a first step, it will be up to the NDIA and planners to 'lead the way' and encourage scheme participants to think about, and connect them with, capacity building and employment supports that are right for them.

5 Boundaries and interfaces with the NDIS

Key points

- Effective interfaces between the National Disability Insurance Scheme (NDIS), other disability services and mainstream services are essential for good outcomes for scheme participants and the financial sustainability of the scheme. To provide the right incentives, services available to people who just qualify for the NDIS and those who just miss out should be as seamless as possible. This requires coordination of services within and outside of the NDIS.
- The Information Linkages and Capacity Building (ILC) program is a key component of the NDIS. It is a false economy to have too few resources for ILC activities, particularly during transition when it is critical to have structures in place to ensure people with disability are adequately connected with appropriate services.
- For people with disability who are not eligible for the NDIS, the Australian, State and Territory Governments have agreed to provide continuity of support.
  - But in practice, there is confusion and uncertainty about what services will continue to be provided and/or funded outside the NDIS.
  - Governments need to be clearer about their approach on continuity of care, and what disability services they will provide for non-NDIS participants.
- The NDIS is meant to work alongside mainstream services (such as services in health, education, aged care and transport), not replace them.
  - The Bilateral Agreements between the Australian Government and State and Territory Governments delineates responsibilities in terms of which services are to be provided by the NDIS and mainstream services.
  - While it is still too early to identify service gaps, there are emerging issues in a number of areas, including justice, emergency, transport and mental health services.
  - Each COAG Council that has responsibility for a service area that interfaces with the NDIS should have a standing item on their agenda to address the provision of those services and how they interface with NDIS services.
  - Further investment in the *National Disability Strategy* could improve accountability.
  - ILC and Local Area Coordinators can play a role in ensuring mainstream services are better informed about their roles and responsibilities.
- The National Injury Insurance Scheme (NIIS) was envisaged to cover the care needs of individuals who newly acquire a disability through a catastrophic injury or accident. Two of the four streams proposed have been implemented. While the cost implications of the two remaining streams are not large for the NDIS, the States and Territories should bear the cost of participants who were intended to be covered by the NIIS.

People with disability, and their families and carers rely on a wide range of services — including mainstream services, specialist disability services and community supports — for their care needs and to maintain the quality of their lives. For the National Disability Insurance Scheme (NDIS) to work efficiently and effectively, the interface of the scheme with these other services must be as seamless as possible. By design, the NDIS is intended to complement these other supports, not replace them. A requirement of any supports provided through the NDIS is that they are most appropriately funded through the scheme and not by other services.

While the level of funding provided to the NDIS recognised that the aggregate level of funding available to people with disability was inadequate, the NDIS was not expected to fill *all* of the very large gaps in services that existed before the scheme was established. The responsibility to provide services to people with disability remains a shared responsibility between all levels of government.

The interface between all kinds of assistance for people with disability will take time to determine at the coalface, but until these interfaces are settled, it is important that governments do not withdraw from services too quickly, as any gaps that emerge will place added burdens on people with disabilities and their families.

As the interface issues become clearer, it is essential to consider the incentives that are set up where boundaries exist. Most critically, it is important that people with disability do not see the NDIS as an oasis of support, surrounded by a desert, where little or nothing is available. Should such a dynamic develop, the financial pressures on the NDIS could be unsustainable, particularly if people feel the need to test their ability to qualify for the scheme, and/or remain in the scheme for as long as possible, for fear of not gaining access again should the need arise.

This can be compared with a situation where the gap between participants with the lowest needs (and therefore the lowest level of supports), and those outside the scheme, is not large. In such a system, people will not have an incentive to enter the scheme as their needs will be adequately met outside it, and those inside the scheme who are assisted sufficiently to no longer need individualised supports will have little incentive to stay in the scheme longer than necessary.

There is a lot of detail yet to be worked through. Nevertheless, establishing clear and robust boundaries is essential for the fiscal sustainability of the NDIS, and for the surrounding network of supports. When people are accessing the services they need, the system as a whole should be providing supports at the most efficient and cost effective level.

This chapter first looks at bridging and capacity building services provided under the NDIS (section 5.1), then how the NDIS interfaces with other disability services (section 5.2). The interface between the NDIS and mainstream services is examined in section 5.3. How the NDIS interfaces with the aged care sector (section 5.4) and the National Injury Insurance Scheme (section 5.5) are also examined.

5.1 Linking people to the right services

About the Information, Linkages and Capacity Building program

The NDIS is just one part of a wider disability system. While the NDIS will benefit all Australians, only a proportion of people with disability will become scheme participants. Of the 4.3 million Australians with disability just 475 000 (those people with a 'permanent and significant' disability) will receive individualised supports under the NDIS (chapter 1, figure 1.1). As the National Disability Insurance Agency (NDIA) said:

> The NDIS is intended to benefit a wide range of Australians, only a proportion of whom will become participants and receive an individualised plan. … short-term or light touch assistance from the NDIS, in collaboration with a capable and inclusive community and mainstream response, can help them better access mainstream supports, build connections into community supports and strengthen natural supports in order to achieve their outcomes. (sub. 161, p. 53)

The Commission recommended a bridging and capacity building service for anyone with, or affected by, disability (PC 2011, pp. 163–165, 198). The Information, Linkages and Capacity Building (ILC) program, to be provided under the NDIS from July 2017, is a key component of the NDIS. It will provide information, linkages and referrals to people with disability, their families and carers, helping them to connect with appropriate community and mainstream supports (NDIA 2017e). The focus of ILC is community inclusion. According to the NDIA, it is to:

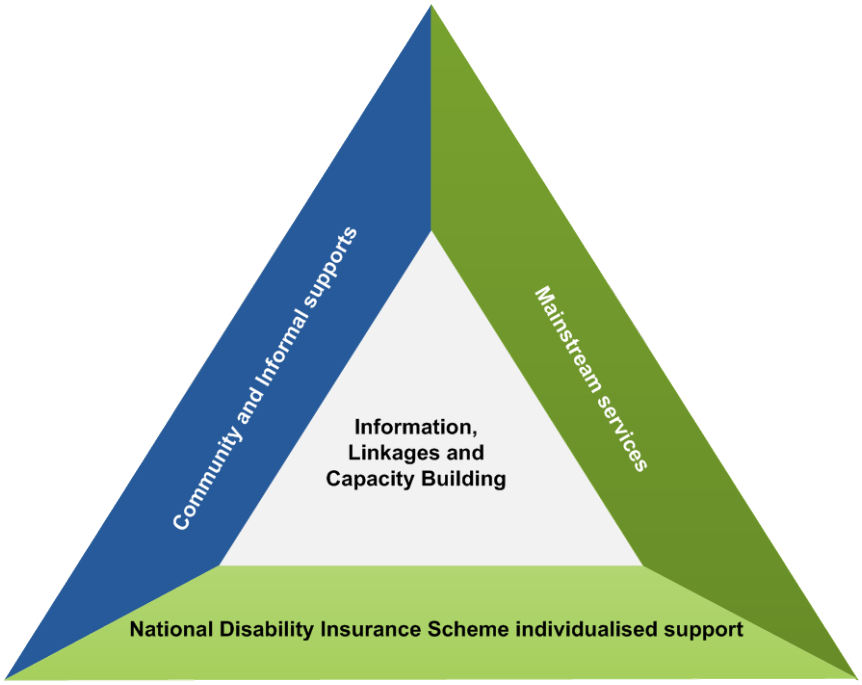
> … build innovative ways to increase the independence, social and community participation of people with a disability. (NDIA 2016d, p. 5)

ILC will also facilitate capacity building support and greater inclusivity by promoting collaboration and partnership with local communities and mainstream services (figure 5.1).

In August 2015, COAG endorsed the ILC Policy Framework (NDIA 2015a). The framework describes five streams to achieve the objective of ILC.

- Information, Linkages and Referrals — connecting people with disability, their families and carers with appropriate disability, community and mainstream supports.
- Capacity building for mainstream services — ensuring people with disability connect with and access mainstream supports.
- Community awareness and capacity building — supporting organisations (such as not-for-profit organisations, local councils and businesses) and people within communities to be inclusive of people with disability, and understand the needs of families and carers.
- Individual capacity building — fostering the principle of choice and control, improving outcomes for people with disability, their families and carers.
- Local Area Coordinators (LACs) — developing relationships between the NDIS, people with disability, their families and carers, and the local community (NDIA 2015a).

Figure 5.1 **Bridging services — Information, Linkages and Capacity Building**



Source: NDIA (2015a, p. 4).

ILC is an important tenet of the NDIS insurance model, and will affect scheme sustainability because it is expected to reduce reliance on NDIS funded support and thus reduce costs over time. ILC is expected to:

- *reduce the demand for individualised packages* — ILC is a lever to divert people from needing to access individualised packages and instead connect them to the appropriate supports for their needs
- *reduce the need for supports within funded packages* — ILC can maximise the ability of participants to access mainstream, community and informal supports, which in turn can reduce the need for funded supports (for example, targeted supports to assist a person to navigate the public transport system can reduce the need for funded taxi travel)
- *make supports more effective at helping people achieve their goals* — many supports are more effective in helping a participant achieve their goals when complemented by informal and community support (for example, a fitness goal is more likely to be achieved if funded support to use gym equipment is complemented by an inclusive gym community or a friend for companionship and motivation) (NDIA, sub. 161, p. 54).

ILC in practice

ILC is still to be rolled out. Grant rounds are completed for ILC activities in the ACT (2017-18) and for national activities (2016-17). ILC activities are expected to begin operating in ACT on 1 July 2017 (NDIA 2017e, 2017h). Only one component of ILC — Local Area Coordinators (box 5.1 and chapter 4) — has been implemented. LACs will be the single largest investment by the NDIA in delivering outcomes for ILC.

Box 5.1 Local Area Coordinators

LACs plays a central role in the delivery of ILC, by ensuring people with disability participate in and contribute to social and economic life, and that people with disability receive appropriate services. LACs connect across each of the first four streams of ILC, including information and linkages and individual capacity building as well as working with mainstream services and communities to better enable access and participation.

LACs also provide support for people with disability to understand their plans and how changes in funding and processes of the scheme are likely to affect them. LACs can help people put their plan into action and help them build capacity to self-manage their plan.

LACs have three primary roles:

- to work directly with people who have an NDIS plan, by connecting them to mainstream services, community activities, and getting their plans into action (chapter 4)
- provide some short-term assistance to non-NDIS plan participants and connect them into mainstream services and community activities
- work with the local community to ensure it is more accessible and inclusive for people with disability.

It is agreed with LAC partners that 20 per cent of their effort (and funding) should be allocated to the delivery of ILC activities.

Sources: NDIA (2015a, 2017k);. NDIA (sub. 161, p. 56).

In November 2016, the NDIA released its ILC Commissioning Framework (NDIA 2016f). The framework reflects the ILC Policy activities and identifies five focus areas which are deemed ‘priority areas’ for funding. These focus areas provide broad indications of the types of services that are eligible to be supported through ILC (table 5.1).

Table 5.1 **ILC Focus Areas**

Focus Area	*Definition*	*Example*
Specialist or expert delivery	Focus on activities that provide specific skills and knowledge in relation to disability — for example, diagnostic specific expertise or expertise in particular models of support or capacity building.	A comprehensive website that provides information about particular disabilities or conditions.
Cohort-focused delivery	Focus on activities for specific groups of people that require detailed cultural or other knowledge to be effective — for example, multilingual activities to assist Aboriginal and Torres Strait Islander peoples or people from culturally or linguistically diverse backgrounds.	A yarning circle (peer group) for Aboriginal women run by local Aboriginal organisations.
Multi-regional activities	Focus on activities that would be inefficient if delivered separately in different local areas – for example, advice or information that is not based on location and could be relevant anywhere.	A community awareness campaign to increase employment opportunities for people with disability.
Remote/rural delivery	Focus on ensuring activities are designed to address local needs, circumstances and conditions in rural and remote locations.	A project that connects young people with disability in a rural area with each other via multimedia or social media.
Delivery by people with disability, for people with disability	Focus on supporting organisations that are run and controlled by people with disability. These are sometimes called user-led organisations.	A telephone information service for people with disability, staffed by people with disability.

Source: NDIA (2016f, p. 18).

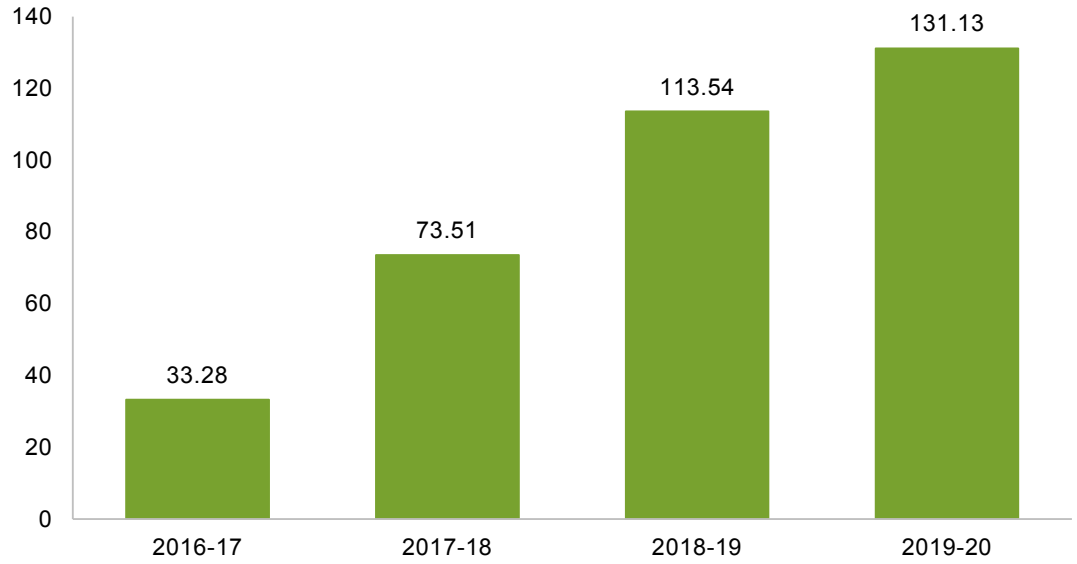
The ILC Commissioning Framework developed five strands of outcomes which programs funded through ILC will be measured against. They include the extent to which people with disability:

- participate in and benefit from, the same community activities as everyone else
- use and benefit from the same mainstream services as everyone else
- have the skills and confidence to participate and contribute to the economy
- have the appropriate information so they can make informed decisions and choices
- contribute to, lead, shape and influence their community (NDIA 2016f, p. 8).

Funding for ILC will gradually increase over the transition period from $33 million in 2016-17 to $131 million in 2019-20 (figure 5.2).

Figure 5.2 **ILC Funding**[a]

$million



[a] These numbers include funding for ILC activities in Western Australia; excluding Western Australia, the budget is about $119 million for 2019-20.

Sources: Australian Treasury (2017b, p. 140); NDIA (2016d).

Tendering processes are staggered across jurisdictions in line with the rollout timeline. Accordingly, the ACT will be the first jurisdiction to have ILC activities (commencing on 1 July 2017) (NDIA 2017e). Some of the successful grants in the ACT include:

- changing the ACT Health Care System to be more inclusive of people with impaired decision making ability
- educating Aboriginal and Torres Strait Islander people about what is meant by the term 'disability'
- establishing a peer support network for people with mild and borderline cognitive disability (NDIA 2017i).

As part of the ILC program, the successful ILC organisations and the NDIA will collect detailed data on ILC activities. The collection of data is important for measuring how effective ILC activities are in achieving outcomes for people with disability. The data will be used by the NDIA to identify and address performance issues, and inform future decisions on the allocation of funds.

Data collected will include the outcome success of activities in the short, medium and long term; quality and effectiveness of the activities; and performance over time. Data will be both qualitative and quantitative (NDIA 2016f, p. 27).

Is the funding for ILC adequate?

It is difficult to measure the adequacy of current ILC funding …

According to the NDIA, the timing of ILC funding has prevented it from investing in ILC activities and delayed the rollout of initiatives which would allow the infrastructure of a national ILC framework.

> The budget for ILC will increase over time and will reach a total budget of approximately A$131 million. This budget allocation severely hampers the NDIA's flexibility to use ILC at the time when the greatest impact could be realised. … The timing of payments means that the NDIA cannot apply ILC to assist the community or people with disability to prepare for the NDIS in advance of the NDIS rolling out in their area. … The timing of funding, linked to State and Territory contributions also prevents the NDIA from rolling out widespread national initiatives which would allow the infrastructure of a national ILC framework to be established. (sub. 161, pp. 54–55)

Many study participants questioned the adequacy of funding for ILC services given the scope outlined in the commissioning framework. For example:

> The PC should consider whether the one per cent cap (of scheme costs) on ILC expenditure should be adjusted to more flexibly accommodate investment in these areas that would generate better participant outcomes. (Victorian Government, sub. 174, p. 11)

> It is a widely reported view from the disability sector that there is a significant under-funding of the ILC in order to meet the needs of people with disability. (Speech Pathology Australia, sub. 136, p. 24)

> It appears that ILC is significantly underfunded and therefore will not deliver on rising community expectations. (Goldfields Individual & Family Support Association, sub. 13, p. 4)

> While some supports may be available through the Information, Linkage and Capacity Building (ILC) framework, it currently is not sufficiently resourced to meet the gaps. (Cohealth, sub. 50, p. 8)

> The total funding package for ILC at full roll out … when split across all types of disability is not adequate. (Mental Illness Fellowship of Australia sub. 122, p. 15)

> The implementation of the [ILC] framework … is dependent on adequate resourcing. Under full roll out, only $132 million is being allocated to the ILC. This is equivalent to approximately $30 to provide services to each person with a disability as well as to support mainstream services in capacity building. (Down Syndrome Australia, sub. 121, p. 12)

> Currently, only $132 million … has been allocated to the ILC. This is not sufficient and means that one of the key foundations on which the NDIS is being built is weak. (Bruce Bonyhady, sub. 100, p. 5)

Others said that the scope of ILC is too narrow to accommodate ILC's intended purpose (box 5.2), particularly in the context of what the Commission proposed would be covered under tier 2 of the NDIS.

Box 5.2 Many participants consider the scope of ILC too narrow

Physical Disability Australia (PDA):

> … it is PDA's understanding that the original tier 2 of the NDIS (that the ILC program replaces) was supposed to boost all non-participants' capacity to access to mainstream services. For example, we envisioned this might involve an 'Access Fund' to support the building of ramps and accessible toilets in the community.
>
> As such, PDA finds the current scope of the ILC (and its proposed budget) to be somewhat disappointing. (sub. 38, p. 6)

Australian Blindness Forum:

> … the range and type of services initially promised to be funded under the ILC program has changed substantially. The original proposal was that ILC would reflect the 'Tier 2' programs including block funding and early intervention programs. The goal of this was to continue to provide disability services to those who were not eligible for the NDIS. Now, the way the ILC program has been developed, it is only tools and awareness programs, delivered by mainstream services for a limited time or on an ad hoc basis. (sub. 48, p. 7)

Belconnen Community Service Board:

> ILC does not appear to cover the apparent lack of low intensity early intervention services needed for people who are not eligible for an NDIS package. The limited amount of funding for ILC and the competitive nature of these resources means people living with low to moderate mental health/psychosocial disabilities will struggle to access the supports required to maintain good mental health. (sub. 39, p. 4)

Woden Community Service:

> For the ILC to be able to make meaningful referrals block funded programs will need to continue in parallel with individually funded arrangements. (sub. 159, p. 11)

Allied Health Professions Australia (AHPA):

> AHPA believes the range and types of services proposed for funding under the Information, Linkages and Capacity Building (ILC) program does not currently fit well with the goals of the NDIS, particularly the intention to create and support small and innovative programs. (sub. 37, p. 12)

Centre for Disability Research and Policy:

> The ILC will be an important tool in developing or enhancing services to meet the needs of people where services do not currently exist. This is particularly important in 'thin markets' and within rural and regional contexts. (sub. 55, p. 4)

Psychiatric Disability Services of Victoria.

> Under the current framework, there is no real benefit to mental health services from the ILC because the funding provided through the framework is so minimal; the ILC simply does not have the capacity to provide for the scope of what existing services deliver, whilst also responding to the needs of people who won't be eligible for the NDIS. (sub. 169, p. 9)

ILC services could be broader than envisaged, at least in New South Wales. Under the New South Wales Bilateral Agreement[19], it has been agreed that the NDIA will establish ILC arrangements to support people who have been in receipt of state-based specialist disability supports but not eligible for the NDIS. The ILC supports will enable the person

[19] The Bilateral Agreements are individual agreements between the Commonwealth Government and each State and Territory Government, covering the roles and responsibilities afforded to each government for the implementation of the NDIS.

to transition to alternative arrangements over time. What this means in terms of funding adequacy is hard to determine, as it is not clear what specific ILC services will be provided (Australian Government and New South Wales Government 2015).

The question of whether the funding for ILC is adequate is difficult to answer for a number of reasons. First, the program is still to be rolled out. Second, there do not appear to be any comparable programs, either within Australia or overseas. Third, it is unclear where gaps may exist in services, or what activities should be funded by ILC. As the New South Wales Government said:

> … there is still a gap in the information presented in relation to the Commissioning Framework not setting out what activities the NDIA will actually fund under the ILC budget for full scheme. (sub 60, p. 18)

Further, without appropriate information, it is too early to pass judgment on whether ILC will reduce the demand to access individualised support and how ILC initiatives will affect individualised support related services. This was noted in a report commissioned by the Department of Social Services which found:

> The evidence … suggests that the existing funding allocation ($120 million per annum) may not be sufficient to achieve intended social outcomes; although it is difficult to determine budget adequacy in terms of either ILC outcomes or avoiding escalation to Individually Funded Packages. (URBIS 2017, p. 11)

… but additional funding is critical in the short term

Although directing additional funds to ILC in transition could crowd out state and territory 'ILC like' activities, the grants process by which organisations receive ILC funding means these activities can be targeted to where they are most needed. There could also be a risk of duplicating services, but the risk of service gaps appears a much more likely prospect under current arrangements, particularly as determining precisely what ILC should cover is unclear at the operational level.

It is a false economy to have too few resources for ILC activities in the transition period when it is critical to have structures in place to ensure that people eligible for the NDIS access the scheme and those who are not eligible can access supports and services outside the NDIS. Withdrawal of existing ILC type activities by State and Territory Governments may also have affected the supports available. The NDIA, in relation to ILC and LACs funding, stated that:

> The success of this [ILC and LACs] strategy will … be heavily reliant on the quality and availability of such supports that largely remain the responsibility of state and territory governments to fund. The experience of trial is that this is not a certain or consistent base upon which the NDIS is building. (sub. 161, p. 53)

The Commission recommends increasing ILC funding by $75 million so that the ILC is resourced with $131 million for each year in the transition period (2017-18 to 2018-19) to

allow a national rollout of ILC activities. This additional funding should come from the program delivery budget.

Data on the effectiveness of programs funded through ILC in improving outcomes for people with disability, or reducing scheme costs by lowering demand for supports through individualised supports will be critical to determining funding in the future. The requirement for organisations to collect data as a condition of receiving an ILC grant will help build this evidence base.

COAG has agreed to a review of NDIS costs in 2023 (Heads of Agreements). This will provide an opportunity to review the performance of the ILC program and the magnitude of any benefits from increasing its funding. It is reasonable to expect that there will be more data on ILC by this time, and many of the transitional issues which may be exacerbating concerns about the adequacy of ILC funding could be resolved.

Given that underfunding ILC carries significant risk for the sustainability of the scheme, the Commission recommends that the funding for ILC continue to be funded at a minimum of $131 million per year until the review in 2023.

DRAFT FINDING 5.1

It is a false economy to have too few resources for Information Linkages and Capacity Building, particularly during the transition period when it is critical to have structures in place to ensure people with disability (both inside and outside the National Disability Insurance Scheme) are adequately connected with appropriate services.

DRAFT RECOMMENDATION 5.1

Funding for Information, Linkages and Capacity Building (ILC) should be increased to the full scheme amount (of $131 million) for each year during the transition. The funds that are required beyond the amounts already allocated to ILC to reach $131 million should be made available from the National Disability Insurance Agency's program delivery budget.

The effectiveness of the ILC program in improving outcomes for people with disability and its impact on the sustainability of the National Disability Insurance Scheme should be reviewed as part of the next COAG agreed five-yearly review of scheme costs. The ILC budget should be maintained at a minimum of $131 million per annum until results from this review are available.

5.2 The NDIS and other disability services

Prior to the NDIS, the delivery and funding of disability services was primarily governed by the National Disability Agreement (NDA). The Agreement, of which the Australian

Government and all State and Territory Governments are signatories, was established in 2009 and revised in 2012. It features clear roles and responsibilities for each level of government and nationally agreed objectives and outcomes for people with disability, their families and carers (COAG 2012c).

The NDA also establishes that the Australian Government is responsible for providing income support and employment services for people with disability. States and territories are responsible for the delivery of specialist disability services such as supported accommodation, respite and community support services, therapy, early childhood interventions, life skills and case management (SCRGSP 2017, p. 15.3).

Other services available to people with disability, prior to the introduction of the NDIS, included (but were not limited to):

- home and community care
- residential aged care (provided to a person under the age of 65)
- taxi and transport subsidy schemes
- psychiatric disability community supports.

While the scope of these services and their eligibility requirements varied by jurisdiction, they typically included programs that covered both people who would be eligible and not eligible for individualised supports under the NDIS. Continuity of service and program interfaces are therefore critical to ensure that people with disability do not 'fall between the cracks' when services are split between NDIS and non-NDIS provision.

How does the NDIS affect other disability services?

As individuals transition to the NDIS, many existing services will be defunded, with previous funds used to offset the cost of the NDIS. Funds transferred from these services to the NDIS are calculated on a predetermined per person basis. The funds move with the individual when they transition to the NDIS, as agreed in the Bilateral Agreements. However, not all individuals will meet the NDIS eligibility criteria and not all services will be funded by the NDIS. Consequently, some services provided under the NDA and other avenues will need to continue.

Unless agreed otherwise, the responsibility of governments to provide services under the NDA remains (part 2, subsection 16 of Bilateral Agreements). The Australian and State and Territory Governments have also agreed in the Bilateral Agreements to continuity of disability support services for:

- people who receive support but do not meet the access requirements outlined in the *National Disability Insurance Scheme Act 2013* (Cwlth) (NDIS Act), or are receiving supports that do not meet the definition of reasonable and necessary support in the NDIS Act; and

- funding for supports attributed to a program/service that will cease when the NDIS is introduced.

All states and territories have agreed to provide continuity of support to people in receipt of state and territory administered disability programs/services. The Australian Government is responsible for providing Commonwealth administered disability programs/services (Bilateral Agreements schedule D). As part of annex E of the Continuity of Support Agreement (COAG 2013), the Australian, State and Territory Governments are also obliged to make clear their policy approach to providing continuity of support.

On the basis of the agreements that are in place, if the State, Territory and Australian Governments adhere to their responsibilities there should be few, if any, gaps in disability services for existing users (or at least the funding for these services). People previously receiving a disability service will continue to receive the same level of service — either through the NDIS or from other services funded by the State, Territory and Australian Governments.

Continuity of support is less straightforward in practice

Where programs are transitioning into the NDIS (closing) and there are people not eligible for the NDIS, these clients should receive services under continuity of support arrangements. In practice, however, there is a lot of uncertainty around continuity of support arrangements (box 5.3).

Most states and territories (to date) have not demonstrated how they will deliver on their commitment to provide continuity of support. There is varying detail on what disability support services will continue after the full rollout of the NDIS, and who will fund them. And where it is clear that services will continue, the detail on what will be provided varies. For example, the Queensland Government stated that they will continue providing some disability services (Queensland Government 2017b), while the Department of Social Services (DSS) have made public that 17 DSS and Department of Health programs will be affected by the introduction of the NDIS (DSS 2016e). Beyond this, little information is provided on specific programs that will cease or continue and who may be able to access the services. Those governments that have made public their intentions (the New South Wales and Australian Capital Territory Governments), are ceasing to provide specialist disability services altogether (NDS 2014; NSW Government nd).

Box 5.3 Participants point to uncertainty around continuity of support

Flourish Australia:

> People not eligible for the NDIS are already experiencing uncertainty and confusion. Continuity of support arrangements are still not finalised, so it is unclear whether they will be able to continue to access the services they currently receive, post full Scheme rollout. The concern is that if people currently accessing support in the community have this support 'switched off' at a future point, their needs and circumstances could be exacerbated, pushing up demand for the NDIS. (sub. 74, p. 9)

National Mental Health Commission:

> It is not clear how continuity of support for carers will be addressed through the NDIS. For example, the NDIS does not include direct provision of respite support for carers. Anecdotal evidence indicates that some applicants are being encouraged not to include family support in order to enhance their chances of getting a package. (sub. 153, p. 4)

Department of Health:

> The continuity of support commitment has been raised as a concern by service providers. It is currently unknown the proportion of program clients that will be deemed ineligible for the NDIS. Further information is needed of this cohort to inform continuity of support planning, such as the reasons for the ineligible access decision and the type of supports that individuals are currently accessing. (sub. 175, p. 5)

Rather than having a clear framework around the continuity of support, there seems to be some signs of brinkmanship, with governments holding off implementing policies (perhaps until another jurisdiction acts, or waiting for gaps to emerge before engaging in renegotiations).

While the Commission heard concerns about the quantum and nature of supports that will be provided outside the NDIS across a number of areas, mental health is one area where these concerns were particularly pronounced (box 5.4). In this case, the non-clinical supports that will be available for people with mental health disabilities who are not eligible for the NDIS is very unclear (box 5.4). State and Territory Governments have primary responsibility for mental health services — in 2014-15, state spending on community mental health services accounted for 83 per cent of all spending with the Commonwealth accounting for 17 per cent (DSS, sub. 146, p. 16).

In March this year, the Disability Reform Council agreed to focus on mental health to ensure mainstream systems are effectively supporting people with disability in Australia (DRC 2017, p. 2). In the most recent budget, the Australian Government also allocated $80 million over four years for support services for people with mental health illnesses who do not qualify for the NDIS, contingent on State and Territory Governments matching this contribution (Australian Treasury 2017a, p. 120). This should go some way to addressing support gaps, but continual monitoring will be required to ensure that people with significant needs are not missing out because they do not satisfy the NDIS eligibility criteria.

Box 5.4 Mental health — an area where uncertainty abounds

Many participants to this study raised concerns about people with severe mental illness missing out on services. In 2011, the Commission assumed that around 57 000 people with a psychosocial disability would be eligible for individualised supports under the NDIS (PC 2011, p. 190). The NDIA has since revised this number to 64 000 people (NDIA 2016g, p. 26).

The National Mental Health Commission's report on Mental Health Programs and Services estimated that around 700 000 Australians experience severe mental illness in any one year (and there are estimated to be over three million people in Australia with some sort of mental illness in any one year) (NMHC 2014, p. 5). The Department of Health (sub. 175, p. 4) submitted that through their internal modelling, around 282 000 people aged 0–64 years have a severe psychosocial disability requiring supports, and about 92 000 (aged 18–64 years) would 'most closely align' with the NDIS (although this did not involve modelling against the NDIS eligibility criteria per se).

For those people with a psychosocial disability not eligible for an individualised package under the NDIS, it is intended that mainstream or other disability supports will assist them. However, many submissions to this study pointed to current uncertainty around what services and supports will be provided to individuals with a psychosocial disability outside the NDIS. For example:

Mental Illness Fellowship of Australia said:

> While there have been assurances under the principle of continuity of service, in practice there is no clear indication of who and how the system will provide for those not eligible for the NDIS yet in existing programs, and more generally, those who were never Commonwealth clients to begin with. Members have reported emerging evidence of cost-shifting and ambiguities in responsibility, resulting in program uncertainty. (sub. 122, p. 12)

The National Mental Health Commission submitted:

> A particular concern is that there seem to be many people in existing community mental health programs at the Commonwealth and the State and Territory level who are being found ineligible for the NDIS, and while governments' commitment to continuity of support for existing clients is welcome (subject to the details of how such support is to be provided into the future), there appears to be no clear strategy for dealing with future cohorts of people who would otherwise have accessed such programs but who are not eligible for the NDIS. (sub. 153, p. 6)

And the Mental Health Community Coalition of the ACT said:

> … there is a need for both the NDIS and a mental health system. One is not a substitute for the other. However, since the introduction of the NDIS, the intersection between these systems has become very unclear and difficult; as well as inconsistent between States and Territories.
>
> - States and Territories made different decisions about what was in and out of scope for the NDIS.
> - Further, these decisions were made very early in the process when detail of scheme design was limited — it's fair to say that in many cases decisions would now be different given how the scheme has evolved. (sub. 135, p. 15)

The DSS (sub. 146) also noted that service gaps in this area have been known for some time. The implications of gaps are significant — uncertainty about what supports will be provided is distressing for people who rely on them and places an additional call on the generosity of informal support. They can also threaten the sustainability of the scheme by encouraging scope creep, or by forcing those who are unlikely to meet eligibility requirements to test their access anyway.

The DSS argued that the States and Territories:

> … need to demonstrate they are delivering their undertakings to provide continuity of support to clients not eligible for NDIS. (sub. 146, p. 27)

The DSS also noted that while measurement and reporting of service gaps are difficult, the agreed development of a new reporting framework for the *National Disability Strategy* could assist and better cross-system reporting could make any moves away from those services more obvious (and therefore more difficult to shift costs).

An important first step to ensuring an effective interface between the NDIS and other disability services is for governments to set out what disability services outside the NDIS will be funded, including the value of supports and number of people covered. Without this, it is impossible to work out where the gaps are and where cost-shifting is occurring. Delineation of services at the operational level should be made public immediately. This will help ensure that gaps do not emerge and the burden of these gaps do not fall on people with disability and their family. A schedule setting out the value of supports and number of people covered by disability support programs outside the NDIS should be included in the upcoming bilateral agreements for the full scheme.

The NDIA should also report — as part of the quarterly COAG DRC report — on boundary issues, including the number and value of supports being refused by the NDIS on the grounds that they are best provided by another support system, such as other disability services and mainstream services. The Commonwealth, State and Territory Governments should also publically report on the number of people covered by their disability programs pre and post NDIS, and the value of these services.

The delineation and reporting of disability services at the operational level will encourage discussions between the NDIA and disability service providers (including governments, local communities and businesses), and help identify gaps as they emerge.

ILC programs and LACs should also assist in identifying any gaps and reporting them back to the NDIA.

DRAFT RECOMMENDATION 5.2

The Australian, State and Territory Governments should make public their approach to providing continuity of support and the services they intend to provide to people (including the value of supports and number of people covered), beyond supports provided through the National Disability Insurance Scheme. These arrangements for services should be reflected in the upcoming bilateral agreements for the full scheme.

The National Disability Insurance Agency should report, in its quarterly COAG Disability Reform Council report, on boundary issues as they are playing out on the ground, including identifying service gaps and actions to address barriers to accessing disability and mainstream services for people with disability.

5.3 The interface between NDIS and mainstream services

A key requirement of any support provided under the NDIS is that the support is most appropriately provided and funded by the scheme and not by another service.[20] The NDIS is not designed nor funded to replace mainstream services. But for the NDIS to be successful and financially sustainable, there must be clear lines of responsibility between the mainstream services and the scheme. Also, as people with disability can require supports across a number of service systems, it is essential that service systems work well together.

In theory, the delineation between NDIS and mainstream services is clear cut. The *National Disability Strategy* 2010–2020 sets out the guiding principles around the supports to be provided by mainstream services (box 5.5). The Strategy's Second Implementation Plan (Driving Action 2015–2018) states that:

> While the NDIS is a significant step forward for many people with disability, the strategy remains the key to achieving improvements in access to mainstream services and support for all people with disability, regardless of age or type and level of support required. (COAG 2016b, p. 6)

However, as the NDIA (sub. 161, p. 57) put it, 'the Strategy is an overarching framework rather than a binding agreement for action'. It does not include 'substantial commitments, key performance indicators or targets' and 'there are limited identifiable consequences for governments if there is a lack of action'.

The Australian Government has also entered into Bilateral Agreements with State and Territory Governments to delineate the types of supports to be provided and funded by the NDIS and mainstream services (table 5.2). COAG has endorsed Principles to Determine the Responsibilities of the NDIS and other service systems, which are to be used to determine the funding and delivery responsibilities of the NDIS. The Principles are incorporated into the reasonable and necessary decision making of the NDIA by being incorporated in the *National Disability Insurance Scheme (Supports for Participants) Rules 2013*, Schedule 1.

[20] NDIS Act subsection 34(f).

Box 5.5 National Disability Strategy 2010–2020

The *National Disability Strategy 2010–2020* provides a ten-year national policy framework for improving life for Australians with disability, their families and carers. It represents a commitment by all levels of government, industry and the community to a unified, national approach to policy and program development. The vision of the Strategy is for 'an inclusive Australian society that enables people with disability to fulfil their potential as equal citizens' (COAG 2011b, p. 8).

The Strategy was endorsed by the Council of Australian Governments in February 2011. It guides public policy across all level of governments and aims to bring about change in mainstream services, specialist programs and services, and community infrastructure — to meet the needs of people with disability, their families and carers. It is the first time the Australian, State and Territory Governments have agreed to such a wide range of policy directions for disability. The Strategy sets out six priority policy areas for action. They are:

1. inclusive and accessible communities
2. rights protection, justice and legislation
3. economic security
4. personal and community support
5. learning and skills
6. health and wellbeing.

The first implementation plan, *Laying the Groundwork 2011–2014*, established the foundations to bring about reform in the planning and delivery of both mainstream and disability-specific programs and services. The Strategy's second implementation plan, *Driving Action 2015–18*, outlines new priority actions and builds on ongoing commitments to improving outcomes for people with disability across the Strategy's six policy outcome areas. Additional areas of national co-operation include: NDIS transition to full scheme; improving employment outcomes for people with disability; improving outcomes for Aboriginal and Torres Strait Islander people with disability; and communication activities to promote the intent of the Strategy throughout the community.

In September 2016, the Disability Reform Council reaffirmed its ongoing commitment to the National Disability Strategy.

Sources: COAG (2011b, 2016b); DSS (2017c).

Table 5.2 **What the NDIS covers and what mainstream services provide**

	What the NDIS covers	*What mainstream services provide / what the NDIS does not cover*
Health	Support to enable a person with disability to undertake daily activities, including 'maintenance' supports (from clinically trained or qualified health practitioners) directly associated with the person's disability.	Access to health services, such as diagnosis and clinical treatment of health condition, as required by National Healthcare Agreement and Commonwealth Disability Discrimination Act.
Mental Health	Non-clinical supports that focus on the person's functional ability to undertake daily living.	Clinical support related to mental health and any residential care and rehabilitative care.
Early childhood development	Individualised support or early intervention, specific to a child's disability or developmental delay, targeted at enhancing the child's functionality to engage in daily activities.	Early childhood education and care needs, child and maternal health services and any supports clinical in nature.
Child protection and family support	Support for the child, family and carer as a direct result of the child's disability, to enable participation in the community.	Promoting the safety of children from abuse and neglect, and providing parenting programs, counselling and other supports for families.
School education	Supports related to the functional impact of a student's disability to undertake activities of daily living, such as personal care and transport to and from school.	Personalising learning and support related to educational attainment, including teaching, learning assistance, school building modifications and transport between school activities.
Higher education and vocational education and training	Functional support related to the student's disability to undertake daily activities, including personal care and transport to and from education.	Learning and support needs of students that primarily relate to their educational and training attainment, and transport between education, training and employment venues.
Employment	Assistance to take part in the workforce and support in the person's functional capacity to work, such as training in workplace relationships and communication skills.	Employment services to support people with disability to prepare for, find and maintain a job, and employers to hire people with disability in their workplace (e.g. workplace modification, training and funding assistance).
Housing and community infrastructure	Assist individuals with disability to live independently by building their capacity to maintain tenancy, such as home modifications for accessibility, specific to their disability.	Accommodation for people in need of housing assistance, access to housing and homelessness services and any previous infrastructure responsibilities.
Transport	Funding support to enable independent travel, including aids and equipment and training to use transport. Cover reasonable and necessary costs for those not able to travel independently.	Ensuring transport options are available to people with disability. Other parties are still responsible for transport infrastructure as part of universal service obligation, including managing disability parking.
Justice	Continue to fund the full NDIS support related to the person's disability impairment where the person is not serving a custodial sentence.	Meet the needs of people with disability in line with the National Disability Strategy and existing legal obligations, such as ensuring the system supports accessibility for people with a disability and a secure environment for those in prison.
Aged care	Those under age of 65 can choose to purchase support from an aged care provider and the NDIS will fully meet these 'reasonable and necessary' costs.	Responsible for access to quality and affordable aged care and carer support. Cater for individuals aged over 65 years, unless they qualify to remain in the NDIS.

Source: COAG DRC (2015b).

Interfaces are not so clear at an operational level

At the operational level, the lines of responsibility between the NDIS and mainstream services are not so clear. The NDIA reported that during trial and transition it faced three key challenges in relation to mainstream supports, including:

- lack of clarity around some interfaces
- different understanding of mainstream obligations, by each jurisdiction and the NDIS
- difficulty in holding mainstream services accountable (sub. 161, pp. 59–60).

State governments also pointed to the need for further work on achieving greater clarity. For example, the South Australian Government said:

> There remains a lack of clarity in relation to roles and responsibilities across the NDIS and mainstream services in some areas. South Australia believes that there is still extensive work to be done in defining mainstream interface boundaries. (sub. 203, p. 6)

And the New South Wales Government said:

> Extensive further work is required by the States and the Commonwealth to scope, agree and communicate service boundaries. Any movement of boundaries (existing responsibilities) between the NDIS and other service systems should be implemented with associated resourcing considerations. (sub. 60, pp. 13–14)

A lack of clarity around responsibilities between the NDIS and mainstream services has the potential to impact on NDIS costs, and on the effectiveness and efficiency of service delivery in multiple ways, including scope creep; cost shifting from mainstream provision to the NDIS and vice-versa; gaps in service provision; inconsistent support access decisions; and duplication of services.

An added complexity is in-kind support arrangements (a program may have been agreed as in-kind but some people receiving the program may not be eligible for the NDIS and not all supports within the program may align with reasonable and necessary supports) (chapter 10).

There is some early evidence that interface issues are emerging. The NDIA reports some instances of possible cost-shifting, scope creep and services gaps, including:

- providers trying to extend the amount of therapeutic (health) interventions through use of NDIS funding
- reports that mainstream services are refusing entry to people who are likely to be eligible for the NDIS
- issues around a lack of accessible public transport options, particularly in regional, rural and remote areas, which means NDIS participants seek transport funding through the NDIS despite having the capacity to travel independently were transport options available (sub. 161, pp. 59–60).

State and Territory Governments also reported instances of cost shifting. The South Australian Government said:

> As policies and eligibility have been clarified over the trial/transition period, there are a number of emerging issues which are or are expected to result in costs for the state in areas which were originally assumed to be part of the scheme. … South Australia is keen to ensure that all appropriate costs are met by the NDIS to avoid any potential of states effectively paying twice for services. (sub. 203, pp. 7)

The ACT Government said:

> The ACT has experienced a cost pressure associated with the fact that what is 'in scope' for the NDIS has moved over time. (sub. 156, p. 9)

Some of the examples provided by the ACT Government include:

- a narrowing of the eligibility criteria for Early Intervention meant that some children who were deemed eligible for the scheme and have not implemented plans are being reviewed by the NDIA and referred back to mainstream services
- the lack of clarity from the NDIA about what is considered as parental responsibility and what is reasonable and necessary to fund student transport means that a tightening of scope by the NDIA will shift costs to states and territories
- the NDIA being insistent that supports for people with forensic disability where their behaviour manifests as a public safety issue is the responsibility of mainstream services. The ACT Government did not anticipate that it would be required to meet such costs, given that they relate directly to the participant's ability to live in the community (sub. 159, pp. 9–16).

And while many submissions to this study raised concerns about how the NDIS interface was working with mainstream services, particular concerns were raised in the areas of the justice system (box 5.6) and emergency and health services (box 5.7).

Box 5.6 Interface between the NDIS and justice services: views of study participants

Participants to this study expressed a number of concerns about the interface between the NDIS and mainstream criminal justice disability services. While there are specific NDIS rules that deal with the interface with the justice system (NDIS (Supports for Participants) Rules), there are some concerns that these rules are not clearly defined and that differences in interpretation will create inconsistencies. The Office of the Public Advocate, for example, said:

> On the intersection with the justice system, the COAG principles outline that the NDIS 'will continue to fund the reasonable and necessary supports'; a statement that is vague and subject to differing interpretations. Moreover, some of the responsibilities accorded to the justice system in the COAG principles have seldom been available in the pre-NDIS environment; for example, 'specific interventions to reduce criminal behaviours' and intensive case coordination — both of which are attributed to mainstream services — are not currently provided by the justice system and it is unlikely that they will be under the NDIS. (sub. 46, p. 2)

Participants also expressed concern that delineation between the NDIS and state and territory responsibilities is resulting in the withdrawal of some community justice programs and creating inconsistencies between jurisdictions and gaps in service provision. Disabled People's Organisations Australia submitted:

> There is an assumption that States and Territories are providing the appropriate supports to people with disability through the mainstream or their own specialist disability support systems. In some cases, States and Territories are entirely withdrawing funding and services for disability support while others are retaining a residual role in specialist supports. This creates inequity in programs within different jurisdictions. For example, NSW is ceasing its funding of specialist disability criminal justice programs based on the rationale that this should be the purview of the mainstream criminal justice system. (sub. 165, p. 11)

A further issue was the ability of people in custody to access NDIS support. Sisters Inside, for example, said:

> In our view, the unique and 'complex' needs of women in prison pose a significant challenge for the current NDIS model. We are concerned that most criminalised women will not be eligible for NDIS services. Even if eligible, many criminalised women can be expected to avoid the application process and services provided by mainstream (institutional charity) organisations. (sub. 16, p. 1)

In particular, access to disability services for people moving in and out custody is viewed as problematic. Neami National submitted that an:

> … issue occurs when participants move in/out of justice settings. For example, in preparation for discharge from a forensic mental health unit, extensive preparatory work and relationship building is provided through in-reach of community mental health disability support. This is not funded under the NDIS and will compromise the capacity of justice services to facilitate safe and timely discharge for people, again increasing overall cost pressures on the health and social care systems. (sub. 63, p. 9)

Similarly, Leanne Dowse, Melinda Paterson and Mike Sprange said:

> … as the NDIS implementation is only partially complete in NSW, it is hard to comment on how the interface between the NDIS and mainstream services has been working. What is clear has come from areas where trial implementations of the NDIS have occurred, such as in the Hunter region.
>
> In the area of Justice, there are some reports that the transition out of custodial sentences for people with disability who may be eligible for the NDIS, or even already in it, is problematic. It is likely that in relation to the mainstream area of Justice, many complex issues will arise in the interface. (sub. 114, p. 7)

Box 5.7 Emerging gaps in emergency and health services

Responsibility for funding emergency services

A gap in emergency response funding was identified by a number of study participants. For example, the ACT Government (sub. 156, p. 24) pointed out that there is currently no provision for emergencies, such as accommodation for:

- children with challenging behaviours who may not be able to live with their parents all of the time
- participants being discharged from a psychiatric inpatient unit
- participants unable to leave hospital without a modified or supported accommodation option.

It is unclear whether the NDIS or State and Territory Governments are responsible for funding this service. For example, in the ACT, the government has 'cashed out' on disability services related to emergency care (the ACT is expected to close its doors for 'Disability ACT' on 30 June 2017) under the expectation that the NDIS would fund these services. On the other hand, the NDIA has claimed that providing emergency accommodation falls under the state and territory responsibility of child protection, public housing and health sector respectively.

Based on the Commission's 2011 report, the intention was that crisis and emergency responses would be funded under ILC. However, ILC is yet to roll out and it is not clear whether it will provide such services.

Uncertainty in some health services

There are also cases where individuals are being turned away from specific state funded health services, and there seems to be uncertainty around who should provide these services.

- Audiologists report confusion around the funding of services for people experiencing tinnitus, with one practitioner being told that supports for tinnitus would no longer be funded by South Australia Health as this program would move over to the NDIS. However, young and adult clients with severe tinnitus are being advised that they are ineligible for the NDIS (Allied Health Professions Australia, sub. 37, p. 11).
- The Australian Physiotherapy Association (sub. 93, p. 10) reported feedback from consumers that rehabilitation services have 'closed their books' to NDIS package holders.
- The Australian Physiotherapy Association also noted cases of individuals being discharged early from hospitals:

  > … there are increasing incentives for 'early discharge' from public and private hospitals resulting from the introduction of the NDIS … There is little incentive, for example, for hospitals to ensure optimal pre-discharge functioning of a participant, compared with early hand-off and the transfer of the responsibility for achieving optimal functioning into the hands of the participant, their NDIS budget and community-based providers. (sub. 93, p. 10)

Where to from here?

It is too early to determine whether emerging problems in the interface between the NDIS and mainstream services are transitory or more long-term in nature. However, it is important that steps are taken to clarify NDIS boundaries and a process put in place to identify and address any service gaps, cost shifting, duplication and inconsistencies.

The first step is for State and Territory Governments to agree and finalise the boundaries between NDIS and mainstream services. As the New South Wales Government said:

> … at this early stage, NSW considers reviewing scheme boundaries by the PC to be of limited value given extensive work is still required by governments to define and agree boundaries. (sub. 60, p. 14)

A number of Administrative Appeals Tribunal cases have tested the boundaries of the NDIS (box 5.8), but given the narrow focus of these cases to date, their use in defining boundaries between services is limited. As more decisions are tested through the Tribunal, it can be expected that boundaries may be clarified. Importantly, however, the fact that a support is ruled to be best provided by a mainstream service does not in itself mean that the support will necessarily be provided.

Box 5.8 AAT Cases — whether a support is most appropriately funded by the NDIS

The following are examples of Administrative Appeals Tribunal cases that look at whether the requested NDIS support item is most appropriately funded by the NDIS or mainstream services. The cases have generally focused on specific claims for medical equipment and disability care.

- *Young and the National Disability Insurance Agency* [2014] AATA 401 — Young applied for a portable oxygen concentrator and insulin pump to be funded through the NDIS. The AAT found that the oxygen concentrator and insulin pump were clinical treatments and should be funded or subsidised under the health system.
- *McCutcheon and the National Disability Insurance Agency* [2015] AATA 624 — McCutcheon's NDIS support package did not include chiropractic care, which she appealed. The AAT found that the chiropractic treatment was related to McCutcheon's ongoing functional impairment and was therefore most appropriately funded by the NDIS.
- *Fear by his mother Vanda Fear and National Disability Insurance Agency* [2015] AATA 706 — On behalf of Fear, his parents applied for certain equipment (pulse oximeter and oral suctioning machine) as part of his individual support package under the NDIS, but they were not included in his plan. The AAT found that the oximeter and oxygen suction machines are more closely related to clinical treatment for Mr Fear's health and were the responsibility of the health system.

Interface disputes are an inevitable part of the transition process. Because of this, there needs to be a process to monitor interfaces, and prevent or resolve problems as they emerge.

The Commission considers that the most appropriate vehicle for the discussion and monitoring of mainstream services for this process is COAG. A standing item should be introduced through the COAG Disability Reform Council and at each COAG council that is responsible for services that interface with the NDIS, to discuss how the services interface with the NDIS.

The DSS suggested specific disability reporting across COAG Councils:

> Monitoring and reporting through COAG infrastructure could be strengthened by specific disability reporting across relevant COAG Councils, specifically on the effectiveness of mainstream systems in supporting all people with disability; and improving the interfaces between mainstream services and the NDIS.
>
> DRC could consider proposing this through its regular reporting to COAG, starting with the three agreed priorities for the *National Disability Strategy*:
>
> - mental health services outside the NDIS
> - health services for people with disability
> - over-representation and lack of support for people with disability in the criminal justice system (sub. 146, p. 28).

The *National Disability Strategy* should be strengthened to improve government accountability. There should be more detailed reporting around the boundaries of the NDIS and the implications for mainstream service provision. Specific commitments, key performance targets and outcomes should be set out. This should be pursued through review points of National Agreements and National Partnership Agreements under the Federal Financial Relations Intergovernmental Agreements. (An important commitment by governments under the Disability Reform Strategy was to use the review points of National Agreements and National Partnerships as an opportunity to assess their consistency with the aims and objectives of the Strategy.)

As the DSS said:

> Translating the National Disability Strategy into tangible results for people with disability, their families and carers is a major factor in successful implementation of the NDIS. (sub. 146, p. 5)

ILC and LAC can play a role in ensuring mainstream services are better informed about their roles and responsibilities.

DRAFT RECOMMENDATION 5.3

Each COAG Council that has responsibility for a service area that interfaces with the National Disability Insurance Scheme (NDIS) should have a standing item on its agenda to address the provision of those services and how they interface with NDIS services. This item should cover service gaps, duplications and other boundary issues.

Through the review points of National Agreements and National Partnership Agreements under the Federal Financial Relations Intergovernmental Agreement, parties should include specific commitments and reporting obligations consistent with the National Disability Strategy. The Agreements should be strengthened to include more details around how boundary issues are being dealt with, including practical examples.

5.4 Interface with aged care

An important issue in the design of the NDIS is the interface between the aged care and disability systems. As people with disability age, they are likely to experience age related conditions, such as increasing frailty, or the onset of age related neurological conditions (such as Alzheimer's). At the same time, a person may develop a non-age related disability later in life.

Under the NDIS, a scheme participant:

- under the age of 65 can choose to purchase support from an aged care provider and the NDIS will fully meet these 'reasonable and necessary' individualised support costs
- are free to remain in the NDIS once they turn 65, or they can exit the scheme and enter the aged care system
- ceases to be a participant when they enter a residential care service or start being provided with home based care on a permanent basis, but only after they turn 65 (DRC 2015b, p. 26).

There are incentives for people to stay in the NDIS

There are aspects of the design of the NDIS, and how it interfaces with the aged care system, that create incentives for people to stay in the NDIS after the age of 65, and encourage people nearing the age of 65 to apply for NDIS access (and have their needs met through the scheme, rather than through the aged care system).

There are different objectives and different supports

The NDIS and the aged care systems have different objectives.

The NDIS is designed to provide all eligible participants with a wide set of supports, while the aged care system rations places and the amount of government funding for each place.

- The NDIS is intended to support the independence of people with disability, the *Aged Care 1997 Act* (Cwlth) does not include independence or participation objectives.
- The NDIS aims to provide reasonable and necessary supports to participants, while the aged care system attempts to target limited resources to people within the system.

The NDIS is intended to provide each participant with reasonable care and assistance they need at each stage of their life. The scheme has a strong emphasis on contributing to the participant's independence and ability to participate in all aspects of life (including education, socially and economically). In addition, one of the objectives of the NDIS is to help participants enjoy the same rights as other people in Australia (NDIS Act s. 4(1)).

Aged care may require financial co-contributions. The NDIS does not.

While supports are provided at no cost to NDIS participants, means-tested co-contributions are a feature of the aged care system (My Aged Care 2017b). This means that there is a financial incentive for participants aged 65 years and over to remain in the NDIS, even where their needs could be better met through the aged care system. As noted by one participant (Name withheld, sub. 5, p. 1) as long as the market for providing services to NDIS participants is operating effectively, it is difficult to see why people would choose to transition from the NDIS to aged care.

That said, as noted by the DSS (sub. 146, pp. 14–15), 'for many with lifelong disability, it is unlikely that sufficient assets would have been accumulated for a means tested co-contribution to apply after the age of 65 years'.

However, means testing for aged care services is based on both income and assets, with co-contributions applying to people on an age pension — for example, the basic contribution for at home care costs is 17.5 per cent of the pension (My Aged Care 2017a). Contributions for residential aged care are higher.

It is too early to assess the cost implications

The Australian Government has agreed to fund the full cost of participants in the NDIS scheme aged 65 years or older. As the aged care system is also Commonwealth funded, this means that the cost of supporting older people falls to the Australian Government, whether they are in the NDIS or the aged care system. The additional costs to the Australian Government is the difference in the value of NDIS packages compared to the aged care costs that the same NDIS participants would otherwise have incurred.

If people aged nearly 65 join the NDIS, or those aged 65 or older elect to stay in the NDIS, there is a cost implication — the NDIS is more generous in support provided, and requires no co-contribution. As such people staying in the NDIS rather than moving to the aged care system is likely to result in higher expenditure for the Australian Government. It could also raise questions about equity.

Given the infancy of the NDIS, the interface between the scheme and the aged care system is yet to be tested. There are currently very few participants aged over 65 years in the scheme and the average support costs for this group are lower than expected (DSS, sub. 146, p. 14). However, the higher costs associated with the past few years of life and issues around the interface with the aged care system are unlikely to have materialised as the oldest participants in the scheme are 69 years of age (DSS, sub. 146, pp. 14–15). By 2019-20, however, there are expected to be around 15 000 scheme participants aged 65 years or older (chapter 2).

As part of the NDIS transition arrangements, the aged care system is implementing a new continuity of support program for people aged 65 and over — it is looking at who is

ineligible for the NDIS and who is currently in state specialist disability services. Insights from this program should help inform the aged care system in providing specialist disability supports (DSS, sub. 146). There should be ongoing monitoring as the scheme matures.

5.5 Interface with the National Injury Insurance Scheme

In 2011, the Productivity Commission also recommended a National Injury Insurance Scheme (NIIS) that would operate in parallel to the NDIS. At the time, the Commission considered it a priority to establish a no-fault lifetime care and support scheme for catastrophic injuries, as many Australians acquiring such injuries were receiving poor care and support because they were unable to find an at-fault party to sue.

Under the model proposed by the Commission, the NIIS was to fully fund health, rehabilitation and care and support costs for all newly acquired catastrophic injuries. As such, lifetime care and support needs of people with newly acquired catastrophic injuries would be met through the NIIS and not the NDIS. However, the care and support needs of people with existing catastrophic injuries, and not covered under any no-fault arrangements, would be met through the NDIS.

The NIIS, as proposed by the Commission, was to operate as a federation of individual state-based no-fault insurance schemes. Implementation of the NIIS is overseen by the Australian Treasury and has been undertaken across four streams — motor vehicle accidents, workplace accidents, medical treatment injuries and general accidents (occurring in the home or community).

The Commission, in 2011, recommended that the NIIS be in full operation in 2015, or before the full rollout of the NDIS. This was on the basis that there were well-established schemes in place that could form the blueprint for the design of schemes and the number of people affected was relatively small (around 1000 people a year) (PC 2011, p. 863). This has not happened. Of the four streams, motor vehicle accidents has been completed, and workplace accidents is in the process of being completed — a consultation Regulation Impact Statement has been released and progress is being made towards setting minimum benchmarks.

Progress on the other two streams, medical accidents and general accidents, has been slower. A discussion paper was released in 2015 for the medical treatment injuries stream (Australian Treasury 2016c); however, negotiations for the general accidents stream have not commenced. The DSS (sub, 146, p. 25) noted that over the short to medium term, the medical and general streams may not be implemented, with a number of implementation challenges identified for the medical stream.

As there is no agreement in place by the states and territories to commit to the funding for, or establishment of, the medical and general accident streams, anyone who acquires a

catastrophic injury from a medical or general accident will receive supports through the NDIS. This will have a direct impact on NDIS costs. As the DSS said:

> Contingencies are needed if the full NIIS is not delivered, as this would move costs onto the NDIS. … If the NDIS were to pick up responsibility the funding obligation would sit fully with the States, which have responsibility for implementing the NIIS. (sub. 146, p. 5)

The number of people entering the NDIS, who would otherwise be covered by the medical or general accident streams of the NIIS in any one year is expected to be relatively small — across both streams the Commission in 2011 estimated there to be around 400 people.

But over time, as new people enter each year, there is a cumulative effect. To illustrate, modelling undertaken by the NDIA suggests that the cost to the NDIS of the medical and general schemes not operating would amount to about $23 million in 2018-19, but would increase to about $226 million in 2025-26 and to around $1.3 billion in 2040-41 (table 5.3).

Table 5.3 **Medical and general accidents costs to the NDIS**
$ million

	2018-19	*2019-20*	*2020-21*	*2025-26*	*2030-31*	*2035-36*	*2040-41*	*2045-46*
Medical	1	3	7	33	71	121	186	271
General	4	19	42	193	417	712	1 098	1 597
Total	**5**	**23**	**49**	**226**	**488**	**833**	**1 284**	**1 868**

Source: NDIA modelling.

One of the key goals of the NIIS is to deter high-risk behaviour and reduce local risks that can contribute to accidents. For this reason, in 2011 the Commission argued that premiums and state and territory funding should be used to send price signals and encourage greater incentives for safety.

The Commission acknowledged that the appropriate funding source for no-fault coverage of catastrophic injuries following medical treatment is more complex than for other accidents. A key consideration is to build on existing incentives to minimise risk by:

- motivating the systematic collection and analysis of data that may decrease risks
- varying premiums depending on whether practitioners (or the health sector more broadly) follow best practice protocols and have the appropriate training and credentials (PC 2011, p. 877).

In terms of general injuries, accidents result from a number of causes, such as environmental factors (for example, maintenance of footpaths and safety of play grounds) and the nature of activity being undertaken (such as recreational activities). For this reason local governments (which are devolved powers by the states and territories) are in a better position to implement incentives to minimise the risk of accidents (such as proper signage

around dangerous areas) and are able to collect revenue reasonably efficiently to fund the NIIS, including a potential levy on local government rates.

Because the states and territories have greater control over implementing risk reducing programs (and therefore, indirectly, the costs of the NIIS), they should bear the costs of the NIIS if it remains only partially rolled out for an extended period. A number of participants pointed to the costs to the NDIS.

> Not proceeding with the medical or general streams of the NIIS will have a direct impact on the NDIS by increasing overall Scheme costs. … Any additional cost, not adequately funded by the States, is a risk to the Commonwealth. (DSS sub. 146, p. 26)
>
> The sustainability of the NDIS depends on a complete NIIS that, in providing no fault insurance for catastrophic injury, removes the significant cost drivers of these injuries from the NDIS. (Young People In Nursing Homes National Alliance, sub. 187. p. 4)
>
> Without the NIIS in place, further cost-pressure will be placed on the NDIS. (NDIA sub. 161, p. 113)

The Commission is seeking feedback on a mechanism to ensure that the states and territories bear the cost of participants who were intended to be covered by the NIIS.

INFORMATION REQUEST 5.1

The Commission is seeking feedback on a mechanism to ensure that the States and Territories bear the cost of participants who were intended to be covered by the National Injury Insurance Scheme.

---

6 Provider readiness

Key points

- Providers play an important role in meeting the needs and goals of National Disability Insurance Scheme participants, and improving their lives. However, the transition to a market-based system means that providers will need to make substantial changes to the way they provide disability supports. They need to become more efficient, innovative and responsive in the delivery of supports to participants.
- The supply of disability supports affects scheme costs. If there is insufficient supply, scheme costs are likely to be lower in the short term because individualised supports are underutilised, but higher in the long term as participants are unable to access the supports that can reduce their costs of care in the future.
- The National Disability Insurance Agency (NDIA) currently sets the maximum price of disability supports that can be charged by NDIA-registered providers. However, the responsibility to set prices may conflict with the Agency's other responsibilities, including maintaining financial sustainability and its market stewardship role. This potential conflict should be addressed in three stages, by:
  - introducing an independent price monitor to serve as a transparent 'check and balance' on the NDIA's pricing over the transition period
  - transferring the NDIA's power to set prices to an independent price regulator, who would also be responsible for deregulating the prices of supports
  - continuing independent price monitoring following price deregulation.
- While the market-based approach to providing disability supports will increase incentives for providers to deliver supports in areas previously undersupplied, there will still be 'thin markets', where there are few, if any, providers. Arrangements to deal with thin markets (including Provider of Last Resort arrangements) need timely and considered attention because shortages, less competition and poorer outcomes for participants may persist. While there is a range of ways to address access issues (including block-funding), ongoing public reporting, monitoring and evaluation of thin markets is crucial.
- Participants to this study also raised other potential barriers to supply — including moving to fee-for-service, administrative burdens, in-kind services and collaboration in the sector. While these are likely to be transitional issues, ongoing monitoring can ensure that they do not become entrenched or systemic issues.

The ability of the disability support sector to provide disability supports has a direct bearing on National Disability Insurance Scheme (NDIS) costs. If there are not enough providers and workers to deliver the supports allocated by the National Disability Insurance Agency (NDIA) to participants, this will lead to underutilisation of supports, and ultimately lower than expected costs to the scheme in a given year, and poorer outcomes for participants (and their families).

Costs should be considered from a long-term perspective. When reasonable and necessary supports are allocated to participants under the NDIS's insurance-based approach, the package of supports should minimise the long-term cost of care to the community. If these supports are not available, the costs of supporting participants may be higher in the long term — because of more services demanded through the NDIS, through other government services, or through informal carers. There are also costs to participants and their families from reduced wellbeing.

The loss in wellbeing of not being able to access supports for a person with disability will vary by the type of support. For example, not being able to find a carer to provide core supports (like an attendant carer to provide assistance to get out of bed and with personal daily activities) is likely to impose a higher cost on a person with disability than being unable to find a provider for community-engagement activities. Also, the use of the community-engagement support is likely to be contingent on being able to find someone to provide core supports, and vice versa.

The focus of chapters 6-8 is on how ready the market (providers, workers and participants) is to respond to such growth in demand, and how this will ultimately affect scheme costs. This chapter considers how existing and new providers are responding to the increased demand for supports under the NDIS. Section 6.1 provides a snapshot of the current state of the disability support sector and the expected growth required to meet the demands of the NDIS. Section 6.2 examines the pricing of disability supports in the context of market growth to date. Section 6.3 looks at where the market supply for disability supports could be limited and result in 'thin markets'. Section 6.4 discusses other transitional matters affecting provider readiness.

6.1 The disability support sector

People with disability have a range of different wants and needs (including personal care, therapy, and assistance with cleaning and mowing), which require a variety of supports. In turn, the cost of providing a range of services varies by region and the degree of competition. This means that there are a number of submarkets within the aggregate disability support market. As explained by one provider, there are particular characteristics of the disability support market that distinguish it from a traditional market.

> The disability support 'market' is not a normal or 'perfect' market in classical economic terms. It is about providing a range of customised supports, human and technological, paid and unpaid, to meet complex and often poorly-defined human needs and wants. Outcomes are often hard to measure and report. Information is unbalanced. Regional, rural and remote markets are 'thin'. The 'buyers' of services and their local situations are diverse and heterogeneous, not homogeneous. Many are vulnerable. (House With No Steps, sub. 104, p. 1)

It is within this context that the NDIS is driving market-based competition between disability support providers, at a time when the size of the aggregate disability support market needs to increase significantly to meet NDIS demand.

This includes:

- a shift away from a block-funded, welfare model of support to a fee-for-service, market-based approach
- an increase in funding for the sector from about $8 billion in 2015-16 to $22 billion by 2019-20 (SCRGSP 2017)
- assessing and meeting the reasonable and necessary needs of about 475 000 people by 2019-20 (chapter 2)
- about 70 000 additional workers (or about 20 per cent of all new jobs created in Australia) in the three-year transition period to full scheme (Bonyhady 2016, p. 5; chapter 7).

As put by the NDIA:

> In the first year [of transition], to meet projected Scheme demand, growth in supply needs to be around eight per cent. By the second and third year respectively, growth must reach 30-40 per cent, although … the supply needed to meet funded participant demand varies depending on location. (2016k, p. 8)

The market for disability supports is diverse and difficult to characterise in general terms. There is a range of different markets for people with disability. Some providers specialise in providing supports for those with specific disability, while others specialise in providing particular types of supports (such as accommodation or therapeutic supports). Others provide a much broader service. NDIA 2016k, p. 8)

The data on disability support providers are patchy. The most comprehensive data were collected by Martin and Healy in 2010. More recent work by National Disability Services (NDS) and Curtin University's Not-for-profit Initiative contains data on provider characteristics and financial performance.[21]

Notwithstanding the data limitations, a few broad points can be made.

- Many providers are small. About 40 per cent of disability service outlets employed 10 or fewer disability workers (Martin and Healy 2010, p. 122). The NDS estimated that about 58 per cent of providers are either small or very small (with a turnover of less than $5 million) (Gilchrist and Knight 2017, p. 10).
- About 80 per cent of disability providers are not-for-profit (NDS 2016, p. 7).
- Most providers do not exclusively provide disability services. About 57 per cent of providers surveyed by the NDS provided services in other areas, such as aged care, mental health and homelessness (NDS 2016, p. 13).

[21] The National Disability Services' (NDS) State of the Disability Sector Report 2016 is based on the fourth wave of the National Business Confidence Survey of 549 disability service providers, of whom 486 were NDS members and 63 were non-members (NDS 2016, p. 7). The NDS has also undertaken a financial benchmarking project for disability services (NDS nd).

How will the sector need to change under the NDIS?

While a lack of data prevents a complete evaluation of the current state of the sector, envisioning how the future disability sector will look under the NDIS is even more difficult. Some of the supports required by participants will be provided by existing providers who expand, while others will be provided by new entrants. However, it is not certain:

- how many providers will be needed — and the proportion of new and existing providers
- what the proportion of for-profits, not-for-profits and government service providers will be
- whether there will be greater specialisation by disability, type of support, or both
- how long it will take for these changes to occur.

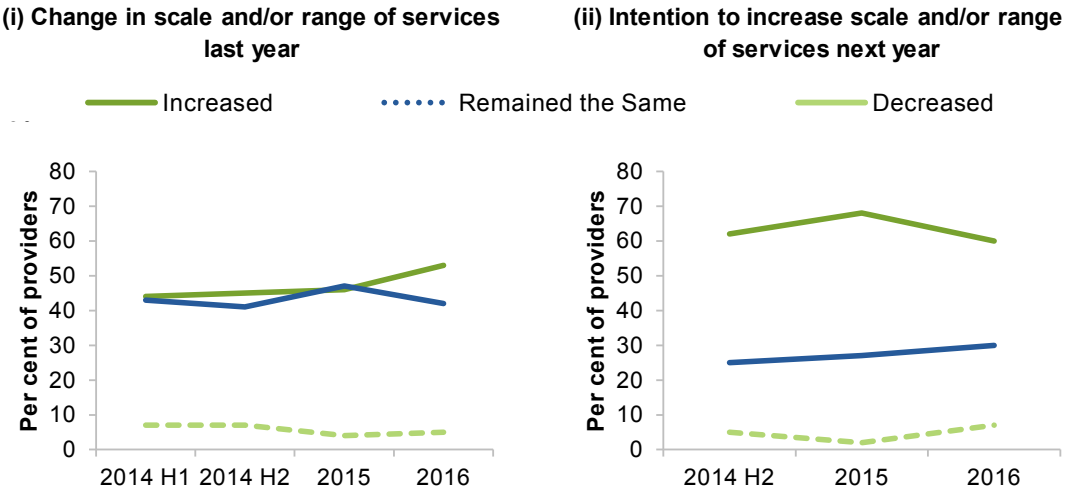
This uncertainty is reflected in estimates on the number of providers needed under the NDIS. The ANAO (2016, p. 68) estimated that between 13 500 and 40 000 providers will be needed by the end of the transition period in 2020. Therefore, understanding how existing providers are responding to, and whether new providers are entering, the NDIS market is important.

The NDS survey of providers gives some insight into how existing providers are responding. The majority of providers surveyed said that they expanded their services last year, and that they intend to expand further next year (figure 6.1). Providers reported increasing their services particularly in the areas of therapy, early intervention, and planning and coordination supports (NDS 2016, p. 11), but the amount of additional supports is unclear. However, some providers also reported plans to reduce or stop supplying services in other areas, and that they are entering new markets (outside of the disability support sector) (NDS 2016, pp. 12–13). The financial position of providers is also variable, and in turn, the strength of existing supply.

It is more difficult to ascertain the size, scope and number of new providers who are entering the market in response to the NDIS. Data are available on the number of providers *registered* with the NDIA to provide supports under the scheme, which includes both existing and new providers (figure 6.2).

While registrations increased by about 30 per cent between the December 2016 and March 2017 quarters, about 54 per cent of registered providers are yet to provide a service, and the top 25 per cent of registered providers currently account for about 80-90 per cent of the value of payments made by the NDIA for participant supports (NDIA 2017o, pp. 38, 41).

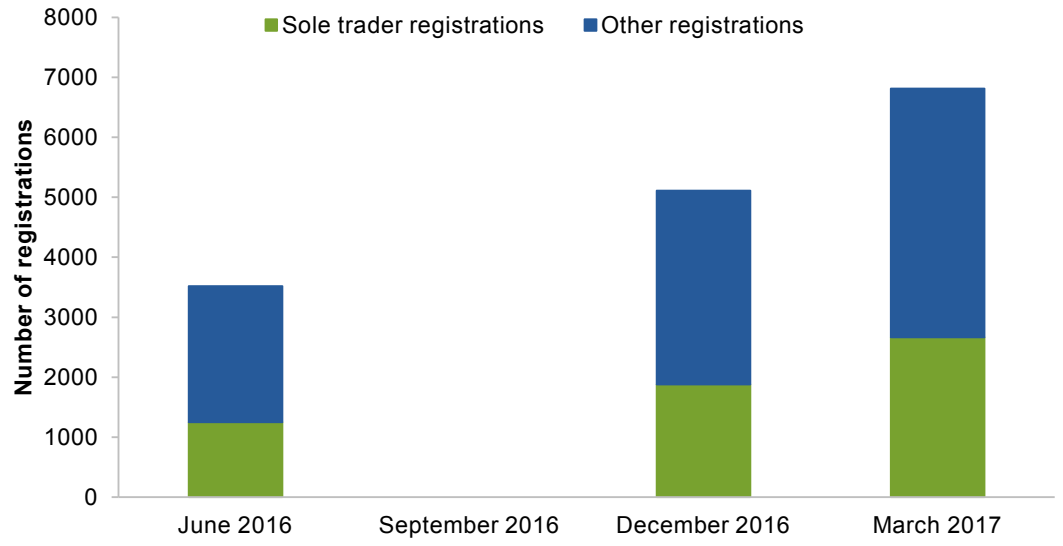
Figure 6.1 **Providers' response and intention to increase supply[a]**



[a] H1 and H2 refer to the first half and second half of the calendar year respectively.

Source: Gilchrist and Knight (2017, p. 16), who surveyed 492 respondents.

Figure 6.2 **Cumulative number of NDIA-registered providers by quarter[a]**



[a] Data for September 2016 are unavailable.

Sources: Commission estimates based on NDIA (2016t, 2016u, 2017o).

This is consistent with NDS data, where 77 per cent of providers surveyed had registered, but only about half had provided services under the NDIS (Gilchrist and Knight 2017, p. 5). One explanation could be that some providers are registering to provide services ahead of the NDIS rollout in their location (NDIA 2017o, p. 41; DSS, sub. 146, p. 36).

Growth in registrations of those providing therapy supports — usually allied health professionals — has been strong, and accounted for 54 per cent of the increase in registrations in the quarter ending 31 March 2017 (NDIA 2017o, p. 40).

While the scale of market growth to date is uncertain, many providers pointed to two challenges to developing the market for disability supports:

- the effect of price controls for supports set by the NDIA
- concerns that some markets will be too small to be profitable for providers to supply.

The next two sections examine these concerns in turn.

6.2 Pricing of disability supports

In a mature market, the choice and control that participants exercise will increasingly be the main factor driving the price of disability supports. Allowing the market to determine the price of supports is an important tenet of the NDIS, as it will contribute to both participant outcomes and the financial sustainability of the scheme.

However, there is a need for the temporary regulation of prices in the disability support sector, as recommended by the Productivity Commission in its 2011 *Disability Care and Support* inquiry (box 6.1).

Box 6.1 Why regulate the price of disability supports?

Governments have historically regulated the price of human services (PC 2016, p. 35), including disability care and support services, on the grounds of equity and efficiency. Absent price regulation, the use and provision of disability supports may be below socially optimal levels for a number of reasons, including ineffective competition and abuse of market power (NDIA 2017a, p. 5).

In particular, there may be too few providers in the market, which is a real risk in the disability support sector. Early data indicate a market concentration of more than 80 per cent in some disability service sub-markets (NDIA 2016p, p. 32, 2016w, p. 29, 2016aa, p. 38; DSS, sub. 146, p. 38). This may result in prices that are too high, and limited access to services for some disadvantaged groups. Others have noted the need to maintain price controls in the foreseeable future, as it may take at least a decade for the new market for NDIS disability supports to develop (ANAO 2016, p. 54; AONSW 2017, p. 5; DSS, sub. 154, p. 39).

The Commission in 2011 recommended that an early — albeit temporary — task for the NDIA was to set efficient prices to allow providers to recover the costs of service provision (including adequate returns for capital investment), and in turn, ensure the supply of disability supports (PC 2011, pp. 51, 412–414). While the NDIA has set prices since the beginning of the NDIS trials in July 2013, the Agency indicated that it does not plan to do so in the long term.

> During transition, the market stewardship role of the Agency will be more active; to facilitate development of the marketplace and as a catalyst for basic market infrastructure. This includes … setting prices and pricing policy …
>
> The setting and reviewing of NDIS prices is a significant market-intervention initiative … for most submarkets, it sees this [price-setting] as a temporary measure to support the marketplace. In the long-term, the NDIA will not set prices to the extent it does now and will instead allow the marketplace to determine the price of supports. (NDIA 2016k, pp. 18, 26)

An important principle of price regulation is that it should not persist unnecessarily, have excessive scope, nor shape the market — such as by benefiting some providers or participants over others.

How are prices set?

The NDIA sets the total value of a participant's support package as part of the planning process (chapter 4). Participants can only purchase supports from NDIA-registered providers if they want the Agency to manage their plan (chapter 8). These supports are subject to a maximum price set by the NDIA — 'a price cap'. Given that about three-quarters of participants are currently subject to these price caps (NDIA 2017o, p. 21), price controls have considerable scope to affect market development.

The NDIA walks a fine line in setting prices.

> The NDIA risks unnecessarily disrupting existing markets through setting prices inaccurately. If price limits are set too high (relative to an efficient benchmark) providers will not face adequate incentives to review practices and operations in an effort to be more efficient. As a result, participants, and the Scheme in general, would not get value for money from expenditure on supports. On the other hand, if price limits were set too low, providers would be

> unable to recover even efficient costs. This could result in a significant share of providers leaving the sector and/or a lack of new investment in disability services. (NDIA 2016r, p. 10)

This is reflected in the rationale of price caps, which is to:

- ensure 'value for money' for participants — as the price of supports may be bid up too quickly in the absence of price caps in the period after funding is allocated to participants, but before the disability support sector grows sufficiently to meet the increased demand
- encourage the market supply of disability supports by giving providers sufficient incentive to grow and enter the NDIS market (NDIA 2016s).

There are also trade-offs associated with price controls. While fixing prices causes scheme costs to be lower in the short term, it may slow the development of the market. Conversely, the deregulation of prices could mean higher short-term costs, but potentially lead to faster growth of the market in the long term.

The NDIA currently sets price caps using a 'reasonable cost model', which seeks to 'define the direct cost elements at a rate that is sufficient to cover the efficient costs of a reasonable quality support provider at a point of time' (NDIA 2014a, p. 2). Prices are intended to reflect an estimate of what the long-term 'efficient' price would be in a competitive, deregulated market, *plus* an additional margin to reflect both the cost and time needed for existing providers to transition to a market-based system, and to entice new providers to enter the disability support market (transitional pricing). To do this, the reasonable cost model makes a number of assumptions about the cost of providing supports, which vary by the support in question (box 6.2).

Prices are currently set by annual reviews conducted by the NDIA. The price review for 2017-18 was recently completed, with prices effective from 1 July 2017 (NDIA 2016a). This price review included an examination of the evidence and methodology used to set prices, with a focus on attendant care (NDIA 2017a, p. 8). The Agency also considered changing the nature of price information provided to firms by introducing 'price bands', which would consist of two components: a benchmark price that reflects the efficient costs of providing a reasonable and necessary level of care, and a price cap *above* the benchmark price reflecting the maximum price that can be charged under the NDIS (NDIA 2017a, p. 17).

Regulating prices is always difficult — regulating a market that is still developing and undergoing significant change is even harder, as the past may offer less guidance to regulators than in a mature market, and there is an increased risk of disruption caused by regulated prices. Prices are also only one of many factors that affect the willingness and ability of providers to supply disability supports.

Box 6.2 The NDIA's reasonable cost model used to set price caps

The reasonable cost model (RCM) uses a range of assumptions that have been developed in consultation with the disability support sector to determine the price cap for a given support type under the NDIS. These price caps are intended to inform providers about the efficiency levels that should be targeted under the market-based system. To date, price caps have included an additional premium to reflect the costs of transitioning existing providers into the scheme, and to give new providers an incentive to enter the sector.

One support subject to a price cap is the cost of an hour of attendant care — one of the most common supports provided under the NDIS. The RCM assumes the following conditions for an hour of attendant care provided in 2016-17.

- The hourly rate of pay is based on the *Social, Community, Home Care and Disability Services Industry Award 2010* pay point 2.3 for employees and 3.2 for managers or supervisors. Pay rates depend on whether the hour worked is on a weekday (6am-8pm or 8pm-12am), Saturday, Sunday, or a public holiday.
- Employees are employed on a full-time or permanent part-time basis. No allowance for shift work or other allowances are included. Leave entitlements are ten days of paid personal leave; four weeks of paid annual leave at 17.5 per cent leave loading; and 17.98 per cent of employees achieve long service leave of 8.67 weeks.

In terms of other costs, including 'on-costs', the RCM assumes:

- loadings for location (18 and 23 per cent for remote and very remote areas respectively) and the complexity of client needs (about 6 per cent)
- that carers spend 95 per cent of paid time with clients, and that managers spend 90 per cent of time with clients, or dealing with client matters. A manager is expected to supervise 15 employees (for standard needs clients)
- that providers operate with a corporate overhead equal to 15 per cent of total salary, management and non-client facing expenses. There is an additional payment for provider travel costs for travelling between clients (maximum 20 minutes).
- superannuation is 9.5 per cent of total salary costs, and workers' compensation insurance is 4 per cent of total salary costs
- a profit margin of 5 per cent of total costs, as well as an additional margin for the transition pricing period.

The RCM, under these assumptions, results in a price cap of about $42 for an hour of attendant daytime weekday care in metropolitan New South Wales, Victoria, Queensland and Tasmania. About a third of this price is for on-costs.

Most of the assumptions and methodology of the model were initially developed in consultation with National Disability Services; however, the parties did not agree on what assumptions were appropriate for the future efficient price (NDIA and NDS 2014, p. 16). Many providers who made submissions to this study argued that the price caps resulting from the RCM are inappropriately low (box 6.3).

Sources: NDIA (2016l, 2016m, 2016n, 2016o, 2016s, 2017a).

However, prices are also important because they affect participant choice and control. What participants want and need should ultimately be the main driver of prices — something that can be most effectively and efficiently achieved in a market *without* price

controls. This is because price caps constrain quality, variety, innovation and ultimately reduce the benefits to participants. It is therefore important that prices are not regulated where it is unnecessary to do so.

Prices affect who providers choose to supply. Although it is difficult to get a complete picture as the scheme is still early in the transition period, a number of providers submitted to this study that they were unable to provide services for participants with complex needs at the prices derived from the reasonable cost model (Anglicare Australia, sub. 157, pp. 11-12, 19; CMHA, sub. 11, pp. 5, 13; Leadership Plus, sub. 128, pp. 3-4; NDS 2017c, p. 4; United Voice, sub. 118, p. 12; VCOSS, sub. 176, pp. 20-21) — an unintended consequence of assumptions in the model of a single complexity loading, base salary rate and supervisory requirements. As put by the Brotherhood of St Lawrence:

> The existing fixed pricing structures pose some problems for both participants and service providers because they fail to take into account the circumstances of activities. By setting a single price, the provider does not have the option to charge less or more for a tailored service. This has the unintended consequence of reducing the choice and control of people with disability. (sub. 189, p. 20)

NDIS transition data tend to suggest greater underutilisation of supports for those with complex needs (as proxied by level of function). While this could indicate problems with plans or participant readiness to navigate the NDIS (chapter 8), many study participants indicated that those with complex needs were experiencing significant difficulties with finding providers willing to provide services to them.[22]

Some concerns about prices may reflect a general inefficiency by providers or a reluctance to change business practices. While a number of study participants raised concerns about the adequacy of prices to provide quality supports (box 6.3), the NDIA submitted that some providers may be finding it difficult to become more efficient under the new fee-for-service model.

> Some providers have raised concerns that NDIS price levels are too low, particularly for personal care and community supports, but have generally not supported these arguments with clear evidence. Other providers have suggested that current price levels are appropriate. These contradictory views within the provider population might be evidence that some are struggling to adjust to a funding model that is based on market principles. There is also evidence of a wide variation in operating costs under pre-NDIS approaches where efficiency was not a key consideration. It also might reflect changes in volume as well as the extent of cross-subsidisation of services that previously existed.
>
> The NDIA effort to set maximum prices has incorrectly been taken by many in the sector to authorise an 'NDIS price' for their services, which is often inflated above actual costs. (sub. 161, p. 101)

[22] Including: ACT Government (sub. 156); Anglicare Australia (sub. 157); Belinda Jane (sub. 80); Disability Services Australia (sub. 9); Disability Services Commissioner Victoria (sub. 35); National Disability Services (sub. 51); Scope Australia (sub. 72); and Victorian Government (sub. 174).

Given that the most recent price review by the NDIA has only just concluded (with new prices to take effect on 1 July 2017), the Commission has not made any findings or recommendations about the adequacy of prices at this stage.

Box 6.3 Study participants' views on NDIS price caps

Many providers gave anecdotal evidence to the study about the NDIS price caps being too low to provide services, with a particular focus on the price cap for an hour of attendant care. Estimates of the shortfall between what was needed against what the cap offered varied considerably.

- House with No Steps (sub. 104, p. 3) indicated a shortfall of about 10 per cent.
- Belconnen Community Service Board (sub. 39, p. 1) indicated a shortfall of between 10.5 and 16.0 per cent.
- Cohealth (sub. 50, p. 11) indicated a shortfall of 98 per cent for those with mental health needs.

The Commonwealth Ombudsman provided an anecdote in relation to wages relative to other care sectors.

> … at a recent consultation a provider told us they could bill around $10 per hour more for providing in-home domestic assistance for aged care clients than they could for providing the same service to an NDIS participant. They suggested it was difficult to understand the rationale for this difference and said it created a risk that service providers would focus their service provision on areas that were more financially sustainable, leaving NDIS participants with even fewer choices. (sub. 137, p. 14)

While these anecdotes are helpful, data and evidence on how the overall market is responding to price caps are limited.

A survey by National Disability Services in partnership with Curtin University found that 67 per cent of respondents reported that they were worried that they would not be able to provide services at the prices being offered under the NDIS. And 46 per cent advised that to provide services at the prices being offered by the NDIA, they would have to reduce the quality of service (NDS 2016, p. 19). Although 55 per cent of disability support organisations reported making a profit, only 40 per cent of respondents budgeted to make a profit in 2016-17 (NDS 2016, p. 14).

Another report applied assumptions in the pricing model that it considered to be more representative of what could be achieved by disability support providers. It found that the price cap on an hour of attendant care would have to increase by approximately 13 and 25 per cent for providers to continue to provide care of a reasonable quality (Samaritans Foundation, in Anglicare Australia, sub. 157, att. 4, p. 1).

Should the NDIA set prices?

Regardless of the effectiveness of the NDIA's price caps to date, a question that needs to be asked is whether the NDIA should be setting prices. Even though it is an independent statutory agency, the NDIA's roles of funder and purchaser of supports, market steward and guardian of financial sustainability mean that it has a potential or perceived conflict when setting prices.

Typically, agencies such as the NDIA are not placed in such a position when managing human services provision. This was noted by the ANAO in its audit of the performance of the DSS' and NDIA's management of the transition of the disability services market.

> … the NDIA's dual roles in the market as both a funder or 'purchaser' on behalf of governments, and as a price 'regulator' presents a conflict of interest which needs to be transparently managed. In other (largely public-provided) sector transformations such as the establishment of the national energy market, governments have progressively taken steps to establish independent pricing regulators, for all or part of the market's operations where public interest concerns remain. In a similar human service delivery market, the Aged Care Financing Authority provides independent advice to government on funding and financing matters.
>
> In the context of entities' analysis of NDIS market arrangements, and advice to governments' on the NDIS market design, the ANAO could find no evidence that the implications of these dual market roles for the NDIA had been actively examined. (2016, p. 30)

This concern was shared by the DSS (sub. 146, p. 39), who suggested that while the NDIA is best placed to continue to set NDIS prices in the short term, consideration should be given to prices being set by an independent pricing authority in the medium term (ideally within the next five years). The New South Wales Government (sub. 60, p. 8) queried whether prices should be set by the NDIA, when the independent regulation of prices has assisted market development in other sectors. The Victorian Government (sub. 174, p. 19) also emphasised the need for prices to be set independently.

Is there a better way to set prices?

A fundamental tenet of the NDIS is for prices to be driven by the market in the long term. While price caps are only meant to be transitional, if set inappropriately, there is the risk that the NDIA's pricing decisions 'make the market', rather than allowing the market to develop in a way that reflects the needs (and goals) of participants. To avoid this outcome, price controls need to be evidence-based, set transparently and determined independently.

Evidence and transparency are essential

As the NDIS disability support market is still developing, the evidence base needed to determine the appropriate price controls is limited. This is reflected in the NDIA's approach, which includes consultation with the disability support sector.

> In the roll-out phase of the NDIS, the NDIA is adopting a cautious approach to price controls in the absence of information on the competitiveness of markets for supports. (NDIA 2017a, p. 5)
>
> Price control decisions are informed by significant input from market stakeholders through regional forums, targeted workshops, individual discussions and responses to discussion papers. (NDIA, sub. 161, p. 100)

This approach is consistent with the Office of Best Practice Regulation's recommendation that the NDIA:

> … continue to make its decisions about the setting of reference prices transparent, continue to work with the NDS to collect information on the costs of providing supports, and continue to monitor the impacts of reference prices on existing providers. (2015, p. 43)

There is some evidence that the NDIA has responded to market circumstances and feedback. For example, the NDIA increased price caps for personal care and community supports by about 10 per cent in 2014 and 2015 at some NDIS trial sites (ANAO 2016, p. 47).

However, some providers argued that they have had no real opportunity to provide feedback on pricing decisions. For example, House with No Steps (sub. 104, p. 4) said that there was a 'lack of real consultation by the NDIA with service providers', and that they had never been formally consulted on any matter (including prices), despite being one of the largest providers nationally.

> Our frustration is that this pricing is relatively easily and transparently modelled in an Award environment. Such modelling, if publicly shared, would move the discussion from the inadequacy of a 'black box' number to an informed discussion around cost drivers such as staffing mix, management spans of control and overhead levels. We understand such modelling has been carried out by the NDIA and independent actuaries and, if so, do not understand why the output of those modelling exercises has not been made public or reflected in NDIA pricing. (sub. 104, p. 3)

These frustrations extend to a lack of usable information about prices needed to provide meaningful feedback.

> The NDIA's process for pricing services of various kinds has been difficult for non-government stakeholders to understand or contribute to … Providers have also been largely unable to provide detailed advice in response to any consultations either during or subsequent to the RCM's development. To build the NDIA's evidence base for 'a market price' for psychological services, Mental Health Australia asked the NDIA to check the assumptions in the model with providers, but to our knowledge this did not occur. (Mental Health Australia, sub. 155, p. 22)

Concerns about a lack of transparency and consultation appear to be shared by many others (not just providers) — including the Health Services Union (sub. 132, p. 10), the ACT Government (sub. 156, p. 27) and the ANAO (2016, p. 13). As part of its most recent price review, the NDIA said that it had received feedback from stakeholders that there was:

> … a lack of transparency on the assumptions and methodology used to calculate price controls (which could affect discussion about how price arrangements relate to other parts of the NDIS, as well as debate about the price controls themselves). (2017a, p. 7)

To address this lack of transparency, the NDIA released additional information about pricing as part of the latest pricing review (NDIA 2017a). That said, the price-setting process remains largely opaque. Submissions to the price review process are not made public, nor is it clear how the material is used. Details about the operation of the RCM are not in the public domain.

The lack of transparency around prices is at odds with the practice of independent price regulators in other sectors.[23] It is also inconsistent with the Commission's 2011 recommendation that the NDIA's recommendations to change prices should be transparent, if the Agency is to set prices (PC 2011, p. 412). Transparency is important to impose discipline and public accountability in setting prices, as well as to increase credibility and certainty of price signals, which assists with forward planning and investment by providers. It also creates greater incentives for new providers to enter the disability support market, and helps build community confidence that the prices for supports are fair and reasonable for providers, participants and taxpayers. A lack of transparency can erode this confidence, and put the scheme at risk.

An independent price regulator

The transition period of the scheme represents an opportunity to resolve concerns about the NDIA's perceived conflict of interest and lack of transparency in price regulation. It is also an opportunity to provide greater certainty to providers about how and when price deregulation will occur, which is a key milestone in moving to a market-driven approach.

The Commission considers that prices for disability supports should be deregulated in three stages. In the first stage, the NDIA would maintain its role of price regulator, and an independent price monitor would be introduced with responsibilities, including to:

- examine how the market is responding to price caps set by the NDIA
- review the NDIA's price caps based on the available evidence, including submissions made to the NDIA's price reviews, and making comparisons with prices in other care sectors (including aged care)
- report publicly on its assessment of the NDIA's price controls with regard to market development and participant outcomes.

This monitor should be put in place immediately to serve as a 'check and balance' on the NDIA's pricing over the crucial transition period. The monitor would improve transparency on how price caps are set, and in turn, lead to greater accountability to participants, providers and the wider community.

The second stage is to shift the NDIA's price-setting powers to a regulator that is an independent statutory authority — an approach consistent with the evolution of other markets for consumer-directed care, such as in the aged care sector. This would allow the NDIA to focus on its core responsibilities of delivering and administering the NDIS; remove any potential conflict of interest; and help address concerns about a lack of transparency in price regulation.

[23] For example, aged care (Aged Care Pricing Commissioner), electricity and telecommunications (Australian Competition and Consumer Commission), minimum wages (Fair Work Commission) and hospitals (Independent Hospital Pricing Authority).

At this time, the Commission envisions that the independent price monitor would be best placed to take over these pricing powers, as it would have developed the knowledge and expertise necessary to understand the disability support market.

The body tasked with price regulation for scheme supports (including the NDIA while it remains the price regulator) should, among other things:

- collect and publicly report data on providers' characteristics and costs — public reporting of this data would provide a benchmark for providers, inform public debate about prices, and facilitate relevant research by external parties
- communicate with disability support providers, participants and the NDIA to transparently set prices at regular intervals, with sufficient time for providers to phase in price changes
- periodically review and publish its price model for transitional and efficient prices in a transparent and comprehensive manner
- send granular and targeted price signals — that is, provide prices at the state and territory level, with an expectation that prices could be set at a more disaggregated regional level where possible
- assess and recommend — on the basis of transparent consultation and evidence — when prices for particular NDIS supports in each region should be deregulated, and evaluate whether there is a need for price controls. To enable efficiencies to be driven by the market wherever possible, the price regulator should presume that it is appropriate for prices to be deregulated — that is, to only have price controls when there is clear evidence that unregulated prices are likely to lead to inflation that would harm participants.

Pricing of NDIS disability supports should be transferred to the independent body by 1 July 2019. This is important for providing certainty to the sector of a transparent pricing regime. There is also an expectation that price regulation will be required for some supports over the medium to long term.

The third and final stage of deregulation will occur when the price of a given disability support is deregulated, but is still subject to subsequent monitoring. The independent price monitor would maintain an ongoing watch on pricing, collect data, and publicly report on emerging market issues that affect the purchasing power of scheme participants. The pricing role of the independent regulator would gradually diminish (and revert to a monitoring role) as the market develops over time.

DRAFT RECOMMENDATION 6.1

The Australian Government should:

- immediately introduce an independent price monitor to review the transitional and efficient maximum prices for scheme supports set by the National Disability Insurance Agency (NDIA)
- transfer the NDIA's power to set price caps for scheme supports to an independent price regulator by no later than 1 July 2019.

The body tasked with price regulation for scheme supports should:

- collect data on providers' characteristics and costs. This should include appropriate funding to continue the business characteristics and benchmarking study currently undertaken by National Disability Services and Curtin University
- determine transitional and efficient prices for supports at a state and territory level
- comprehensively review and publish its price model on an annual basis. This review should be transparent, have public consultation, be evidence-based and evaluate the effectiveness of prices in meeting clearly-defined objectives
- assess and recommend when to deregulate prices for supports, with particular regard to the type of support and region, on the basis that prices should only be regulated as narrowly, and for as short a time, as possible.

6.3 Thin markets

The market-based model for disability supports is designed to encourage the provision of more supports that people with disability want and need than under previous arrangements (PC 2011, pp. 111–156). However, there are still going to be cases when the disability support market remains too small (in terms of the number of providers or participants) to support the competitive provision of services. This outcome is known as a 'thin market'.

There are a number of negative consequences of thin markets. Insufficient supply may lead to higher prices, less variety, lower quality services and unmet demand. In the disability support sector, thin markets can result in poor participant outcomes, increased demand for mainstream services, and greater pressure on informal carers. Scheme costs are also affected — while they may be lower in the short term (due to underutilisation of supports), they may be higher in the long term if participants are not receiving the right supports at the right time. For these reasons, governments often need to — and do — intervene in thin markets to ensure the supply of disability supports for people with disability.

When will thin markets arise in the NDIS?

Thin markets can arise in places or for particular disability supports when demand is limited and the cost of supply is high. The NDIA and COAG Disability Reform Council

both noted that thin markets are most likely to occur in rural and remote areas, and for specialised supports, such as aids and equipment (DRC 2015a, p. 19; NDIA 2016k, p. 15). Participants in this study also identified access problems for particular groups of people with disability, including some participants:

- living in outer regional, remote or very remote areas[24]
- with complex, specialised or high intensity needs, or very challenging behaviours, such as those with psychosocial disabilities[25]
- from culturally and linguistically diverse (CALD) backgrounds (ECCV, sub. 31)
- who are Aboriginal and Torres Strait Islander Australians (GIFSA, sub. 13; OPG of the Northern Territory, sub. 143; VACCHO, sub. 162; and Northern Territory Government, sub. 205)
- who have an acute and immediate need (crisis care and accommodation) (Anglicare Tasmania, sub. 145, pp. 46–47).

Given the early stage of the transition, it is difficult to tell where thin markets may be diminishing, growing or persisting under the NDIS. Even when thin markets do occur, it is not necessarily the case that the NDIS is responsible for them. Thin markets were a feature of disability support arrangements previously, as well as in many other human services (PC 2011, pp. 115–156, 2017). What is important is that the appropriate and timely policies are put in place to minimise their incidence and impact on participants and providers. This is especially the case as the interface with other mainstream services evolves (chapter 5). Thin markets will remain a feature of the provision of some disability supports under the NDIS (box 6.4).

[25] Including: Carers Australia Victoria (sub. 131); Department of Health (sub. 175); DSA (sub. 9); and Leadership Plus (sub. 128).

Box 6.4 Evidence of thin markets under the NDIS

Thin markets for disability supports have long been an issue for some groups and in some regions. The structure of these thin markets means that many will persist under the National Disability Insurance Scheme (NDIS). This is particularly the case for people with disability who live in rural and remote areas, and early evidence from the scheme appears to confirm this.

- The NDIA (2016c, p. 34) deemed there to be supply risks for therapy supports (a specialised support) to be more acute in regional areas in southern New South Wales.
- The DSS (sub. 146, p. 37) said that there was early anecdotal evidence of thin markets for personal care support, participants with complex needs, early childhood and employment supports.
- A National Institute of Labour Studies survey found that unmet demand was experienced more by NDIS participants living in rural and remote areas in the Victorian trial site and for older NDIS participants, particularly those living in regional areas (Mavromaras, Moskos and Mahuteau 2016, p. xi).
- In some service regions, the increase in the value of support packages is forecast to grow more quickly than the growth in participants (NDIA 2016p, pp. 10–12, 2016aa, pp. 10–12). This could reflect a lack of supports and more unmet demand for these participants.
- In South Australia, almost one-third of NDIS participants are expected to reside outside of Adelaide (NDIA 2016y, p. 25); however, the NDIA observed that there was a lack of provider choice in remote and very remote areas in South Australia, with participants often dependent on a key support worker (NDIA 2016y, p. 26).
- Participants in the Barkly region in the Northern Territory had the third highest level of unutilised funding — 41 per cent in 2014-15, and 64 per cent in 2015-16 (NDIA 2017m, p. 29). However, underutilisation may be due to a number of factors other than unmet demand (chapter 2).
- In the Northern Territory, there appears to be a shortage of supports for physical disabilities. As at 30 June 2016, only one per cent of active registered providers in the Northern Territory provided physical wellbeing services, but 27 per cent of participants with an approved plan in the Barkly trial region were identified as having a physical disability (NDIA 2017m, pp. 10, 22). The NDIA noted that:

  > Given the much higher level of physical disability in the Territory as compared to … [Victoria and New South Wales], the number of providers registered to provide physical wellbeing supports appears to be low. (2017m, p. 21)

How can thin markets be minimised?

One of the challenges of addressing thin markets is that while they share some common characteristics, often they have very specific and different causes. A ‘one-size-fits-all’ approach will not to be feasible or effective. A more tailored response that considers the complexities of dealing with the wide variety of thin markets is required, taking into account issues such as the presence of CALD and Aboriginal and Torres Strait Islander

communities; quality of infrastructure; weather events and population density.[26] In practice, it means that standardised approaches to pricing may not be effective to encourage supply in some thin markets. This is reflected in the diversity of options that can be used to address thin markets (box 6.5).

There are costs associated with government intervention to minimise under-provision of disability supports in thin markets. In addressing thin markets, it is necessary to balance the trade-off between providing cost-effective service provision, and providing as flexible a service as possible to enable participant choice and control.

The NDIA's recently published Rural and Remote Strategy (NDIA 2016x), and Aboriginal and Torres Strait Islander Engagement Strategy (NDIA 2017b) both reflect the need to provide disability supports in a way that allows for as much choice and control for participants as possible, and to enable innovative methods of service delivery.

Such an approach is also reflected in the Bilateral Agreement between the Northern Territory and Australian Governments on the transition to the NDIS, as the Northern Territory has historically faced particular challenges in providing human services due to thin markets (PC 2017). It was agreed that the Northern Territory's approach to the transition would be guided by the following principles:

- place-based, tailored solutions to planning, market development, access to services and risk management
- a coordinated, client-centred, and tailored approach to the operating model in remote communities, informed by existing effective frameworks that maximise access, engagement and management of risk for individuals
- culturally competent engagement and professional practices
- local planning, market development and risk management strategies informed by timely and appropriate data (Australian Government and Northern Territory Government 2016, p. 4).

[26] For example, scheme participant density in the Northern Territory (except the Darwin urban service region) in 2020 is expected to be less than five participants per 100 square km (NDIA 2017m, p. 14). Despite remoteness price loadings, some providers in Queensland also reported to the NDIA that recent new providers were concentrated in major population centres such as Townsville, Cairns and Mackay (NDIA 2016w, p. 33). The Commonwealth Ombudsman (sub. 137, p. 16) also noted that some existing providers who specialise in providing services for CALD and Aboriginal and Torres Strait Islander people with disability may not be able to make the transition, due to registration barriers and insufficient cash reserves to transition to fee-for-service.

Box 6.5 Different approaches to address thin markets

There are a number of measures that could be used to mitigate the risks of thin markets, including:

- partial or full block-funding to commission or procure services (PC 2011, pp. 521–523). Goldfields Individual and Family Support Association (sub. 13, p. 12) said that removing block-funding would likely result in an 'almost complete loss of services on the very remote Lands.' Many study participants said that block-funding is the most efficient way to ensure that needs are met (Centacare Brisbane, sub. 44; Australian Blindness Forum, sub. 48; Cohealth, sub. 50; and Anglicare Tasmania, sub. 145)
- sharing of infrastructure, knowledge, skills and experience among providers
- facilitating bulk-purchasing arrangements by participants — for example, by pooling of participants' funds (Mallee Track Health and Community Service, sub. 6; PC 2017)
- more collaboration, coordination and integration of services, particularly with local and mainstream service providers — to avoid supply gaps or duplication (CADR 2014, p. 15; RACGP, sub. 200). Providing more hours of support coordination in participants' packages should also be considered, particularly for those with complex needs (Alzheimer's Australia, sub. 10, pp. 9–10). Brain Injury SA (sub. 116, p. 14) emphasised the need for effective coordination of services between State (and Territory) and Australian Government providers
- use of community- or place-based services (PC 2017) — including greater use of the local workforce where possible
- greater use of information technology, including videoconferencing, telehealth and other technologies, particularly for therapeutic supports (NDIA 2016z, p. 28; APA, sub. 93; Amaze, sub. 160)
- the NDIA providing more detailed information on market demand (and unmet demand) to encourage providers to enter thin markets
- cultural training, education and awareness programs (Brain Injury SA, sub. 116; Commonwealth Ombudsman, sub. 137) — including greater funding of translators and interpreters (Goldfields Individual and Family Support Association, sub. 13; Cohealth, sub. 50; SDN Children's Services, sub. 73; and Companion House, sub. 84)
- more support and respite care for informal carers (chapter 7)
- greater engagement with the local community to build trust and relationships.

What is being done to address thin markets?

Based on the experience of the NDIS trial sites (particularly the Barkly trial in the Northern Territory), the NDIA said that it would consider a range of approaches to mitigate the risk of thin markets, including:

- active and deliberate cross-government collaboration — including the use of locally-based workers, and educating the community about the interface between health services and disability supports
- leveraging established community organisations (such as those already operating in health, aged and community care sectors) who may also deliver disability services

- supporting a provider to access supports from business councils, Indigenous Business Australia, or any other organisation in the Aboriginal and Torres Strait Islander business capacity-building sector
- using the hub and spoke model (also known as scaffolded support) — where generalist providers provide support in the rural or remote community, and where needed, can collaborate or seek oversight from an advanced practitioner or specialist centre, either through a visiting clinic or telepresence
- working with existing mainstream providers to expand their services to better meet the needs of participants — such as plan management services by local accounting services and re-purposing underutilised infrastructure (sub. 161, pp. 105–106).

These approaches rely heavily on the commercial decisions of providers (such as the type of workforce, the decision to deliver disability services, and service delivery business models). They also appropriately reflect an attempt to make the market-based, consumer-driven approach succeed where possible — with more interventionist alternatives a last resort.

The NDIA (sub. 161, p. 106) noted that 'some providers are thinking creatively about supply in thin markets', including by diversifying into associated areas to provide additional business income, and forming business relationships between urban and remote businesses.

While the details of how providers are to be encouraged to supply thin markets are not yet clear, the Commission understands that the NDIA and DSS are jointly developing a more detailed Market Intervention Framework to address thin markets, which is being negotiated with each jurisdiction (NDIA 2016k, p. 15, 2016x, p. 26). This framework will be released later in 2017.

Given that the NDIS is already in the transition phase, there is a risk that thin markets will persist or worsen in the absence of timely strategies and intervention by the NDIA. There is a growing need for the NDIA to clarify and implement practical measures to mitigate the risks to participants associated with thin markets, particularly with the withdrawal of in-kind supports by governments (DSS, sub. 146, p. 37).

Interventions need to be tailored to the specific circumstances of each case — such as user characteristics, the broader service landscape, resource constraints and effects on the wider community (PC 2017). The diversity of user needs also means that a 'one-size-fits-all' solution will not be effective in addressing access issues. As a result, it is inappropriate to automatically default to block-funding, direct commissioning or mainstream services (particularly acute or primary health care services). While it is likely that block-funding will be needed in some cases (PC 2011, pp. 521–523), care must be taken to avoid crowding out competition.

Regardless of the approach chosen, there will be a need for strong market stewardship (PC 2017), and collaboration between the Australian, and State and Territory

Governments, given the latter's knowledge and experience as funders and providers to date. Addressing thin markets requires a whole of government approach and community involvement.

As noted by the Commission in 2011, it will not always be possible to match the price, quality and range of services in the major cities (PC 2011, p. 529). Some participants may need to travel (and in some cases, move) to metropolitan areas to access highly specialised services. This highlights the need for complementary services, such as transport to access specialised disability care, to be provided either in a participant's plan or outside of the NDIS where appropriate (chapter 5). Improving access for participants in thin markets is a key objective of the NDIS, but it is an ongoing task requiring constant vigilance, monitoring and evaluation (box 6.6).

DRAFT FINDING 6.1

In a market-based model for disability supports, thin markets will persist for some groups, including some participants:

- living in outer regional, remote and very remote areas
- with complex, specialised or high intensity needs, or very challenging behaviours
- from culturally and linguistically diverse backgrounds
- who are Aboriginal and Torres Strait Islander Australians
- who have an acute and immediate need (crisis care and accommodation).

In the absence of effective government intervention, such market failure is likely to result in greater shortages, less competition and poorer participant outcomes.

Box 6.6 Addressing thin markets requires data and ongoing public reporting

Mitigating the effects of thin markets (and informing associated funding arrangements) will require more transparent identification, reporting and evaluation of thin markets than at present. Planning, evaluation, monitoring and feedback systems (as well as commissioning practices) are discussed in the Commission's current inquiry into Human Services. Specific key performance targets and indicators (both outputs and outcomes) need to be developed, and the relevant data collected, to ensure the equity, effectiveness and efficiency of disability supports and thin market strategies. This was recognised by the Joint Standing Committee on the NDIS for services in rural and remote areas, which recommended that:

> … all options to develop a market that provides choice and control for participants in rural and remote areas be explored, and that any additional funding for disability in the Northern Territory to any provider is conditional on measureable increases in service provision. (2015, p. 78)

The Northern Territory Government also emphasised the need for more granular data.

> The availability of more granular data is particularly important to enable monitoring of the Scheme's roll out in remote regions and thin markets – where the NDIS market-based model is most challenging to implement. Detailed regional level data is also important to inform service providers to enable localised market growth and development (e.g. client base, size of market, and service provider gaps). (sub. 205, p. 3)

As a starting point, the type of information that could be collected in the monitoring of thin markets (including through Local Area Coordinators and current feedback mechanisms in the NDIS) could supplement current reporting to COAG under the National Disability Strategy. In particular, reporting in each thin market could better reflect similar measures reported by the Commission as part of the National Disability Agreement, including:

- participation rates — such as the number of eligible participants; the severity and nature of disabilities; and other participant characteristics. The Joint Standing Committee on the NDIS (2015, pp. 62–67) noted a lack of data for participants who are from culturally and linguistically diverse backgrounds, as well as for Aboriginal and Torres Strait Islander Australians
- access or support use by participants — including utilisation rates; the number of providers, workers and supports; as well as market concentration
- appropriateness of supports — for example, whether supports were delivered in a culturally and linguistically respectful manner in accordance with the NDIA's Aboriginal and Torres Strait Islander Engagement Strategy
- quality of services — such as reporting the satisfaction rate of participants and carers, and any complaints under the NDIS Quality and Safeguarding Framework (and State and Territory Government quality and safeguard regulations in the interim)
- cost per unit of output — including government and NDIA contribution per participant, and forecasts of future costs per participant. This would also be consistent with the insurance-based approach of the scheme
- participant outcomes — such as choice and control; economic or social participation; and use of other services by people with disability (including mainstream services and informal support) (SCRGSP 2017, p. 15.1-15.39).

Timely and ongoing data collection is particularly important as the NDIA's online platform (eMarketPlace) is still being developed (chapter 8).

What if there is no market? The Provider of Last Resort

The NDIA does not directly supply individualised supports to participants, but there are times when it may take a direct role to ensure that services are provided. This might occur in very specific and exceptional circumstances when providers are unwilling or unable to supply disability supports under NDIS policy settings, for example, when:

- participants cannot access disability supports — there is no provider, or the only external provider is likely to fail in circumstances that would leave participants at risk (such as in remote locations)
- supports are not available at reasonable prices — this might be true for participants with highly complex needs or challenging behaviours, or in emergency situations when supports are needed at short notice
- it is difficult to verify that external providers are genuinely achieving good quality outcomes for participants or their carers
- there are significant economies from combining or coordinating several services together, and where the government has an advantage in supplying the package of services ('economies of scope') — this might apply to participants who are Aboriginal and Torres Strait Islander Australians, where governments might have to deal with multiple levels of disadvantage (housing, health, education, urban amenity, employment, transport and disability) (NDIA 2016k, pp. 26–27; PC 2011, p. 409).

The principles that should govern provider of last resort (POLR) arrangements were considered by the Commission in 2011. The Commission noted that POLR needed to be subject to the same regulatory oversight and monitoring as other providers in the scheme, and that block-funding of providers should only be used when fee-for-service was proven to be infeasible to ensure the supply of supports (PC 2011, pp. 523–526).

The Commission also emphasised the need for POLR arrangements to be contestable and at arm's length from the commissioning body, and when block-funding is judged to be the preferred method, that the NDIA should develop standardised tendering, contracting, reporting and acquittal requirements in order to reduce compliance costs (PC 2011, pp. 523, 528). Importantly, it is not the role of the NDIA to support failing providers in thin markets, but to ensure the supply of disability supports for participants in the most effective and efficient way.

The POLR arrangements for the NDIS are still being developed by the NDIA, but appear consistent with the Commission's views in 2011 (box 6.7). However, the delay in formalising these arrangements is resulting in uncertainty for both participants and providers.

The NDS stated that POLR arrangements under the NDIS are:

> … currently poorly articulated and are inadequate. This needs to be addressed, ideally through the NDIA establishing emergency response agreements with a number of disability support providers across the country. (sub. 51, p. 16)

Box 6.7 The NDIA's provider of last resort arrangements

What is the provider of last resort (POLR)?

As a market steward, the NDIA is responsible for POLR arrangements. When there is a significant risk of insufficient market supply; when no provider is available; or in the event of provider failure (for example, if the *only* local provider for a range of disability support services in a remote community goes into administration), the NDIA may directly commission and procure disability supports for scheme participants. Triggers are likely to include:

- insufficient, volatile or uneven supply — in a particular geography, market segment or service type, potentially due to lack of scale or providers being active in that market
- evidence of inappropriate use of market power — for example, constraints to competition or lack of consumers exercising choice
- insufficient quality at a reasonable price
- benefits for greater return on investment from arrangements other than individual commissioning.

A provider contracted as a POLR will need to meet agreed quality standards and ensure that services are delivered in an appropriate and culturally competent way. The provider may also need to leverage existing infrastructure. The NDIA considers POLR arrangements to be a highly interventionist form of market intervention.

Who is responsible for the POLR?

As the transition leads to full scheme, the NDIA will lead an integrated response jointly with the States and Territories. In the interim, the States and Territories lead as POLR, and will continue to do so for providers who they fund during transition (except for the Northern Territory, where the NDIA is responsible for ensuring POLR services even in the transition period pursuant to Schedule K of the Northern Territory Bilateral Agreement). The Agency noted that identification and response to such market failure will require collaboration among all NDIS stakeholders.

What does the POLR involve?

The POLR framework forms part of the NDIA's broader *Market Intervention Framework*. Both are currently being developed by the NDIA and DSS, and negotiated with each jurisdiction. It is expected that in 2016-17, the NDIA will agree to POLR processes, and that by 2018-19, there will be a maturity of POLR capabilities, to potentially include a range of response options, such as panels in relevant jurisdictions or submarkets capable of providing emergency capabilities at extremely short notice.

Sources: NDIA (2016k, 2016x).

Some guidance about POLR arrangements has been included for scheme participants in the Northern Territory. In the Bilateral Agreement between the Australian and the Northern Territory Governments on the transition to the NDIS, it was agreed that the NDIA would

be responsible for ensuring that POLR services are in place for all participants in the Northern Territory (Australian Government and Northern Territory Government 2016, p. 1, Schedule K). The bilateral agreement also includes principles on how these arrangements are to work (risk, transparency, person-centred approach, non-exclusivity, barriers to entry, supply of services and end of service arrangements) (Australian Government and Northern Territory Government 2016, p. 2, Schedule K). It also stipulated that 'solutions will be established to avoid inappropriate default to the acute medical system as the provider of last resort' (Australian Government and Northern Territory Government 2016, p. 2, Schedule K). Some have commented that this detail has not been sufficient to ensure that POLR arrangements are in place (and what they would entail).

> The State Committee is further concerned the POLR [provider of last resort] commitment is behind in its conceptual and operational planning in line with the rollout schedule and ambiguous to members on what these provisions mean in terms of their own business planning and existing services.
>
> We ask that urgent attention be given to clarify the POLR aspect of the NT Bilateral Agreement so as to further mitigate the risk of market failure. (TEAMhealth, sub. 102, p. 22)

The Northern Territory Government (sub. 205, p. 6) said that it is working with the NDIA to develop the POLR framework, which once developed, could have broader application nationally. The need for greater clarity on how POLR and thin market arrangements more generally are to be put into practice is increasing, particularly as governments change their involvement in providing disability and mainstream supports (chapter 5).

The Commission is seeking feedback on when particular measures should be used to provide services in thin markets, when POLR arrangements should be used, and any other information on ways to address thin markets.

INFORMATION REQUEST 6.1

In what circumstances are measures such as:

- *cross-government collaboration*
- *leveraging established community organisations*
- *using hub and spoke (scaffolding) models*
- *relying on other mainstream providers*

appropriate to meet the needs of participants in thin markets? What effects do each have on scheme costs and participant outcomes? Are there barriers to adopting these approaches?

Under what conditions should block-funding or direct commissioning of disability supports (including under 'provider of last resort' arrangements) occur in thin markets, and how should these conditions be measured?

Are there any other measures to address thin markets?

6.4 Other factors affecting provider readiness in transition

The NDIS is a new system for existing providers, and is creating a new market for all participants and providers in the disability support sector. And there are several transitional issues affecting the sector's supply response. These include:

- challenges faced by providers who were previously block-funded
- administrative burdens associated with the scheme
- the effect of supports that are provided 'in-kind' by governments to the scheme
- the scheme's effect on collaboration among providers.

Moving from block-funding to fee-for-service

As detailed in table 1.1, providers received government funding *before* providing certain supports in 'bulk' to participants prior to the NDIS. This usually took the form of lump sum payments for each participant under annual contracts that were paid three months in advance (AONSW 2017, p. 7). Providers now claim reimbursement from the NDIA *after* providing individualised supports to scheme participants. The majority of support items are based on per hour, or 'per instance' of service provided (NDIA 2016l, 2016m, 2016n, 2016o).

Providers face significant challenges to adapt to the new fee-for-service model, and some may not be able to make the transition. Providers bear increased financial risk (such as from non-payment and late payment) and in turn, have a greater need for cash reserves, making it harder to maintain liquidity and solvency (DSS, sub. 146, p. 37). The NDS (2015, p. 17) stated that 'the majority of not-for-profit disability service providers report insufficient cash flow required to transition to the NDIS.' Providers will incur specific fixed costs to restructure and adapt their business to the NDIS market. Costs may relate to unit pricing, IT, accounting, marketing and the provision of individualised supports.

While these costs are likely to be significant given the scale and nature of the required changes (particularly for small providers, and there are many of them in the disability support sector (box 6.8)), they are better addressed by the price received for supports than the payment method (PC 2011, p. 520). In general, the need to cover fixed costs is not a reason for government intervention (PC 2011, p. 523). Fixed costs are also likely to be a transitional issue for a number of reasons.

- The introduction of innovative payment systems by some financial intermediaries may reduce some of the financial risks of the fee-for-service model and help providers adapt to the new system (Eyers 2017).

- Price deregulation will help providers recover their fixed costs, as prices will more accurately reflect the cost of supply, and fixed costs will be driven by consumer preferences (PC 2011, p. 520).
- Providers may be able to use different pricing methods to efficiently recover fixed costs (such as discounts for regular users, or for periods where demand is lower) (PC 2011, p. 521).
- The experience of providers in comparable and adjacent sectors in the economy (including aged care) that moved from block-funding to fee-for-service as part of consumer-directed care reforms also suggests that adjustment can and will take place in the medium to long term. As the NDIA observed:

  > Similarly, aged care providers are undergoing their own reforms related to consumer-directed-care and many businesses are leveraging this experience to build services and products relevant for the disability market. (2016aa, p. 5)

Box 6.8 Small providers can face big challenges to transition

A feature of the disability support sector is that many providers are small (Martin and Healy 2010, p. 122). National Disability Services estimated that about 58 per cent of providers are either small or very small (with a turnover of $5 million or less) (Gilchrist and Knight 2017, p. 10). And about 39 per cent of NDIA-registered providers are individuals or sole traders (NDIA 2017o, p. 38). Small providers may have less capacity to make the transition to the NDIS than larger providers. For example, they face challenges from:

- proportionately higher fixed costs of operating in the NDIS, especially as they must incur new marketing and systems costs
- achieving economies of scale or scope, with total costs spread more thinly across smaller hours of support, particularly with the shift to more individualised or tailored supports.

The scale of these challenges may be inferred by the amount of merger and acquisition activity in response to the challenges of being a small provider. Merger activity and restructuring in the sector provides some indication that this may be the case (NDS 2016, p. 17), although it is unclear whether this has led to an actual increase in services or substantially reduced competition.

The Commission heard that some providers are delaying making changes to their business model and planning decisions (including investment) because of uncertainty and lack of clarity, particularly about the timing of price deregulation and the withdrawal of in-kind services (ANAO 2016, p. 32). About 75 per cent of providers surveyed by the NDS felt that 'the policy environment is uncertain' (NDS 2016, p. 19). One provider surveyed by the NDS commented that:

> The uncertainty around 'how much we will be able to receive' once NDIS is implemented in our region means that the climate for any investment is too uncertain, because we cannot make a reliable business plan. (NDS 2016, p. 10)

The Office of Best Practice Regulation also noted that:

> … ongoing engagement with providers when developing reference prices and maximum prices, particularly for key supports, should help providers during the transition to a fee-for-service based system of disability care. (2015, p. 49)

Better information and communication by the NDIA would assist, as will independent price monitoring (recommendation 6.1).

Administrative burdens

There are a range of regulatory and other costs to provide supports. As the NDIA (2016k, p. 9) noted, there are 'high costs to enter the marketplace'.

Regulatory costs include those to register with the NDIA, and costs associated with ensuring quality and safety of supports. These include professional registration (in the case of specialised services, like therapeutic supports), working with children checks, and police checks. These costs are necessary to ensure safe and high quality support provision for NDIS participants. The recently developed NDIS Quality and Safeguarding Framework (which will only apply to NDIA-registered providers) aims to provide a nationally consistent set of regulations on what providers need to do to provide disability supports (chapter 9). Increased regulatory consistency across jurisdictions should mean lower costs for some providers.

Concerns were also raised by a number of study participants about the NDIA's online payment system and communication issues with the NDIA. As Catholic Social Services Australia said:

> Though CSSA [Catholic Social Services Australia] member agencies have been preparing for transition to the NDIS for a long time, the dysfunctionality and un-preparedness of the NDIA has severely affected its capacity to deliver sustainable services through the NDIS. Complex and ongoing issues with the portal (including the system being taken down for weeks at a time with very little notice) means that providers are finding it very difficult to access the funds for services provided. These cash flow issues have restricted providers' ability to invest, innovate and even operate (for example one agency providing significant disability services in a trial site had $1 million 'stuck' in the portal in December 2016). This has led to cash flow issues and providers withdrawing due directly to pricing or lack of payment. (sub. 166, p. 9)

The problems associated with the online portal have been examined in some depth by others (ANAO 2016, pp. 62–71; Conifer and McKinnon 2017; PwC 2016), and were recognised by the NDIA (sub. 161, p. 119). The Agency indicated that it is reforming its processes to improve the 'provider pathway', including registration and payment arrangements, and is also delivering tailored information sessions for providers.

> The NDIA is working to improve the quality and amount of information available to providers in all elements of the provider pathway (awareness, commercial assessment, registration process (including the impacts of the move to the national arrangements being led by DSS),

> service planning and delivery, payment and claiming outcomes) so that providers are better placed to meet expectations and develop their service offer under the NDIS. (sub. 161, p. 102)

Payments to providers need to be timely so that innovation, entry and the supply of supports are not hampered.

Competition and in-kind services

Under Bilateral Agreements between the Australian, and State and Territory Governments, government funding of the NDIS is a combination of services and cash contributions, with the proportion differing by jurisdiction.

This means that Australian, State and Territory Government programs under existing block-funding arrangements ('in-kind services') continue to exist to ensure continuity of supply in the short term. In practice, this means that governments may continue to remain a service provider,[27] or block-fund a provider to deliver services. Most in-kind services are to be phased out through transition and replaced by cash contributions, though the timing of this varies by jurisdiction (NDIA 2016v, p. 71).

The withdrawal of in-kind services is consistent with the NDIS objective of a more competitive, consumer-driven and market-based system, with services to be delivered by a wider range of private providers. Governments will no longer provide or procure disability services except in limited circumstances, such as in thin markets and under POLR arrangements (section 6.3).

However, there are concerns that the continuation of in-kind services in the meantime may adversely affect the transition by existing providers, market entry (PC 2017), the quality of supports (PDA, sub. 38, p. 13) and overall scheme costs. Providers may also delay adapting to the fee-for-service model due to ongoing block-funding under in-kind service arrangements (Mavromaras, Moskos and Mahuteau 2016, p. 45; NDIA, sub. 161, p. 102). In addition, providers may have less incentive to provide or increase services if they are effectively foreclosed from meeting demand for the entire market due to in-kind services.

> … large parts of the marketplace are subject to in-kind arrangements and therefore, not immediately available to prospective providers … (NDIA 2016k, p. 7)

The risk of deterring private providers may be higher in regional or remote areas, and other thin markets, where governments may be the main provider with few actual or potential competitors.

> Mr Croker from Keep Moving, was concerned that because the NT Government was the only entity that was able to provide services across all of the region, this left his organisation

[27] Host jurisdictions are also likely to provide services in monitoring the overall integrity and effectiveness of the *NDIS Quality and Safeguarding Framework*. For example, approval of restrictive practices by providers will continue to be managed through current State and Territory government processes (DSS 2016c, p. 17).

> effectively in competition with the NT Government and begged the question of 'How do you compete as a private enterprise against government departments?'. (JSCNDIS 2015, p. 68)

Some in-kind services also cannot be bundled by the NDIA and can only be priced as individual line items (JSCNDIS 2015, p. 33), often at prices higher than the NDIA's price caps (NDIA, sub. 161, p. 101). This limits the potential efficiencies and pro-competitive benefits of allowing providers to bundle supports due to economies of scale or scope, and price discrimination.

As in-kind services restrict the development of the disability support market and place upward pressure on scheme costs, they should be phased out as quickly as possible (chapter 10, recommendation 10.3). At the same time, it will be important to monitor and respond to any service gaps arising from cashing out of in-kind services — particularly if they result in or exacerbate thin markets (section 6.3). This is likely to occur when in-kind services comprise a large share of the market. For example, about 45 per cent of disability support accommodation services are provided in-kind in South Australia (South Australian Government, sub. 203, p. 16).

Even if in-kind services are phased out, governments may still provide some disability supports under the NDIS and therefore have an impact on competition. Private providers need to be able to compete with governments on a level playing field to ensure the most efficient provision of disability supports to scheme participants (also known as 'competitive neutrality'). Greater clarity by governments about the application of competitive neutrality in the disability support market would assist in achieving this outcome (PC 2017).

Collaboration in the disability support sector

Some disability supports are provided using collaborative and co-operative arrangements. Some providers were concerned that the increased competitive pressures of a market-based system will reduce collaborative activity (and the associated benefits), and therefore lead to a potential erosion of 'social capital'[28] (Alzheimer's Australia, sub. 10, p. 15; Anglicare Australia, sub. 157, p. 13; and CMHA, sub. 11, p. 14). This could increase provider costs and lead to the withdrawal of some services.

A National Institute of Labour Studies survey found that the introduction of the NDIS had made providers more guarded and that less information was shared due to commercial considerations (which may undermine provider networks), although some collaboration among providers was continuing to occur. One provider who was surveyed commented that:

> I think that's been a sad sort of aspect of the NDIA. When you create a competitive marketplace it's very hard, you know, those old networks that we would have been a part of and shared ideas and things like that have kind of broken down a little bit. (Mavromaras, Moskos and Mahuteau 2016, p. 45)

[28] The relationships and trust that underpin the functioning of society (PC 2010, p. XIX).

Not-for-profit providers may experience lower volunteering and fundraising contributions due to public perception of their perceived greater 'commercial' focus and competitive behaviour, and that the NDIS is fully-funded (ABF, sub. 48, p. 14; Australia Scope, sub. 72, p. 25). The NDS said that:

> Providers are beginning to report that fundraising is dropping as donors believe that the NDIS will provide all people with disability with all the supports they need. This is clearly a misunderstanding but seems to be becoming more pervasive. (sub. 51, p. 14)

While these contributions may be retained within the disability sector (either redirected to other providers or spread more thinly across all providers), they could also be transferred to other human service sectors, and therefore be lost from the disability support sector.

Conversely, providers may have greater incentives for collaboration in order to increase flexibility and responsiveness to participant demand in an increasingly competitive funding environment (NDS and CADR 2015, p. 13). Collaboration may allow providers to offer services at a greater range of times and locations, and achieve economies of scale or scope that would otherwise be difficult to achieve (particularly in thin markets and for small providers). Market stewards (and regulators) need to monitor such arrangements closely to ensure that collaboration does not reduce competition, efficiency and participant wellbeing.

NDS data indicate that in 2015-16, the majority of providers surveyed collaborated to advocate for the sector (68 per cent) or for clients (62 per cent), and had agreements to refer to provide services to clients (55 per cent), despite increased competition for both workers and clients (NDS 2016, p. 17). This appears to be broadly in line with previous results, where providers reported that they were forming alliances and joint working relationships with other organisations to offer services at a greater range of times and locations (NDS 2015, p. 38; NDS and CADR 2015, p. 13). Collaboration would also be consistent with the objectives and mission of not-for-profit providers, which typically promote the interests and wellbeing of NDIS participants. As noted by Centacare Brisbane (sub. 44, p. 3), the degree of collaboration and cooperation between providers under the NDIS will depend on the maturity, interests and skills of each party.

On balance, collaboration is a voluntary and valuable activity undertaken by not-for-profit providers that produces intangible benefits, but has tangible costs when removed. The mixed evidence on the degree of and incentives for collaboration in a more competitive environment suggests that the net effect will depend on whether the increased efficiency of providers offsets the higher costs associated with reduced social capital. The Commission has previously noted that for the not-for-profit sector, efficiency and effectiveness are central to maximising community wellbeing (PC 2010, p. 18).

While it is difficult to assess the change in collaboration (particularly when there are price caps and lack of data), based on the available evidence to date, some collaboration may continue to exist in the NDIS, and will be primarily determined by provider efficiency.

Separating transitional issues from structural issues is difficult

The disability support market is undergoing significant change. The way that participants, providers, workers and governments interact with the demand and supply of supports means that it is difficult to be certain about which challenges faced by providers are transitional, and which may become more entrenched or systemic. This is especially as the NDIA is already responding to some problems faced by providers.

The importance of choice and control for participants means that a diverse range of providers will be necessary for participants to achieve the best outcomes from the scheme. The Commission is seeking further feedback on barriers to new providers entering the market, and existing providers expanding their provision of disability supports. The Commission is also interested in approaches that will promote greater market innovation and responsiveness to demand.

INFORMATION REQUEST 6.2

What changes would be necessary to encourage a greater supply of disability supports over the transition period? Are there any approaches from other consumer-directed care sectors — such as aged care — that could be adopted to make supplying services more attractive?

---

7 Workforce readiness

Key points

- The disability care workforce will need to roughly double from its 2014-15 level to meet the increased demand for National Disability Insurance Scheme (NDIS) supports. Such workforce growth will mean that about one in five new jobs forecast to be created in Australia over the transition period will need to be in disability care. While the disability care workforce has grown considerably over the transition period to date, it is unlikely to meet this target under current policy settings.
- There are a number of challenges to growing the disability care workforce. These include: finding carers to meet high participant demand at particular times of the day; ensuring that there are enough qualified carers to provide a reasonable quality of care (including allied health professionals); and increasing rates of retirement of workers from the sector as they age. There are also regional challenges. In some areas, the workforce will need to more than double to meet demand.
- Policy changes that would help to address some of the workforce shortages over the transition period include:
  - taking advantage of the preference of many workers in the disability care sector to work more hours
  - relaxing the rules on informal carers providing paid care to participants, especially in remote and regional areas
  - using a targeted approach to immigration to address persistent skill shortages.
- The way that respite services are provided under the NDIS — requiring participants to include it in their plans, and being subject to caps on the amount of respite — could be creating a disincentive for providers to supply these services. This may reduce the ability of participants' family members and friends to provide informal care. A lack of respite and informal care will increase demand for formal carers and scheme costs.
- There needs to be a clearer delineation of roles and responsibilities for developing workforce policy for a more coordinated response to meeting the workforce needs of the NDIS in the future. Building the evidence base on the number of workers in the sector, their conditions and working arrangements would be a sound investment to develop more effective workforce policies in the future.

As discussed in chapter 6, the state of the disability care market's readiness to deliver National Disability Insurance Scheme (NDIS) supports will affect scheme costs. Market readiness will depend on, among other things, whether there are enough workers to provide NDIS supports.

As recognised by the National Disability Insurance Agency (NDIA), any workforce shortages are a risk to the scheme.

> A major concern for the NDIA is that the speed in growth of demand cannot be met by a commensurate speed in growth of supply. The availability of workforce is a significant factor in the ability of the market to supply the needs of people with disability. (sub. 161, p. 95)

While workforce shortages will have a direct effect on scheme costs, the pricing policies of the NDIA will also have an effect on workforce growth and scheme costs. For example, without price regulation (in the short term), increased competition for care workers could bid up wages and increase scheme costs. However, with price regulation, it may be difficult to build up the workforce fast enough. This could lead to unmet demand for participants, which will put a brake on scheme costs, but could undermine the objectives of the scheme by restricting access to supports that are regarded as reasonable and necessary.

This chapter examines the question — can the disability care workforce grow quickly enough to supply the increasing demand for services under the NDIS? Section 7.1 looks at the current state and characteristics of the disability care workforce. Section 7.2 discusses the size and scope of the workforce that will be needed when the NDIS is fully rolled out. Section 7.3 examines policy options for developing the workforce, and ways to reduce the number of workers required to provide NDIS supports.

7.1 The current disability care workforce

The disability care and support workforce is diverse. It includes disability support workers that provide daily care and allied health professionals that provide specialised care. As the NDIS is rolled out, the size and scope of the workforce will increase further — both to cater for more participants, and to embrace new roles driven by the market-based system as participants exercise greater choice over their supports.

To understand how the workforce will need to change requires an understanding of what it looks like now. It is difficult to measure the disability care workforce by itself, as it is classified with aged care in regularly published statistics (box 7.1). With this in mind, a number of broad conclusions about the disability (and aged care) workforce can be drawn:

- disability care workers are older than the workforce in general (figure 7.1) — about one fifth of workers are aged 55 and older (NDS, sub. 51, p. 9)
- about 80 per cent of employees in the disability care sector are women (compared to about 46 per cent of employees for all occupations)[29]
- about 60 per cent of employees in the disability care sector work part time (compared to about 30 per cent of employees for all occupations)[30]

[29] Commission estimates based on ABS (*TableBuilder*, Education and Work, May 2016).

[30] Commission estimates based on ABS (*TableBuilder*, Education and Work, May 2016).

- the majority of workers in the disability care sector hold a certificate-level qualification (figure 7.2).

Box 7.1 Measurement issues: the disability care workforce

Data on workers in Australia are collected regularly by the Australian Bureau of Statistics based on the of industry of operation (the Australia-New Zealand Standard Industry Classification (ANZSIC)) and the occupation of the worker (using the Australia-New Zealand Standard Classification of Occupations (ANZSCO)) (ABS 2006, 2013). However, neither of these classifications are well suited to identifying those working in the disability care sector, or those working in disability care roles.

For example, the most disaggregated — that is, the level of finest detail — ANZSIC classification that includes disability carers is '8790 Other Social Assistance Services', which also includes aged care assistance services, marriage guidance services, and the operation of soup kitchens. In ANZSCO it is '4231 Aged or Disabled Carer', which again combines aged and disability carers together. Neither of these are ideal for analysing the state of the disability care workforce.

Allied health professionals that work in the disability support sector are similarly hard to identify, as it is difficult to distinguish between those that may provide services occasionally or those that provide them full time to people with disability. The classification of allied health professionals is also contentious and subject to revision.

> There is no one definition which prescribes the disciplines considered as allied health. At the meeting of the Council of Australian Governments in July 2006, agreement was reached to establish NRAS [the National Registration and Accreditation Scheme] for health professionals, beginning with the ten professional groups registered in all jurisdictions, of which seven fall under the allied health banner: chiropractic care, optometry, osteopathy, pharmacy, physiotherapy, podiatry, and psychology. … A further four allied health professions joined NRAS on 1 July 2012: Aboriginal and Torres Strait Islander health practitioners, Chinese medicine practitioners, medical radiation practitioners and occupational therapists. … Other allied health professions that are not included under NRAS, but are considered in the Commonwealth's health workforce policy planning, include: Audiologists, Counsellors, [Dieticians], Exercise physiologists, Music therapists, Nutritionists, Pathologists, Social workers, Sonographers, Speech pathologists. (Department of Health and Ageing 2013)

Other studies, including the Commission's inquiry into *Disability Care and Support* (PC 2011), relied on 'one-off' surveys and alternative data sources to better understand the disability care workforce. This included a detailed survey by Martin and Healy (2010). This survey remains the most specialised data source for the disability care sector workforce, though is now becoming dated. A forthcoming survey on the disability care workforce may also help solve some unaddressed measurement issues (Cortis nd).

7.2 What will the size of the workforce need to be by scheme roll out?

While estimates of the number of workers required to deliver supports allocated through the NDIS vary, the consensus is that the workforce will need to increase by between 60 000-90 000 full-time equivalent employees (FTE) — or roughly double in size:

> The workforce will need to increase from approximately 73 600 full-time equivalent (FTE) workers, to an estimated 162 000 FTE workers. (DRC 2015a, p. 19).
>
> The workforce opportunities and challenges as a result of the introduction of the NDIS are very significant. It is expected that the NDIS will generate between 60 000 and 70 000 new jobs on a full-time equivalent basis over the next three years. This represents about 20 per cent of the total number of new jobs forecast to be created in Australia over this period. (Bonyhady 2016, p. 5)

The NDIA's market position statements indicate that about an additional 70 000 FTE workers will be needed from 2015-16 to 2019-20 (NDIA 2016c, 2016p, 2016w, 2016y, 2016z, 2016aa, 2017m).

The evidence to date — admittedly at the very early stage of transition — indicates that the workforce is growing quickly, but not fast enough to meet the overall growth target. For example:

- data collected on the workforce by National Disability Services (NDS), a peak body for disability care providers, indicates that the number of workers in the sector is growing at a rate of about 12 per cent each year (NDS, sub. 51, p. 9)
- the number of people employed in aged and disability care occupations increased by about 27 per cent between 2015 and 2016 according to ABS Labour Force data.[31]

Neither of these sources are on a FTE basis. Based on the proportion of part-time to full-time positions, halving the rates of reported 'headcount' growth allows for a rough approximation of the FTE growth targets. As such, both figures are well short of the average annual growth rate of 18 per cent in FTE employees required to meet the expected workforce needed for the scheme.[32]

Data on allied health professionals, albeit patchy and reported in a period early in the trial phase, also indicate that growth rates in FTE employees are slow (table 7.1). Clearly, there are considerable challenges emerging in scaling up the workforce to meet the needs of NDIS participants.

[31] Commission estimates based on ABS (*TableBuilder*, Education and Work, May 2015 and May 2016).

Challenges to reaching the workforce target

While estimates of FTE employees are helpful for providing an overview of the growth required, they mask a wider variation of supply and demand at a more disaggregated level. There are many different workforces that will provide services for NDIS participants, and the challenges — and policy responses to address those challenges — to each will vary. A better way is to consider the disability care workforce across 'role and region'.

- Role covers the types of workers needed to fulfil a NDIS participant's needs, which in turn will depend on individual choice, disability and other family circumstances. In turn, this translates to the skill mix of workers needed, and in turn, the mix of general carers, allied health professionals, and other workers required.
- Region covers the different number and growth in workers required in different locations.

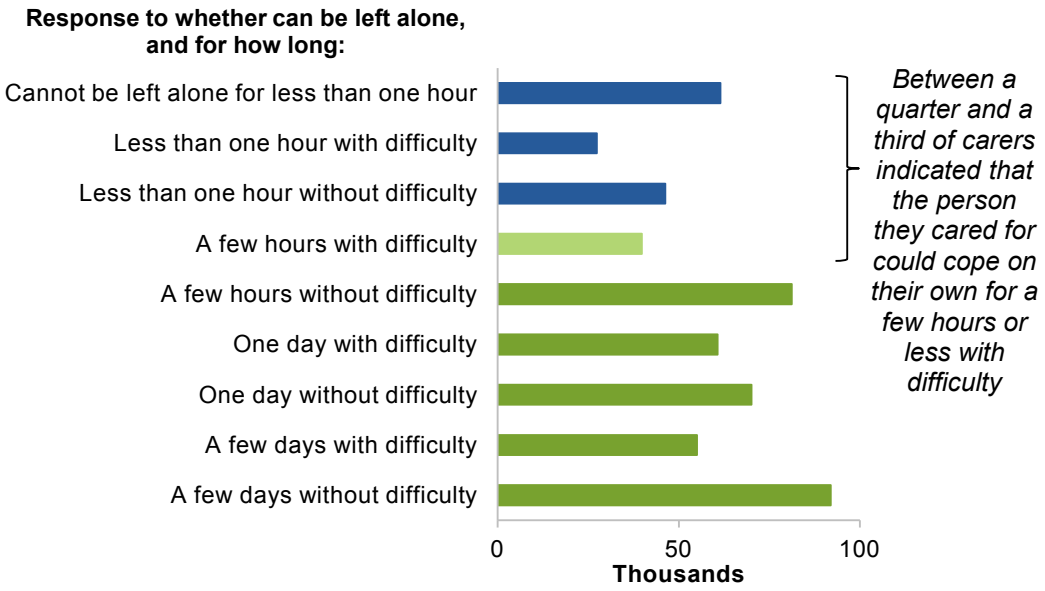
Role challenges

Peak hours

Disability carers are often required for only a few hours per day at 'peak times' — when there is high demand for carers in early mornings and evenings to help people with

disability get in or out of bed, showered and fed (Physical Disability Australia Ltd, sub. 38, p. 11). This is reflected in the Survey of Disability, Ageing and Carers, which indicates that about three-quarters of people with severe or profound disability require attendant care for a few hours a day before encountering difficulties (figure 7.3).

Figure 7.3 **Amount of care required before recipient has difficulties[a]**
2015



[a] Based on the response by the carer for those with severe or profound disability aged 15 years or more.

Source: Commission estimates based on ABS (*Disability, Ageing and Carers Australia: Summary of Findings, 2015,* Cat. no. 4430.0, table 42).

This means that there are times of the day when more carers are needed than on average, which would require a greater headcount than the FTE figures suggest. This has implications for how 'flexible' the workforce needs to be. As the NDIA said:

> Participant demand for care often occurs at 'peak times' or high demand periods which may include 7-9am (breakfast) and 4-8pm (bathing and mealtime) with less demand at late morning or mid-afternoon. This poses challenges for the sector to develop more mature rostering and staff management practices which are emerging in some areas. (sub. 161, p. 98)

One way to address this challenge is to make greater use of a more casualised workforce. This could provide the labour needed in those hours of greatest demand. However, there are also some impediments to such an approach, including:

- minimum shift requirements under the Social, Community, Home Care and Disability Services Industry Award, and the cost of casual loadings and penalty rates for working less desirable hours (such as those outside ordinary hours of work)
- quality concerns, such as whether NDIS participants want a different carer for each instance of care, and issues of reliability of casual labour (Cortis nd, p. 6)

- whether there is the supply of casual labour to allow such an approach
  - this includes the attractiveness to work on a casual basis for prospective workers, and the risk that more experienced and better qualified workers may seek permanent jobs elsewhere given the disincentives associated with less secure work (Independent Inquiry into Insecure Work in Australia 2012, pp. 20–21).

Qualified staff in general

The quality of care provided to NDIS participants will depend, in large part, on the quality and skills of the workers providing disability supports. For many roles, formal qualifications are important, if not mandatory, to provide supports. For other roles, formal qualifications are less important. The available evidence suggests that the 'average' level of formal skills in the disability care workforce will decline over the transition period of the NDIS (box 7.2).

This raises the question — is a formal qualification the most important or necessary characteristic to secure employment as a disability support carer? A survey of firms specialising in disability support by the Department of Employment (2014, pp. 2, 5) found the evidence to be mixed.

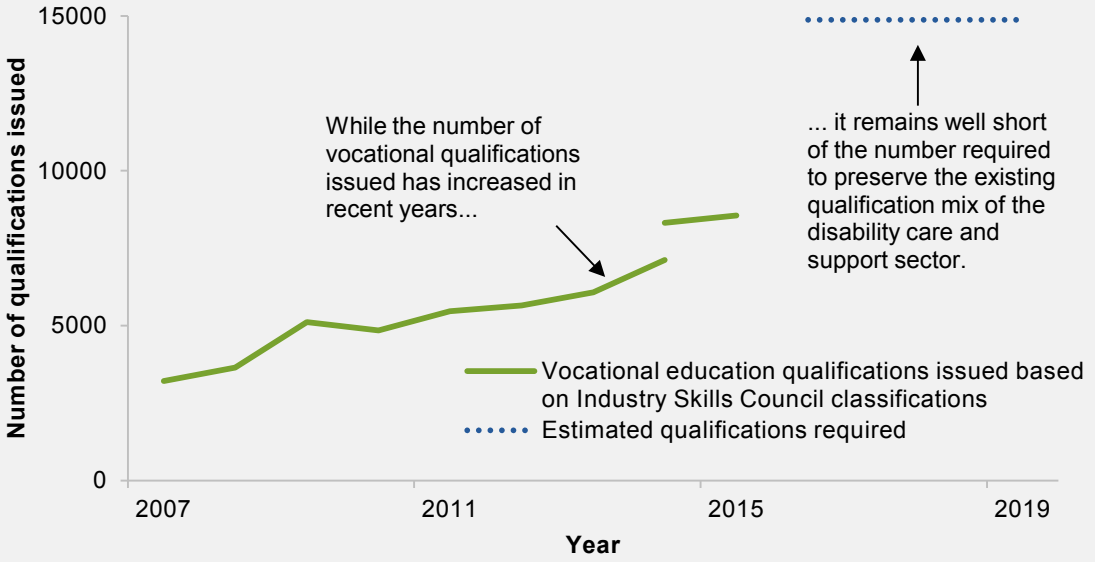
- 89 per cent of providers said that 'personal qualities' were 'important or very important' in terms of the characteristics sought; this compared to 70 per cent for 'relevant experience' and 47 per cent for 'relevant qualifications'.
- 89 per cent of firms said that their minimum requirement for employment was a certificate-level qualification. However, 26 per cent of firms indicated that they regularly employed unqualified workers, suggesting this requirement was not as binding a constraint for some firms.

This mixed story was also reflected in evidence provided to the Commission's 2011 inquiry into *Disability Care and Support*. While some providers argued that a minimum standard or qualification should be mandated for disability support staff, others said that formal qualifications sometimes fell short of providing 'work ready' employees, and that on-the-job training was far more important (PC 2011, p. 740).

Box 7.2 Not enough new trainees to maintain formal qualifications[a]

People employed in aged and disability care roles are more likely to hold a formal qualification than the workforce in general. The most common level of qualification for disability and aged care workers is a certificate III or IV. The number of people completing a qualification against expected workforce targets provides a measure of how the qualification mix of the workforce may look by the end of the National Disability Insurance Scheme transition.

The National Centre for Vocational Education Research dataset on vocational education outcomes (VOCSTATS) indicates that, if workforce targets are met, there will be a smaller proportion (than currently) of workers holding a certificate-level qualification. The figure below shows that about 50 000 certificate or diploma level qualifications were issued in the nine years between 2007 and 2015, while about another 60 000 qualifications would be necessary in the four years between 2016 and 2019 to preserve the same distribution of qualifications observed in the 2011 census.



This indicates that the proportion of workers holding certificate-level qualifications in disability care related studies will fall over the transition period. However, it is not clear what mix of qualifications will be necessary for all National Disability Insurance Scheme participants.

a Estimate is derived by subtracting the expected and current midpoint estimates of FTE disability care and support workers from the NDIA's market position statements and multiplying by a scaling factor of 0.85 to apply the proportion of full-time equivalent workers with a certificate or diploma qualification. This yields a result of 59 500 additional qualified workers, which when apportioned over 4 years requires 14 875 new qualified workers per year. Vocational qualifications are identified using Industry Skills Council classifications that include the term 'disability' in their title (specifically, codes CHC20599, CHC30302, CHC30408, CHC30799, CHC40202, CHC40302, CHC40308, CHC40312, CHC40799, CHC50102, CHC50108, CHC50799, CHC60102, CHC60108, CHC60112, CHC60799). Note that these data are presented in terms of qualifications awarded rather than qualifications used on a full-time equivalent basis. The break in series reflects changes in concordance between previously offered qualifications and current qualifications.

Sources: Commission estimates based on ABS (*TableBuilder,* Education and Work, May 2016) and VOCSTATS (http://www.ncver.edu.au/resources/vocstats.html), extracted on 15 March 2017.

In practice, the benefits of a formal qualification depend in large part on the role that a disability care worker is employed in, and the client's needs. The NDIS will also mean that many workers will need to learn additional skills in the market-based environment for disability supports.

> The NDIS differs considerably from previous reforms as it moves away from 'block funding' programs to a 'fee for service' model. Earlier reforms had little effect on frontline workers. But now workforce models are changing. Frontline workers need to have an understanding of sales, customer service and the ability to work within financial constraints as well [as] being able to adapt and customise service delivery in a person centred model.
>
> Conversations are being held in the sector regarding formal qualifications and whether they are necessary. Some organisations are recruiting workers with no experience and no formal qualifications, with new staff undergoing customised organisational training only. For other organisations, formal qualifications are a pre-requisite. This brings opportunities for a diverse workforce. (Queensland Alliance for Mental Health, in VICSERV & CMHA 2017, p. 46)

It seems reasonable to conclude that the lack of certificate-qualified workers will affect some firms and present a challenge to meeting the workforce target of the NDIS, but the evidence is too limited to say which areas will be most disadvantaged. Also, participants may prioritise attitude and aptitude, and choose to employ less qualified staff who better suit their needs.

Qualified allied health professionals

Allied health roles are very different to attendant care roles. Allied health professionals specialise in a range of different areas, and hold higher level qualifications relative to the disability support workforce in general.

> Allied health professionals are generally educated in the university sector with bachelor degrees, usually three to four years duration. However, in a development common to other health professions, there is an increasing move to postgraduate degrees, for example an initial generic undergraduate science degree followed by a Masters in an individual discipline. (Department of Health and Ageing 2013)

Formal qualifications are almost always a requirement for allied health professionals to practice, which means building up qualified staff can take much longer than for other roles. Constraints in this regard were recognised as part of the *NDIS Integrated Market Sector and Workforce Strategy*.

> It is estimated that the highest rate of increase in the demand for disability workers will be for allied health professionals. The disability sector will need to work closely with related community service sectors, particularly health and aged care, to ensure the demand for allied health professionals is met.
>
> To support the sector and enhance the supply of allied health professionals to the disability sector, the Commonwealth and jurisdictions will work with the sector, education authorities, and professional bodies to ensure that professional education prepares graduates adequately to work in the NDIS. At the same time, to encourage allied health professionals to choose the

> disability sector, the Commonwealth will work with these same stakeholders to strengthen the sector's capacity to provide high-quality placements and support continuing professional development for allied health workers. (DRC 2015a, p. 20)

If the allied health professional workforce does not build quickly enough, then this could lead to unmet demand for participants. It could also lead to a substitution away from using professionals carers to using more general workers instead. This has already been reported in the evaluation of the NDIS, along with the effect this has had on the quality of care provided.

> A perception was expressed in the wave 1 interviews that the pricing structure of the NDIS would bring change to the role of allied health professionals through encouraging the increased use of non-professional staff. By wave 2 a de-professionalisation of the disability workforce was more commonly being reported, with increasing numbers of allied health assistants in the sector. Concerns were raised about the ability and skills of these workers to provide more complex supports and the impact this could have on the quality of care and outcomes for participants. (Mavromaras, Moskos and Mahuteau 2016, p. 48)

And as put by one of the providers interviewed in that study:

> We have employed a number of inexperienced people, but I believe that's starting to backfire … Just the inexperience and the lack of knowledge on how to work with behaviours or understand confidentiality, or things like professional distance and all those types of things. And we're sending inexperienced people out to work individually with people with disabilities. (Mavromaras, Moskos and Mahuteau 2016, p. 48)

Evidence presented to the Commission provides another mixed story about supply and demand for allied health workers in the NDIS. On the one hand, the number of providers registered to deliver allied health services to NDIS participants has grown strongly (NDIA 2016v, p. 44), and in line with the expected number needed by the end of the transition period. However, many who have registered are not yet providing services to scheme participants. This makes it difficult to determine if they are registering in advance of the NDIS rollout or have changed their mind about delivering services.

Many disability service providers indicated that there are a number of allied health roles that are moderately or extremely difficult to fill. For example, more than half of the firms surveyed by National Disability Services indicated that they had experienced difficulties recruiting speech therapists and occupational therapists (NDS 2016, p. 38). The *Intermediate Review of the NDIS* also identified persistent shortages in the provision of speech pathology, occupational therapy and psychology supports (Mavromaras, Moskos and Mahuteau 2016, p. 32), though supply to those who needed such services had increased. As one staff member of the NDIA in the Intermediate Review put it:

> The NDIS has worked twofold. It's increased the amount of service available so people can see other OTs [Occupational Therapists] outside of what they would have been able to. But there's an increased demand. The increased demand is way above the increase of services. (Mavromaras, Moskos and Mahuteau 2016, p. 54)

Some service providers and peak bodies expressed concerns about whether there will be enough allied health providers for NDIS participants, and the consequences for sectors (box 7.3).

Box 7.3 Difficulties faced finding allied health workers

Matthew Burrows:

> The workforce is a wicked problem. … To think that we, as service providers, can just advertise for and employ that many qualified staff (eg therapists) in such a short time is just misguided. Let alone the considerations of balancing a commercial and compassionate culture during this transition time.
>
> At entry to the NDIS in 2012-13 the employment market for therapists relied heavily on internationals supported to work domestically on 457 visas. By 2016-17 the training institutions had geared up and graduates now make up a steady portion of the new recruits. But there remains a gap and that gap is being filled from the full employment market being accessed elsewhere. Australia only has so many therapists and their entry into the NDIS employment field means they are exiting elsewhere. (sub. 7, pp. 3–4)

Disability Services Australia:

> Professional staff, in particular Psychologists and Speech Pathologists are generally difficult to attract (especially in Regional areas) in a very competitive marketplace. This has driven the need to implement creative sourcing strategies such as the hiring of interns for a short term solution. We have also seen significant wages growth in the allied health professions due to labour shortages. (sub. 9, p. 9)

Australian Physiotherapy Association:

> Our members have suggested that increasing the NDIS workforce to that which is projected as being required will not be possible in the current policy settings. They have advised us that demand for services has already stripped supply of providers. (sub. 93, p. 16)

Allied Health Professionals Australia:

> Current demand for services is already exceeding the available supply of allied health providers and there is no evidence of short term changes to this workforce shortage. (sub. 37, p. 16)

A lack of allied health professionals represents a risk that supports of appropriate (and necessary) quality may not be available to some NDIS participants. The time it takes to train an allied health worker — both in terms of formal qualifications and on-the-job training — means that it may be too late to prepare the necessary allied health workforce without either diverting them from other caring sectors, or to seek skilled migrants to fill the workforce gap in the short term. Both approaches involve costs.

An ageing workforce and population presents a greater challenge

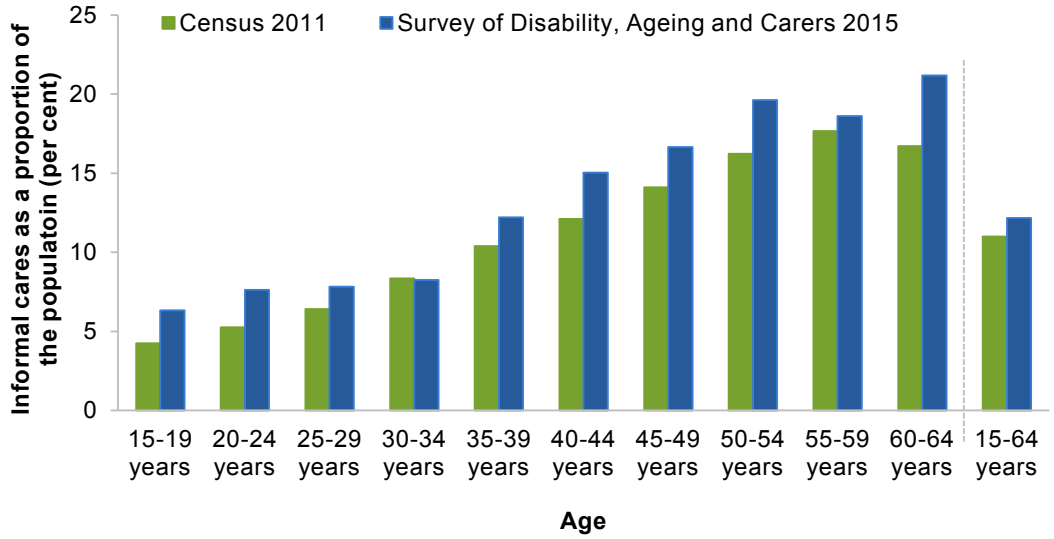
Australia has an ageing population, and this is reflected in the increasing average age of:

- formal carers employed to look after people with disability (figure 7.1)
- informal carers who look after friends and family with a disability
- the general population, which will affect the on demand for carers more broadly.

As noted above, the average age of carers employed in the aged and disability care workforce is higher than for the general workforce. The average age of people employed in aged and disability care is about 47 years, and more than 30 per cent are above the age of 55 years (figure 7.1).[33] An increasing proportion of the care workforce is likely to retire in the coming years, with the average retirement age of those employed in the personal care and assistance occupations being about 55 years in 2014-15.[34] Only about half of those working in disability care intend to still be working in the sector in five years' time (Cortis nd, p. 24).

Informal carers are also ageing. The trend since the 2011 Census has been an increasing proportion people aged 50-64 years providing care for others (figure 7.4). The ability for informal carers to continue providing this care as they age is likely to diminish. As the degree of informal care a NDIS participant receives affects the amount of formal care supports that they are allocated, this suggests that as informal carers age, there will be greater calls on the NDIS to provide more supports and this will require a larger formal workforce.

Figure 7.4 **Informal carers are growing older**



Sources: Commission estimates based on ABS (*TableBuilder Basic,* 2011 Census; *TableBuilder,* Survey of Disability, Ageing and Carers 2015).

The ageing population also means that there will be more intensive demand for carers. While aged carers are not perfect substitutes for disability care workers, there are some roles that cross over, and about one-fifth of disability care providers also provide aged care

33 Commission estimates based on ABS (*TableBuilder Basic,* 2011 Census).

34 Commission estimates based on ABS (*Retirement and Retirement Intentions, Australia, July 2014 to June 2015,* Cat. no. 6238.0, unpublished data).

(NDS 2016, p. 13). This means that even if new carers are trained, they may not be necessarily attracted to the disability care sector as the aged care sector expands. As Disability Services Australia said:

> There is no doubt that as Baby Boomers retire from full time work there will be an overall impact on a range of employment sectors. Whilst there may be some potential for retirees to take on casual disability support or mentoring roles, the ageing population will also create an increase in demand for aged care workers, in direct competition with the recruitment for workers in to disability roles. (sub. 9, p. 9)

Even if the disability sector attracts workers from the aged care sector, there could still be implications for scheme costs. For example, if the quality of aged care services falls as a result of workforce shortages, there could be a stronger incentive for NDIS participants to remain in the scheme past the age of 65 years.

The role of wages in growing the workforce

Most of the payments from the NDIS will be spent on wages, given the labour-intensive nature of disability care. While price caps will have an impact (chapter 6), this is likely to mean more money will be available for workers. From a policy perspective, the question is whether this money will be sufficient to induce more workers to provide disability supports. This depends on how competitive the disability care market is, how responsive care workers are to wages, and in turn, why people work in the disability care sector.

Analysis conducted prior to the introduction of the NDIS suggests that pay is not the primary motivation to work in disability care. For example, a study of community service employees undertaken in 2009 found that only 16 per cent of employees were attracted to work in the disability services sector primarily for the remuneration (Martin and Healy 2010, p. 135). A desire to help others and a desire to do something worthwhile were far more important motivations (nominated by 76 and 68 per cent of workers, respectively) (Martin and Healy 2010, p. 135). As put by one disability support worker:

> I love this industry. It's not about coming into work, doing an 8 hour shift and leaving. It's so much more than that. For some people we can be their eyes, their ears or their hands. (United Voice, sub. 118, p. 2)

However, there is evidence that suggests that higher rates of pay may help to retain workers in disability care roles and to attract new workers to the sector. Just over half of employees who left a disability support provider surveyed by the Department of Employment (2014, p. 17) said that they left for a position that had 'better pay and conditions', and that about 60 per cent of firms used increased remuneration as a means to improve retention. Given the ageing workforce, higher wages to keep workers from retiring may prove to be one of the scheme's strengths, notwithstanding the effects of the NDIA's price controls.

Overcoming the perception that caring jobs do not lead to fulfilling careers may be necessary to enough workers to provide NDIS supports. As noted in the *NDIS Integrated Market, Sector and Workforce Strategy*:

> To meet the increased demand for disability workers, including allied health professionals, it will be necessary to assist suppliers to promote the disability sector nationally as a career. (DRC 2015a, p. 20)

A number of study participants noted that caring roles are seen as unattractive due to the nature and remuneration of the work.

> The nature of the work of disability support staff may not in itself be attractive enough to appeal to many school leavers and those looking for a career change in later life. The work itself can be highly complex and carry significant risk, especially when supporting people with severe challenging behaviours or people with complex medical support needs. Greater provision for training support staff is vitally important at present, providers are limited in the amount of training that can be provided due to cost pressures. (Macarthur Disability Services, sub. 57, p. 8)

> The NDIA has observed over the course of trial and transition that caring jobs are often poorly valued. Common reasons cited for a lack of retention (Department of Employment survey of Personal Care Workers 2014, National Aged Care Workforce Census and Survey) include the low conditions of work and physical and emotional toll of the job. This is regrettable. (NDIA, sub. 161, p. 97)

> That caring roles are poorly [valued] is not perception, it is reality. Caring jobs are poorly valued. Pay rates are mostly minimal. Good or exceptional performance of the role is rarely valued financially. (Autism Aspergers Advocacy Australia, sub. 178, p. 26)

The longer term responsiveness of labour supply to conditions under the NDIS is hard to determine. The nature of the data makes it difficult to understand the number and hours worked by employees of disability care providers. The unprecedented scale of workforce growth required combined with a new market-based approach also mean that historical data on wages and work patterns are less useful to estimate the future. The interaction with other care sectors — especially aged care — will also important. More data will need to be collected to make meaningful wage policy when it comes to NDIS workers.

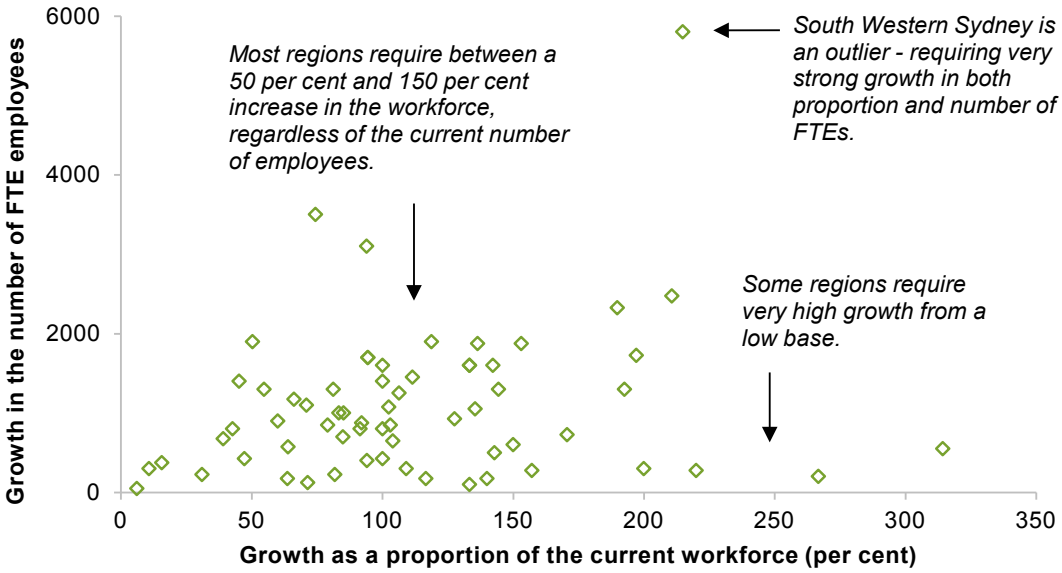
Regional challenges

The disability care workforce needs to double in aggregate, but the scale of growth required in individual regions varies between as little as 5 and over 300 per cent (figure 7.5).[35] Most regions will need to grow their disability care workforce between 50 and 150 per cent. While some of the percentage increases are large, many are based on a very low number of workers to start with. This is especially the case in rural or remote areas where a few workers can represent a doubling of the disability care workforce.

[35] Regions are groups of local government areas, which are the geographical basis for the NDIA's market position statements.

Figure 7.5 **Variation in growth required in different regions[a]**

Each dot represents the growth in the amount of FTE employees needed relative to the current situation, both in terms of the number and proportion, between 2015-16 and 2019-20.



[a] The NDIA's market position statements provide a range of estimates for the number of FTE disability workers at present and what will be needed in the future. To derive these estimates for growth, the midpoints of each range are used. No data are available for Western Australia. Regions are groups of local government areas.

Sources: Commission estimates based on NDIA (2016c, 2016p, 2016w, 2016y, 2016z, 2016aa, 2017m).

Some of the challenges associated with thin markets in remote areas are discussed in chapter 6, but it is worth noting that there are several regions within metropolitan areas where the required growth is about 200 per cent:

- South Western Sydney, where about an additional 5800 FTE workers are needed (growth of 215 per cent)
- Southern Melbourne, where about an additional 2400 FTE workers are needed (growth of 211 per cent)
- Beenleigh, where about an additional 2300 FTE workers are needed (growth of 190 per cent)
- Brimbank Melton, where about an additional 1700 FTE workers are needed (growth of 197 per cent).

These data, as published, do not capture the mix of roles within the FTE positions. For example, they do not distinguish between the hours of care provided by an in-home carer as opposed to those provided by an allied health professional. All of this emphasises the need for policies that seek to mitigate workforce shortages to have a focus at a regional

level, where different policy responses may be more appropriate across different regions and roles.

The bottom line?

The scale of workforce growth required, combined with challenges related to worker roles and regional variation, means that the NDIS workforce targets are unlikely to be met by 2020. As the Intermediate Review of the NDIS noted:

> While the NDIS had led to an increase in the supply of disability supports, the Scheme had also led to an increase in a demand for services (and particularly therapy services); NDIA staff concluded that overall, demand now exceeded supply. (Mavromaras, Moskos and Mahuteau 2016, p. 54)

The trends to date show that providers are already responding to workforce shortages by using less skilled labour. In some cases, this may compromise the quality of care received by participants and could become more widespread as the NDIS is fully rolled out. This, in turn, will reduce the effectiveness of the NDIS, compromise its insurance principles (and increase long-term costs), and in some cases, be a risk to participants' wellbeing.

It is more difficult to make an assessment of how far the workforce will develop beyond the transition given the uncertainties about how yet-to-be implemented policies will affect the supply and demand for workers (such as the implementation of the NDIS Quality and Safeguarding Framework, outcomes from future price reviews, and the implications of the NDIS's market intervention framework).

DRAFT FINDING 7.1

It is unlikely that the disability care workforce will be sufficient to deliver the supports expected to be allocated by the National Disability Insurance Agency by 2020.

7.3 What can be done to improve workforce readiness?

The challenges confronting the readiness of the workforce, if left unaddressed, could create short-term and long-term risks to the sustainability of the scheme and the wellbeing of participants. In the short term, a lack of qualified workers may mean that less qualified staff are used to deliver supports, or there will be unmet demand. This, in turn, erodes the benefits of the insurance approach over the longer term, meaning that the costs to support participants will be higher than necessary.

However, some of these challenges can be addressed relatively quickly, or alternative arrangements employed to mitigate their effects.

Getting the right balance between strategy and action

The responsibility for funding sector and workforce development was allocated to the Australian Government as part of the 2012 *Intergovernmental Agreement for the National Disability Insurance Scheme Launch* (ANAO 2016). The Department of Social Services (DSS) has responsibility for many roles in developing the disability care workforce to meet the needs of the NDIS, including: coordinating and facilitating responses to workforce shortages; coordinating with other Australian Government agencies to build workforce supply; and developing a coordinated response in particularly challenging areas — such as the demand for allied health professionals (Independent Review of the Readiness of NDIS for Transition to Full Scheme 2016).

Australian Government initiatives to foster disability care workforce readiness have focused primarily on a range of frameworks and principles that have been developed in consultation with the NDIA (table 7.2). These have been designed to provide guidance on how the workforce is to develop.

Such a strategic approach to developing a market — especially one so ground-breaking as the NDIS — was appropriate for the trial period. However, as the scheme begins to build up over the transition period, there needs to be more practical implementation of the strategic objectives, particularly to develop the workforce. Relying on strategic policies alone is leading to uncertainty among providers.

> Several strategies have been published (Assistive Technology, Rural and Remote, Market and Workforce). They provide directions but are light on implementation detail. For these strategies to inform the planning and investment decisions of service providers, they need to be underpinned by clear publicly-available plans. (NDS in ANAO 2016, p. 32)

Table 7.2 **Many strategies affect workforce development**

Entity	*Strategy*
NDIA (2013, 2016h)	2013–16 Strategic Plan and 2015–21 Corporate Plan
NDIA (2015b)	Assistive Technology Strategy
NDIA (2016x)	Rural and Remote Strategy
NDIA (2017b)	Aboriginal and Torres Strait Islander Strategy
NDIA (forthcoming)	Provider of Last Resort Strategy
NDIA (forthcoming)	Market Intervention Framework
COAG DRC (DSS 2016c)	Quality and Safeguards Framework
COAG DRC (DRC 2015a)	Integrated Market, Sector and Workforce Strategy
COAG DRC (DSS 2017c)	National Disability Strategy 2010-2020
DSS (2015)	Sector Development Fund Strategy and Operational Guidelines
DSS (2017b)	Integrated Plan for Carer Support Services

The Australian National Audit Office (ANAO), when it examined the market transition under the NDIS, found that the *Integrated Market Sector and Workforce Strategy* lacked the details necessary for the transition.

> While establishing a national approach to the market transition, the Strategy does not provide a clear basis for coordinated actions, as it does not commit jurisdictions to specific deliverables, with agreed timeframes, accountabilities and milestones. DSS advised the ANAO that 'detailed timeframes and accountabilities will likely be captured in a bilateral context going forward, recognising the unique characteristics in each jurisdiction in terms of the market and workforce.' …
>
> Further detail about how the Strategy is to be operationalised, including specific actions and timeframes, would assist stakeholders, particularly service providers who need to make investment decisions. In July 2016, DSS advised the ANAO that it intends to develop a Strategy 'action plan' for 2016-17 and into the future. Publishing this action plan, including key priorities and initiatives, timeframes and milestones, may help to address stakeholder concerns. (ANAO 2016, p. 32)

The Sector Development Fund (SDF), which is funded by the Australian Government with $146 million to support the NDIS market transition between 2012-13 and 2017-18, includes workforce development as one of its objectives. The DSS administers the SDF by allocating grants to organisations and governments to address areas of identified need. However, in its evaluation of the SDF, the ANAO (2016, p. 34) found that the approach to grant-making had not followed the objectives outlined in the strategic documents themselves, and that greater evaluation of SDF projects was necessary . More recently, funding to boost the workforce was allocated as part of the 2017-18 budget.

> The Government will assist service providers in rural, regional and outer suburban areas to provide the workforce required to meet the expected growth in the disability and aged care sectors arising from the introduction of the National Disability Insurance Scheme and an ageing population by investing $33.0 million over three years from 2017-18. (Australian Treasury 2017a, p. 145)

Some State and Territory Governments have already taken action in response to workforce concerns. For example:

- The New South Wales Government spent $5 million to supplement its 'industry development fund', which provides a range of resources for firms to transition to the NDIS and includes materials regarding workforce development (NDS 2017b; Nucleus Group 2015)
- The Victorian Government (sub. 174, p. 18) spent about $26 million (supplemented in part by the Sector Development Fund) on its *Keeping Our Sector Strong* policy, which has the goal of 'developing and growing the disability workforce over the transition to full scheme'
- The South Australian Government has sought independent advice about likely workforce needs at a more detailed level, and has provided grants as part of its *Provider Readiness Program* (SA DCSI 2017)

- The ACT Government has invested in market development, and made a number of direct grants to provider organisations, including some using SDF monies (ACT Directorate of Community Services 2016).

While it is understandable that State and Territory Governments want to address potential workforce shortages, there is a risk that fragmented workforce policies may lead to duplication or unnecessary programs at a time when the scheme can least afford it. As a union that represents many disability carers said:

> Unclear delineation of market development and stewardship responsibilities between the National Disability Insurance Agency (NDIA), the Commonwealth Department of Social Services (DSS) and the States and Territories has resulted in no substantive progress on a workforce development strategy focusing on attraction, retention, skills or quality. (Health Services Union, sub. 132, p. 4)

While the COAG Disability Reform Council has taken steps to clarify responsibilities, the Commission considers that further refinement is necessary. The 'big tent' approach to workforce development remains appropriate, but the responsibilities of different parties should be made public.

- State and Territory Governments should have more responsibility for workforce development issues over the transition period. They have the best experience of where historically unmet need has been and the approaches best suited to solve such issues in particular jurisdictions.
- The Australian Government should retain oversight of the scheme and focus on areas such as tertiary education and immigration, and how increased demand affects and interacts with other care sectors, in particular aged care.
- The NDIA is best placed to provide more information to governments in the form of actuarial and scheme data collected to provide more granular detail on where supply gaps are emerging, or likely to emerge.
- Providers should also be regularly consulted by governments about emerging workforce policy issues, such as where the incentives of the scheme may be affected by other laws and regulations, like minimum standards, conditions of State and Commonwealth awards, and training and development.

The workforce development responsibilities of State and Territory Governments will be less as the NDIA fully rolls out and replaces their existing disability support programs. However, State and Territory Governments should remain 'in the tent' when it comes to workforce policymaking given the interaction between the NDIS and other mainstream services. The Commission seeks feedback on the best way for governments and the NDIA to manage these responsibilities as the scheme rolls out.

DRAFT RECOMMENDATION 7.1

The roles and responsibilities of different parties to develop the National Disability Insurance Scheme workforce should be clarified and made public.

- State and Territory Governments should make use of their previous experience in administering disability care and support services to play a greater role in identifying workforce gaps and remedies tailored to their jurisdiction.
- The Australian Government should retain oversight of workforce development, including how tertiary education, immigration and aged care policy interact and affect the development of the workforce. In doing so, the Australian Government should pay particular attention to immigration policy to mitigate workforce shortages over the transition period.
- The National Disability Insurance Agency should provide State and Territory Governments with data held by the Agency to enable those jurisdictions to make effective workforce development policy.
- Providers of disability supports should have access to a clear and consistent mechanism to alert those tasked with market development about emerging and persistent workforce gaps.

INFORMATION REQUEST 7.1

What is the best way for governments and the National Disability Insurance Agency to work together to develop a holistic workforce strategy to meet the workforce needs of the National Disability Insurance Scheme?

An evidence-based approach to workforce policy is needed

A lack of data makes it difficult for policymakers and market stewards to properly exercise direction and support to the sector for it to develop sustainably. The existing data do not lend itself to measurements of specialisation, or differentiation of caring roles (such as between aged and disability care). Nor is it straightforward to examine labour supply and wage outcomes. This means that tasks that are simple for other industries — like identifying the response in labour supply to an increase in wages — are impossible to undertake with any degree of certainty. As the DSS said:

> A significant limitation to assessing the NDIS market readiness is the availability of market and workforce data. DRC has agreed Market Key Performance Indicators to monitor NDIS market performance and identify emerging market risks and, as the Scheme matures, will assist the NDIA with identifying risk requiring intervention. (sub. 146, p. 34)

These key performance indicators will be drawn from scheme data, which will provide a richer dataset on providers and participants. However, the nature of the data means that it will be less well suited for measuring workforce growth and gaps over the transition period

and over the longer term. The Commission considers that the evidence base on the NDIS workforce needs to be commensurate with the importance of the scheme itself.

More data need to be collected on the supply and demand of disability care workers. On the demand side, the NDIA's market position statements provide the necessary information on when and where workers will be needed, and should be updated regularly. On the supply side, the Australian Bureau of Statistics should be funded to collect policy-relevant data on the disability care workforce.

DRAFT RECOMMENDATION 7.2

The National Disability Insurance Agency should publish more detailed market position statements on an annual basis. These should include information on the number of participants, committed supports, existing providers and previous actual expenditure by local government area.

The Australian Government should provide funding to the Australian Bureau of Statistics to regularly collect and publish information on the qualifications, age, hours of work and incomes of those working in disability care roles, including allied health professionals.

There is some scope to expand the supply of carers in the short term

One short-term policy to bolster the workforce is to make better use of existing disability carers. About 20 per cent of current aged and disability care workers express a desire to work more hours, half of whom wanted to work full-time (figure 7.6). This confirms the observation made by Martin and Healy (2010, p. 146), that frontline disability care workers 'generally wanted a substantial increase of 10 or more hours' of their weekly workload.

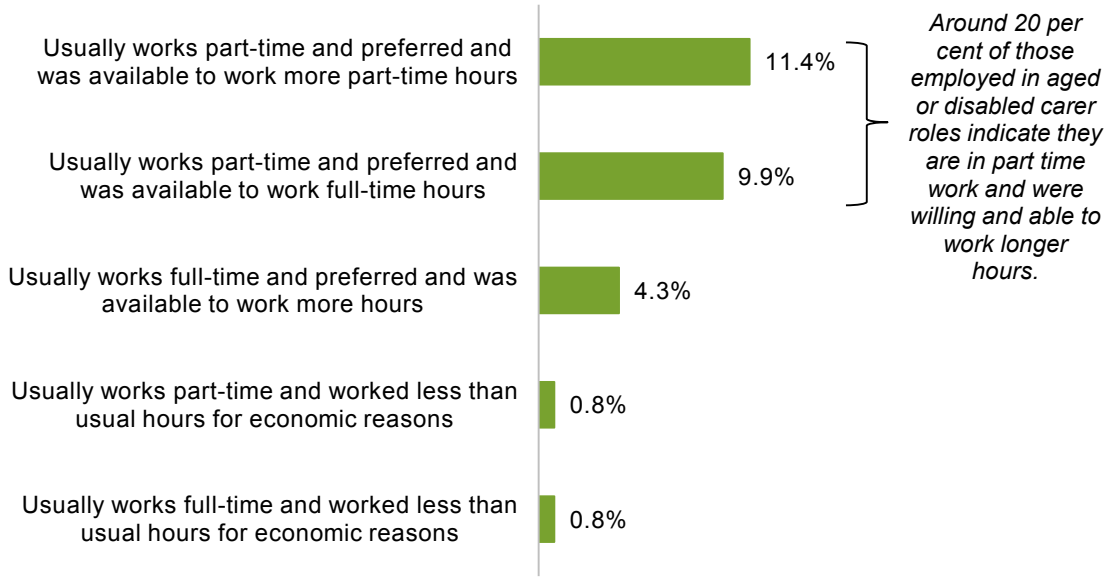
However, a desire to work more hours, does not mean an outcome of working more hours if policy settings and preferences of workers do not align. As put by the South Australian Government:

> Offering additional hours and more full time positions is an effective strategy to increase the size of the workforce, capitalising on the use of existing skilled workers and potentially offering greater security for some, particularly in the short term. However, this should also be balanced with being an employer of choice and offering flexible work arrangements to retain skilled workers in the sector. SA would therefore be interested in analysis being conducted on what level of inducement is provided by the flexibility of work arrangements that part time employment provides. (sub. 203, p. 14)

The Commission agrees, and considers that building the evidence base is key to identifying and addressing further impediments to making the most of the existing workforce. There may also be impediments to working additional hours arising from the price caps set by the NDIA, an issue that would form part of an independent pricing monitor and pricing regulator's duties to assess and respond to, if necessary (chapter 6).

Figure 7.6 **Aged and disabled carers express a desire to work longer hours[a]**

Per cent of aged and disabled carers, based on ANZSCO definitions, 2016



[a] Residual are those who are not underemployed (about 72 per cent of aged and disabled carers). 'Economic reasons' include being stood down or there not being enough work available.

Source: Commission estimates based on ABS (*TableBuilder,* Education and Work, May 2016).

Some informal carers may be able to provide additional care

Workforce shortages will mean that some people with disability will have to continue for some time yet to rely on their informal carers. But there are three constraints on informal carers providing additional hours of care:

- declining ability to care (especially in the case of ageing informal carers)
- other commitments (such as paid employment, or the need to engage in paid work)
- lack of respite.

In terms of the first point, and as mentioned above, the increasing age of informal carers means that there will be many carers who are unable to provide additional care. The most striking example are ageing parents of adult children with disabilities. Many ageing parents contributed to this study (box 7.3). It is clear that their capacity to offer additional care is extremely limited, and should not be relied upon.

Box 7.3 Many parents are currently the 'provider of last resort'

Rosa Miot:

> The NDIS is crucial to my future. I have a 40 year old daughter with an intellectual disability. I have been her full time carer all of her life. … However, I am now 70 years old and I will need the NDIS to provide her with the ongoing supports she will need to be able to remain living in the community as she has done all her life. I would like to be able to concentrate on my own life and health needs and not be overburdened with the caring role. (brief sub. 134)

Evelyn Ware:

> My husband and I are 89 and 82 years old respectively and have a daughter aged 55 with autism and intellectual disability. Although living in the community she requires a considerable amount of support with budgeting, health matters, cooking and general management of her life. … once we are unable to provide the assistance we are now providing she will need to have more support from NDIS, or go into supported accommodation as her disability prevents her from living independently in the community. (brief sub. 137)

Pat van der Beek:

> Our intellectually disabled son is 41 years old this year and my husband and I are 73 and 72 respectively. When the NDIS rolls out in our area in July, we are hopeful that we will have additional resources to enhance his life. His siblings are busy with their own families, careers and lives in general and there is no certainty that they will be able (or willing) to provide the necessary support for their brother when we no longer can. … While we are currently both in reasonable health, there is obviously no guarantee this will continue; inevitably, our son will be without our support in the later years of his life. … We have genuinely done our utmost to give him the best possible life to this point and welcome the introduction of the NDIS which we hope will enhance his future while also lifting some of the responsibility from our shoulders. (brief sub. 70)

However, for others the constraint is less to do with ability and more to do with the forgone wages that caring entails. Alleviating these constraints may allow informal carers to support family members with disability for longer and more intensively.

The simplest option is to allow the payment of informal carers through NDIA-managed plans. The NDIA's operational guidelines do not allow family members to be paid as carers except in exceptional circumstances. Specifically, the NDIA (ndd) 'will not fund a family member to provide personal care or community access supports unless all other options to identify a suitable provider of supports have been exhausted'. In practice, this has been interpreted to mean that family members who are paid to provide supports do not reside at the same location as the participant (NDIA 2014b, p. 5; Queensland Advocacy Limited, sub. 115, p. 15).

Due to slower than expected workforce growth, the Commission considers that it is appropriate for the guidelines concerning payment for informal care to be relaxed over the transition period for core supports (as these supports are critical to the wellbeing of a participant). Specifically:

- any requirement that the paid informal carer not reside at the same location as the participant should be removed

- the need to 'exhaust' all options to identify suitable providers should be more clearly defined, and linked to the NDIA's own data about the number and nature of providers in a region.

It is appropriate for such supports provided by informal carers paid by the NDIS to be reviewed regularly in light of market development, as well as issues about quality, safety and the longer-term objective of the scheme to relieve the burden on informal carers. There are also potential benefits for those in thin markets, including for Aboriginal and Torres Strait Islander participants where a greater use of informal carers could be more culturally appropriate in some circumstances.

> Peak representative group the First People's Disability Network argues there is an existing workforce in many Aboriginal and Torres Strait Islander communities because family members provide support informally. Giving resources to people already providing informal support may help fill capacity gaps in a culturally appropriate way. Additionally, area or community-based cooperatives could be used to develop capacity in Aboriginal and Torres Strait Islander communities. (AONSW 2017, p. 15)

A separate price for the supports provided by informal carers should be determined by the body tasked with setting prices for NDIS supports (chapter 6). It could reflect the opportunity cost of wages or welfare payments forgone, but should, generally speaking, be lower than that of the base hourly wage set in the NDIA price list for formal carers. The methodology used to determine the carers payment could also form a basis for setting the price of supports provided by informal carers.

There remain some administrative difficulties. Carers employed by participants are subject to the same laws about superannuation, occupational health and safety, industrial relations and workers compensation insurance. These arrangements should be the responsibility of participants and their families.

DRAFT RECOMMENDATION 7.3

The National Disability Insurance Agency's (NDIA) guidelines on paying informal carers who live at the same residence as a participant should be relaxed for core supports for the period of the National Disability Insurance Scheme (NDIS) transition. Such payments should be:

- accessible under clearly defined and public guidelines, which make reference to worker shortages in the relevant market using the NDIA's information about providers and supports in the participant's region
- set at a single rate determined by the NDIS price regulator in a transparent manner
- reviewed by the NDIA as part of plan reviews.

Respite plays an important role in facilitating informal care

Respite services can also help informal carers care for longer. A number of submissions to this study argued that respite services are not well catered for in NDIS supports. Specifically:

- the prices for short-term accommodation under the NDIS, which is used for respite, are too low to be sustainable (Cerebral Palsy Alliance, sub. 163, att. 1, p. 4) — an issue of price caps set by the NDIA for some supports (discussed in chapter 6).
- there is a lack of respite supports for family members (Carers Australia Victoria, sub. 131, pp. 37–38).

The shift towards participant-driven demand means that there are few avenues for informal carers to be assured of respite care. For informal carers to receive NDIS-funded respite care, it must form part of a participant's plan. While this maximises choice and control for the participant, it can lead to inappropriate levels of support for informal carers (National Mental Health Commission, sub. 153, p. 4), especially as some block-funded supports for carers are withdrawn. As Anglicare Sydney said:

> … carer needs and supports are not formally recognised as part of NDIS packages. There is no formal assessment of the needs of the carer, no funding package for the carer and no guarantee of involvement in the assessment of the care recipient's needs. … With the closure of carer-specific support services, Anglicare is concerned that carers will no longer receive the same amount of support, let alone improved levels of support, under the new system. (Kemp et al. 2016, p. 10)

The supports for respite under the NDIS are made up of several different options, most of which place a cap on the number of respite days provided per year. These caps have attracted criticism, with some providers claiming that they make the provision of respite services commercially unviable, including for participants with particularly complex needs or challenging behaviour (Cerebral Palsy Alliance, sub. 163, att. 2, p. 1). Some families also indicated that the respite offered in plans is insufficient (Carers ACT 2015, pp. 1–3).

Broader support for carers, including information and linkage about respite, is also to be provided under the DSS' *Integrated Plan for Carer Support Services*, which is yet to be fully implemented. A gap is emerging for respite services both within and outside the NDIS as the scheme transition occurs.

A lack of respite may mean that informal carers are unable to support family members and friends who are NDIS participants. This, in turn, will require more formal and costly supports in their place. It was for this reason that the Commission in its 2011 *Disability Care and Support* inquiry recommended that the needs of carers be considered as part of a participant's individualised supports (PC 2011, p. 340).

However, it is less clear whether a quantity cap (as well as a price cap) for respite services is warranted, and whether it is in the best interests of participants, providers and the

community over the transition period of the scheme where *all* carers are needed. The Commission is seeking further information on these issues.

INFORMATION REQUEST 7.2

How has the introduction of the National Disability Insurance Scheme affected the supply and demand for respite services? Are there policy changes that should be made to allow for more effective provision of respite services, and how would these affect the net costs of the scheme and net costs to the community?

Greater use of skilled migration has costs and benefits

While reducing underemployment for general care workers may bolster supply of some workers, there is practically negligible underemployment in allied health professions.[36] For such workers, the long lead time to train them means that shortages could persist over the shorter term, and potentially beyond the end of the NDIS transition period.

An option to meet a shortfall in the short-term is to make greater use of skilled migrants, which was proposed by the Commission in its 2011 inquiry (2011, p. 721). The Commission considers that the existing policies and regulations for using skilled migrants is appropriate to meet the needs of the NDIS over the transition period, if required.[37] The flexibility of using staff employed on visas over a few years is also of value to the scheme, as participants may have changing preferences over a similar time period.

That said, it should be recognised that using skilled migrants is not an immediate solution. Like any new worker, there is a period of on-the-job training required to become proficient in providing services, and in the case of allied health, it will still be necessary for sufficient mentoring to occur. These issues touch directly on setting the appropriate prices for supports over the transition period to enable a sufficient margin for such training to occur — an issue for the independent price regulator discussed in chapter 6.

36 Commission estimates based on ABS (*TableBuilder*, Education and Work, May 2016).

37 Commission estimates based on ABS Census data from 2011 indicate that about 10 per cent of those working in a group of allied health professional occupations (based on the ANZSCO classes relating to dieticians, optometrists and orthoptists, health therapy professionals (not further defined), occupational therapists, physiotherapists, podiatrists, speech professionals and audiologists) were born overseas and arrived in Australia after 2000, suggesting that avenues for skilled migration are possible. Analysis by the ABS found that the second most commonly reported industries of Skilled Program migrants' employment was in the Health Care and Social Assistance industry division, which includes carers and some allied health professionals (ABS 2010). It is too early to tell if recently announced changes to skilled migration visas (Dutton and Turnbull 2017) may impact on this flexibility.

Not all participants to this study agreed that greater use of skilled migration is an appropriate approach to workforce shortages. For example, Allied Health Professions Australia, while agreeing that skilled migration is one way to increase the number of qualified allied health professionals, said that the time spent to acclimatise skilled migrants to Australian conditions was as intensive as training someone locally.

> … skilled migrants are unlikely to be familiar with local health and social systems and services and may not have specialised skills as required to provide appropriate support to many participants. As a result these skilled migrants are likely to have skills and knowledge at a level that is closer to entry level allied health professionals and requiring mentoring and support. Experience suggests that significant time is required for overseas-trained graduates to learn to navigate the complex interaction of systems and understand the various parties involved in providing support. These factors mean that there will need to be significant investment to ensure that skill[ed] migrants can provide services of equivalent quality and AHPA [Allied Health Professions Australia] submits that it may be more effective to pursue alternatives such as incentivisation of Australian graduates and other workers. (sub. 37, p. 18)

The Commission considers that the time taken to train someone to understand Australian conditions is likely to be shorter than the time taken to achieve the formal qualifications to practice in the first place. This is particularly the case in the transition stage, when the time to train new staff is limited.

Another objection raised was in relation to the precarious nature of skilled migration visas, and that it should not be viewed as a substitute for training local workers. As put by the Australian Services Union and the Disabled People's Organisations of Australia:

> Any migrant worker scheme for the NDIS should provide permanent migration and only be considered after there has been local labour market testing. The NDIS provides a significant opportunity to address high levels of unemployment for many people, including people with disability. While we do not support a precarious, exploitative 457-style visa scheme for NDIS workers, we do support the development of a comprehensive workforce plan to retain and attract new workers locally. (sub. 198, p. 2)

The Commission agrees that skilled migration is a policy response that should focus on meeting the shortfall in specific roles (rather than as a general measure to address all shortages), and considers that more clearly delineating workforce development responsibilities among governments would provide a better platform to train and develop local workers. However, given the risk of shortages in the transition period, greater use of skilled migration appears to have more benefits than costs at present. As previously put by the Commission:

> Overall, the role of immigration as a source of labour must balance the impacts on wages and other strategies for eliciting domestic supply of workers, and the reality that significant labour shortages are still likely, especially during the rapid growth in disability supports during the establishment phase of the NDIS. In that vein, immigration should mainly address acute and persistent shortages. (2011, p. 720)

What remains to be seen is whether the shortfalls persist over the longer term, which is when further review and consideration should be given to changes to workforce

development and immigration policies. This could be facilitated as part of the expected future reviews of the NDIS, including the regular reviews by the Joint Standing Committee on the NDIS.

New technology may reduce demand for workers

A number of submissions to the study indicated that greater use of technology could reduce the need for some disability care workers, and so mitigate a potential shortfall. Understanding the extent that technology could be 'labour-saving' is difficult: the market for disability supports is undergoing major change, and what NDIS participants will demand is still unclear. That said, there is a range of emerging technologies that could significantly reduce the need for workers. As put by the NDIA:

> Technology may reduce the need for formal and informal care as innovations allow participants to partake in more daily living tasks:
>
> - Incorporating smart design into Specialist Disability Accommodation has the potential to reduce reliance on person-to-person supports. For instance, smart alert systems may enable participants to operate their homes better without or with less assistance;
> - The expansion of innovative transport services such as car-sharing into accessible transport options may provide more efficient ways for people with disability to access modified vehicles compared to private ownership; and
> - Creating communities of support and effective use of telepresence technologies for the delivery of paid supports may assist informal carers to maintain and develop their care with the reassurance that they can seek advice or assistance when needed. Communities of support may also help reduce the expectation that therapy/ interventions can only be undertaken in a clinic or practitioner's premises and thus support the NDIA expectation of a diverse workforce.
>
> Appropriate use of assistive technologies (including suitable monitoring/ alert systems) can reduce dependence of participants on carers for routine tasks and appointments (e.g. getting a drink or going to the toilet), and permit care and interventions to target activities or periods that require skilled human input (e.g. preparing a meal or intervention to manage a period of muscle spasm).
>
> Technology advances and innovation in service sectors similar to the disability support sector demonstrate potential future uses of technology:
>
> - Evidence from dementia research has shown that appropriate use of location triggered alerts/alarms can enable greater freedom for people who may wander, without increasing (even lessening) the burden on carers. Similarly, such technologies can also offer protection for carers dealing with participants out of hours or with at risk behaviours; and
> - Recent reports on the use of robot monitors in homes of the elderly to predict falls. While this particular instance is in an aged care setting, there are clearly applications in this technology applicable to disability support services. (sub. 161, pp. 98–99)

Other participants highlighted the values of providing care remotely through 'telepractice' (Allied Health Professions Australia, sub. 37, p. 17; The Shepherd Centre, sub. 107,

pp. 14–15; Speech Pathology Australia, sub. 136, p. 47), which reduces the need for service providers to travel.

Given the scheme is in the early period of transition, it is difficult to tell what technologies will emerge and what effects they will have on the need for workers. The Commission will examine these issues, as well as other impediments to participants making the use of emerging technologies, including issues about internet access and access to telepractice supports in NDIS plans in preparing the final study report.

8 Participant readiness

Key points

- How ready participants are to make the most of their National Disability Insurance Scheme (NDIS) plan will depend on a number of factors, including: an individual's capacity; their network, informal carers and peers; the assistance provided under the NDIS; how ready the market is to provide supports; and the complexity of the scheme.
- Some participants (as well as their carers and families) are finding the NDIS difficult to understand and interact with, particularly in the context of the scheme being a new way to allocate and supply disability supports. Some transitional issues are also making it harder for participants to navigate the scheme.
  - If participants are unable to interact well with the NDIS, then the benefits of the scheme will not be fully realised. This has consequences for the lives of participants and the financial sustainability of the NDIS.
- Supports are provided to some participants to increase their capacity to navigate the scheme and implement their plans — including through support coordination, which makes up about 4 per cent of committed supports (for plans after 30 June 2016). There may be ways to improve the efficiency of support coordination, including through complementary actions directed at building participant readiness.
- The National Disability Insurance Agency is currently responding to participants' concerns about the online portal (through which participants manage and organise payment for supports). It is also developing the eMarketPlace to provide timely information to participants to help them find and purchase supports from disability support providers. The eMarketPlace is critical to supporting participant decision making.
- Intermediary services, which can help participants manage different elements of their plans, can also help to reduce the transaction costs and complexity of the scheme for participants. At this early stage of the scheme rollout, the extent of any barriers to entry for intermediary services is unclear, as well as whether additional safeguards are required to regulate their operations.

The readiness of participants to make the most of their National Disability Insurance Scheme (NDIS) plan is key to the success of the scheme. Understanding how ready participants are to enter the NDIS; to get the plans that they need; to find their supports; and, if they desire, to self-manage their own affairs, is directly linked to the intended outcomes of the scheme.

Participant readiness also has a direct bearing on costs. If people with disability are unable to navigate the scheme, this will lead to lower participation in the scheme and underutilisation of supports. Both outcomes will reduce scheme costs in the short term, but may lead to higher costs (both inside and outside of the NDIS) over the longer term.

This chapter examines participant readiness by looking at how readiness to navigate the NDIS can be considered, and the supports available to participants to assist them to use the scheme (section 8.1). It then discusses options for improving participant readiness (section 8.2). Issues relating to participant engagement in the planning process are discussed in more detail in chapter 4.

8.1 What is participant readiness?

Participant readiness should be considered in the context of the changes that the NDIS is driving for people with disability. Participants are moving from a scheme where they had little choice and control over their supports to a new system, where they have greater opportunities to exercise choice and control. While this empowers participants to take greater control of their lives, it also brings with it challenges that they may have never faced before. This includes: thinking about the best way to achieve their goals; shopping around for providers; and managing more administrative and financial tasks than previously. And they must do this while the scheme is still rolling out and as the disability support market is changing. A study participant said that:

> Telling people they have choice and control, does not give them the skills to find appropriate service providers, which are much harder to find when they are full and simply tell people to go somewhere else if they are not happy with something. There is no information anywhere on how people can choose providers, what to look for in them, the sorts of questions to ask and what sorts of things you might want to consider. Equally when providers are all full, then what options are there. (Belinda Jane, sub. 80, p. 10)

There will be some degree of 'learning-by-doing' as participants spend more time in the NDIS and become more accustomed to the scheme. But at this point in time, it is clear that participants need help to become well-informed consumers who are able to make decisions that provide cost-effective outcomes. This was recognised by the COAG Disability Reform Council.

> … many people with disability will not have had the opportunity to exercise choice. Some people with disability may require additional support to effectively exercise informed choice, especially those with high and complex needs. (2015a, pp. 14–15)

Broadly speaking, there are two main aspects to participant readiness:

- the capacity of participants (and informal carers who they may have to assist them) to navigate the NDIS — including their ability, willingness, skills and resources
- the complexity of the NDIS — including interactions with the National Disability Insurance Agency (NDIA), Local Area Coordinators (LACs) and providers to secure and purchase supports. The more complex the scheme, the more skills that participants require to engage with it.

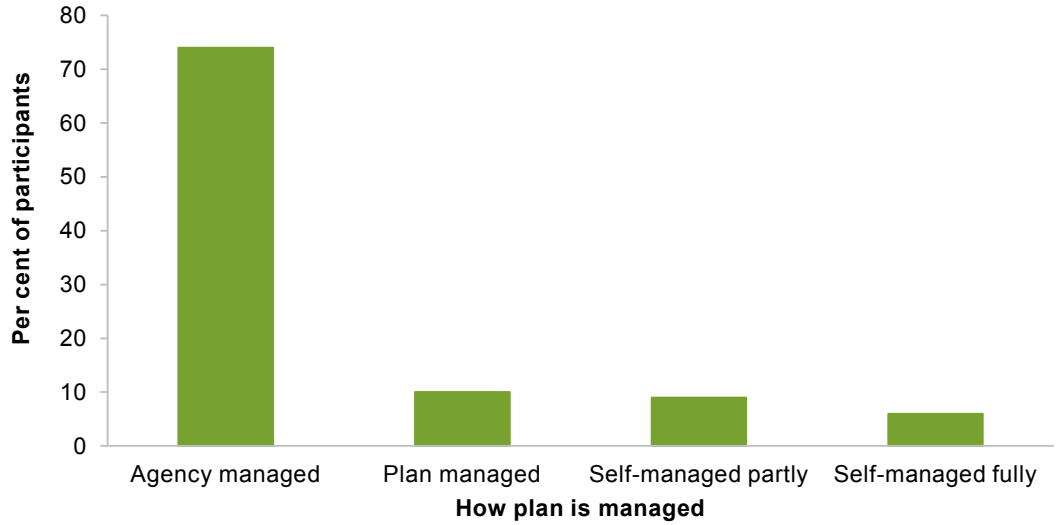
As such, there are two levers that can be used to improve participant readiness: developing the skills (and capacity) of participants, and reducing the complexity of the scheme. While

both approaches have costs and benefits, they are not mutually exclusive, but interdependent and complementary.

What assistance is there for participants?

NDIS participants have access to a range of resources to help them navigate the scheme, and to exercise choice and control over their disability supports. Participants have a range of options in relation to managing their plans (box 8.1). Most participants in the transition period to date have chosen to use a NDIA-managed plan, rather than using a third party or managing their plans themselves (figure 8.1).

Figure 8.1 **How NDIS participants are managing their plans**
For participants joining the scheme between 1 July 2016 and 31 March 2017



Source: NDIA (2017o, p. 21).

Box 8.1 Managing the funding for supports under a participant's plan

The *National Disability Insurance Scheme Act 2013* (Cwlth) (NDIS Act) allows a participant to choose how to manage their funding for supports. Management of funds is defined as:

- purchasing the supports identified in the plan (including paying any applicable indirect costs, such as taxes, associated with the supports)
- receiving and managing any funding provided by the Agency
- acquitting any funding provided by the Agency (s. 42(1)).

A participant with an approved plan (or one that is being prepared) may make a request that funding be managed wholly, or to a specific extent, by one of the following:

- the participant — this is known as 'self-management'
- a registered plan management provider nominated by the participant
- the National Disability Insurance Agency (NDIA)
- the plan nominee nominated by the participant or the CEO of the NDIA (ss. 42(2) and 43).

The NDIS Act does not permit self-management of funds in some circumstances, including when:

- the participant or the plan nominee is an insolvent under administration (s. 44(1))
- self-management would present an 'unreasonable risk to the participant' (s. 44(2)(a)). This is prescribed by the *National Disability Insurance Scheme (Plan Management) Rules 2013* (Cwlth), which includes a range of factors relating to the participant's legal capacity and decision-making ability that the CEO of the NDIA must consider in making the determination (s. 44(3)(a), rr. 3.7 and 3.8)
- the NDIS Rules have prescribed matters that must not be managed by a participant (s. 44(2)(b)).

If a participant does not make a plan management request, the plan is to be managed by the registered plan management provider specified by the NDIA, or by the NDIA itself (s. 43(4)). If this occurs, the CEO of the NDIA 'must, so far as reasonably practicable, have regard to the wishes of the participant in specifying who is to manage the funding for supports under the plan' (s. 43(5)).

General assistance is available for all participants

General assistance to implement and manage a plan is available for all NDIS participants, including via LACs, Information, Linkages and Capacity Building (ILC), and plan managers (sometimes referred to as intermediaries).

LACs link participants to the NDIS, and to information and support in the community. They also work with the local community to make it more inclusive for people with disability. LACs can also help participants understand the NDIS and implement their plan. This involves helping participants to:

- find and start receiving the supports that they need

- self-direct or self-manage their plan
- find mainstream and community services.

However, LACs are still being rolled out. The nature of their services also means that they assist participants with less complex needs (NDIA, sub. 161, p. 107).

ILC-funded projects focus on community inclusion, and making sure that the community becomes more accessible and inclusive for people with disability. This includes:

- personal capacity building — making sure that people with disability and their families have the skills, resources and confidence that they need to participate in the community, or access the same kind of opportunities or services as others
- community capacity building — making sure that mainstream services or community organisations become more inclusive of people with disability (NDIA 2017h).

ILC was not part of the NDIS trial period, but will be progressively rolled out across the country (chapter 5). The NDIA has provided grants to organisations to carry out activities in the community, with further funding rounds open in the second half of 2017 (NDIA 2017h).

Participants can also choose to use an external plan manager for some or all of their supports. A plan manager can take on a range of different tasks for the participant, allowing the participant to effectively 'outsource' the tasks that they feel least comfortable with managing, and in turn, reduce the administrative burden on participants. For example, plan managers can coordinate payments between the participant, provider and the NDIA, but participants retain choice and control over their supports. Plan managers can also take a larger role, such as searching and securing providers to meet a participant's needs — effectively acting as an agent for the participant.

Specialised support coordination is available for some participants

Some participants, including those with complex needs or less capacity to actively manage their affairs, can receive a range of 'support coordination' items as part of their plan. These include: support connection; coordination of supports; participant training in planning and plan management; and specialist support coordination. Support coordination is determined in the same way as any other support in a plan — based on what is reasonable and necessary for the NDIS to provide in meeting a participant's needs or goals.

In practice, support coordinators provide more intensive assistance to help a participant understand their plan, and to help them choose and connect with providers — effectively a more personalised and in-depth service than what LACs would provide (NDIA ndc, nde). Between July 2016 and March 2017, about 55 per cent of scheme participants had some funding for support coordination included in their plans (NDIA 2017o, p. 21).

Other groups can also provide assistance to participants

While LACs, ILC, plan management and support coordination are all provided under the umbrella of the NDIS, there are other groups and representatives who can offer assistance to NDIS participants. These include Disability Support Organisations (DSOs) and peer support groups, advocacy organisations, and trustees. These groups currently play, and will continue to play, an important role in assisting participants and their families to make the most of the NDIS.

DSOs are community organisations that facilitate disability peer support groups, which allow scheme participants and their families to share their experience, information and knowledge with others about issues associated with disability and the scheme (including helping people think about their goals and the supports that they might need). Peer support groups can also provide information on how best to find and arrange supports, and connect with community activities.

Funding through the Australian Government's Sector Development Fund was allocated to 18 DSOs to facilitate up to 20 peer support groups over the life of the project (NDIA 2015c, p. 80). However, peer support groups are also forming naturally (without funding) as the NDIS rolls out (for example, the Mental Health and NDIS Facebook Support Group (sub. 8)).

Advocacy for people with disability (including NDIS participants) can be defined as having an independent person (without a conflict of interest) directly speaking, acting or writing on behalf of the interests of an individual or group. There are a number of different models of disability advocacy, including:

- systemic advocacy — this is aimed at bringing about systematic improvement in policy and practice, and removing discriminatory barriers for people with disability
- individual advocacy — this involves upholding the rights of individuals with disability by working on discrimination, abuse and neglect (DSS 2016b, p. 2).

Advocacy may extend to helping participants find supports; however, it is currently not funded through the NDIS, but shared between the Australian,[38] and State and Territory Governments (except for South Australia). There are also a small number of disability advocacy organisations that are not funded by government (DSS 2016d, p. 2). The Department of Social Services (DSS) is currently reviewing what an updated National Disability Advocacy Program should look like, and how it should work (including funding) in a NDIS environment (DSS 2016d, p. 2). To reflect this, the COAG Disability Reform Council's terms of reference was recently amended to include a review of

[38] National Disability Advocacy Program (NDAP) agencies based in the NDIS sites may have additional roles, such as assisting people through the planning and internal review processes with the NDIA. Australian Government funding has been provided via the NDIS Appeals program to support people with disability who seek an external review of the NDIA's decisions through the Administrative Appeals Tribunal. Funding to current providers of the NDAP has been extended until 30 June 2018 (DSS 2016b).

advocacy arrangements, including roles and responsibilities, by 31 October 2017 (COAG 2017, p. 3).

Trustees can also help participants manage their affairs. For example, public trustees, established by State and Territory Governments, aim to ensure that all members of the community (including people with disability) have access to financial management services in the event that their capacity to make decisions is affected. Public trustees can make decisions on behalf of the person with disability in the best interests of that person (known as 'substitute decision making'), taking into account their needs and views. The *National Disability Insurance Scheme Act 2013* (Cwlth) also allows the CEO of the NDIA to appoint a public trustee as a participant's nominee in order to make decisions on planning and actioning supports.[39]

Navigating the NDIS is difficult for some participants

Some scheme participants are finding it difficult to understand and interact with the scheme, and to exercise choice and control over their supports. Study participants said that they are finding it difficult to understand plans; find, negotiate and coordinate supports with providers; and seek assistance from the NDIA when problems occur.

Study participants mentioned problems with clear communication of the participant pathway in particular. This partly reflects the changing nature of the disability support landscape. Under the previous system, NDIS participants who had access to support programs (typically block-funded) often relied on providers to be the 'first port of call' to seek remedies or changes to services. Under the NDIS, participants now have a range of options to seek information or clarity — including approaching a LAC or the NDIA itself. A lack of fit-for-purpose information means that confusion continues to arise among participants, and that burdens are still being placed on providers.

> There needs to be much more focus on communicating clearly and simply with clients. For instance, at the moment, plans are vague and written in 'government speak'. If the government is concerned about clients overspending, the NDIS needs to give clients clear information on what their funding is for and clear conditions under which it can be spent. (Angela Blakston, brief sub. 168)

> If anything has characterised the NDIS to date it is poor communications performance. It has failed to communicate changes in the Scheme as it has been rolled out to potential participants. Its communications have frequently been heavily jargonised and pitched at a very high level. Even people whose job it is to understand NDIS developments and operations often struggle with exactly what is being communicated. In some cases the NDIA has been successful in

[39] This process is one that is still relatively underutilised, but there are some concerns that nominees may have a narrower ability and responsibility compared to what a public trustee would ordinarily be able to do in the interests of the beneficiary. The Australian Law Reform Commission and participants in this study also noted that there may be a conflict in the duties required of a nominee as defined in the *National Disability Insurance Scheme Act 2013* (Cwlth), and relevant State and Territory legislation (ALRC 2014, pp. 151–152; Financial Services Council, sub. 98, pp. 4-5), but this is yet to be tested in court.

> making elements of the Scheme intelligible to consumers; for example, in a number of their plain English guidelines to supports available under the NDIS. This approach needs to be incorporated into all communications with participants, their carers and providers. (Carers Australia, sub. 195, p. 22)

The time spent by providers in assisting participants and their carers to navigate the complex system is significant, but are often 'unbillable hours' of support. Participants and their carers indicated that they are not able to obtain helpful advice from the Agency or LACs (Macarthur Disability Services, sub. 57, p. 9). The NDIA acknowledged that:

> People with disability and their families and carers have reported that there is continued difficulty in understanding the NDIS and the process of moving through the [participant] pathway. (sub. 161, p. 107)

Reflecting the complexity and variation of needs and circumstances among participants, some participants will be more ready than others. This, in turn, partly reflects the extent of help that they received under previous disability support arrangements. For example, one study participant said that:

> I don't think I will have trouble utilising my plan, because I am overdue some support and will fully appreciate the value of NDIS funding. I've done my research and I know what's available in my area; however, I appreciate that I live in a city area where there is choice of providers and my needs will not be difficult for me to articulate and negotiate around. (Name Withheld, sub. 5, p. 1)

Another study participant commented that:

> As a now plan-managed NDIS participant I find it even harder, if anything, to manage that additional layer of administrative burden and all I really want to do is to go back to the good old days when the MS [Multiple Sclerosis] Society told me what I want and needed and provided it at a reasonable cost. … there are many benefits to it, including being able to shrug off the burden of managing your costs and choices with a reasonably low level of bureaucratic rigidity. In the meantime … I am an 'under-utilisation' risk to the NDIS, with the immediate threat of having my unused funding cut back — not because I don't want and need the features these choices provide, but because I can't get organised to utilise the promised benefits and it's easier to blow my budget RIGHT OUT than navigate the NDIS' portal … (Kirsty Magarey, sub. 150, p. 4)

8.2 How can participant readiness be improved?

The balance between support coordination and other assistance

It was recognised before the implementation of the NDIS that it would be necessary to build the capacity of participants to interact with the scheme.

The NDIA recently implemented a 'participant pathway', which includes additional funding for those participants with less capacity to navigate the scheme.

> The NDIA has designed the participant pathway to include support for participants during the planning and implementation phases … In the implementation phase, the NDIA provides LACs for those with less complex needs and funding for support coordination for the intensive participant groups. … The NDIA has also identified that there is a need for work in the support coordination sector, particularly in some cohorts such as where participants have challenging behaviours, rural and remote areas and where there are gaps in mainstream services that the NDIS cannot fill. Work continues to educate support coordinators on the capacity building role expected of their function which is designed to build the skills of individuals over time to make support decisions themselves. (NDIA, sub. 161, p. 107)

Support coordination is an element of the participant pathway, which is the key means to bolster the readiness of participants with *complex* needs. However, study participants said that there is confusion about the role of support coordinators, and that it is not clear whether they are effective in helping scheme participants find providers, nor whether they are being allocated to the participants who most need such supports.

> We need a step by step guide. A clear list of who is who and who does what. What the heck is a support coordinator and what exactly can they achieve in an hour a week? … Especially at the start of a plan, [a] support coordinator needs to be much more active. (Cheryl McDonnell, sub. 79, p. 3)

> There has been a lack of clarity and guidance around the function, allocation and use of support coordination funding … Providers also report a wide variation in the quality of the support provided. (Early Childhood Intervention Australia Victoria/Tasmania Limited, sub. 129, p. 11)

While it is too early to evaluate the efficacy of support coordination, there is some evidence to suggest that it does help those who receive and use it. For example, participants who are allocated and use support coordination have higher rates of utilisation (the ratio of used to committed supports in a plan) on average than those who are allocated, but do not use, support coordination. While many factors affect a participant's readiness to navigate the NDIS and decision to use supports provided in plans, at face value, this suggests that support coordination does help build a participant's capacity.

Support coordination funding has been significant over the transition period to date. About 4 per cent of committed supports in participant plans after 30 June 2016 have been allocated to support coordination (figure 2.9). If the same proportion were applied to total scheme costs in 2020, then this suggests that support coordination could cost around $900 million each year. (This would assume, however, that support coordination is fully utilised to the same extent as other committed supports, which is not the scheme experience to date.)

Effective support coordination is important to both deliver participant outcomes and contain scheme costs. The Commission is seeking feedback on both possible improvements to support coordination, and any complementary actions that may make support coordination more efficient.

INFORMATION REQUEST 8.1

Is support coordination being appropriately targeted to meet the aims for which it was designed?

How can scheme complexity be reduced?

The Commission received a lot of feedback about the complexity of the NDIS. The two main areas of concern were:

- participants finding providers
- participants (and providers) understanding and using the online portal where plans and payments are managed (box 8.2).

The rapid rollout of the NDIS has led to a number of transitional issues, including the implementation of the online portal. A review of the portal found many shortcomings in its implementation, mainly stemming from the speed of the rollout (PwC 2016). The NDIA said that it accepted the recommendations of the review and is addressing the portal issues.

> Significant difficulties with the implementation of the new ICT system in July 2016 adversely impacted on both participants and providers and caused a loss of community confidence in the NDIA's administration. An assessment of the failures from July 2016 have been documented in the PricewaterhouseCoopers *NDIS MyPlace Portal Implementation Review*. The NDIA accepts the broad thrust of those findings and has now implemented, or is the process of implementing, all of the recommendations from that report. (sub. 161, p. 15)

Given the NDIA's commitment to address portal issues, the Commission has made no finding or recommendation on this matter. However, as participants (and providers) rely heavily on the portal to manage supports and payments, it may be appropriate to examine the operation of the portal in future reviews of the NDIS, as well as closely monitor any issues with the portal to improve accessibility for scheme participants.

Box 8.2 Problems using the NDIS online portal

Syndromes Without A Name Australia said that:

> The portal has a number of plans on it if the plan has been reviewed, causing confusions for clients. The headings are not the same as what is written in the plan, leading to interpretation errors. The portal crashes a number of times and the dates need to be entered a certain way. Some days the portal works better than others. There is no form on the MyGov tab or NDIS website to ask for a correction if you accidently upload a payment request to the wrong category. One family is still waiting 6 weeks later to hear from NDIS re: this issue, after submitting an enquiry regarding this. As there is no way to upload receipts, the portal uploads are open to exploitation. (sub. 86, p. 2)

Mental Health Community Coalition ACT said that:

> Service Providers are often placed in the unenviable position of having to help participants use the MyGov website in order to use their NDIS plans, including by entering passwords – technically this is breaking the guidelines of use, possibly the law. (sub. 135, p. 28)

Summer Foundation said that:

> The current administration of the NDIS creates a high barrier for participation by individuals with complex needs. Young people in RAC [residential aged care] typically have few informal supports and many have cognitive impairment. Most don't have ready access to a computer and/or are not able to navigate the Internet, both of which are required to activate plans and to find and negotiate supports with providers … More accessible and flexible approaches to delivering information and building the capacity of people with disabilities and their families are desperately needed (sub. 113, p. 25)

Timely and useful information can minimise transaction costs for participants

While a functioning portal is important, participants also need information about providers. As the Prader-Willi Syndrome Association of Australia said:

> NDIS participants must have access to information about the performance of providers (e.g. number of complaints against them, participant's budgets running out too early, etc.). (sub. 112, p. 6)

Information that helps participants to exercise informed choice and control can emerge naturally from private sources, such as online comparison sites, connecting services and peer support groups for disability supports. There is evidence that this is already occurring, but the extent is unclear. Some providers also indicated that they will provide more information to participants to make choices (Australian Orthotic Prosthetic Association, sub. 123, p. 8).

That said, the NDIA's role as a market steward means that it has a responsibility to provide information about providers to reduce participant search costs, to increase competition, to better monitor the market, and to reduce information asymmetry (NDIA 2016k, pp. 24–25). This role will become increasingly important as the number of participants and the disability support market increases through transition. This role also reflects a key area for action under the *Integrated Market Sector and Workforce Strategy* (DRC 2015a, p. 15) to enhance the amount of information available to consumers, and the NDIA's (2016k, p. 24)

desire for participants to have easy access to information 'about all possible service providers from which they can choose'.

This is to be achieved, in large part, by the NDIS 'eMarketPlace', which, according to the NDIA (sub. 161, p. 65), will support information discovery, encourage industry innovation, build local community capacity, and provide timely data and analytics to assist with NDIS sustainability (box 8.3). The eMarketPlace is broadly consistent with the Commission's 2011 recommendation that the NDIA should provide a centralised internet database of service providers that indicates the range of products and services, price, availability and links to measures of performance and quality (PC 2011, pp. 486–487).

Box 8.3 The eMarketPlace aims to help participants and providers

The eMarketPlace is a project of the National Disability Insurance Agency (NDIA) to 'support information discovery, encourage industry innovation, and build local community capacity' and to 'provide timely data and analytics to assist with Scheme sustainability' (NDIA, sub. 161, p. 65). This includes the introduction of 'cognitive intelligence capabilities' — a form of artificial intelligence that will allow for easier interaction between participants, providers and the NDIA. For example, participants would be able to ask general and personalised questions about the eMarketPlace and the National Disability Insurance Scheme, rather than contacting the scheme's call centre. The eMarketPlace will be co-designed by the NDIA and people with disability.

The aim of the eMarketPlace is to maximise the benefits of the scheme by making it easier and more efficient for participants to find and access the supports that they need. It will also enable providers, businesses and community organisations to market their products and services. In turn, it will improve the responsiveness of providers to participant demand, and encourage innovation.

The eMarketPlace is expected to reduce transaction costs of both participants and the NDIA. According to the NDIA:

> By introducing an eMarketPlace and eventually automating much of the payments and processing function, the NDIA will reduce the time spent on these activities and consequently the potential costs.
>
> In general contexts, eMarket platforms may be able to reduce unit costs by between 15-30%. In the NDIA context, these cost savings may flow through to participants in some scenarios. Where the NDIS is incentivising participants to shop around, the eMarketPlace will likely result in the best price for support services, in particular homogenous supports, being achieved more often. As well as open price comparison and price competition, the eMarketPlace also adds an additional commissioning channel for the participant. Cost savings realised from eMarketPlace price competition will serve to promote the effectiveness of the eMarketPlace, incentivising eMarketPlace participation, improving the scale of use and the sustainability of the NDIS. (sub. 161, p. 66)

Source: Adapted from NDIA (sub. 161, pp. 65–66).

The NDIA (2016k, pp. 29–31) plans to introduce the eMarketPlace by the end of June 2018, but it is unclear how long this will take in practice (and there are a number of market stewardship activities and projects that are to take place during this period).

The DSS also stated that:

> The NDIA will conduct a 'Request for Information' (RFI) process to gather advice from industry stakeholders about innovative solutions and commercial models to deliver the NDIS eMarket Place to assist providers to reach their participants. (sub. 146, p. 38)

The eMarketPlace, as described, would go a long way towards meeting the needs of participants when it comes to information about providers. It can overcome some existing information gaps, such as the slow updates to existing provider lists, inaccessibility of provider lists, and lack of indicators of consumer satisfaction (particularly on service quality and performance). The eMarketPlace will also supplement other work by the NDIA to develop a range of consumer guides to best practice in areas such as therapeutic supports or equipment (DRC 2015a, p. 15), which are currently being refined. Metrics are also being developed to better understand purchasing patterns and the timing in which participants make decisions (NDIA, sub. 161, p. 107).

For participants to exercise choice and control, they must have access to information about options for supports and providers that is timely, accurate, relevant, clear and accessible. As the New South Wales Government (sub. 60, p. 4) said, 'participants are particularly vulnerable to information asymmetries and/or a differential in bargaining power between themselves and providers'. This is particularly the case for people with disability where quality of service is highly valued (as there are significant negative consequences from the provision of poor service) and switching costs are high.

The Commission considers that the eMarketPlace should be introduced as a matter of priority.

DRAFT RECOMMENDATION 8.1

The National Disability Insurance Agency should implement the eMarketPlace discussed in the *Integrated Market Sector and Workforce Strategy* as a matter of priority.

A greater role for intermediaries?

Directly reducing complexity and building participant capacity can be costly. A more cost-effective (and preferable) option for participants could be outsourcing some or all of the administration of their plans to an intermediary. This can be done by using an intermediary as a plan manager, or even a third party to procure and manage particular supports.

Intermediaries can assist participants who may struggle to deal with the detail necessary to self-manage their affairs, and reduce scheme costs by aggregating participants' purchasing power for common supports. There is evidence that the administrative burden of self-managing a plan is a disincentive for some participants to take full control of their

supports. As put by the National Institute of Labour Studies' Intermediate Evaluation of the NDIS:

> At wave 1 the option of self-managed funding was not always fully understood by NDIS participants; nor was it always discussed in the planning meetings. By wave 2 it was evident that while NDIS participants had a greater understanding of what self-management was there remained very few self-managers. The main reason for this appeared to be a reluctance to take on additional administrative activities. (Mavromaras, Moskos and Mahuteau 2016, p. 72)

Intermediaries can also reduce the stress from dealing with NDIA processes. As noted by Mind Australia Limited:

> … when processes are overwhelming or negotiations are difficult, the impact on an individual's mental health can be devastating. One participant in the choice project said that when she was accepted into the NDIS, she thought that getting good support would mean fewer stays in hospital. In fact, she was admitted to hospital eight times in her first year in the scheme, which she put down [to] the stress of dealing with the NDIS and NDIS processes. Ongoing navigational support is one means to address this situation. (sub. 144, pp. 11–12)

Intermediary-managed plans can help participants with a range of tasks,[40] including to:

- help participants find providers, and take responsibility for the hiring and firing of workers
- take charge of financial administration, including invoicing and budgeting
- assist in dispute resolution with providers and/or the NDIA
- deal with the complexities of hiring particular individuals, by administering superannuation, workers' compensation, and occupational health and safety insurance[41]
- provide assistance dealing with the NDIA and LACs, including during plan reviews.

By coordinating these activities, intermediaries can act as a 'one-stop shop' for NDIS participants, which reduces the complexity faced by participants. They can also provide systemic feedback to the NDIA on any common and recurring issues, which in turn can reinforce the scheme's insurance approach.

40 In some ways, intermediaries could fulfil the roles that the Commission recommended for Disability Support Organisations in its 2011 inquiry (PC 2011, pp. 414–422).

41 An alternative approach that is being used by some self-managing participants is to use independent contractors to provide supports (Home Life Association, sub. 59, p. 9). As contractors must organise their own insurance, superannuation and other administrative matters, the use of contractors may reduce the administrative burden on participants.

Financial and service intermediaries can be funded as line items in approved NDIS plans (NDIA 2016n, p. 48, 2016o, p. 48).

- Financial intermediaries hold funds and manage risk on behalf of participants.
- Service intermediaries provide broader technical assistance, including:
  - assisting participants develop skills with plan management
  - negotiating and coordinating the provision of supports
  - sourcing providers
  - negotiating the method and timing of the delivery of supports
  - negotiating individual requirements as part of support management
  - recruitment, training, support and employment of staff (NDIS IAC nd).

However, the distinction between financial and service intermediaries is somewhat blurred in practice, as the service intermediary role can only be undertaken in conjunction with the financial intermediary role (NDIS IAC nd).

What is less clear, however, are the roles and responsibilities that intermediaries can more effectively and efficiently undertake given the presence of LACs and support coordinators, and whether they should be funded out of participants' plans or elsewhere.

The Commission has been unable to identify any barriers that prevent intermediaries from helping participants manage their supports. Given that it is 'early days', it may be too soon to observe such barriers. Participants may also not be aware that intermediaries are an option, as noted by Blind Citizens Australia.

> Due to the speed of the roll out, we are increasingly concerned that participants are not always being made aware of the full range of options in regards to plan management and support coordination and as such, their plans do not always include the support that will enable them to put their plan into action. (sub. 130, p. 8)

It is also unclear what safeguards or regulations should apply to intermediaries, especially as other parts of the NDIS are implemented or improved. As the Victorian Government put it:

> It is too early to say how well equipped and how well supported NDIS participants will be to exercise informed choice in this new marketplace. As the disability service market matures, it can be anticipated that intermediaries will emerge to facilitate mutually satisfactory transactions between providers and consumers, often aided by new information and communication technologies and tools.
>
> Appropriate regulatory responses for intermediaries will also need to be determined. In the interim, the readiness of participants to exercise choice is likely to rely heavily on NDIA funded initiatives and programs designed to assist participants navigate the disability support sector. Much of this support infrastructure is yet to be fully rolled out. (sub. 174, p. 19)

Intermediaries should be closely monitored over the next few years to ensure that there are no undue barriers to their operation, but also as a means to better identify areas of

complexity that participants are seeking paid assistance to overcome as part of ongoing scheme reform. The activities of intermediaries should also be monitored with an eye to developing any necessary safeguards that may be needed beyond the NDIS Quality and Safeguarding Framework (which is currently being developed by the DSS and yet to commence).

The Commission is seeking feedback on a range of questions relating to intermediaries and disability support organisations, including how they fit within the broader landscape of assistance for participants; whether there are barriers to entry for intermediary services; and what safeguards should apply to them. This includes any safeguards that may be appropriate to address conflict of interest when intermediaries are both plan managers and a disability support provider at the same time.

INFORMATION REQUEST 8.2

Is there scope for Disability Support Organisations and private intermediaries to play a greater role in supporting participants? If so, how? How would their role compare to Local Area Coordinators and other support coordinators?

Are there any barriers to entry for intermediaries? Should intermediaries be able to provide supports when they also manage a participant's plan? Are there sufficient safeguards for the operation of intermediaries to protect participants?

---

9 Governance

Key points

- The governance arrangements for the National Disability Insurance Scheme (NDIS) provide a good foundation for the scheme. Some enhancements can be made where the governance arrangements affect, or have the potential to affect, scheme costs and financial sustainability.
- There is a lack of clarity around some roles and responsibilities, including Local Area Coordinators, mainstream services and market development.
- The current arrangements for implementing NDIS Rules need to be relaxed to ensure that they can be amended quickly when there are changing circumstances that could risk the financial sustainability of the scheme.
- Internal review processes have the potential to increase scheme costs and poor planning processes can increase the number of reviews.
- External review processes will clarify the law over time, including the entitlement to reasonable and necessary supports. Outcomes from such reviews could potentially have a significant impact on scheme costs.
- The timeframe to implement the *NDIS Quality and Safeguarding Framework* is ambitious. However, it is important that it be met to ensure quality and safety for scheme participants, to provide clarity and reduce regulatory burden for providers.
- While the Western Australian NDIS is meant to mirror the national scheme in many respects, there is a risk that the governance arrangements could lead to a divergence in participant outcomes. There are also costs associated with setting up parallel schemes. The Commission's preference is for Western Australia to be part of the NDIS.
- Current NDIS performance reporting does not have a sufficient focus on plan quality. Reporting on scheme participants' outcomes and attainment of participants' goals also requires further development.
- The National Disability Insurance Agency's (NDIA) focus on participant intake has compromised the success of the scheme. The NDIA needs to find a better balance between participant intake, the quality of plans, participant outcomes, and the financial sustainability of the scheme during the transition period. Some steps are now being taken by the NDIA to better balance these aspects, but the outcomes are not yet clear.

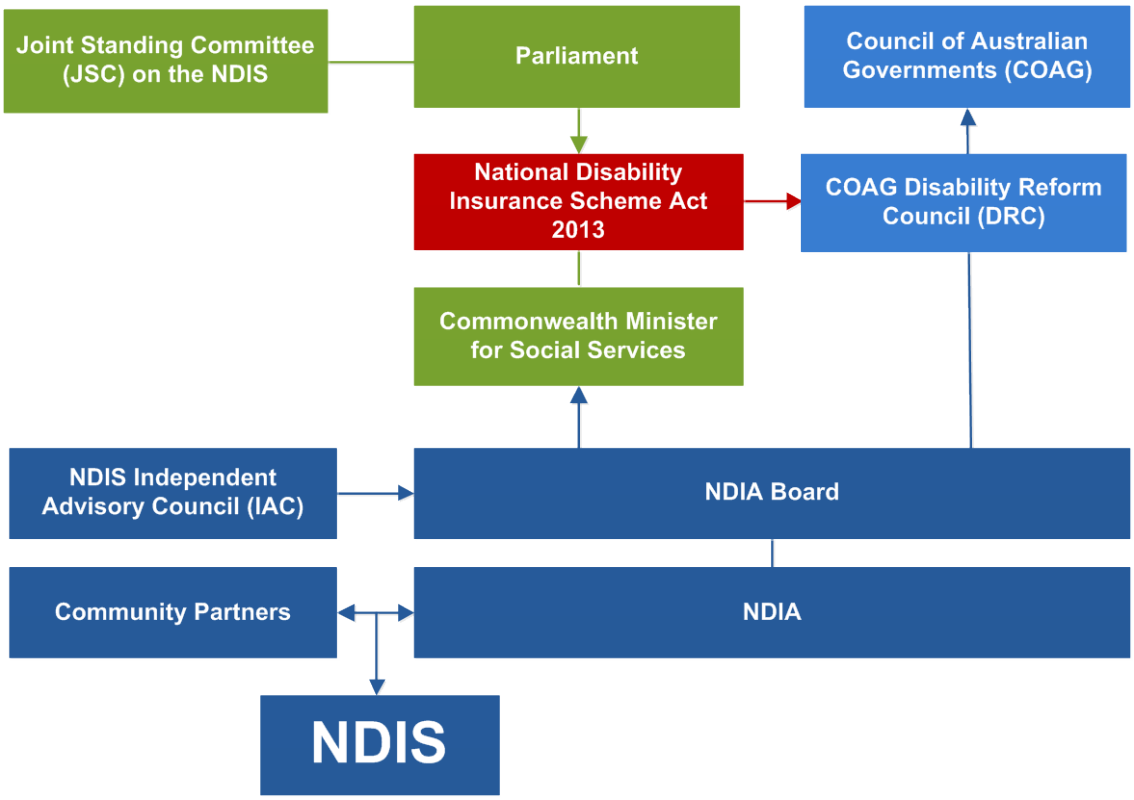
This chapter looks at the National Disability Insurance Scheme (NDIS) governance arrangements in the context of scheme costs and financial sustainability. Section 9.1 provides an overview of the governance arrangements. Sections 9.2 to 9.7 discuss issues with the current governance arrangements including: clarity and transparency around roles, responsibilities and processes; flexibility of the arrangements; the Western Australian

NDIS; review processes; regulation; and performance reporting arrangements. Section 9.8 discusses the timetable for the scheme rollout.

9.1 Overview of governance arrangements

The *National Disability Insurance Scheme Act 2013* (Cwlth) (NDIS Act) sets out the governance arrangements of the NDIS (figure 9.1). The Act is supported by the NDIS Rules, which are legislative instruments that provide more detail on the operation of the NDIS (NDIA 2017j).

Figure 9.1 **Summary of NDIS governance arrangements**



Source: Adapted from NDIA (2016g, p. 127).

The Australian, State and Territory Governments share responsibility for the governance and policy decisions of the NDIS. The Australian Government Minister for Social Services is responsible for administering the NDIS Act, and exercises statutory powers with the agreement of State and Territory Governments. The Minister can (in some cases, with the agreement of State and Territory Governments) make NDIS Rules and issue directions to the NDIA about the performance of its functions (NDIA 2016g, 2017f; NDIS Act).

The COAG Disability Reform Council (DRC) is responsible for NDIS policy and broader disability policy. Its members include the Minister responsible for disability policy and the Minister responsible for the Treasury portfolio from each Australian, State and Territory Government, and a representative from the Australian Local Government Association (DSS 2017a). The DRC:

- considers policy matters relating to the NDIS and the NDIS Act
- advises the Minister for Social Services and makes recommendations to COAG (NDIS Act s. 12)
- oversees the implementation of the NDIS and can make recommendations to COAG on the transition to full scheme
- is responsible for a range of reforms that are to be implemented through the National Disability Agreement and the National Disability Strategy to support people with disability and their families and carers (DSS 2017a).

State and Territory Governments are also responsible for regulating providers in their respective jurisdictions until the *NDIS Quality and Safeguarding Framework* is implemented (DSS 2016c, p. 17).

The NDIA is responsible for managing and delivering the NDIS. It is an Australian Government agency established under the NDIS Act and the *Public Governance, Performance and Accountability Act 2013* (Cwlth) (NDIA 2017f; NDIS Act s. 117). Its main functions include:

- delivering the NDIS to support the independence and social and economic participation of people with disability, and enable them to exercise choice and control in the pursuit of their goals
- managing, advising and reporting on the financial sustainability of the NDIS
- facilitating innovation, research and best practice in the disability sector
- building community awareness of disabilities
- collecting, analysing and exchanging data on people with disability, and the supports provided to them
- undertaking research relating to disabilities (NDIA 2017q; NDIS Act s.118).

The NDIA is governed by a Board, which is appointed by the Minister for Social Services in consultation with State and Territory Governments. The Board is responsible for managing risk and setting the strategic direction of the NDIA. It is also responsible for monitoring and reporting on the performance of the Agency (NDIA 2017n). The Board was expanded from 1 January 2017 'to ensure it has the disability service, financial management, corporate governance and insurance-based expertise needed to guide the $22 billion scheme through its critical three year expansion to 2019-20' (Porter 2016).

The Independent Advisory Council (IAC) provides independent advice to the NDIA Board on how the NDIA performs its functions. The IAC is a panel of experts including people with disability, carers of people with disability, at least one person with expertise on disability in rural or remote areas, and at least one person with expertise in the supply of equipment or provision of disability services. The IAC can provide advice either on its own initiative or at the written request of the Board. The Board must consider all advice and provide the DRC a copy of the advice and its response (NDIA 2017g).

A Parliamentary Joint Standing Committee on the National Disability Insurance Scheme was established in 2013, with the role of reviewing the implementation, administration, performance, governance and expenditure of the NDIS, and other NDIS-related matters referred to it by parliament (JSCNDIS 2017; NDIA 2016g, p. 131). It has provided two progress reports to Parliament on the implementation and administration of the NDIS and is currently undertaking inquiries into hearing services and services for people with psychosocial disabilities related to a mental health condition.

Different arrangements for Western Australia

Western Australia has different governance arrangements for the NDIS to the rest of Australia. While it is intended to provide similar supports as the national scheme, the Western Australian NDIS (WA NDIS) will:

- be administered by the Western Australian Government, not the NDIA
- be funded differently (chapter 10)
- begin rollout one year later than the national scheme (2017-18) (box 9.1).

Are the current governance arrangements effective?

The high-level governance arrangements for the NDIS mostly reflect those recommended by the Commission in its 2011 inquiry on *Disability Care and Support*, including the appointment of an independent body (the NDIA), an independent Board and an Independent Advisory Council.

The NDIS Act and its objectives are also broadly aligned with the Commission's recommendations, including the entitlement to reasonable and necessary supports, eligibility criteria and an obligation to ensure the scheme is financially sustainable (PC 2011).

The governance arrangements provide a good foundation for delivering the scheme and managing financial sustainability.

Box 9.1 The NDIS in Western Australia

In January 2017, the Western Australian and Australian Governments signed a bilateral agreement for the implementation of the WA NDIS. Under this agreement, Western Australia will have a locally administered scheme, but the scheme is to be consistent with the national NDIS. The WA NDIS is expected to begin rollout on 1 July 2017 (one year later than the national scheme).

Unlike the national scheme, the WA NDIS will be managed by the State Government under State legislation. A WA NDIS authority will be established to manage the scheme which, similar to the NDIA, will have a Board and Independent Advisory Committee.

The intention is that the WA NDIS will be consistent with the national scheme in a number of areas, including:

- eligibility requirements
- the core principles, including access to reasonable and necessary supports, choice and control and guaranteed portability
- the application of the National Quality and Safeguarding Framework
- the complaints and appeals process, which will mirror the national process including access to the Administrative Appeals Tribunal
- reporting requirements, including the requirement to report quarterly to the DRC
- other governance arrangements, including relevant Rules under the NDIS Act
- contributions to policy at the national level by the Western Australian Government.

Sources: Australian Government and Western Australian Government (2017); WADSC (2017).

One important difference is the Australian Government minister responsible for the NDIS. The Commission recommended that the Australian Government Treasurer be the responsible Minister for the NDIS because of the proposed commercial focus of the NDIA, and the need to ensure strong cost controls, insurance characteristics, long-run sustainability and appropriate management of funds (PC 2011, p. 432). The Commission also envisaged other ministers, such as the Minister for Social Services, playing a prominent role in disability policy.

However, primary responsibility for the NDIS is with the Australian Government Minister for Social Services. While the Commission has not received any evidence to suggest that the insurance and commercial focus of the scheme is compromised by these arrangements, it is important that the NDIS is managed as an insurance scheme and not as a welfare program.

The following sections discuss areas of concern about the governance arrangements.

9.2 Lack of clarity around roles and responsibilities

While the high-level governance arrangements for the scheme are clearly set out in the NDIS Act, the Heads of Agreement, the Bilateral Agreements and other policy documents, the way the governance arrangements play out in practice, including who is responsible for what, is less clear. For example, there is a lot of confusion about the role of Local Area Coordinators (LACs). For example, DARE Disability Support said:

> DARE's understanding of the role initially envisaged for the LACs, namely frontline problem solving and assistance with plan implementation, appeared to change shortly before transition to planning and the Coordination of Supports for non-complex participants, surely a foreseeable gap in NDIS planning resources. (sub. 182, p. 7)

The confusion is, in part, because the NDIA experimented during the trial with a number of options for delivering LACs' activities. The NDIA ultimately chose to outsource the LAC functions, and this arrangement was put in place for the beginning of the rollout. However, the confusion could also be because LACs have been diverted away from their intended activities towards planning-related tasks. As the NDIA said:

> The need to meet bilateral estimates has also meant that for the first period of transition the NDIA has asked LAC partners to divert their resources into information gathering to facilitate the approval of plans and implementation of plans. (sub. 161, p. 56)

There is also a lack of clarity around the responsibilities of the NDIS and mainstream services, and how governments are approaching continuity of care (chapter 5). As noted by the Department of Social Services (DSS):

> The Council of Australian Governments (COAG) agreed principles to determine the responsibilities of the NDIS and mainstream service systems, which are generally sound, but need clarifying at an operational level. (sub. 146, p. 4)

The Commission is recommending that the National Disability Strategy be strengthened to improve accountability, and a standing item be added to the agenda of the relevant COAG Councils to address mainstream and other disability services and how they interface with the NDIS (chapter 5).

Other areas in need of greater clarity include supply side arrangements, such as the responsibilities for developing the NDIS workforce, the arrangements for provider of last resort and addressing thin markets. The DSS and the NDIA are working on these issues (chapters 6 and 7).

Given the scale and complexity of the NDIS, and the focus on insurance principles — which involves ongoing monitoring and refining of the scheme — changes to roles, responsibilities and processes are expected. However, it is crucial that governments and the NDIA continue to work to ensure clarity and transparency in the governance arrangements so that they do not undermine accountability and put the success of the scheme at risk.

9.3 Flexibility of governance arrangements

The NDIA and governments need to be able to respond quickly when circumstances arise that could threaten the financial sustainability of the scheme. This requires governance arrangements that are sufficiently flexible and that allow changes to be made quickly when required. This is especially important during the transition period of the NDIS, when the compressed timeframes increase the potential for poor arrangements to lead to poorer outcomes in the longer term.

While the NDIA has some flexibility and autonomy in how it operates the scheme, governments also have significant control over its operations. For example, the Minister for Social Services, with unanimous agreement from the State and Territory Governments, is responsible for appointing NDIA Board members and can, by legislative instrument, give directions to the NDIA about the performance of its functions (NDIS Act ss. 121, 127).

Also, as the NDIA operates under legislation, including the NDIS Act and the NDIS Rules, issues that could affect scheme costs or financial sustainability may require changes to legislation. For example, an Administrative Appeals Tribunal (AAT) or Federal Court ruling that was not in line with the original intention of the scheme, and had the potential to significantly increase scheme costs, could require a legislative change.

While the Australian Government is responsible for the NDIS Act, the Australian, State and Territory Governments are jointly responsible for the NDIS Rules. There are four categories of NDIS Rules. The Minister for Social Services has overarching responsibility for making Rules, and making Rules under each Category requires a different level of involvement or agreement from State and Territory Governments (box 9.2). The Minister can also delegate the power to make Rules to the CEO of the NDIA, with the agreement of State and Territory Governments (NDIS Act s. 201).

Most of the Rules currently in force are either Category A or Category B Rules (box 9.2). Category A Rules cover most of the sections of the NDIS Act, including (but not limited to) disability and early intervention requirements, what must be included in plans, and the statement of participants' supports. They require agreement from the Australian Government and each State and Territory Government (NDIS Act s. 209).

Box 9.2 Categories of NDIS Rules

There are four main categories of NDIS Rules.

- Category A — The Australian Government and each host jurisdiction must agree to the Rule.
- Category B — The Australian Government and the specific host jurisdiction that the Rule relates to must agree to the Rule.
- Category C — The Australian Government and a majority of host jurisdictions must agree to the Rule.
- Category D — Each host jurisdiction must be consulted on the Rule (NDIS Act s. 209).

In addition, under sections 125B and 180C of the NDIS Act, the Minister responsible for the *Insurance Act 1973* (Cwlth) can make Rules related to the management of risk and the Scheme Actuary's duties.

Most of the current NDIS Rules are either Category A Rules (requiring unanimous agreement) or Category B Rules (requiring agreement between the Australian Government and the relevant host jurisdiction).

Category A rules

The current Category A Rules cover areas such as:

- rules to assist in determining who can become a participant, including extra details about age, residence and early intervention requirements (*National Disability Insurance Scheme (Becoming a Participant) Rules 2016*)
- requirements in determining representatives for children, and what that child's representative must comply with (*National Disability Insurance Scheme (Children) Rules 2013* (Cwlth))
- nominees, including their appointment, duties and cancellation and suspension (*National Disability Insurance Scheme (Nominees) Rules 2013* (Cwlth))
- how supports in a participant's plan should be specified and how to assess whether it would pose an unreasonable risk for a participant to manage their own plan (*National Disability Insurance Scheme (Plan Management) Rules 2013* (Cwlth))
- criteria for approving registered providers of supports and requirements registered providers of supports must comply with (*National Disability Insurance Scheme (Registered Providers of Supports) Rules 2013* (Cwlth))
- funding of Specialist Disability Accommodation (*National Disability Insurance Scheme (Specialist Disability Accommodation) Rules 2016* (Cwlth)).

Category B Rules

Category B Rules are jurisdiction-specific Rules. They generally relate to the schedules for when areas and people will be phased into the scheme (such as the Rules regarding the preparation of participant plans), or the specific State and Territory laws that prevent a person providing certain information to the NDIA (*National Disability Insurance Scheme (Protection and Disclosure of Information) Rules 2013* (Cwlth)).

Some study participants raised concerns about the governance arrangements for Rule changes. Both the NDIA and the DSS pointed to the length of time it can take to get agreement from the States and Territories on Rule changes.

> The process for amendment of the NDIS Rules requires agreement from a majority or all (depending on the rules) of the States and Territories. Recent experience of seeking amendments to rules is that the process takes considerable time. (NDIA, sub. 161, pp. 48–49)
>
> This has proved cumbersome and complicated for most rules and other actions, such as making appointments and issuing directions, requiring unanimous agreement by the Commonwealth and the States. This can delay the timely sign-off of amendments, and can potentially impact timely direction being provided to the NDIA. (DSS, sub. 146, p. 32)

Both the NDIA (sub. 161, p. 49) and the DSS (sub. 146, p. 32) raised the example of the *National Disability Insurance Scheme (Specialist Disability Accommodation) Rules 2016* (Cwlth) (Category A Rules), which require unanimous agreement from the Australian, State and Territory Governments. According to the DSS (sub. 146, p. 32), it took about 10 months to implement these Rules. In a transition period of three years, such timeframes could pose significant operational difficulties for the NDIA.

The DSS (sub. 146, p. 32) called for governance arrangements to be changed to enable more streamlined decision making, particularly by the Australian Government. The NDIA argued for a mechanism for efficient and timely amendment of NDIS Rules and suggested that it could be achieved through:

> … legislative amendment that allows some rules to be made that do not require agreement from all jurisdictions, more efficient administrative arrangements to agree changes or by the Minister making a delegation under s.201 of the NDIS Act to the CEO to make legislative instruments in limited circumstances. (sub. 161, p. 49)

State and Territory Governments did not raise this issue specifically in their submissions to this study, and they were generally supportive of the current governance arrangements. For example, the Victorian Government said:

> Victoria reaffirms its support for the governance arrangements outlined in the 2013 Heads of Agreement. This includes a standing council of state and federal ministers as the decision maker on significant NDIS policy issues, COAG as decision maker in relation to scheme costs and implications for mainstream services, and a centralised national NDIA to administer the scheme. (sub. 174, p. 5)
>
> The states must be part of any decision-making process that determines what will be funded under the NDIS. Given the critical interface between the NDIS and state-funded mainstream services, Victoria considers these arrangements as a necessary safeguard against decisions about the scheme's scope which could result in a significant transfer of costs and risks to state-funded services, and poor outcomes for people with a disability. (sub. 174, p. 22)

However, the New South Wales Government said:

> NSW has always been open to considering governance changes, if required, to provide the Commonwealth with greater capacity to effectively administer the scheme, including managing cost risks and ensuring positive outcomes for participants. (sub. 60, p. 13)

While there can be benefits from requiring agreement from all jurisdictions to implement Category A Rules (different perspectives can ensure a better overall outcome is achieved),

there are also costs and risks to delaying changes. The benefits of requiring agreement from all jurisdictions to implement many NDIS Rules, therefore, need to be balanced against the need for the NDIS to be agile and able to adapt to emerging risks within a timeframe that ensures the financial sustainability of the scheme.

The Commission's view is that the risks of delaying implementing or changing Category A Rules in response to risks to financial sustainability are greater than the benefits of requiring unanimous agreement. The requirement for unanimous agreement from the Australian Government and all host jurisdictions for changes to some Rules should be relaxed.

However, any changes to the level of responsibility of governments in making Rule changes need to be considered in light of the risk-sharing arrangements in place, so that incentives can be aligned. This, and possible options for relaxing the Rule making requirements, are discussed in chapter 10.

DRAFT RECOMMENDATION 9.1

The requirement that changes to National Disability Insurance Scheme Category A Rules have unanimous agreement from the Australian Government and all host jurisdictions should be relaxed.

9.4 Western Australian NDIS

As noted above, Western Australia has not signed up to the national NDIS. This section looks at whether the governance arrangements for the WA NDIS will affect costs and financial sustainability. The funding and risk sharing arrangements are discussed in more detail in chapter 10.

Will two schemes affect costs and sustainability?

In 2011, the Commission recommended a single national scheme, and a single national agency, to provide disability care and support across the country (PC 2011, pp. 424, 428). The Commission also recommended that, if a single national scheme could not be achieved, the scheme should still be established, but with its funding and scheme design only applying to participating jurisdictions. The proposed model in Western Australia means that the arrangements in Australia fall somewhere in between these two approaches.

There are costs involved in implementing two systems. There is the cost of two sets of legislation — the NDIS Act and the proposed Western Australian legislation. There are also additional costs associated with setting up a separate agency in Western Australia to administer the WA NDIS (in addition to setting up the NDIA), and any associated loss of economies of scale that could ensue from having a single agency. Also, it is important that

learnings from the transition, such as things that have gone well or poorly, are adopted as quickly as possible in other parts of the scheme. Having two agencies could mean that it takes longer for lessons learned from the national scheme to be adopted in Western Australia and vice versa.

There could, however, be benefits to Western Australia having its own scheme. For example, a WA NDIS could allow increased flexibility and an ability to quickly adapt to changing Western Australian conditions. While the scheme is intended to mirror the national scheme in many aspects, including most parts of the NDIS Act and the NDIS Rules, the fact that the NDIA has its own detailed operational guidelines for its functions suggests that mirroring the legislation allows for significant flexibility. This flexibility could lead to a divergence in the supports provided to scheme participants and participant outcomes between Western Australia and the rest of Australia.

There were two trials of the NDIS in Western Australia — one managed by the NDIA and the other by the Western Australian Government. There are two reviews that have compared the trials in Western Australia. One review identified key features for an effective disability support model for Western Australia, and made a number of recommendations to address gaps in processes. It found that the Western Australian-managed trial required fewer changes in policy and processes to achieve an effective model than the NDIA-managed trial (Stantons International 2016). However, the limitations of this review should be noted. It compared and contrasted the processes related to plan preparation, activation, operation and review. It did not compare actual outcomes of participants in the two trials (this was not feasible due to the timing of the review), nor did it compare the costs of the different approaches.

The WA NDIS and the NDIS scheme actuaries have also undertaken an assessment of the two Western Australian trials. The results of the evaluation are not public.

While the Goldfields Individual and Family Support Association (sub. 13, p. 3) noted it ‘supports a decentralised and localised WA state governance model’, the majority of study participants who commented on the Western Australian model did not support a separate scheme. A key concern was that it will create inequities in specialist disability support (box 9.3).

Under the Bilateral Agreement between the Western Australian and Australian Governments, there are to be regular reviews of the state legislation, the first occurring two years after the commencement of the WA NDIS (Australian Government and Western Australian Government 2017). While the terms of reference for these reviews are yet to be agreed, they will include the extent to which the WA NDIS is achieving consistency with the agreed provisions in the NDIS Act. If the WA NDIS is to proceed as agreed under the Bilateral Agreement, these reviews will be important for ensuring consistency between the two schemes, and that people with disability in Western Australia are not disadvantaged by not being part of the national scheme.

In April 2017, it was reported that the Western Australian Government was undertaking a review of the decision to implement the WA NDIS and that joining the national scheme was still an option (Emerson, Wearne and Carporn 2017).

It is the Commission's view that Western Australia should be in the national NDIS. There are benefits of having a national scheme (as identified in the Commission's 2011 inquiry) and there are additional costs with two schemes. Where there is evidence that different processes in the Western Australian-managed trial have resulted in better outcomes for participants than under the national scheme, these processes should be considered for the national scheme. Given the concerns about the transition timetable, Western Australia could delay joining the national scheme until the national NDIS is at full scheme. However, to minimise uncertainty for participants, providers and governments, any decision to join the national scheme should be made public as soon as possible.

Box 9.3 Study participants' views on the WA NDIS

Down Syndrome Australia:

> Down Syndrome Australia, as a federation of state and territory Down syndrome organisations, has advocated strongly for WA to be part of the national scheme. DSA is very concerned that people with Down syndrome in WA will not get an equitable level of support, nor the choice and control nor long-term certainty of the national scheme. (sub. 121, p. 20)

Disabled People's Organisations Australia:

> DPO Australia is very concerned about the decision by the previous Western Australian Government to establish its own NDIS. Despite a number of nationally consistent provisions in the bilateral agreement, it is concerning that the WA NDIS will have different funding arrangements and accountabilities and a greater focus on service provider control. This is highly likely to prevent market growth and innovation for people with disability in WA and create inequities in the provision of specialist disability support in WA. (sub. 165, p. 10)

Matt Burrows:

> Without WA signed up to a national Scheme, the entire Scheme is at risk. The entire Scheme is not sustainable as a *national* reform unless all States and Territories are signed up to it. (sub. 7, p. 4)

Community Mental Health Australia:

> The announcement that Western Australia (WA) would be implementing its own state-based system has immediately created a situation where there will not be a nationally consistent scheme … (sub. 11, pp. 1–2)

Queensland Advocacy Incorporated:

> [Western Australia's agreement with the Australian Government] undermines that nationally consistent approach and increases state and territory variation. (sub. 115, p. 18)

Department of Social Services:

> An additional risk to consistency and sustainability will arise if a different model is implemented in Western Australia (WA), with the Commonwealth preference for WA to be part of the national NDIS delivery model. (sub. 146, p. 33)

DRAFT RECOMMENDATION 9.2

The Western Australian Government and Australian Government should put in place arrangements for Western Australia to transition to the National Disability Insurance Scheme. Any decision to join the national scheme should be made public as soon as possible.

9.5 Review processes

There are two types of *internal review* processes that can be accessed by those dissatisfied with an NDIA decision.

- *An unexpected plan review* — a scheme participant can request that the NDIA conduct a review of their plan. The NDIA must decide within 14 days whether or not to conduct the review, begin the review within 14 days of that decision, and complete the review as soon as reasonably practicable (NDIS Act s. 48). (This is distinct from the periodic (usually annual) plan review that is discussed in chapter 4.)
- *A review of a decision* — a number of reviewable decisions relating to the NDIA are set out under s. 99 of the NDIS Act, including decisions regarding eligibility, supports provided and registration of providers. When the NDIA makes a reviewable decision, it must give written notice to each person affected by the decision informing them of the option for review. A person then has three months to request a review of the decision. The review must be completed as soon as reasonably practicable (NDIS Act, s. 100).

There are also *external review* processes. If a person is dissatisfied with the outcome from a review of an NDIA decision (not a plan review), they can apply to the AAT to undertake a merit review of the decision within 28 days of the review decision (or apply for an extension of time). And if the person is not happy with the outcome of the external review, they can appeal the AAT's decision in the Federal Court, but only if it is a question of law (NDIA 2017p).[42]

Are the review processes appropriate and effective?

Some study participants argued that the review processes are not as appropriate and effective as they could be. First, there is confusion about the two types of NDIA reviews. The NDIA said that it:

[42] A question of law can include, for example, whether the AAT denied a person procedural fairness, correctly interpreted or applied the NDIS Act, or applied or identified the correct test. This is also known as a judicial review.

> … is aware that there has been confusion around avenues for reviews of decision[s] (especially given the word 'review' is used in the legislation to refer to two different [processes] in relation to planning). (sub. 161, p. 94)

The Commonwealth Ombudsman also commented that:

> … the distinction between an 'internal review' [a review of a decision by the NDIA] and a 'plan review' often seems to be lost on participants and their representatives. This situation was demonstrated in a recent AAT decision, Bridgland and National Disability Insurance Agency, where the applicant had sought an internal review and then, remaining dissatisfied, lodged an appeal with the AAT. The Tribunal found that it did not have jurisdiction to review the matter because the NDIA reviewer had initiated a plan review, resulting in a new plan which attracted internal review rights the applicant had not yet exercised. (sub. 137, p. 12)

This confusion was also noted by Ernst & Young (2015, p. 70) in its review of the NDIS Act, which recommended that the terminology in the Act be amended to make the distinction between the two types of reviews clearer.

Second, there are concerns about the accessibility of the review processes and the adequacy of information provided to scheme participants about review options. Down Syndrome Australia (sub. 121, p. 15) said that 'it appears that people are not well enough informed about their rights to ask for an internal review within the timeframe'. Scope Australia argued that the process is not clear and that the amount of information provided is insufficient.

> … the process for resolving disputes or disagreements is not clear. The Agency rarely provides a contact name for appeals or provides a process by which participants can escalate their concerns. There is only one email address where the information and requests for review can be lodged. This is not customer friendly nor does it encourage participants to best advocate for their rights. (sub. 72, p. 19)

Similarly, Brain Injury SA commented that:

> … the information provided to participants about review is unclear and inadequate. There is minimal information about the process and no information about how or where participants can get help with a review. Brain Injury SA delivers presentations to client communities about the support it can provide to participants wanting a review of an NDIA decision and further appeal rights and support. However, NDIA should provide this sort of information to all participants and be consistent about this approach.
>
> Further, Brain Injury SA has received anecdotal evidence from parents and guardians that NDIA has not been informing participants of their right to an internal review or external merits review through the AAT. (sub. 116, p. 10)

Third, while there is no limit in the Act on how long a review can take, study participants expressed frustration about both the overall length of reviews, and the variability in timeframes. For example, Brain Injury SA (sub. 116, p. 6) said that 'reviews can take between 1 and 8 months'. Others also commented on the delays.

> If people are not satisfied with their plan, they can apply for an internal review of a decision, and if necessary escalate this to the Administrative Appeals Tribunal. However, VCOSS members report this process can be confusing and time-consuming, taking months to resolve. (VCOSS, sub 176, p. 12)
>
> The review process itself is complex and bureaucratic and we have heard of cases where it can take up to 18 months to be completed. Participants who are implementing their second plan are sometimes still waiting for the review of their first plan to be finalized. (Leadership Plus, sub. 128, p. 2)
>
> Although operational guidelines suggest NDIA has 14 days to decide to review a plan, Anglicare Tasmania have examples of cases where reviews have not been resolved for up to seven months. In all cases we have been involved with, timeframes have been very lengthy and involved a huge amount of follow up from families or workers. (Anglicare Tasmania, sub. 145, p. 33)

Governments and the NDIA are working to address concerns about review processes. COAG has agreed to implement the recommendation from Ernst and Young's review of the NDIS Act to review the terminology in the Act to make the distinction between the types of reviews clearer, and to amend the legislation to provide more guidance on the rights of scheme participants to request a review of their plan (COAG 2016a, pp. 4–5). The NDIA (sub. 161, p. 94) also said that it is working to improve its review processes, including working with the Commonwealth Ombudsman to develop service and process improvements.

It is important that the NDIA continues to improve the transparency, clarity and adequacy of the information it provides about reviews and on the timeliness of its reviews.

Are review processes affecting scheme costs?

Review processes can affect scheme costs and financial sustainability in two ways.

- Internal reviews can affect the amount of supports provided or the number of people eligible for the scheme, and thereby affect scheme costs. (But if the review reverses an incorrect decision, there will be benefits, even if it increases scheme costs.)
- Decisions resulting from external review processes will clarify the eligibility requirements and reasonable and necessary supports, which can impact scheme costs.

In addition, poor planning processes can lead to an increase in the number of reviews being requested. This can be costly for the NDIA and scheme participants, and can divert resources away from other, more valuable activities.

Some study participants said that a high number of unexpected plan reviews are being undertaken for certain types of disabilities. For example, MND Australia stated:

> From June 2016 until January 2017 100% of all Plans for people with MND in NSW and the ACT required review. (sub. 45, p. 7)

Publicly available data on the number of unexpected plan reviews being undertaken by the NDIA are limited. Between 1 July 2016 and 31 March 2017, the NDIA had conducted about 26 500 plan reviews that lasted for 30 days or more (NDIA 2017o, p. 15). However, it is not known how many of these were unexpected plan reviews. As such, there is insufficient evidence for the Commission to judge whether the number of unexpected plan reviews is higher than expected, or whether reviews are increasing scheme costs. One way to reduce the number of unnecessary unscheduled plan reviews (and the costs of such reviews), is for the NDIA to implement a process for allowing minor amendments or adjustments to plans without triggering a full plan review. Improving planning processes should also reduce the need for unscheduled plan reviews. This is discussed in more detail in chapter 4.

For internal reviews of decisions, the most recent publicly available data are included in the NDIA's June 2016 quarter report to the DRC (NDIA 2016t, p. 46). At the end of June 2016, the NDIA had conducted 772 reviews of decisions. Of these:

- 262 related to access decisions and 510 to plan decisions
- about 66 per cent of completed reviews where an outcome was recorded (430 reviews) had resulted in the original decision being overturned.

However, there is no information about whether the review decisions have increased scheme costs, for example, by allowing more participants to enter the scheme or additional supports being included in plans.

As at 31 March 2017, there had been 161 external appeals to the AAT (NDIA 2017o, p. 27). Of these, 43 related to access issues, 104 to planning issues and 14 to plan reviews. The NDIA did not report the outcomes of the AAT reviews in its March 2017 quarterly report to the DRC, but it did so in December 2016. Of the 77 (out of a total of 112) appeals that were resolved by 31 December 2016, the NDIA's decision in about half was varied or set aside (the participant was successful) (NDIA 2016v, p. 40). As with the internal reviews of decisions, while participants have successfully appealed many external reviews, it is not clear whether this has led to increased scheme costs.

Two decisions by the AAT have been appealed to the Federal Court. The first case, *Mulligan v National Disability Insurance Agency* [2015] FCA 544, was an appeal of an AAT ruling to affirm the NDIA's decision to decline access to the scheme. The Federal Court set aside the AAT's decision and remitted for another decision by the AAT (NDIA 2017d).

The second case, *McGarrigle v National Disability Insurance Agency* [2017] FCA 308, was an appeal of an AAT decision to affirm the NDIA's decision to partially fund transport to access daily activities (chapter 4). The Federal Court set aside the AAT decision and remitted for another decision by the AAT. The implications of the McGarrigle case are yet to be fully understood, and the NDIA has announced it will appeal the decision (NDIA 2017l).

There is the potential for external review processes to significantly increase costs in the future by expanding eligibility requirements and the scope of supports provided. As the NDIA said:

> Decisions by the AAT (and/or an appeal to the Federal Court) have the potential to vastly increase the scope of both access and reasonable and necessary supports and must be adhered to while in effect, even if the NDIA challenges the decision. (sub. 161, p. 49)

That said, it is important that scheme participants have access to appropriate and effective external review processes. This ensures trust in the scheme, that participants have access to the scheme where appropriate and are receiving the right level of support (even where it increases scheme costs), and that the objectives of the scheme are being fully achieved. As noted by Carers Australia Victoria:

> Internal and external reviews are a vital quality safeguard for participants and carers, enabling them to test the lawfulness and merits of NDIA decisions affecting them. Importantly, they also promote transparency in NDIA decision-making. (sub. 131, p. 14)

As discussed in section 9.3, when external reviews result in outcomes that are not in line with the objectives of the scheme and could significantly increase scheme costs, it is important that governance arrangements allow for timely responses to ensure the financial sustainability of the scheme.

To provide greater clarity and transparency around the effectiveness of the review process and their effect on financial sustainability, the NDIA should undertake more detailed performance reporting on review processes (including on the number of reviews, review timeframes, outcomes of reviews, and participant satisfaction with the review process).

DRAFT RECOMMENDATION 9.3

The National Disability Insurance Agency should publicly report on the number of unexpected plan reviews and reviews of decisions, review timeframes and the outcomes of reviews.

9.6 Regulation and quality assurance arrangements

Regulation and quality assurance arrangements are important for ensuring the quality of the scheme and good outcomes for scheme participants. Currently, the Australian Government and the State and Territory Governments are responsible for regulation and quality assurance in their jurisdictions, and for the programs they fund (Bilateral Agreements, sch. F; DSS 2016c, p. 17).

In December 2016, the DRC endorsed the NDIS Quality and Safeguarding Framework. Under this framework, nationally consistent regulation and quality assurance processes will be implemented from 1 January 2018 (Australian Treasury 2017a, p. 154). The focus

of the framework is on helping scheme participants to exercise choice and control, while ensuring appropriate safeguards are in place.

The Australian Government will be responsible for most of the regulatory functions under the framework, including provider registration, the complaints handling system, serious incident notification, restrictive practice oversight, and investigation and enforcement (box 9.4).

A number of entities will be established to oversee the Australian Government's regulatory functions including the:

- NDIS Complaints Commissioner, which will be responsible for handling complaints, investigating serious incident notifications and investigating potential breaches of the NDIS code of conduct. The Commissioner will refer complaints to the relevant entity where appropriate, including those about provider standards to the NDIS registrar
- NDIS Registrar, which will be responsible for:
  - registering providers
  - managing the NDIS practice standards and certification scheme
  - leading the design and broad policy settings for worker screening
  - monitoring provider compliance
  - monitoring, reviewing and reporting on the effectiveness of the market for supports
- Senior Practitioner, which will be responsible for:
  - overseeing approved behaviour support practitioners and providers
  - providing best practice advice
  - receiving, reviewing and reporting on providers using restrictive practices
  - following up on serious incidents that suggest unmet support needs (DSS 2016c, pp. 16–17).

The State and Territory Governments will be responsible for worker screening and for the authorisation of restrictive practices in their jurisdiction (box 9.4).

The Australian Government has also announced that it will establish an NDIS Quality and Safeguards Commission to implement the framework and to undertake some of the Australian Government's regulatory functions listed above, including provider registration and regulation, complaints, reportable incidents, and behaviour support practices (Australian Treasury 2017a, p. 154; DSS, sub. 146, pp. 6-7). However, there is still a lot of work to be done in terms of implementation design and roll out of the arrangements (DSS 2016c).

Box 9.4 NDIS Quality and Safeguarding Framework

The NDIS Quality and Safeguarding Framework outlines the national approach to regulation and quality assurance for the NDIS. The DRC endorsed the framework in December 2016. The aim of the framework is to 'help empower and support NDIS participants to exercise choice and control, while ensuring appropriate safeguards are in place, and establishes expectations for providers and their staff to deliver high quality supports' (DSS 2017d, p. 1).

The framework embodies a number of principles.

- Measures within the framework are designed to uphold and respect the human rights of people with disability.
- Developmental measures (measures intended to build capacity) are designed to empower and support people with disability to make informed decisions about providers and supports.
- The framework is designed to ensure that people with disability have the same protection, regardless of where they live in Australia.
- The regulatory requirements for workers and providers are tiered to ensure regulation is proportionate to the level of risk associated with the type of support offered and the needs of the participants supported.
- The framework starts from the presumption that all people with disability have the capacity to make decisions and exercise choice and control.
- The framework streamlines requirements so the system is easier for people with disability to navigate, and red tape is reduced for providers.
- The framework is designed to support the development of an efficient and effective market.

The framework includes a range of measures targeted at individuals, the workforce and providers in three domains — developmental, preventative and corrective.

The Australian, State and Territory Governments will share responsibilities under the framework. The Australian Government will be responsible for provider registration, the complaints handling system, serious incident notification, restrictive practice oversight, and investigation and enforcement. State and Territory Governments will be responsible for worker screening and for the authorisation of restrictive practices in their jurisdiction.

The framework also encompasses a range of other functions including:

- advocacy services, which are funded outside of the NDIS
- systems for detecting fraud and related issues associated with the responsibility for paying providers and verifying that supports have been delivered. These will remain the responsibility of the NDIA
- complaints about the NDIA and Local Area Coordinators, which will be addressed through existing measures
- universal complaints and redress mechanisms, including Fair Trading and professional and industry bodies, which will continue to be available to participants
- anti-discrimination and human rights legislation overseen by the Disability Discrimination and Human Rights Commissioners, which will provide additional avenues for raising a complaint.

The Australian Government has committed $209 million to establish a NDIS Quality and Safeguards Commission to implement the framework.

Sources: Australian Treasury (2017a, p. 154); DSS (2016c, 2017d).

Are arrangements for quality and safety affecting scheme costs or sustainability?

The development of the NDIS Quality and Safeguarding Framework is an acknowledgment that the current arrangements will not be satisfactory for the full scheme. Current arrangements are designed around providers being block-funded and people with disability not having the level of choice and control they have now, or will have under the new system.

Although the current arrangements will not be appropriate for full scheme, they will remain in place for the transition. Given the importance to scheme costs and sustainability of having as smooth a transition as possible, ideally the current arrangements would not impede the development of the scheme and would ensure the safety of, and good outcomes for, scheme participants.

However, submissions to this study suggested that the current arrangements pose some risks to the scheme. A concern raised by a number of study participants is the different requirements providers need to meet across jurisdictions. For example, the NDIA (sub. 161, p. 103) argued that having different requirements in each jurisdiction can act as a barrier to entry for new providers. Plan Management Partners argued that:

> The current state based approach in our view is problematic as it is inconsistent in terms of application and requirements between the states. It is important in our view that the National framework (which is being introduced) addresses the current state variability. (sub. 126, p. 13)

And the Australian Rehabilitation Providers Association said:

> Barriers to entry for allied health professionals into the NDIS is high. The variable quality and safety procedures required by each State/Territory places additional costs on businesses employing allied health professionals. (sub. 28, p. 1)

Study participants also raised concerns about the burden of the registration process. Occupational Therapy Australia (sub. 15, p. 6) said that some occupational therapists found the registration process to be quite lengthy, which could deter therapists from registering as providers. Similarly, Allied Health Professions Australia commented that:

> The registration process is slow and complex, which is resulting in costs for practitioners, primarily in the form of significant time outlays required to address the bureaucratic requirements of registration. (sub. 37, p. 5)

Queensland Advocacy Incorporated argued that the registration processes are a particular barrier for smaller providers.

> QAI submits that the requirements for registration as an NDIS service provider will have the effect of squeezing smaller or lower funded organisations out of the marketplace. This will be to the detriment of people with disability and will impact upon the choice and control they have with respect to their services. (sub. 115, p. 16)

Third party verification (TPV) was raised as a concern by some providers. For example, in New South Wales, providers wanting to register to provide specialist disability supports are required to show evidence of full TPV (NDIA, sub. 161, p. 103). The Australian Psychological Society (sub. 19, p. 2) argued that one of the reasons psychologists are choosing not to provide NDIS services is the cost associated with the TPV process. The Australian Rehabilitation Providers Association also argued that:

> … [the TPV] process has imposed an additional layer of regulation and 'red tape' on tertiary educated professionals with rigorous registration requirements already in place. (sub. 28, p. 1)

Unfortunately, the timing of the implementation of the new framework at full scheme means that many regulatory issues will not be addressed until then. It is important that governments working on the implementation design and rollout of the new arrangements take into account current arrangements that are imposing unnecessary regulatory burden on providers. Consistent requirements across jurisdictions at full scheme will reduce the compliance burden for providers who want to provide services across jurisdictions. As the NDIA said:

> The implementation of the new national quality and safeguard framework … will reduce the compliance burden for providers seeking to operate in multiple jurisdictions. The framework will drive consistent approaches to regulating provision of the NDIS funded support. (sub. 161, p. 103)

While there is still work to be done on the implementation design and rollout of the framework, some study participants commented on the framework. Topics raised included the arrangements for psychosocial disability (CMHA, sub. 11, p. 16), children and young people (Centre for Disability Research and Policy, sub. 40), the need for a cultural competence domain (Northern Territory Government, sub. 205, p. 7) and those who provide services to scheme participants who self-manage not being required to register with the NDIA (DSA, sub. 9, p. 12).

Another ambitious timeframe

The NDIS Quality and Safeguarding Framework was only endorsed by the DRC at the end of 2016 which means that the timeframe (like other NDIS timeframes) is ambitious. However, it is important that this timeframe be met to ensure quality and safety for scheme participants, and to provide clarity and reduce the regulatory burden for providers. A number of study participants supported the arrangements being clarified and implemented as soon as possible (for example, Physical Disability Australia, sub. 38, p. 14).

As many of the details of the new arrangements are yet to be worked out, the Commission is not in a position to comment on the detailed regulatory arrangements under the framework.

9.7 Monitoring the performance of the NDIS

Performance reporting requirements can influence scheme costs and financial sustainability. Effective performance monitoring can improve transparency and accountability, and provide incentives for the NDIA and governments to effectively manage the scheme and ensure that the objectives of the scheme are realised.

To be effective, performance reporting indicators should measure performance against the objectives of the scheme and cover both outputs and outcomes. They should also be transparent and ideally released publicly in a timely manner. Some features of good performance indicators are summarised in box 9.5.

Box 9.5 **Features of good performance indicators**

- *Comprehensive* — indicators in a framework should measure performance against all important objectives.
- *Meaningful and understandable* — indicators must measure what they claim to measure and provide a good indication of success.
- *Accurate* — the data should be sufficiently accurate so that the community has confidence in the conclusions drawn from the information.
- *Timely* — the data must be collected at the point in time that aligns with the achievement of the outcome or objective.
- *Comparable* — indicators should allow for comparisons, including over time and between jurisdictions and target groups.
- *Streamlined* — indicators in a framework should be concise.
- *Cost-effective* — the benefits of reporting the indicator should outweigh the costs of collecting and reporting the data.
- *Avoid perverse incentives* — the indicator should not create perverse incentives or lead to unintended consequences.

Sources: Adapted from COAG (2011a, pp. 14–15); SCRGSP (2017).

How is performance currently reported?

The performance of the NDIS is currently monitored and reported through a number of mechanisms, including the:

- Integrated National Disability Insurance Scheme Performance Reporting Framework
- Scheme Actuary's monitoring and reporting on the financial sustainability of the scheme
- NDIA's annual report and corporate plan
- key performance indicators recently agreed by the DRC to monitor NDIS market performance and identify emerging market risks (DSS, sub. 146, p. 34).

Some of these are discussed in more detail below.

The Integrated NDIS Performance Reporting Framework

The main framework used to measure the performance of the NDIS is the Integrated National Disability Insurance Scheme Performance Reporting Framework, which is set out in schedule G in the Bilateral Agreements for the transition between the State and Territory Governments and the Australian Government (schedule H for Western Australia). The Framework comprises three main components:

- *NDIS Performance* — this includes agreed outcomes, key performance indicators and measures designed to assess whether the NDIS is achieving its objectives as set out in the legislation (table 9.1). Requirements at this level are designed to meet the accountability requirements of the DRC. This information is reported annually by the NDIA Board to the DRC.
- *NDIA Operational Performance* — this reporting meets the requirements in the legislation for the NDIA Board to report on expenditure and activities related to the NDIS, and it provides information on various aspects of NDIA operations that contribute directly to the achievement of NDIS outcomes and KPIs. This information is reported quarterly by the NDIA Board to the DRC (table 9.2).
- *NDIS Activity in Jurisdictions* — this reporting provides jurisdictions with the information they need to meet their own individual accountability requirements, such as budget reporting. This information is to be provided monthly by the NDIA to each jurisdiction through the data warehouse.

The NDIA is not yet reporting against all of the performance measures or indicators in the reporting framework, as it has not yet built in to its systems the capability to measure some of the indicators. For example, the NDIA is not yet reporting detailed data on the proportion of participants who attain the goals outlined in their plans, the time between requesting access and receiving support, and the number of participants and other people with disability supported by LACs (NDIA 2016v, 2017o).

In addition, only limited baseline (not longitudinal) data are presented for some indicators, such as the proportion of participants, and their families and carers, who report improved economic and social outcomes (NDIA 2016v, 2017o).

Table 9.1 **NDIS performance outcomes, KPIs & performance measures**

Outcome	*KPIs*	*Performance measures*
1. People with disability lead lives of their choice	1.1. People with disability achieve their goals for independence, social and economic participation	1.1.1. Proportion of participants, and their families and carers, who report improved economic and social outcomes (as measured by the NDIS Outcomes Framework) 1.1.2. Proportion of participants who attain the goals outlined in their plans (as measured by the NDIA's Goal Attainment Scale) 1.1.3. Participant satisfaction
	1.2. Increased mix of support options and innovative approaches to provision of support in response to assessed need	1.2.1. Mix and number of provider services 1.2.2. Proportion of participants with capacity building supports
	1.3. People with disability are able and are supported to exercise choice	1.3.1 Proportion of participants, and their families and carers, who report being able to exercise choice (as measured by the NDIS Outcomes Framework)
2. NDIS is a financially sustainable and insurance-based	2.1. Effective estimation and management of short-term and long-term costs	2.1.1. Comparison of actual expenditure against projected expenditure 2.1.2. Changes in medium- and long-term expenditure projections 2.1.3. Projected expenditure matches projected revenue over the medium and long-term 2.1.4. NDIA operating expenses ratio 2.1.5 Reduction in long-term cost trends against population, price and wages growth 2.1.6. Estimated future lifetime costs of support for current clients (NPV), including disaggregation for new and existing clients by client group
	2.2. Benefits are realised from targeted investment strategies in enhanced disability support	2.2.1. Effectiveness of early intervention in reducing estimated lifetime costs of support measure: • In the short term through case studies which include targeted investment • In the long term through estimated returns from this investment
3. Greater community inclusion of people with disability	3.1. People with disability are able to access support from mainstream services	3.1.1. Referrals to mainstream services for participants and non-participants through Information, Linkages and Capacity Building (ILC) 3.1.2. Proportion of participants accessing mainstream services
	3.2. Community awareness of people with disability	3.2.1 Activities undertaken by the NDIA to increase community awareness of the issues that affect people with disability
	3.3. Effectiveness of Local Area Coordination and other funded community capacity building	3.3.1. Number of people supported through ILC

Table 9.2 **NDIA operational performance outcomes, measures and indicators**

Outcome	*Measures*	*Indicators*
1. People with disability lead lives of their choice	1.1. Outcomes for participants and their families	1.1.1. Proportion of participants, and their families and carers who report improved economic and social outcomes (as measured by the NDIS Outcomes Framework)
		1.1.2. Proportion of participants who attain the goals outlined in their plans (as measured by the NDIA's Goal Attainment Scale)
		1.1.3. Participant satisfaction
	1.2. Provision of support in response to assessed need	1.2.1. Number of registered service providers by characteristics and market profile
		1.2.2. Access request to receiving support within different timeframes
2. NDIS is a financially sustainable and insurance-based	2.1. Participant characteristics and their families	2.1.1. Access requests made by outcome
		2.1.2. Eligible participants against bilateral targets, including key characteristics
		2.1.3. Participants with approved plans against bilateral targets
		2.1.4. Trends in plan approvals
		2.1.5. Access request to plan approval within different timeframes
		2.1.6. Ineligible participant numbers and key characteristics
	2.2. Support packages	2.2.1. Committed support
		2.2.2. Actual payments
		2.2.3. Average and median package costs by sub-groups of the population and for all participants compared with the expected averages and medians, including trends
		2.2.4. Details of participants with second plans, including length and value of supports
		2.2.5. Distribution of package costs
	2.3. Projections	2.3.1. Cost of the NDIS in dollar terms and as a percentage of GDP (split by participants aged under 65 years and over 65 years). This measure will include NDIS operating costs
3. Greater community inclusion of people with disability	3.1. Mainstream services	3.1.1. Number of participants accessing mainstream services by service type
	3.2. Local Area Coordination (LAC)	3.2.1. Number of participants and other people with disability supported by LACs by participant characteristics
		3.2.2. Description of activities undertaken on ILC including dollars spent by regions and activities
	3.3. Information, Linkages and Capacity Building (ILC)	3.3.1. Number of participants and other people with disability supported by ILC activities by participant characteristics
		3.3.2. Description of activities undertaken on ILC including dollars spent by regions and activities.

Monitoring and reporting on financial sustainability

Under the NDIS Act, each time an annual report is prepared the Scheme Actuary is to:

- assess financial sustainability and identify risks to financial sustainability, and any trends in the provision of supports to people with disability

- consider the causes of those risks and trends
- estimate the future expenditure of the NDIS
- prepare a report of that assessment, consideration and estimation
- prepare a summary of that report that includes the estimates of future expenditure (NDIS sub. 161, p. 115).

The Scheme Actuary prepares an annual financial sustainability report, which includes detailed data and information on the financial sustainability of the scheme. This report is not released publicly, although a summary is included in the NDIA's annual report (NDIS Act, s. 172). It is through this reporting that cost pressures are identified.

Are performance monitoring and reporting arrangements appropriate?

As the NDIA is still developing its performance reporting against the integrated framework, it is too early to judge whether the performance reporting will be sufficient to shed light on whether the scheme is meeting its objectives. That said, the Commission has identified some gaps in the framework and the current performance reporting against that framework.

As discussed above, there are limited data reported against the outcomes indicators. In addition, there are limited indicators on mainstream services, Information, Linkages and Capacity Building and LACs, and for the indicators that do exist, the NDIA is not yet reporting against some of them (NDIA 2016v, 2017o). Given the importance of understanding the interaction between the NDIS and mainstream services, and the critical role that Information, Linkages and Capacity Building and LACs play in the scheme (chapter 5), data on these activities should be an important component of reporting on NDIS performance.

There is also not a strong enough focus on quality in the framework, including the quality of plans, and review processes (draft recommendation 9.3). Reporting on quality is especially important given that the NDIA's focus on getting people into the scheme to meet the bilateral estimates has compromised the quality of the planning process and participants' plans (chapter 4). Over time, the NDIA intends to develop its monitoring of, and reporting on, outcomes. Evidence of good outcomes will be evidence of good performance and good plans. However, it could be some time until this reporting is of a sufficient standard. Until then, reporting on quality is needed. This could include indicators such as participant satisfaction with their plans and their planning experience, the number of plans completed by phone and face-to-face, and the number and nature of plan reviews.

As discussed earlier, it is also important that performance reporting is transparent to provide incentives to manage and improve performance, and to help to identify problems early. While the quarterly report to the DRC is made available on the NDIA's website, the financial sustainability report is not.

As the performance reporting on the NDIS is still being developed, the framework should be regularly reviewed and refined as needed. The Bilateral Agreements on transition state that the framework is reviewed annually (Australian Government and Queensland Government 2015, sch. G, p. 2).

DRAFT RECOMMENDATION 9.4

The performance of the National Disability Insurance Scheme (NDIS) should be monitored and reported on by the National Disability Insurance Agency (NDIA) with improved and comprehensive output and outcome performance indicators that directly measure performance against the scheme's objectives.

The NDIA should continue to develop and expand its performance reporting, particularly on outcomes, and Local Area Coordination and Information, Linkages and Capacity Building activities. The NDIA should also fill gaps in its performance reporting, including reporting on plan quality (such as participant satisfaction with their plans and their planning experience, plans completed by phone versus face-to-face, and plan reviews).

The *Integrated NDIS Performance Reporting Framework* should be regularly reviewed by the NDIA and the COAG Disability Reform Council and refined as needed.

9.8 The rollout timetable

As discussed throughout this paper, the ambitious timetable for the rollout presents a risk to the success and financial sustainability of the scheme. The speed of the rollout has:

- compromised the quality of plans (chapter 4)
- implications for the development of other parts of the scheme, especially the disability care workforce, which is unlikely to be sufficiently developed by 2020 to deliver the supports the NDIA is expected to allocate (chapter 7)
- imposed challenging timeframes on the development of important structural elements of the scheme — including details in relation to responsibilities at the coalface in services like health and transport (chapter 5); and instituting the new quality and safeguarding arrangements (section 9.6).

Some study participants argued that the rollout should be slowed down (box 9.6). For example, the Mental Health Community Coalition of the ACT (sub. 135, p. 24) argued that slowing down the implementation of the NDIS would mean that you could 'replace costly mistakes with getting it right in the first place'.

However, others argued that the rollout schedule should not be changed. For example, the Australian Federation of Disability Organisations said that slowing down the rollout is unacceptable to people who are waiting for support:

> Some in the sector have responded by arguing for a slow down [to] the roll out and to lengthen the transition period. To AFDO and its members, this would be completely unacceptable. For many people with disability, the wait has already been too long. For people who have had little or no support for many years, the NDIS cannot come quickly enough. Slowing down the roll out is therefore not an option. (sub. 180, p. 8)

Box 9.6 Some argued for a slowing down of the transition timetable

Cerebral Palsy Alliance:

> We would strongly recommend that the Commonwealth and States revise the transition timetable to support a realistic and manageable change management process for all stakeholders — as per NSW Bilateral Agreement - Management of Risk Clauses 48-51 — if the risk of market, sector and system readiness to transition emerges — changes to the participant phasing schedule may be considered by both parties. (sub. 163, attachment 2, p. 1)

David Parkin:

> The rollout to new areas needs to be slowed. Get the current system as right as it can be. There are enough participants now … who are actually using the system to understand where the effort needs to be applied. The NDIS has to listen to people and Providers. (sub. 177, p. 10)

Australian Lawyers Alliance:

> One important response to the challenges ought in our view to be a reconsideration of the rollout schedule. As at the date of this submission, the rollout is less than nine months old, yet the level of dissatisfaction with the scheme, and the clarity with which problems are being identified, are both rapidly escalating. (sub. 54, p. 6)

Australian Physiotherapy Association:

> Our members are concerned that the balance between the speed of the roll-out and its effectiveness needs to be changed, and the roll-out slowed so that the NDIS can properly train its team, manage its workload and provide consistent support to the regions in which the roll-out is occurring. (sub. 93, p. 8)

Maurice Blackburn Lawyers:

> A prudent approach would be to consider a slower roll-out schedule to help minimise the risks associated with the introduction of the scheme. … A revised rollout schedule could involve a complete cessation of the rollout on a regional basis for a specified period, to enable the remedial work to be undertaken, and a fresh analysis of readiness after that period.
>
> Aside from managing financial risks, a roll-out over an extended period would avoid significant frustration and distress for those living with disabilities and their families, and allow lessons learned from the early results to be incorporated into the scheme's final design. (sub. 58, p. 7)

The Commission acknowledges the hardship that has been imposed on some people with disability under the pre-NDIS arrangements that were 'inequitable, underfunded, fragmented and inefficient' (PC 2011, p. 5). Given the problems under the current rollout schedule, however, it may be that it will be in the interests of people with disability to slow down the rollout timetable.

A slowdown would provide the NDIA with more time to deal with planning and system issues. It would also give the market for disability care and support more time to develop, given that it could take at least a decade for a mature disability services market to develop (chapter 6). Governments at all levels would have more time to deal with interface issues at

an operational level, which is essential to ensure gaps do not emerge in a way that sees costs shifted to people with disability and their carers (chapter 5).

The rollout timetable is tied to the schedules set out in the Bilateral Agreements. Given that the numbers of scheme participants in the Bilateral Agreements are estimates and not hard targets, and that the NDIA is already behind on these estimates (chapter 2), there may be some flexibility for the NDIA to slow down the pace of the rollout should that be required.

The Bilateral Agreements for the transition also provide a potential mechanism for implementing a slowdown. For example, clause 50 of the NSW bilateral agreement on transition allows for a change in the participant phasing arrangements in the event of financial or other risks emerging. It requires the party with primary responsibility for the risk to work with other parties, including the NDIA, to develop an agreed strategy, and notes that other strategies must be pursued fully prior to considering changes in phasing agreements.

Any slowdown would have implications for scheme funding arrangements and the disability services provided by the states and territories. These matters would need careful attention should a slowdown be implemented.

The NDIA is aware of the current problems …

The NDIA acknowledges that the scale of the participant intake has affected the quality of participants' and providers' experiences (NDIA, sub. 161). The NDIA is working with participants, providers, peak disability bodies and other stakeholders to identify changes or improvements required to achieve:

- the intake of participants at the rate required by the Bilateral Agreements
- plans that maximise choice and control for participants, and contribute to improved participant outcomes
- plans that are of high quality
- plans that are financially sustainable so that the aggregate value of all plans remains within the funding envelope (sub. 161, p. 4).

While the NDIA's proposed new approach is yet to be tested with participants and providers, at this stage the Agency plans to have a greater focus on outcomes, more active involvement with communities, more face-to-face communications, and improved interaction with providers and disability organisations. The NDIA also plans to make improvements to its call centre and portal to make it easier to navigate (NDIA, pers. comm., 22 May 2017).

However, it will take time to implement the changes and for the changes to be reflected in the performance reporting data. On the information the Commission has received about the changes proposed by the Agency, the Commission is not in a position to form a judgment

about whether a greater focus on participant and provider experiences can be achieved while also meeting the bilateral estimates. A slowdown in the rollout of the scheme may be required. The Commission is seeking feedback on how a slowdown, if required, could be operationalised, and what the implications of a slowdown would be.

DRAFT RECOMMENDATION 9.5

In undertaking its role in delivering the National Disability Insurance Scheme, the National Disability Insurance Agency needs to find a better balance between participant intake, the quality of plans, participant outcomes and financial sustainability.

INFORMATION REQUEST 9.1

The Commission is seeking feedback on the most effective way to operationalise slowing down the rollout of the National Disability Insurance Scheme in the event it is required. Possible options include:

- *prioritising potential participants with more urgent and complex needs*
- *delaying the transition in some areas*
- *an across-the-board slowdown in the rate that participants are added to the scheme.*

The Commission is also seeking feedback on the implications of slowing down the rollout.

… but scheme success and financial sustainability are about more than the rollout

The rollout schedule is only one of the risks to achieving the objectives and financial sustainability of the scheme. A number of the other risks are outside the control of the NDIA (table 9.3). As the NDIA noted, levers that affect NDIS financial sustainability that it cannot control include:

- The responsiveness of the disability support market to changes in demand;
- National quality and safety regulation in the disability support market;
- Decisions by the Administrative Appeals Tribunal (AAT) or court system in interpreting the boundaries of access and reasonable and necessary supports;
- The efficiency of supports provided by mainstream support systems and community and natural supports. (sub. 161, p. 45)

Table 9.3 **Factors that influence financial risks to the scheme**

Outside the NDIA's control	The NDIA has some influence	Factors within NDIA's control
• Participant intake estimates in bilateral agreements • Adequacy of government disability and mainstream services • Continuity of support outside the NDIS • External reviews of decisions • Quality and safeguards regulation • Legislative framework and amendments	• Market development • Linking people to services outside the NDIS • Provider readiness and registration • Participant readiness • Broader disability policy and the National Disability Strategy	• Upholding eligibility criteria • Effective use of Early Intervention • Planning processes • Assessment of reasonable and necessary supports • Administration of supports • Quality of planners • Prices of supports • Information, Linkages and Capacity Building Activities • Local Area Coordination

Making the scheme work is not just the NDIA's responsibility — it is also the responsibility of governments, service providers, community organisations, employers, participants and their families and carers.

10 NDIS funding arrangements

Key points

- When the National Disability Insurance Scheme (NDIS) is fully rolled out in 2019-20, it is expected to cost about $22 billion. This is an increase of just over 150 per cent in funding from the $8.4 billion allocated to funding disability supports in 2015-16.
- The Australian, State and Territory Governments share responsibility for funding the NDIS. There are different funding arrangements for transition and full scheme.
  - During transition, the Australian, and State and Territory Governments will each contribute an agreed amount per participant based on the intake of participants in each state, which equates to around a 40-60 split respectively.
  - At full scheme (from 2019-20), State and Territory Governments will contribute $10.3 billion to the NDIS (escalated at 3.5 per cent each year). The Australian Government will fund the remainder.
- There are four main levers that affect the federal division of funding responsibilities: funding contributions by the Australian and State and Territory Governments; escalation parameters (which can affect funding contribution from the States and Territories over time); responsibility for funding cost overruns; and the approach taken to underspends.
- The Commission is seeking further input on the role of escalation parameters, as the objective is not clear. The 3.5 per cent escalation parameters currently specified in Bilateral Agreements is at the lower bound of a range that would be expected to keep real per capita contributions from the States and Territories constant over time. It is also likely to be too low to keep funding shares between the Australian Government and the States and Territories constant over time (after allowing for those over 65 who age in the scheme, who will be funded entirely by the Australian Government).
- In line with an insurance-based model, establishing a sufficient reserve fund would enable the National Disability Insurance Agency greater capacity to operate the scheme on insurance principles.
- Responsibility for cost overruns among governments should be allocated according to the proportion of risk controlled by each party. This is not the case in transition — the Australian Government bears liability for cost overruns, but important cost drivers are controlled by the State and Territory Governments. At full scheme, arrangements should apportion cost overrun risk and governance responsibility in line with control of risk.
- While in-kind contributions are necessary in the transition period, they risk jeopardising the objectives of the NDIS and should be phased out by the end of the transition period.

Funding for the National Disability Insurance Scheme (NDIS) is shared between the Australian and State and Territory Governments. The NDIS involves a significant increase in funding provided to people with disability. As discussed earlier in this report, when the NDIS is fully rolled out in 2019-20, it is expected to cost about $22 billion. This is an increase in total government spending on disability supports of:

- just over 150 per cent from the $8.4 billion in funding in 2015-16
- about a 200 per cent increase from the $7.1 billion government spending at the time of the 2011 Commission inquiry into *Disability Care and Support* (PC 2011, p. 675; SCRGSP 2017, p. 15.4).

In 2011, the Commission concluded that people with disability required more certainty about getting reasonable supports over their lifetime, and any disability insurance scheme would need a predictable revenue source:

> … revenue must not vary substantially from year to year or be subject to significant risks that future governments will cut it as part of changing budget circumstances. That implies the need for governments to make a binding commitment that makes it very difficult for them to divert the funding subsequently to other areas of spending. (PC 2011, p. 649)

The Commission's preferred funding option in 2011 was for the Australian Government to finance all the costs of the NDIS using its more efficient taxation base (compared to the State and Territory Governments' relatively limited tax options for raising additional revenue).[43] Another option was for all governments to pool funding subject to a long-run arrangement and with pre-specified funding shares (the arrangement that was put in place). As the Victorian Government said:

> The NDIS was developed against the background of a very high degree of vertical fiscal imbalance within the Australian federal system. In recognition of this, the PC originally recommended the Commonwealth take full responsibility for meeting the entire funding needs of the NDIS in part to '….*reflect the Australian Government's unique capacity to raise efficient and sustainable taxes of the magnitude required*' (PC 2011, p. 35).
>
> In the event it was agreed that the Commonwealth would fund the NDIS, with contributions from states as agreed bilaterally. (sub. 174, p. 23)

This chapter examines the current funding arrangements and the funding levers that affect the division of responsibilities between the Australian and State and Territory Governments.

The way the NDIS is funded in transition and at full scheme is examined in section 10.1. Section 10.2 looks at funding issues arising from the interface between Australian and State and Territory Governments' funding responsibilities, including funding shares, escalation parameters and cost overruns. Section 10.3 examines funding from an insurance-based approach, and section 10.4 looks at in-kind contributions.

[43] Chapter 14 of the Commission's Disability Care and Support inquiry report (PC 2011) examined in detail various options for financing the NDIS.

10.1 How is the NDIS funded?

The complex funding arrangements for the NDIS are set out in a range of intergovernmental agreements (box 10.1). The agreements outline, among other things:

- the respective funding responsibilities of the Australian and State and Territory Governments
- how the arrangements will change over time
- the different arrangements for transition and full scheme.

Box 10.1 Funding arrangements as set out in the intergovernmental agreements

Before the *National Disability Insurance Scheme Act 2013* (Cwlth) was passed (December 2012), the Australian Government and all State and Territory Governments signed the *Intergovernmental Agreement for the National Disability Insurance Scheme (NDIS) Launch*. This agreement established high-level funding principles including how underspends and overspends would be treated. More specific Heads of Agreement between the Australian Government and each of the State and Territory Governments (except Western Australia) set out funding details such as:

- responsibility for cost overruns
- the overall funding shares at full scheme, and escalation parameters
- in-kind arrangements.

For the NDIS transition period, the Australian Government and every State and Territory Government also signed Bilateral Agreements that detail:

- the number of participants that will be funded by the State and Territory Governments (participant numbers are capped in each quarter and preference is given to existing clients of State and Territory Government disability services)
- that the Australian, State and Territory Governments will each contribute a fixed amount per participant, based on actual intake of participants — around a 40-60 split respectively.

Sources: Australian Government and Western Australian Government (2017, p. 14); COAG (2012b).

As discussed in chapter 9, Western Australia has opted for a locally administered scheme and has different funding arrangements to the other states and territories (box 10.2).

Box 10.2 Funding arrangements in Western Australia are different

Western Australia has opted not to join the national scheme, but rather to have a separate WA NDIS (chapter 9).

WA NDIS during transition

During the transition period, as in other jurisdictions, the Western Australian Government will contribute 59.4 per cent of care and support package costs for an agreed number of eligible participants each year.

The Western Australian Government will cover a larger proportion of cost overruns than other State and Territory Governments.

- The Australian Government will bear a maximum of 25 per cent of any cost overruns for the WA NDIS when those overruns are due to a higher than expected number of participants or higher package costs.
- Cost overruns due to any other reasons will be funded by the Western Australian Government.
- If there are lower than expected package costs or participant numbers, the remaining funds will be split according to the contributions of each government.

The Western Australian Government and the Australian Government will share equally in the cost of Information, Linkages and Capacity Building grants and Local Areas Coordinators in that state. The Western Australian Government will fund the administrative costs of the WA NDIS. And as in the other states and territories, the Australian Government will fund supports for participants over 65 years old who choose to remain in the scheme, and Indigenous participants over 50 years old.

WA NDIS at full scheme

Limited details about the WA NDIS at full scheme are available, but at full rollout the Australian Government will make a fixed per person contribution towards the cost of the scheme in Western Australia and this amount will escalate at 3.5 per cent per annum.

Source: Australian Government and Western Australian Government (2017, p. 14).

Transition funding arrangements (2016-17 to 2018-19)

During the transition, the Australian Government will cover 40.6 per cent of the costs for participants under 65 years, and 100 per cent for non-Indigenous participants 65 years and over and Indigenous participants over 50 years who decide to remain in the scheme. The State and Territory Governments will fund the remainder (59.4 per cent of an agreed contribution).

The Australian Government will also fund Information, Linkages and Capacity Building (ILC) activities and the National Disability Insurance Agency's (NDIA's) operating expenses.

All cost overruns in the transition period are to be funded by the Australian Government.

Funding arrangements at full scheme

At full scheme, the State and Territory Governments, excluding Western Australia, will contribute about $9 billion[44] (table 10.1). The Australian Government will contribute the remainder. The fixed funding contributions of each State and Territory are based on the New South Wales fixed contribution of $3133 million in 2018-19 pro-rated, based on census population shares (DSS sub. 146, p. 21).

The Heads of Agreement stipulate that the state and territory contributions will increase at a rate of 3.5 per cent per year, subject to the responses to the recommendations of this study.

Table 10.1 **State and Territory funding commitments in 2019-20**

State or Territory	*Contribution ($ millions)*
New South Wales[a]	3 243
Victoria	2 510
Queensland	2 030
South Australia[a]	748
Tasmania	232
Australian Capital Territory	167
Northern Territory	99
Total[b]	9 029

[a] Not stated directly in Bilateral Agreement, instead a figure of $3133 million is given for 2018-19 which was escalated at 3.5 per cent for the 2019-20 figure. The same calculation was performed for SA where a figure of $723 million is given for their contribution in 2018-19. [b] The total excludes WA's contribution if it joined the national scheme.

Source: Heads of Agreement with each of the State and Territory Governments (except Western Australia).

While arrangements for cost overruns at full scheme are still being finalised, the Australian Government in the Heads of Agreement committed to fund at least 75 per cent of these overruns at full rollout subject to the outcomes of this review (Australian Government and New South Wales Government 2012).

It is evident from the above that funding arrangements are highly complex. Given this complexity, it is essential that comprehensive and timely data from the NDIA be made available to relevant Finance and Treasury departments in all jurisdictions to allow for proper oversight of NDIS costs.

[44] Estimated to be $10.3 billion once agreement with Western Australia is reached.

Sources of NDIS funding

Australian Government funding for the NDIS comes from a number of sources:

- funds redirected from previous Australian Government disability service programs to the NDIS
- funds previously provided to State and Territory Governments under the National Disability Agreement and the 2011 National Health Reform Agreement
- a 0.5 percentage point increase in the Medicare Levy on taxable income which provides funding via the DisabilityCare Australia Fund (DCAF) (box 10.3). Around 75 per cent of the revenue from the DCAF goes to the Australian Government — the remainder is allocated to the State and Territory Governments to partially reimburse their contributions to the NDIS
- debits from the soon-to-be-established NDIS Savings Fund (box 10.3), which will source funding from:
  - an additional 0.5 per cent increase in the Medicare Levy on taxable income (subject to legislative passage)
  - underspends and realised savings from the NDIS (through, for example, changes to budget forecasts reflecting cost saving measures by the NDIA)
  - uncommitted funds from the Building Australia Fund and Education Investment Fund.

State and Territory Government contributions are funded through:

- redirected funding previously used for legacy specialist disability services
- about 25 per cent of the funds available from the DCAF — approximately $825 million from 2014-15. This payment will increase by 3.5 per cent each year until 2023-24 (*DisabilityCare Australia Act 2013* (Cwlth), box 10.3)
- consolidated general State Government revenue.

Box 10.3 The DisabilityCare Australia Fund and the NDIS Savings Fund

The Australian Government increased the Medicare Levy by 0.5 per cent from July 2014-15 to provide funding for the NDIS. The funds from the Medicare Levy are credited to the DisabiltyCare Australia Fund (DCAF) to be invested through the Future Fund to provide payments to the Australian, State and Territory Governments to partially meet their funding obligations for the NDIS.

As set out in the *DisabilityCare Australia Fund Act 2013* (Cwlth), from 2014-15, the State and Territory Governments are entitled to credits of $825 million in funding from the DCAF. This amount will increase at 3.5 per cent each year until 2023-24. Over 10 years (ending 2023-24), State and Territory Governments will have access to a total of $9.7 billion between them, which they can use to partially fund their portion of the NDIS contributions.

State and Territory Governments can draw down from the DCAF when they meet key conditions, including agreement to full scheme and when at least 50 per cent of their eligible population is covered by the scheme. Funds not allocated to State and Territory Governments can be used by the Australian Government to fund its portion of the NDIS.

At 31 December 2016, the DCAF had just over $6 billion in assets.

The DCAF is also to be complemented by the recently announced NDIS Savings Fund. The Australian Government's 2017-18 Budget includes plans to increase the Medicare Levy by (a further) 0.5 per cent which will be credited to a new NDIS Savings Fund (separate from the DCAF) alongside other contributions from underspends on NDIS and recommitting funds from the Building Australia Fund and Education Investment Fund. The increased Medicare levy and creation of the NDIS Savings Fund are subject to legislation passing through parliament.

The NDIS Savings Fund will ring-fence — or hypothecate — revenue specifically for use for the NDIS. These funds will not be made available to the NDIA any sooner than they would if the Australian Government had continued funding their contributions from general consolidated revenue.

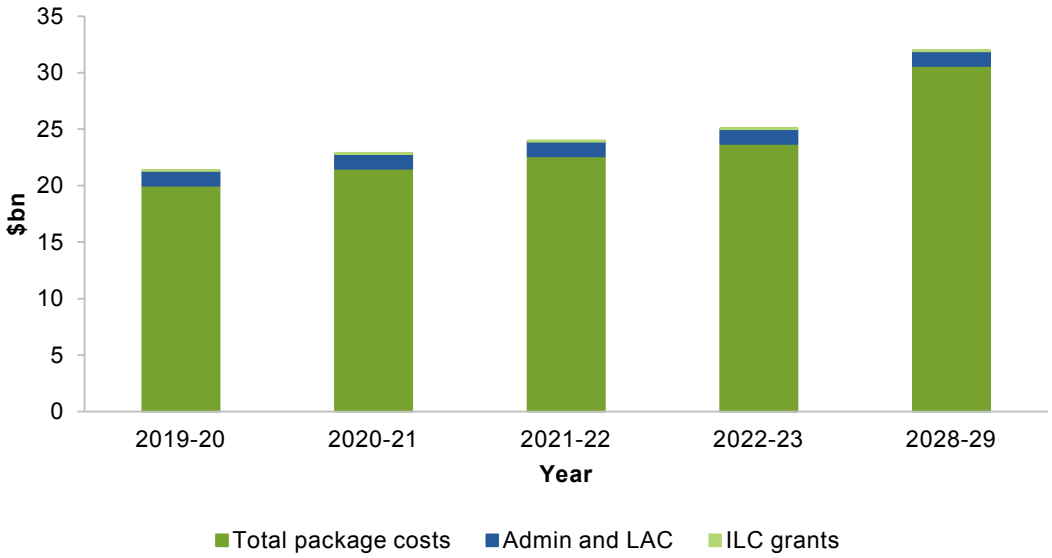
Sources: Australian Government (2012); Australian Treasury (2017c).

The majority of funds are for individualised supports

Individualised support costs make up the majority of the NDIA's funds (around 93 per cent) at full scheme (figure 10.1). The operating budget includes funding for assessment, planning and Local Area Coordination (LAC). The Information, Linkages and Capacity building (ILC) grants program is a separate pillar of the NDIS (Australian Treasury 2017b, p. 140).[45]

[45] ILC will provide information, linkages and referrals to people with disability, their families and carers, with appropriate community and mainstream supports (chapter 5).

Figure 10.1 **Full scheme funding uses over time**[a]



[a] While most chapters in this report use modelling based on NDIA models and data, this chapter uses a funding and costs model provided by the Department of Social Services (DSS). The DSS model is more fit for purpose (than an actuarial model) to examine matters about NDIS costs and funding shares by the Australian, State and Territory Governments. Accordingly, there is a small difference in total scheme costs in this chapter compared to other chapters, reflecting the different purposes of the models and the periods of data used.

Source: Estimates provided by the DSS (sub. 146, p. 17) based on MYEFO 2016-17 data.

10.2 Creating the right incentives in a federal system

As discussed above, Bilateral Agreements define the boundaries of Australian and State and Territory Government responsibility. This section discusses some issues arising out of the interface between Australian and State and Territory Government responsibilities, including:

- escalation parameters
- how any potential large changes to scheme costs might be addressed in the allocation of funding
- how cost overruns are funded and who has control over them.

Escalation parameters and funding shares

As the NDIS is designed to be a no-fault scheme that covers the entire population, the contributions of governments to the NDIS can be thought of as an insurance premium paid by individuals through their taxes. At full scheme, the Australian Government will

contribute an 'insurance premium' to the NDIA on behalf of the citizens in each state. This premium is calculated based on scheme costs and the number of participants in each state.

As discussed above, the State and Territory Governments contribute a fixed amount which escalates at an agreed rate of 3.5 per cent each year from 2019-20 (table 10.2). The escalation parameters are based on:

- the Consumer Price Index (CPI) (midpoint of the long term CPI target Reserve Bank of Australia range (2.5 per cent)) and
- a long term net population growth of one per cent each year (table 10.2).

Table 10.2 **Projections of the funding split over time**[a]

[a] While most chapters in this report use modelling based on NDIA models and data, this chapter uses a funding and costs model provided by the Department of Social Services (DSS). The DSS model is more fit for purpose (than an actuarial model) to examine matters about NDIS costs and funding shares by the Australian, State and Territory Governments. Accordingly, there is a small difference in total scheme costs in this chapter compared to other chapters, reflecting the different purposes of the models and the periods of data used. [b] The $10.3 billion estimate of the contribution from the States and Territories in 2019-20 includes the agreement contributions of the State and Territory Governments (excluding Western Australia), plus the estimated contribution from the Western Australian Government once agreement is reached.

Source: DSS (sub. 146, p. 17).

The Heads of Agreement state that, in the event COAG agrees to revise the escalation parameters (based on the advice of this study), escalation parameters will be revised for the State and Territory Governments. There will also be a review every five years (similar to this review), in order to rebase funding per capita based on Census population figures. The first re-basing is expected to occur from 1 July 2023 based on 2021 Census figures.

The objectives of the escalation parameters

The terms of reference for this study ask the Commission to look at changes in the agreed escalation parameters. This was far from straightforward because there is no clearly stated objective for the escalation parameters in the Heads of Agreement. There are also different views about what escalation parameters should be designed to achieve.

Different views among participants

Some participants were of the view that escalation parameters should be used to maintain real per capita contributions to the NDIS by State and Territory Governments. However, others argued that the parameters should be used to increase contributions in line with changes in scheme costs.

The New South Wales Government, for example, argued that the contributions of State and Territory Governments should not increase in line with changes in scheme costs:

> Unlike other sectors like electricity the NDIS is administered under Commonwealth, not State legislation.
>
> In this context, NSW contributed its full disability funding to the NDIS at 2018-19, namely a fixed $3.2 billion per annum plus escalation (3.5%). This is akin to how the Commonwealth provides Specific Purpose Payments to States for health, education, housing and disability. That is, having made a contribution and defined indexation rate the Commonwealth does not vary its payments based on actual costs.
>
> Currently, States are expected to administer state service systems using Commonwealth and State funds. (sub. 60, pp. 12–13)

The Victorian Government also said:

> Current cost and risk sharing arrangements should be maintained as they reflect the reality that the ability of the states to take on any greater financial risk is severely limited. (sub. 174, p. 23)

However, the NDIA observed that scheme costs are likely to increase by more than the current 3.5 per cent escalation parameters and this will mean that funding shares will change:

> The NDIA can observe that wage inflation and the Equal Remuneration Order (ERO) are likely to result in an increase above 3.5 per cent in the short-term, which will result in a skewing of the contributions. Longer-term assumptions should be set considering wage inflation levels, population growth rates, and efficient prices. (sub. 161, p. 114)

The Department of Social Services (DSS) also said:

> The NDIS is currently estimated to cost in the order of $22 billion once fully rolled out in 2020. Over the medium term, this cost is expected to grow above long-term inflation and population growth trends due to the impact of people ageing over 65 in the Scheme. As a result, the cost of the NDIS is expected to increase to more than $32 billion by 2030, with the Commonwealth

> share roughly half of all costs in the short-term, but growing through time as existing participants turn 65 to around 56 per cent by 2030. (sub. 146, p. 17)

And, while the DSS agreed that in the long term, when the scheme has matured, an escalation rate informed by a small number of key economic parameters would be appropriate, it also argued that in the short to medium term:

> … the escalation rate is unlikely to reflect underlying cost growth in the Scheme. This is because the expansion of the market does not lend itself to long-term growth rates in the near future, and it will take some time for the number of participants aged 65 and over in the scheme to stabilise. Instead, a medium- term escalation rate should be developed that considers known transition variables. (sub. 146, pp. 20-21)

The DSS suggested that a medium-term escalation parameter should take into account scheme cost drivers such as social and community services award wages, market development issues, the impact of early intervention, projected disability prevalence rates and observed growth in similar markets or schemes.

The DSS (sub. 146, p. 21) also suggested that the state contribution escalation parameters should be adjusted to take account of the State and Territory Governments' roles and responsibilities, including the extent to which states support and fund mainstream services.

Different arrangements for funding shares between transition and full scheme

Differences in views about the role of escalation parameters reflect tensions about whether current funding shares of the State and Territory Governments should remain the same or change over time. (Noting that the Australian Government is to fund participants over 65 years, and this alone will mean an increasing share of funding will fall to the Commonwealth).

During transition, state and territory funding shares are explicitly tied to scheme costs — the State and Territory Governments make a contribution towards an agreed reasonable average package cost on a per participant basis for up to a set number of participants. But at full scheme, the State and Territory Governments' funding contributions are fixed (escalating at 3.5 per cent per year), which means if scheme costs increase by more than inflation and population then the states contribution share will decline over time.

Some stakeholders suggested to the Commission that escalation parameters should be used, in lieu of adjusting the way funding shares are calculated, to ensure that State and Territory Government contributions increase in line with scheme costs.

The objectives need to be clearer

The way initial funding contributions are calculated and how they increase over time are key determinants of the division of funding responsibilities between the Australian and

State and Territory Governments. (Responsibility for cost overruns and underspends are the other key levers, discussed below.)

The threshold issue for designing the escalation parameters is whether or not State and Territory Government contributions at full scheme and beyond should be designed to keep pace with scheme costs, or simply maintain existing real per capita contributions. The New South Wales Government noted that it did not commit to meeting scheme costs:

> NSW's disability funding was our contribution towards the NDIS, not a commitment to meet actual costs or activity levels as the scheme evolved. This is clear in paragraphs 15 and 16 of the Heads of Agreement between the Commonwealth and NSW Governments. (sub. 60, p. 13)

One argument in favour of State and Territory Governments contributions not increasing in line with scheme costs over time is that they rely on less efficient tax bases and have more limited ability to raise funds than the Australian Government.

However, the Commission also notes that the DCAF is designed to partially fund State and Territory Government contributions via the Medicare Levy, which is administered by the Australian Government. As discussed in box 10.3, the State and Territory Governments will be entitled to $825 million from the DCAF from 2014-15, but are not guaranteed access before 2023-24. This arrangement could overcome inefficiencies in relying more on state tax bases, but it is due to expire after ten years.

If it is agreed that State and Territory Government contributions should keep pace with scheme costs, there are two ways to achieve this.

The first is to rework the way State and Territory Governments' funding shares are calculated, so that they are adjusted over time to explicitly reflect scheme costs. If state and territory funding shares were calculated to explicitly reflect scheme costs over time then the escalation parameters should be calculated to maintain these shares on a constant real per capita basis over time. It is worth noting that the existing escalation parameters of 3.5 per cent per annum seems to be on the lower bound of estimates that would achieve this (box 10.4).

The alternative approach is to leave the State and Territory Governments' funding shares at full scheme as they are and use the escalation parameters to increase state and territory government contributions in line with scheme costs.

This would require the escalation parameters to be calculated using additional variables to account for cost drivers over time. As noted above, the DSS (sub. 146, p. 21) suggested a number of potential cost drivers, including social and community services award wages, market development issues, the impact of early intervention, projected disability prevalence rates and observed growth in similar markets or schemes.

Box 10.4 Different assumptions lead to different escalation parameters

Using recent history as a guide, the low inflation of recent years could imply the agreed escalation parameters of 3.5 per cent seem reasonable. However, the Reserve Bank of Australia expects inflation to return to its range of 2-3 per cent by 2019-20 and the Australian Bureau of Statistics have previously projected population growth to be higher than one per cent well into mid-century. On this basis, escalation parameters in the range of 3.3 per cent to 4.8 per cent (midpoint of about 4 per cent) seem more appropriate than the current 3.5 per cent.

Any changes to the escalation parameters applied to State and Territory Government contributions towards the National Disability Insurance Scheme (NDIS) should also be applied to other NDIS funding factors linked to the escalation parameters — that is, State and Territory Government receipts from the DisabilityCare Australia Fund and the Australian Governments' planned contribution towards WA NDIS post 2020. This would require legislative change.

	Population	*Inflation*	*Implied escalation parameter*[a]
Historical 10 year average annual growth (Sept 2007 to 2016)	1.66	2.36	4.02
Historical 3 year average annual growth (Sep 2014 to 2016)	1.43	1.70	3.13
Medium-term projections (June 2020 to 2023)[b]	1.31-1.83	2-3	3.31-4.83 (midpoint of 4.07)
Long-term projections	1.00	2.50	3.50

[a] Sum of population growth and inflation. [b] The Australian Bureau of Statistics projections have three different scenarios to project population growth. The numbers presented here are the range implied by their estimates.

Sources: ABS (*Australian Demographic Statistics, Sep 2016*, Cat. no. 3101.0; *Consumer Price Index, Australia, Mar 2017*, Cat. no. 6401.0; *Population Projections, Australia, 2012 (base) to 2101*, Cat. no. 3222.0); RBA (2017).

If escalation parameters were used to maintain the State and Territory Governments' funding shares, it would also be necessary to review them periodically. This is because it may be difficult to sufficiently capture all the variables that would maintain the underlying funding shares over an extended period.

Finally, even though funding shares are subject to a five yearly review, reassessing financial contributions every five years does not allow the funding arrangements to be agile enough to address sudden shocks to scheme costs. This could be problematic if any such shocks had significant implications for the financial sustainability of the NDIS. For example, if there was an unforeseen sudden structural shift in labour markets that caused wages and, as a result, package costs to increase, then under transitional arrangements the Australian Government would bear the entirety of this cost until the next five yearly review. Quickly adjusting Bilateral Agreements is not a feasible option in this instance.

One option (considered below) is to allow the NDIA to retain significant reserves. This would allow them to keep windfalls from underspends for later use if there are sudden overruns and so reduce the need for external funding of overruns.

The Commission seeks more information on these issues.

DRAFT FINDING 10.1

The objective of the escalation parameters is not specified in the Bilateral Agreements between the Australian Government and the State and Territory Governments at full scheme.

The existing escalation parameters are unlikely to reflect the full increase in National Disability Insurance Scheme (NDIS) costs over time, which would result in the Australian Government bearing a higher share of NDIS costs over time.

INFORMATION REQUEST 10.1

The Commission is seeking views on the role of the escalation parameters in the Bilateral Agreements between the Australian Government and the State and Territory Governments.

Should escalation parameters be set on the basis of maintaining a constant real per capita contribution to the National Disability Insurance Scheme by State and Territory Governments; or should they be more explicitly tied to scheme costs so that the proportion of funding allocated to the Australian Government and the State and Territory Governments is maintained over time?

Any changes to state and territory funding shares will affect a number of issues discussed in the remainder of this chapter (and in chapter 5), including:

- the level of participation by State and Territory Governments in the scheme's implementation and governance and the implied incentives to fund mainstream services and disability services outside the NDIS
- the incentives for the Australian Government to manage NDIS cost overruns
- how cost overruns are treated in the absence of agreed package costs and participant numbers.

These factors should also be taken into account in considering reallocation of state and territory funding shares and escalation parameters.

Cost overruns: Aligning risk and responsibility

Good risk management requires those who are best placed to manage the risk have responsibility for it. This implies that arrangements for funding cost overruns should be aligned with the ability to control them. This is not the case in the transition period, because the Australian Government bears full responsibility for cost overruns while not having complete control over the factors that contribute to these cost overruns. Two important factors affecting costs that the Australian Government does not have control over are:

- the impact of governance arrangements over NDIS scheme costs such as those contained in the NDIS Rules (box 9.2) or the processes for appointing NDIA Board members
- provision of mainstream services and their interface with the NDIS (chapter 5).

Mainstream services are within the control of the State and Territory Governments. NDIA governance arrangements — such as changing certain NDIS Rules and changing the NDIA Board — require unanimous support from the State and Territory Governments, limiting the ability of the Australian Government to control costs.

There are two options to redress this misalignment — changing the governance arrangements of the NDIS to give the Australian Government more control over cost overruns, or giving the State and Territory Governments some responsibility for cost overruns to reduce their potential incentives to cost shift from mainstream and other disability services outside the NDIS. These options may not be mutually exclusive, given they address different cost control levers.

DRAFT FINDING 10.2

Responsibility for funding National Disability Insurance Scheme (NDIS) cost overruns should be apportioned according to the parties best able to manage the risk. This is not the case in the transition period, as the Australian Government bears all the risk of any cost overruns, but not all the control.

The governance arrangements for the NDIS do not allow the National Disability Insurance Agency to respond swiftly when factors outside its control threaten to impose cost overruns.

Governance and funding arrangements are critical in defining federal-state responsibilities. And incentive issues will exist as long as multiple levels of government have the responsibility for delivering disability and mainstream services.

Giving the states more responsibility for cost overruns

One option is to give the State and Territory Governments more responsibility for NDIS cost overruns. This could reduce incentives to cost-shift from mainstream services to the

NDIS. Incentives to cost-shift under current arrangements were raised as a concern by some study participants. Physical Disabilities Australia, for example, said:

> PDA does not believe the current funding arrangements between the Commonwealth and the State and Territory Governments secure the NDIS' future. Instead, we believe they will threaten the Scheme's viability. Whilst the funding commitments are shared in this way, politicians at all levels will continue to threaten the Scheme's future by claiming the other entities 'aren't paying their fair share' or are 'exploiting [their jurisdiction's] better run economy'. (sub. 38, p. 17)

If cost overruns were to be reallocated, ideally they would be apportioned by calculating the proportion of control over cost overruns held by State and Territory Governments, and the proportion that the Australian Government controls, and allocating responsibility for cost overruns accordingly. As the NT Government said:

> NDIS governance and administrative arrangements post full Scheme should acknowledge the long term shared responsibility and investment of the Commonwealth, states, territories and the NDIA in achieving outcomes, in terms of both service delivery and financial risk. (sub. 205, p. 3)

While it is difficult to calculate such shares accurately, given the State and Territory Governments' responsibility for providing mainstream services (and some disability services), they should bear a share of cost overruns that is significant enough to mitigate any incentives to cost shift onto the NDIS.

Suggestions from participants were that between 25 and 50 per cent of the cost overruns should be borne by the states. Richard Madden, for example, said:

> A minimum of 25% State and Territory share of cost overruns would seem appropriate having regard to the impact of mainstream service provision. (sub. 101, p. 5)

The DSS suggested that the State and Territory Governments need to bear around half of cost overruns:

> Full Scheme risk sharing arrangements need to be equal until the Scheme matures, and this will require State governments to bear 50 per cent of the risk. To manage Scheme risks, agile and streamlined governance is needed, with more control going to those governments that bear the most risk — currently the Commonwealth Government bears full risk. (sub. 146, p. 33)

Decisions about the allocation of cost overruns should also take into account incentives or levers that the Australian Government might have to cost shift to the states. There are currently safeguards against such behaviour (including the requirement for unanimous agreement to make substantive changes to the scheme through the NDIS Rules, adjusting the NDIA Board membership or giving the NDIA specific directives, chapter 9). However, any increase in the cost overruns assigned to the State and Territory Governments should be considered in combination with their governance role.

Giving the Australian Government more control over governance arrangements

There are two changes to governance arrangements that could be made.

One option is to relax the governance arrangements of the NDIS that require unanimous agreement of the Australian, State and Territory Governments to change the NDIS Rules (chapter 9) on the basis that the Australian Government is responsible for cost overruns. As discussed in chapter 9, there could also be operational benefits for the NDIA from taking a more flexible approach to rule changes — including reducing the time taken to make operational decisions, or responding to emerging pressures.

However, the NDIS is not a scheme that operates in isolation — the State and Territory Governments have responsibility for funding mainstream services. The scope of the NDIS (determined by the eligibility requirements set out in the Rules) can also affect the costs borne by the State and Territory Governments. It is therefore important that the State and Territory Governments have some control over changes to the Rules.

Another option is to allow the Australian Government to have a greater influence over the composition of the Board of the NDIA. But again, for incentives to be aligned, the State and Territory Governments should play a role in Board member appointments to the extent that the Board's management of the Agency affects mainstream and non-NDIS disability services. Some stakeholders echoed these concerns. For example, the Victorian Government argued that:

> The states must be part of any decision-making process that determines what will be funded under the NDIS. Given the critical interface between the NDIS and state-funded mainstream services, Victoria considers these arrangements as a necessary safeguard against decisions about the scheme's scope which could result in a significant transfer of costs and risks to state-funded services, and poor outcomes for people with a disability. (sub. 174, p. 22)

A number of options could potentially strike a balance between giving the Australian Government more control over governance while still allowing the State and Territory Governments to have a significant say in the operation of the NDIS. For changes to the Rules, these options could include: a requirement for majority rather than unanimous agreement (including the Commonwealth); relaxing the formalities required to reach agreement to speed up the process; or having a mechanism that lets the majority (including the Commonwealth) be the deciding vote if agreement is delayed past a certain time limit. The Commission is seeking feedback on possible options for reforming governance that achieve this objective.

INFORMATION REQUEST 10.2

The Commission is seeking information on the best way to align the ability to control cost overruns with the liability to fund cost overruns. Possible options include:

- *estimating the proportion of cost overruns that the Australian and State and Territory Governments are responsible for and allocating funding responsibility accordingly*
- *altering the governance arrangements of the National Disability Insurance Scheme to give the Australian Government greater authority to manage the risk of cost overruns, to better reflect their funding liability.*

However, there are no easy answers to reforming funding and governance arrangements, as changes to governance also affect the operation of the NDIA itself. This is discussed further in the next section.

Arrangements in Western Australia

As discussed above, the Western Australian Government has agreed to bear the majority of the cost overruns in the transition to the WA NDIS, with the Australian Government agreeing to contribute no more than 25 per cent over the transition.

Given the role the Western Australian Government has in managing and implementing the WA scheme, it is reasonable for the State Government to bear greater risk.[46] However, Western Australia's separate management of the scheme also poses risks to national consistency of the NDIS (chapter 9).

Should the Western Australian Government choose to join the national scheme, the Commission considers the risk-sharing arrangements between the Australian and Western Australian Governments should be aligned in accordance with the principles applied for the rest of the NDIS.

10.3 Funding an insurance scheme

While the NDIS is an insurance-based scheme, the way the funding and governance arrangements are designed means that it departs from the principles applying to an insurance scheme in a number of areas. As discussed above, the NDIA does not determine its own funding envelope, and as discussed in chapter 9, COAG controls the NDIS scheme's Rules.

46 The WA NDIS Authority, although a Western Australian Government agency, will be governed by an independent Board of seven, with four of the members (including the chair) appointed by the Western Australian Government and the Australian Government appointing the remainder (Australian Government and Western Australian Government 2017).

The NDIA's capped operating costs

At full scheme, the NDIA's operating costs will be capped at 7 per cent of package costs each year. While operating costs made up 33 per cent of scheme costs in 2016, over the transition to full scheme (in 2019-20), this will decrease to a capped 7 per cent target (NDIA 2016g, p. 109).

The 7 per cent operating cost target is similar to that recommended by the Commission in 2011 (PC 2011, p. 776). However, the Commission did not recommend a hard cap. Also, while it was expected that the NDIA would require a workforce of about 10 000 people to deliver the NDIS at full scheme, the NDIA has a full scheme cap of 3000 directly employed staff. The other 7000 people will be outsourced to partner organisations (DSS, sub. 146, p. 24).

The rationale for capping the operating expenses of the NDIA appears to be to encourage administrative efficiencies, and the rationale for the staff cap to encourage the NDIA to enter into community partnerships. The DSS (sub. 146, p. 24) commented that that the 7 per cent cap was 'an aspirational approach designed to encourage best practice and efficient operations'.

However, capping operating expenses could have perverse outcomes in practice.

First, as noted in the NDIA's Annual Sustainability Report, the risks to the scheme's sustainability from the setting of operating expense budgets are clearly asymmetric:

> It is worth noting that a 10% increase in the operating budget may result in additional expenditure of approximately $150 million at full scheme, however an increase in package costs of 10% could result in an additional $2 billion at full scheme (NDIA 2016b, p. 56).

If the NDIA's operating budget is set too tightly, this could hinder its ability to contain package costs (through upfront investments in ICT, LACs, assessors and planners) which could in turn have a significant effect on package costs and scheme sustainability.

A number of study participants argued that the 7 per cent cap is too low (for example, ABF, sub. 48; PDCN, sub. 29; Sotica, sub. 67) and that it is below typical insurance scheme benchmarks.

The Commission notes that achieving a 7 per cent target by full scheme requires the NDIA to cut operating expenditure by 18 per cent ($250 million) between 2018-19 and 2019-20. This seems highly ambitious (box 10.5) without jeopardising the quality of individualised supports (chapter 4).

However, the NDIA (sub. 161, p. 110) said that it expects it can meet the 7 per cent operating cost target at full scheme and effectively manage the NDIS. But, it argued for greater flexibility in its operating costs budget to account for year-to-year fluctuations in operating expenses.

The Commission notes that comparable, more mature schemes operate close to a 7 per cent average, but have significant fluctuations in their annual operating expenses as a proportion of their overall expenses (box 10.5).

Box 10.5 Operating expenses of the NDIA and comparable schemes

NDIS expenses by category

	2015-16 (actual)	*2016-17 (actual)*	*2017-18 (projections)*	*2018-19 (projections)*	*2019-20 (projections)*	*2020-21 (projections)*
Package costs ($m)	859.9	2 973.0	8 045.1	14 267.1	17 855.8	19 165.5
ILC ($m)	10.7	33.3	68.9	105.3	119.3	118.6
Operating expenses ($m)	301.2	704.9	1 033.0	1 393.9	1 143.9	1 096.2
Total scheme costs ($m) [a]	1 171.7	3 711.2	9 147.0	15 766.2	19 119.1	20 380.3
Operating expense ratio (%)[b]	35	24	13	10	6	6

[a] The total cost of the scheme in the budget papers used in this table is less than the $22 billion figure quoted elsewhere because it does not include WA. Elsewhere in this report, estimates are made on the basis of WA being part of the national scheme. [b] The expense ratios differ from NDIA targets and estimates because the NDIA and the Department of Social Services use slightly different projections of scheme costs.

Operating expense ratios[c] of comparable schemes (per cent)

	2010-11	*2011-12*	*2012-13*	*2013-14*	*2014-15*	*2015-16*	*Average*
NZ Accident Compensation Corporation	11.9	6.0	22.9	11.1	7.4	4.9	8.1
NSW Lifetime Care and Support[d]	2.0	3.6	3.6	3.6	4.0	8.4	3.3
VIC Transport Accident Commission	8.5	4.6	11.7	7.4	6.0	4.8	6.4
Disability Care and Support Nationwide	7.6	7.4	6.6	6.5	6.2	6.4	6.8

[c] The ratio of average operating expenses between 2010-11 to 2015-16 to the average total expenses over the same period. [d] The figure for 2015-16 comes from very different reporting standards so may not be comparable with previous years. Further, the number was given in the annual reports without any information about how it was calculated. For this reason it was excluded from the average.

Sources: Accident Compensation Corporation (2011, 2012, 2013, 2014, 2015, 2016); Australian Treasury (2016a, 2017b); Lifetime Care and Support Authority (2011, 2012, 2013, 2014, 2015, 2016); SCRGSP (2016, 2017); and Transport Accident Commission (2011, 2012, 2013, 2014, 2015, 2016).

While the Commission understands the need to create incentives for administrative efficiencies, a hard cap for operating expenses enforced year in, year out does not align with the way an insurance scheme operates. Greater flexibility (including setting an operating budget that sits within a funding target) would allow investments to be made that reduce lifetime costs (for instance, investing in LACs early on to increase participant capacity and readiness which could lower costs in the long-term).

One way to balance flexibility with accountability would be to allow a target range for operating expenses, with the expectation that the Agency would sit at the bottom of this target on average. This would allow the NDIA some flexibility to smooth out year-to-year fluctuations in spending while also placing some limits on administrative spending.

Based on comparable schemes (box 10.5), a target of 7 to 10 per cent appears to be reasonable. Should the NDIA exceed this in a particular year, they should be required to publicly report the reasons why.

DRAFT RECOMMENDATION 10.1

At full scheme, the annual operating budget for the National Disability Insurance Agency should be set within a funding target of 7-10 per cent of package costs with the expectation that, on average, it would sit at the lower end of the band.

The National Disability Insurance Agency should be required, in its annual report, to state reasons why it has not met this target in any given year.

A similar rationale applies to allowing more flexibility around the current staff cap of 3000 people. Because of the cap, the NDIA needs to outsource much of its work. This presents a particular risk when the agency is so new, and therefore needs to build institutional expertise and knowledge.

However, the Commission understands there may be practical limitations to implementing any changes to the staff cap, given the Australian Government's Smaller Government agenda.

DRAFT RECOMMENDATION 10.2

The Australian Government should reconsider the staffing cap on the National Disability Insurance Agency, given the importance of developing internal capability and expertise.

Lack of flexibility in how funds are used

As discussed above, the funds received by the NDIA are allocated to three streams:

- participant supports
- Information, Linkage and Capacity Building grants (chapter 5)
- operating costs (which includes LACs, and 20 per cent of LAC funding is allocated to ILC activities) (NDIA, sub. 161, p. 13).[47]

[47] At full scheme, the Heads of Agreement state that: State and Territory Government funding will pay for participant supports, defined as: individualised support packages for scheme participants, and Local Area Coordinators and other general supports as defined by section 13(2) of the *National Disability Insurance*

Australian Government entities receive their budget in two allocations: one allocation for operating expenses, and a separate allocation for program delivery, divided into different streams (Department of Finance, nd).

Some participants to this study argued that the NDIA should be given more flexibility in how it allocates its funds. For instance, the NDIA commented:

> The funding model of the NDIS quarantines funds that have been provided to the NDIA for reasonable and necessary supports so that they cannot be used for any other purpose. The effect of this in relation to ILC is that, irrespective of the insurance approach and any potential savings to package costs from ILC, funding is strictly limited to what has been made available for operating costs.
>
> This strict split of funding constrains the NDIA's ability to manage Scheme costs by investing in community based activities that may lower the demand for individual packages. (sub. 161, p. 55)

The DSS also expressed a desire for flexibility to be considered as an option to enhance the Agency's insurance approach:

> The initial PC report recommended a small, fixed amount for ILC, but options could be explored, such as giving the NDIA greater flexibility to invest in ILC if linked to reducing overall Scheme costs via its insurance approach. (sub. 146, p. 31)

Private insurance firms have more flexibility in how they allocate their funding, but they are subject to different transparency and accountability requirements than the NDIA (for instance, more stringent reporting requirements).

The Commission recognises the benefits from having the flexibility to make investments,[48] but a better way to achieve this could be by giving the NDIS access to a pool of reserves (discussed below).

To ensure that ILC grants do not encroach on State and Territory Governments' responsibilities, it is important for State and Territory Governments to be involved in decision making about the scope of these grants.

Limited access to a pool of reserves

The NDIS is currently funded on a mostly pay as you go (PAYG) basis, which means that current taxpayers meet the current obligations of the scheme. In transition, underspends of up to three months' worth of support costs can be retained by the NDIA, with amounts

Scheme Act 2013 (Cwlth). Australian Government funding will pay for all additional participant supports, defined as: individualised support packages for scheme participants, and local area coordinators and other general supports. The Australian Government will also pay all administrative costs for the NDIA.

48 For example, New Zealand's Accident Compensation Corporation invests in programs designed to limit the number of catastrophic accidents in a variety of contexts. Their Board has discretion to undertake such activities within their funding envelope.

over this returned to the particular governments in proportion to their contribution. It is not yet certain what the arrangements will be at full scheme.

Retaining three months of reserves appears suitable for the transition period, where reserve amounts may reflect participants who were expected to transition to the NDIS but have not yet done so (and still remain on pre-NDIS services). Longer term arrangements, once funding has moved to a more stable and certain footing, would ideally allow for greater application of, an insurance approach by making sufficient funds available to allow for upfront investments to reduce outlays in future.

In 2011, the Commission (PC 2011, p. 672) recommended the NDIS be established with a large enough reserve fund to smooth out fluctuations and reduce uncertainty. The Commission continues to endorse this approach of having access to a pool of reserves in the longer term.

Providing a substantial pool of reserves has the advantage of providing greater certainty to participants and providers that the scheme will be enduring, enabling them to make long-term decisions (for example, cost pressures will be reduced if people feel they are able to leave the NDIS, knowing that it will be there in the future should they need to return). Absent a pool of reserves, the PAYG arrangement alone more closely resembles a welfare system, as funds are lacking for future looking investments.

In the longer term, the level of reserves should reflect the level of risk that the NDIA is able to manage. In 2011, the Commission suggested that the level of reserves should be determined by:

- partially funding new entrants for the scheme while also collecting enough revenue on a PAYG basis to fund the reasonable and necessary supports for existing participants or
- making an actuarial and economic determination of optimal reserves (PC 2011, pp. 672-673).

Importantly, reserve money should only be used for investments that allow future benefits to accrue, rather than allowing cross-subsidisation between activities such as increasing the operational costs budget.

The Commission is seeking further feedback on the level of reserves needed to enable the NDIS to operate like an insurance scheme, and the method by which this should be achieved.

The Commission is aware of the potential practical difficulties of establishing a reserve fund in the short term, but is also mindful of the potential long-term benefits of doing so — including enabling the NDIS to operate like an insurance scheme not a welfare scheme, and providing certainty in funding that insulates it against the vagaries of year to year budget funding.

One way of building up reserves could be to, each year, redirect a set proportion of the unspent money to a reserve fund, instead of returning it to the Australian and State and Territory Governments (effectively removing the NDIA's cash ceiling). The Commission is seeking feedback on the best way to implement an increased reserve requirement.

INFORMATION REQUEST 10.3

The Commission seeks feedback on the level of a future contingency reserve that would enable the National Disability Insurance Agency to operate like an insurance scheme, and how this would best be implemented, including any transitional arrangements.

10.4 In-kind support

A necessary part of the transition period …

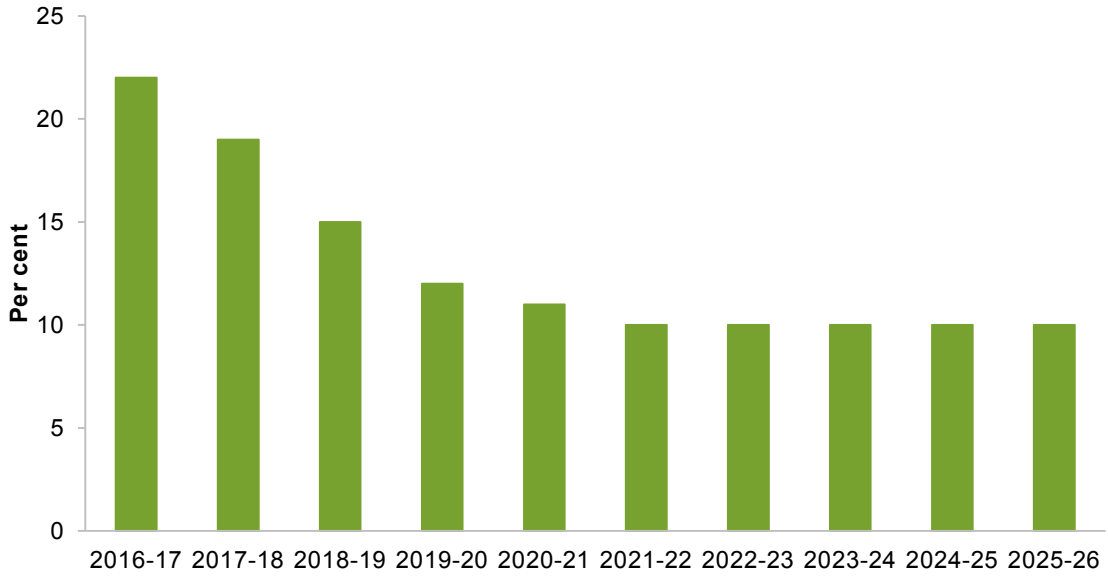
Prior to the NDIS, Australian, State and Territory Governments paid providers to deliver supports to people with disability. This meant that in July 2016 when the transition to full scheme began, governments had in place contracts with existing providers, or had previously made capital investments (like large residential centres or group homes: DSS, sub. 146, p. 22).

Because of these prior arrangements, State and Territory Governments are able to provide 'in kind' services (that is, they can transfer already funded disability supports used by NDIS participants) to the NDIA in lieu of cash contributions towards their funding commitments.

In practice, what this means for scheme participants is that supports in their plans are described specifically as having to be provided by a particular provider (that is, the provider engaged through in-kind arrangements).

In transition, in-kind contributions will account for about 19 per cent of total package costs, and about 10 per cent at the commencement of full scheme (figure 10.2). Over time, and as the assets age, the expectation, as stated in the intergovernmental agreements, is that in-kind contributions will be phased out. According to the DSS (sub. 146, p. 22), all governments are reviewing their in-kind contributions with a view to *minimising* them at full scheme, but 'this is uncertain'.

Figure 10.2 **In-kind supports as a percentage of total package costs**



Source: DSS (sub. 146, p. 23).

… but they reduce choice, increase scheme costs and delay market responses

In-kind contributions reduce choice for participants and, if they are provided at prices above market prices, they can increase scheme costs. A number of study participants pointed out that in-kind contributions undermine the core objectives of the NDIS. The DSS, for example, said:

> The provision of government in-kind contributions as part of NDIS support packages not only reduces participant choice, as in-kind supports must be used to enable the NDIS to be delivered within budget, but adds financial pressure as in-kind contributions are based on current costs to government as opposed to a market-driven efficient price. If maintained, there is a risk inefficient costs from legacy systems will be transferred to the NDIS (sub. 146, p. 21).

Lifestyle in Supported Accommodation commented:

> So much for participant 'choice and control' and 'self managing'. This [in-kind supports] is little different from block-funding. (sub. 3b, p. 2)

Bruce Bonyhady also said that in-kind arrangements:

> … are not consistent with a contestable or competitive market, because they limit control and choice and also lock-in old-style standards and prices above the efficient price (sub. 100, p. 9).

As noted above, in-kind contributions have to be used by participants (*National Disability Insurance Scheme (Plan Management) Rules 2013* (Cwlth) rr. 6.8-6.9) — there is no

ability to opt-out and choose another provider. To the extent that participants would choose another provider if they could, this limits choice.

In-kind contributions may also be of a lower quality than other supports that are more competitively provided. Because providers of in-kind supports do not need to compete for customers there is less incentive to improve the quality and reduce the cost of their services than under more competitive conditions. The NDIA (sub. 161, p. 47) said that one of the challenges to scheme sustainability caused by in-kind supports is they do not encourage innovation.

In-kind supports can also delay market transformation, and the move from a block funded model to a fee-for-service model is a major factor in provider readiness (chapter 6).

And they can result in two-tier pricing, with some participants receiving a higher priced support that is subject to less competition than other participants.

In-kind contributions should be phased out

The Commission recommends that in-kind supports be phased out by the end of the transition period. The NDIS is about developing a functioning disability care and support market that is responsive to the needs of participants and dynamically improves efficiency. The continuation of in-kind arrangements delays the development of such a market.

If in-kind supports are continued into full scheme this would effectively be cost shifting from the State and Territory Governments (who make up the largest share of in-kind contributions) to the Australian Government as well as cost shifting from State and Territory Governments with a large portion of funding provided in-kind to those that do not. As the NDIA put it:

> In-kind is higher than the notional prices, and at present the States and Territories do not carry the financial risk associated with resulting higher package costs. (sub. 161, p. 113)

If in-kind contributions continue beyond transition, jurisdictions should face a financial penalty for doing so.

DRAFT RECOMMENDATION 10.3

In-kind funding arrangements should be phased out by the end of transition and should not form part of the intergovernmental agreements for full scheme funding. Should in-kind funding persist beyond transition, jurisdictions should face a financial penalty for doing so.

A Conduct of the study

The Commission received the terms of reference for this study on 20 January 2017. It subsequently released an issues paper on 22 February 2017 inviting public submissions and highlighting particular matters on which it sought information.

In total, the study received 206 submissions (table A.1). The study also received brief submissions online, including those collected by the organisation Every Australian Counts. All public submissions have been placed on the study's website.

During the study, the Commission held consultations with people with disability, advocacy groups, peak bodies, service providers, disability care and support workers, and government departments and agencies (table A.2).

The Commission thanks all those who contributed to this study.

Data and information

The Commission acknowledges the assistance of the:

- National Disability Insurance Agency in providing unpublished data and information to the study, and allocating a staff member to spend several days in the Commission's Canberra office to provide feedback on analysis conducted by the study. Any errors in the analysis of these data and information in this paper are attributable to the Commission.
- Department of Social Services in providing unpublished data and information to the study.

This paper uses the National Centre for Vocational Education Research's data on vocational education outcomes (VOCSTATS). These data are collected by registered training organisations and state training authorities around Australia. The National Centre for Vocational Education Research is not responsible for errors in the extraction, analysis or interpretation of the data presented herein.

List of Figures

Executive Summary

This report analyses information from almost 1,500 disability service workers. It explores their characteristics and perceptions of their working conditions; their experiences of working under the National Disability Insurance Scheme (NDIS); and their concerns about the implementation of the Scheme and its impact on their working lives.

Characteristics of respondents

- 74.1% of respondents were women.
    - Among those working in allied health and in-home care settings, there were higher proportions of women (over 80%). In employment, mental health, and residential/ group home settings, the proportions of women were lower (around 70%).
- Respondents had extensive experience in disability services: a quarter (22.5%) had more than 20 years of experience in the industry.
- 28.5% of respondents supervised other staff in their current role, while about the same number (27.3%) did so sometimes.

Working under the NDIS

- A little over half of respondents (54.7%) were working in an NDIS rollout area or with participants of the NDIS, while 35.8% said they were not, and 9.5% were unsure.
    - Workers in allied health, case management, day settings and in-home care were more likely to report working under the NDIS, while those in mental health, employment and residential/group home settings were least likely.

Impact of the NDIS on participants and families

- Few workers perceive the NDIS to be having a positive impact on participants or their families
    - 24.6% agreed that the NDIS was positive for the participants they work with
    - A minority (14.6%) agreed that families of participants were happy with the scheme, and
    - 15.7% agreed that the NDIS is better than the previous system.

Impact of the NDIS on working life

- Comparisons of respondents working under the NDIS and those who were not shows:
    - Lower proportions of very experienced employees were working under the NDIS, while proportions of staff new to the industry were higher.
    - Among those working under the NDIS, a higher proportion of employees are working for more than one disability service provider.
    - Those working under the NDIS were no more likely to be satisfied with their pay: across all contexts only a minority of respondents were happy with the pay they receive.
- High proportions of staff reported challenges to working under the NDIS:
    - 55.9% reported that they did not have enough time to do their work under the NDIS

- 72.2% were worried about the future of their job
- 52.6% disagreed that the NDIS has been a positive change for them as a worker.

Supervision and the NDIS

- Supervisors working under the NDIS reported supervising higher numbers of staff than others, which made it difficult to provide proper supervision:
  - 20.0% of those in supervisory roles[1] and who were working under the NDIS were supervising more than 14 staff, compared with only 12.0% of supervisors not working under the NDIS.
  - The proportion of supervisors who agreed that they can't provide proper supervision because of lack of time or too many staff rises with the number of supervisees, indicating a major risk for the Scheme.

General comments from disability workers

Among comments from disability workers, the most common concerns were about the adequacy of resources being provided to people with disability under the NDIS, and the impact of the Scheme on the quality of services people with disability would receive. Many explained the frustrations experienced by people with disability and their families, including delayed, inequitable and impersonal planning processes, resulting in inadequate support plans for participants.

Respondents also made a range of comments about how the NDIS was impacting on their working lives. Many linked risks to quality and safety to the use of casual and agency staff, and untrained staff entering the sector. Others expressed concerns about pay and conditions, including coverage of costs of private vehicle use, loss of penalty rates, subcontracting, short shifts, payment for travel time, and roster changes which could result in fewer hours. Respondents also noted that the NDIS was placing pressure on their employment classifications and pay rates, and some raised concerns their work was misclassified. Related, workers' comments attest to their high levels of stress, with many reporting unsustainable workloads and time pressure (including unpaid work) and poor job security, corroborating the other survey findings.

[1] Excluding those who only sometimes supervised staff.

1. Introduction

This report provides insight into the characteristics and experiences of almost 1,500 survey respondents who were working in disability services in early 2017. The survey was designed and administered by the main unions representing workers in the disability services industry, the Health Services Union, Australian Services Union, and United Voice, to help understand disability workers':

- characteristics and perceptions of their working conditions;
- experiences of working under the National Disability Insurance Scheme (NDIS); and
- their concerns about the implementation of the Scheme and its impact on their working lives.

The survey questions asked about respondents' demographic characteristics and how long they had worked in disability services, the settings in which they provided disability services (respondents could select more than one), their perceptions of their pay, their intention to leave or remain in the disability sector and reasons for this. It also asked whether they were a supervisor and if so, explored the characteristics of supervisory roles, including supervisory workloads. Those who were working in an NDIS area or with participants of the NDIS were asked a series of questions about their experience of working under the Scheme, to capture perceptions of time pressure, job security, and the overall impact of the NDIS on clients and their families. Respondents were also given the opportunity to provide open ended comments about working in disability, and any concerns they had about their work in the industry or under the NDIS.

The survey was distributed online via the networks of the three unions, primarily in the Eastern States. As such it is a non-probability based 'opt-in' sample, selected purposively to enable a focus on members of the unions commissioning the survey and to enable insight into experiences of providing disability services in different contexts, and differences among different groups of workers. A particular aim was to explore the impact of working under the NDIS, and to this end, comparison is made between respondents working under the Scheme and those which were not.

As a purposive sample, it may not be perfectly representative of all disability workers in Australia. As the survey was distributed through union networks, workers who are newer to the industry (and less likely to be union members) are under-represented. Further, responses from the Northern Territory and South Australia were not sought. However, while the sample is skewed to older, more experienced workers in the eastern states and should not be considered representative of the whole disability workforce, it does provide important insights into the experiences of working in disability, and differences for workers in different circumstances and settings. To this end, the analysis focused on comparing workers in different circumstances, with cross tabulations used to provide detailed breakdowns of respondents.

2. About respondents

2.1 Gender

Of the 1,477 survey respondents who provided their gender, 1,094 (74.2%) were female. This varied slightly across disability settings, as shown in Figure 2.1. Allied health was most strongly female dominated (87.1%), while mental health, residential, and employment services had proportionally fewer women (around 70%). The gender composition of the sample also differed slightly across the age groups. The largest group of men and women were aged 45 and 54, with this group comprising a third of all respondents (see Figure 2.2). In terms of differences in the age distribution of men and women, a relatively high proportion of men were aged 35 to 44, while a lower proportion of men were aged 45 to 54. Figures were similar across other age ranges.

Figure 2.1 Proportion of respondents in each disability setting who were women

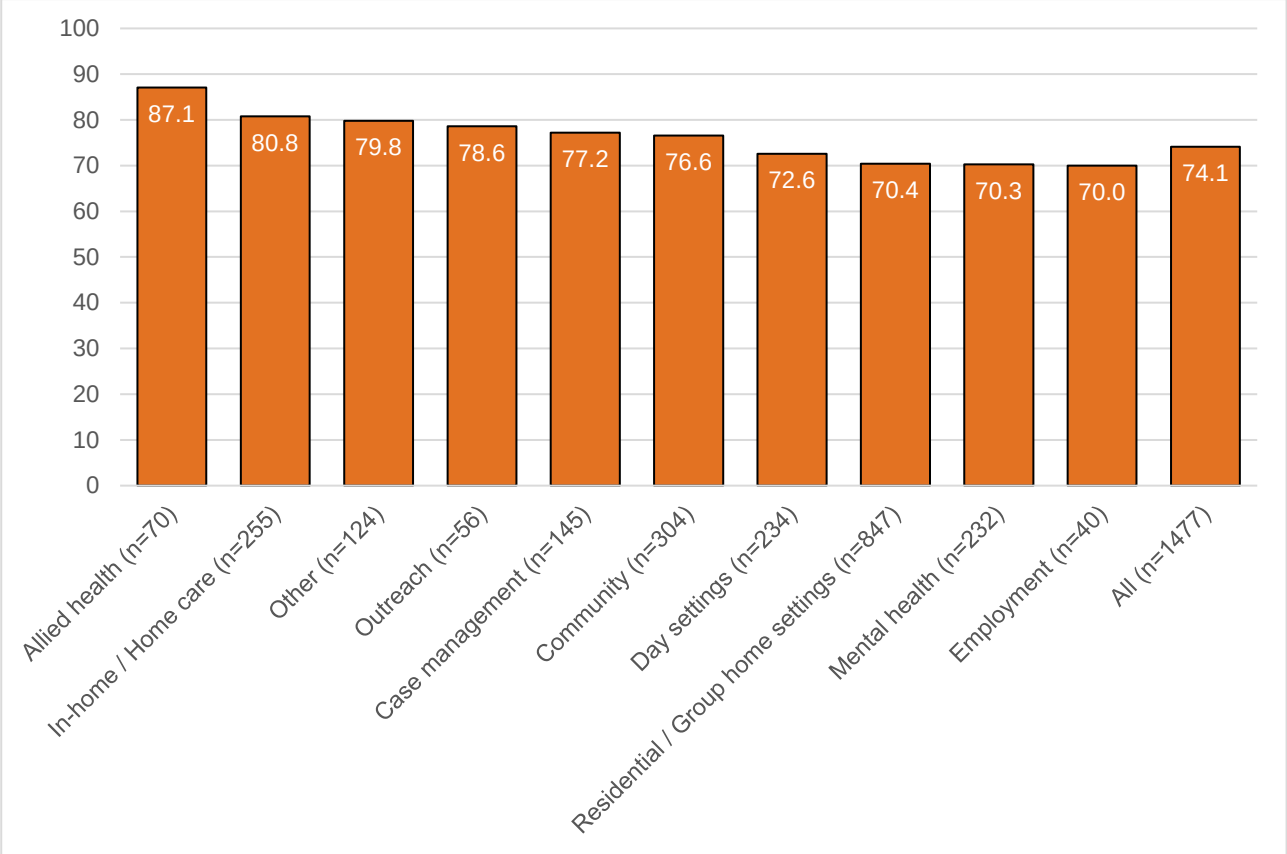

Figure 2.2 Proportion of men and women in each age category (%)

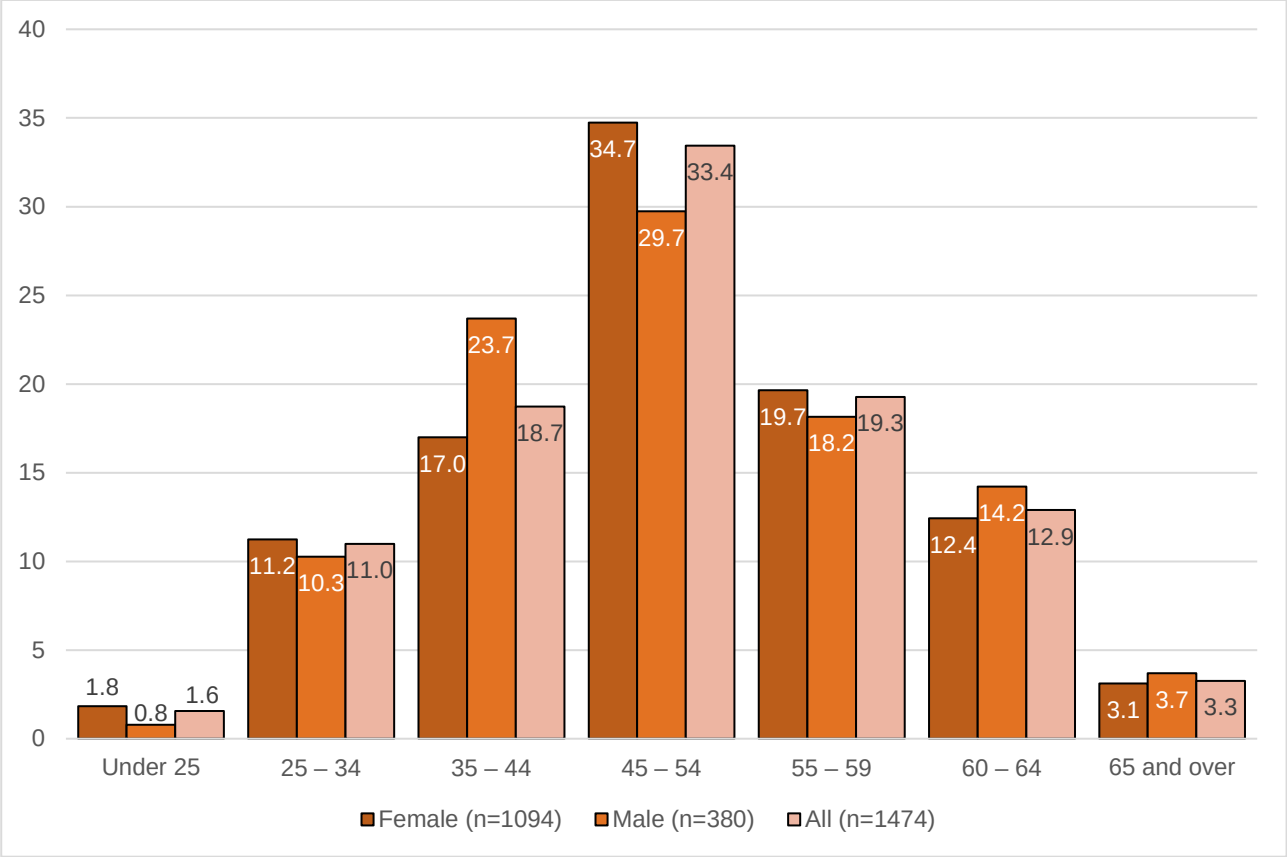


2.2 Experience in disability services

Many respondents were highly experienced in disability services. Almost a quarter (22.5%) had more than 20 years of experience providing disability services, and a further 13.8% had between 16 and 20 years of experience (see Figure 2.3). More than half (54.1%) had more than ten years of experience. Only a minority were new to the sector, with 2.0% having less than 1 year experience and 5.2% having between 1 and 2 years of experience. Although the age distribution of men and women differed slightly, there was little difference in the length of experience of men and women respondents, as shown in Figure 2.3.

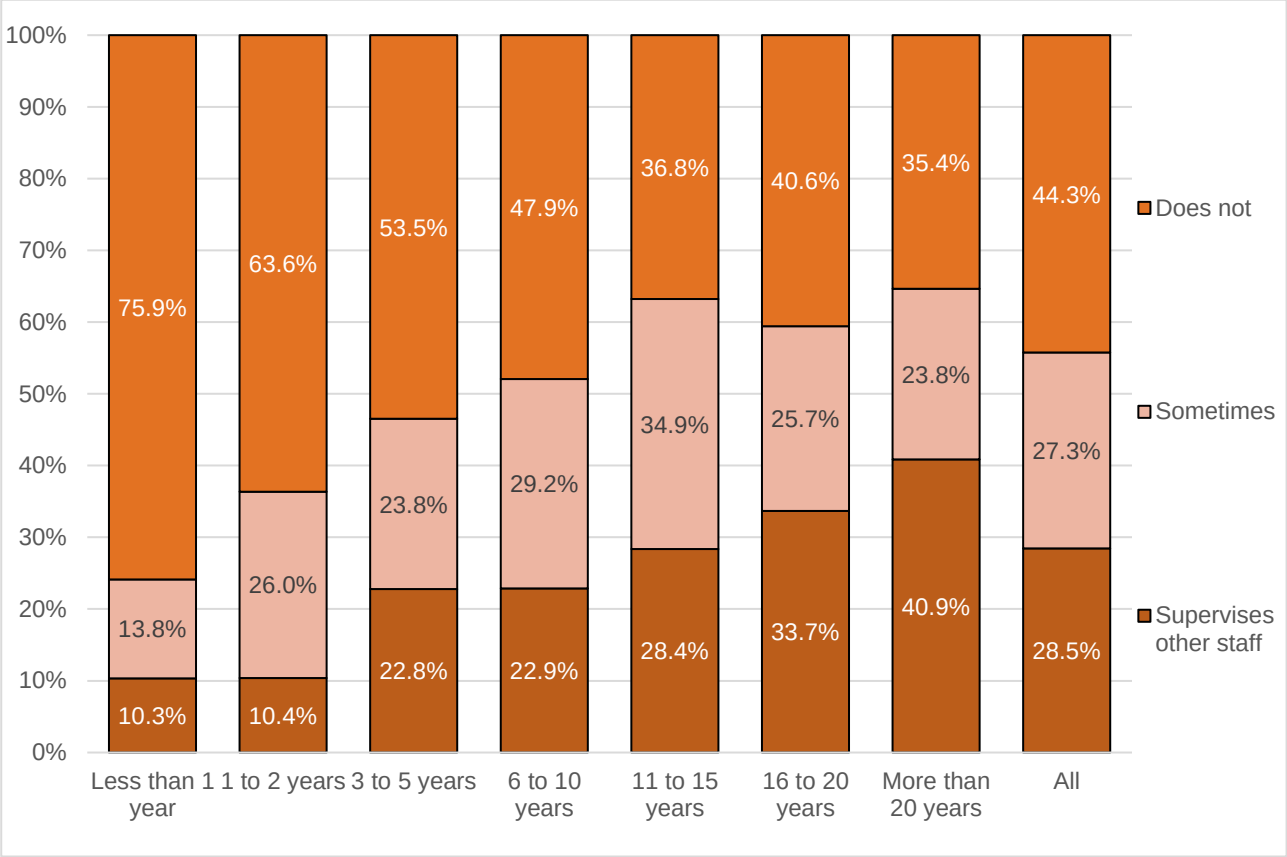
Figure 2.3 Men's and women's experience of working in disability services

	Less than 1 year		1 – 2 years		3 – 5 years		6 – 10 years		11 – 15 years		16 – 20 years		Over 20 years		All	
	n	%	n	%	n	%	n	%	n	%	n	%	n	%	n	%
Male	5	1.3	27	7.1	46	12.0	99	25.9	65	17.0	56	14.7	84	22.0	382	100.0
Female	25	2.3	50	4.6	156	14.3	269	24.6	198	18.1	148	13.5	248	22.7	1094	100.0
All	**30**	**2.0**	**77**	**5.2**	**202**	**13.7**	**368**	**24.9**	**263**	**17.8**	**204**	**13.8**	**332**	**22.5**	**1476**	**100.0**

2.3 Supervisory responsibilities

Figure 2.4 shows that 28.5% of respondents supervised other staff in their current role, while about the same number (27.3%) said they did so sometimes. As would be expected, the proportion of staff supervising others was higher for those with longer experience in the disability services sector: 40.9% of those with more than 20 years of experience were supervisors, compared with around 10% of those with less than 2 years of experience.

Figure 2.4 Proportion of staff which supervised staff in their current role, by length of time working in disability services (n=1,462)



2.4 Residence and NDIS involvement

Most respondents resided in the eastern states, reflecting the networks through which the survey was distributed. Around 2 in 5 respondents (40.7%) resided in Victoria, 37.2% resided in NSW/ACT[2], and 11.8% resided in Tasmania.

Overall, a little over half (54.7%) were working in an NDIS rollout area or with participants of the NDIS, while 35.8% said they did not, and 9.5% were unsure (see Figure 2.5). This differed across the jurisdictions, with relatively high proportions of respondents (more than two thirds) working under the NDIS in NSW/ACT and Tasmania.

[2] A small number (8) were from the ACT, and these are combined with NSW for the purposes of analysis.

Figure 2.5 Respondents from each jurisdiction by whether or not they were working in an NDIS rollout area or with participants of the NDIS

	NDIS		Not NDIS		Not sure		Total	% of total
	n	%	n	%	n	%	n	%

2.5 Experience in disability by NDIS involvement

As shown above, over half of respondents were working under the NDIS (54.7%). However, slightly lower proportions of those working under the NDIS had lengthy experience in disability services. As shown in Figure 2.6, among those working under the NDIS, 21.4% of respondents had more than 20 years of experience compared with 26.2% of those not working under the NDIS. Relatively high proportions of those working under the NDIS had 2 years of experience: 8.7% of those working under the NDIS were in this category compared with 4.2% of those not working under NDIS.

The difference between levels of experience of respondents working under the NDIS and others is more apparent for non-supervisor staff (see Figure 2.7). Among staff working under the NDIS, 41.8% of non-supervisory staff had over 10 years of experience and 13.8% had less than 2 years of experience. For those not working under the NDIS the equivalent figures were 53.2% and 5.1% respectively.

Figure 2.6 Number of years worked in the disability sector, by NDIS involvement, supervisors and non-supervisors, n=1,462

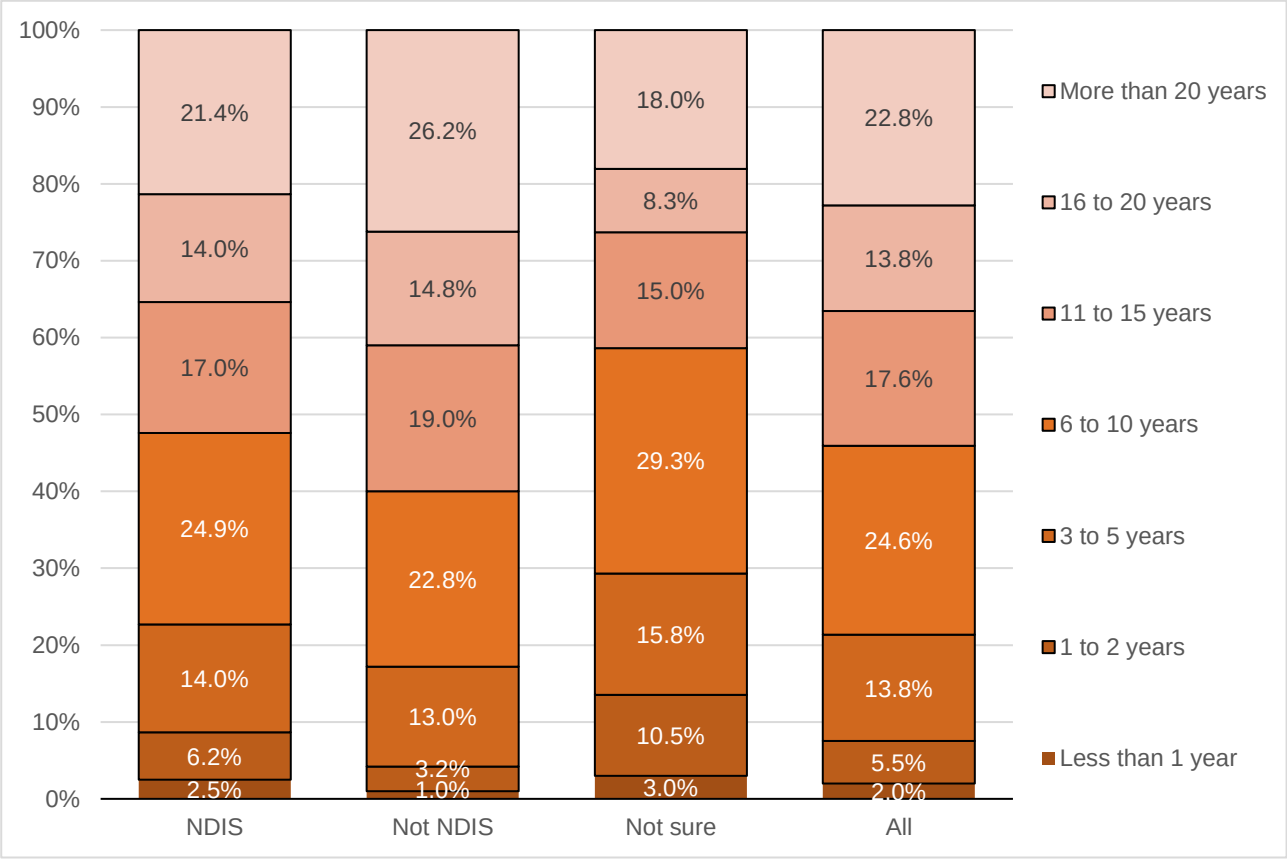

Figure 2.7 Number of years worked in the disability sector, by NDIS involvement, non-supervisory staff only, n=646

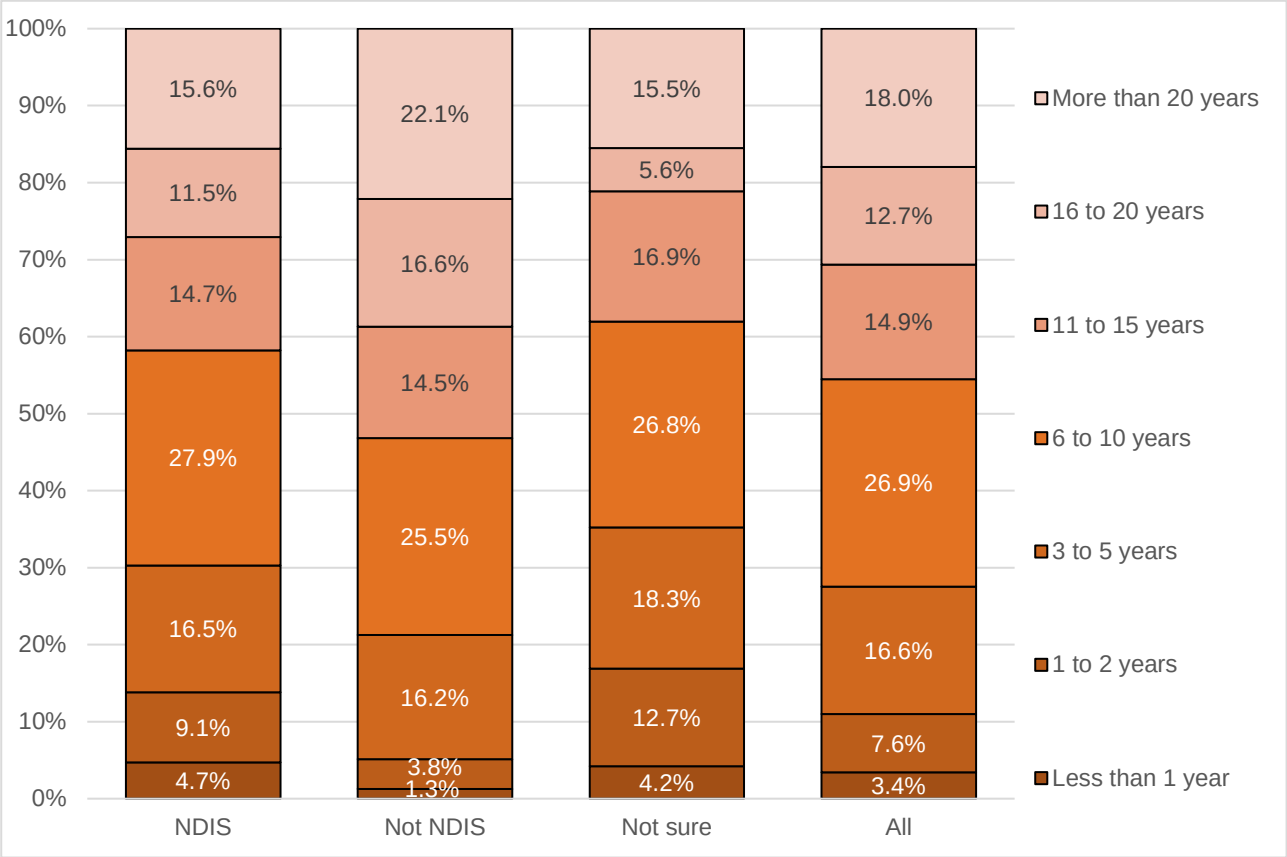
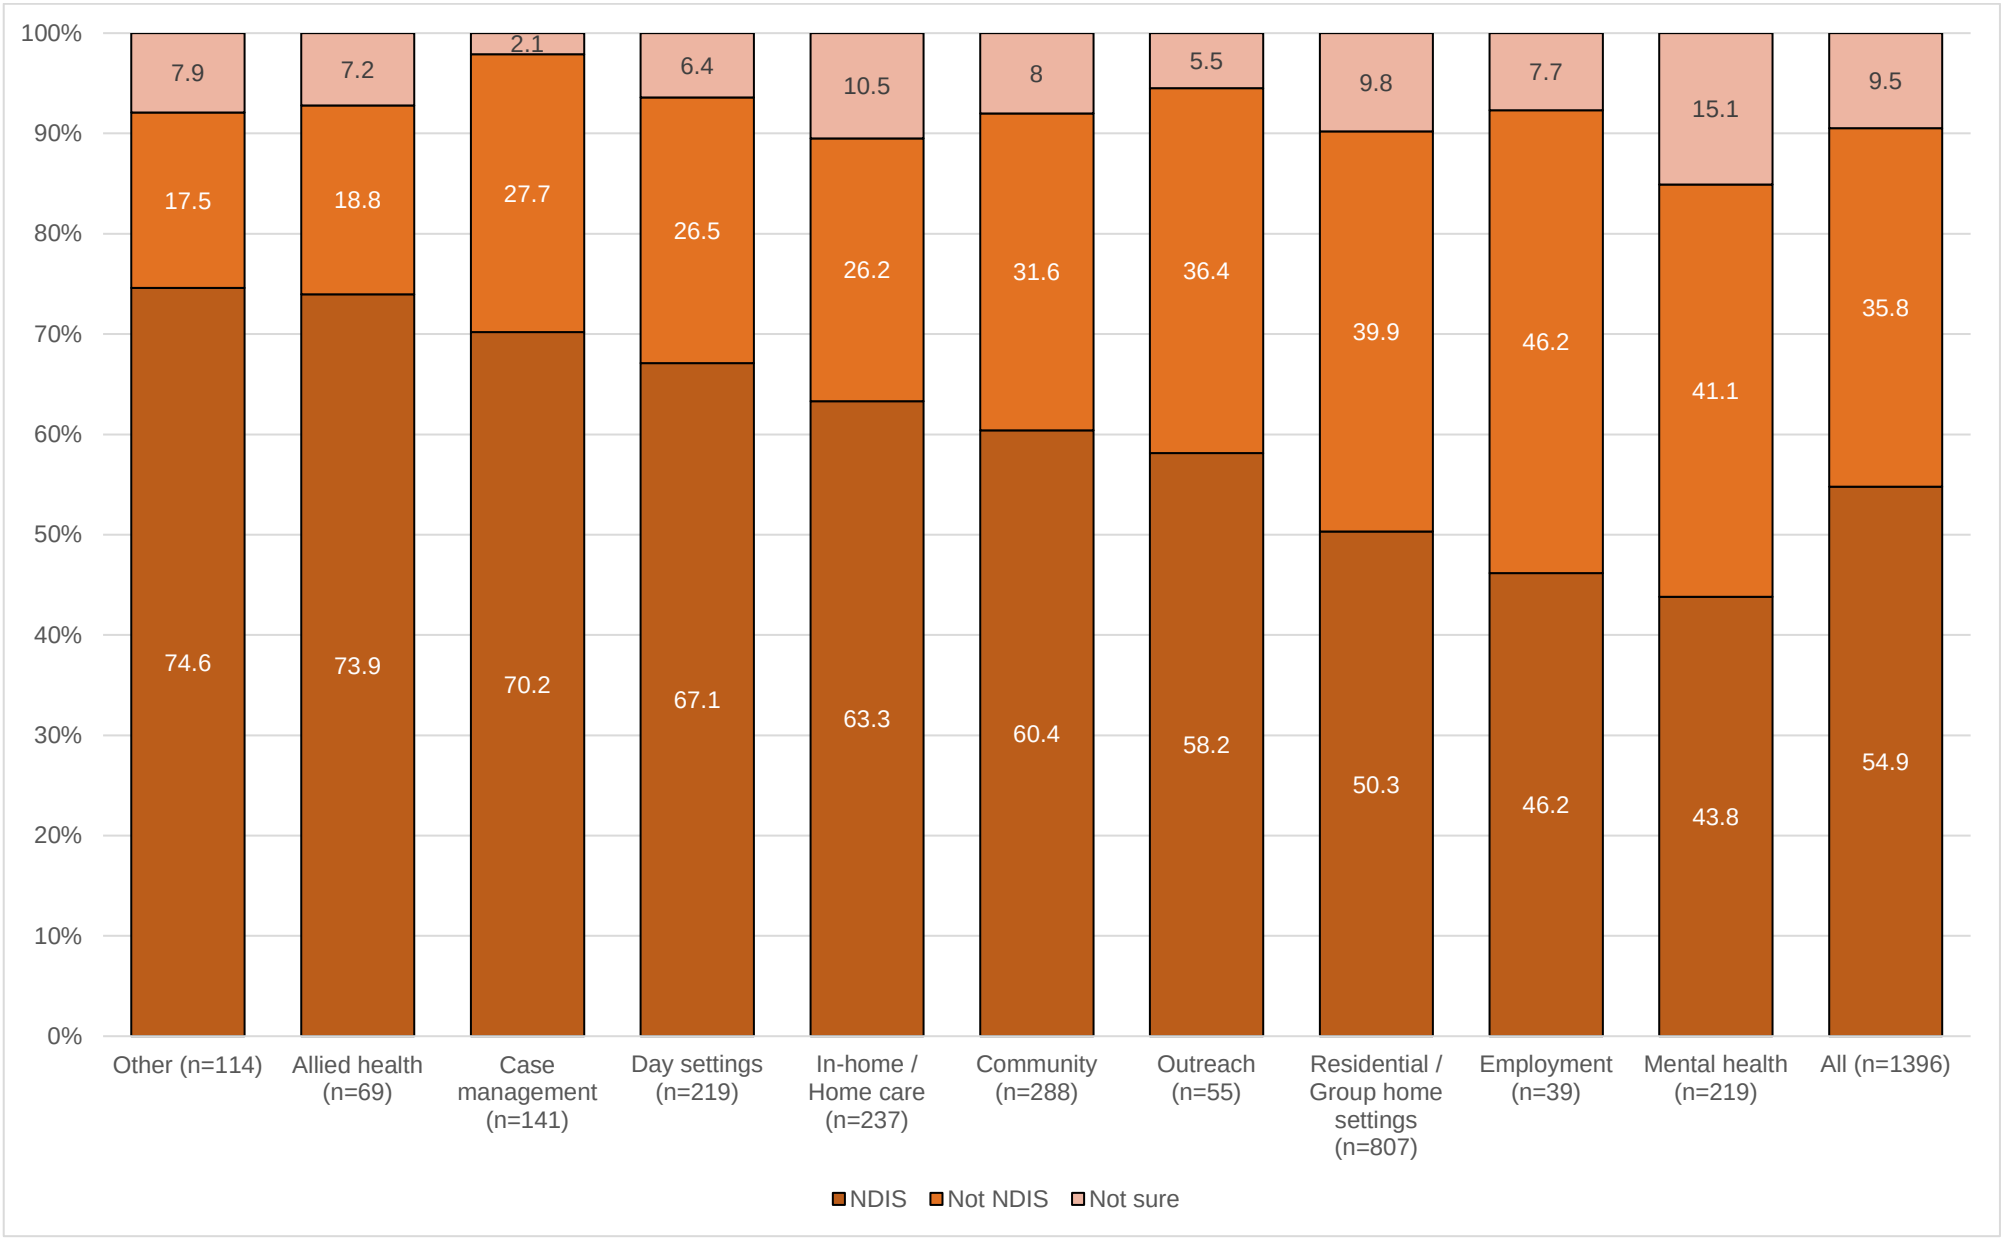


2.6 Disability settings and the NDIS

Figure 2.8 shows the proportions of survey respondents working in various settings who were working under the NDIS. The largest group of respondents were working in residential / group home settings (807, or 54.7%)[3]. A lower than average proportion of respondents in residential settings reported working under the NDIS (50.3%). The highest proportions working under the NDIS were in 'other' settings (not specified) (74.6%), allied health (73.9%), case management (70.2%), day settings (67.1%) and in home settings or home care (63.3%).

[3] Note that many residential workers also said they worked in community settings (20.5%), in-home settings (15.1%), and day settings (13.0%)

Figure 2.8 NDIS involvement for respondents working in the main disability service provision settings



2.7 Multiple job holding

Overall, 11.3% of respondents said they worked for more than one disability service provider or employer. However, this was slightly higher among non-supervisory staff 11.7% were multiple job holders compared with 7.2% of supervisory staff (see Figure 2.9). There was also a slightly higher proportion of staff who held multiple jobs among respondents working under the NDIS. Figure 2.10 shows that 12.8% of those working under the NDIS worked for more than one provider, compared with 8.8% of those who weren't. Further, in some disability settings, very high proportions of respondents worked for more than one disability employer. For example, 23.9% of respondents working in in-home or home care settings worked for more than 1 employer, as did 20.5% of those working in day settings. This is shown in Figure 2.11.

3. Perspectives on pay

The survey asked respondents to indicate their level of agreement with the statements "I am paid fairly for the work I do" and "I am satisfied with my overall level of take-home pay". For each of these statements, only a minority of respondents agreed, and this was the case for each statement and in all states (see Figure 3.1 and Figure 3.2). There was little difference between levels of agreement among supervisors and other staff: in both cases and for both statements, only a minority agreed. There were also no significant differences in levels of agreement on either measure between staff working under the NDIS and those who were not; in either context only a minority of respondents were satisfied with their pay.

Figure 3.1 Proportion of respondents who agreed with statement "I am paid fairly for the work I do", by state

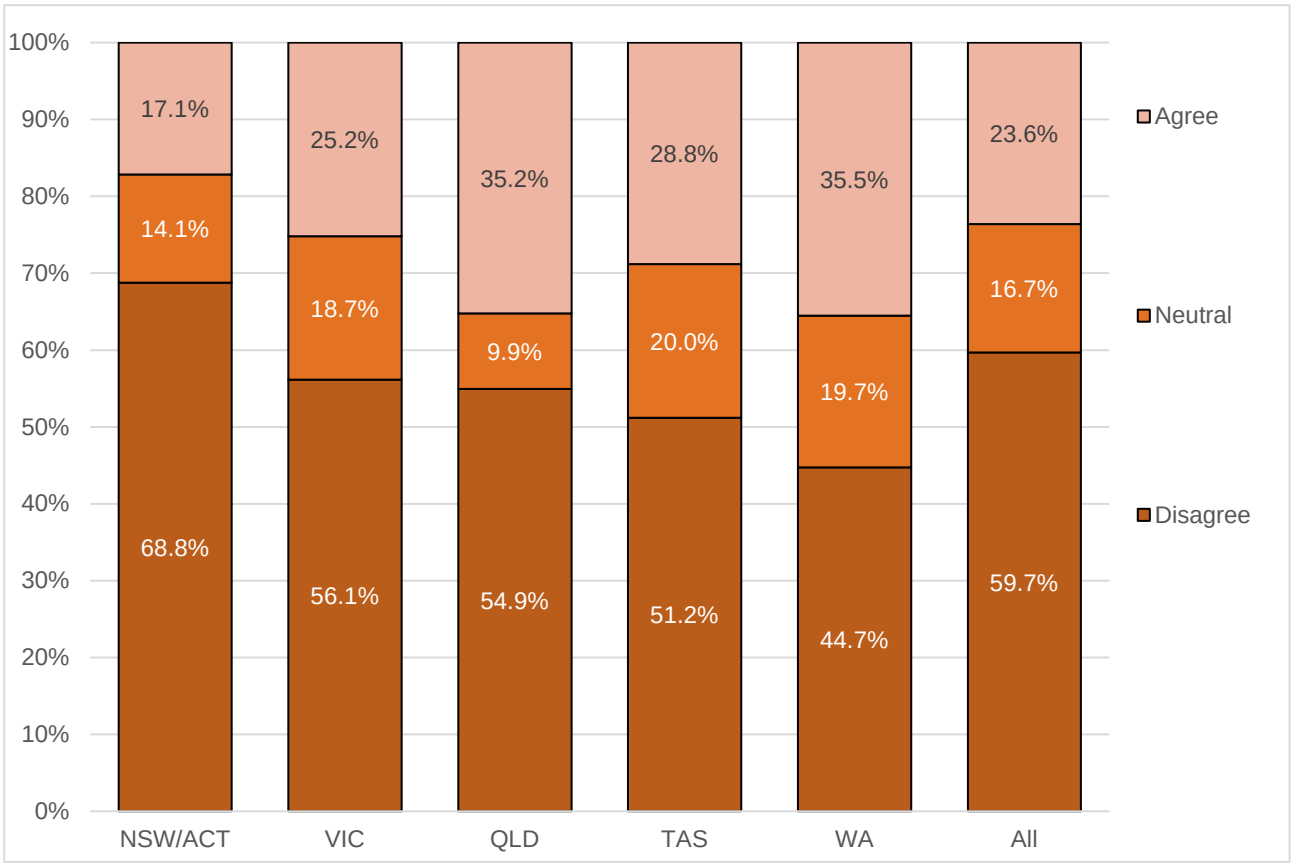

Figure 3.2 Proportion of respondents who agreed with statement "I am satisfied with my overall level of take-home pay", by state

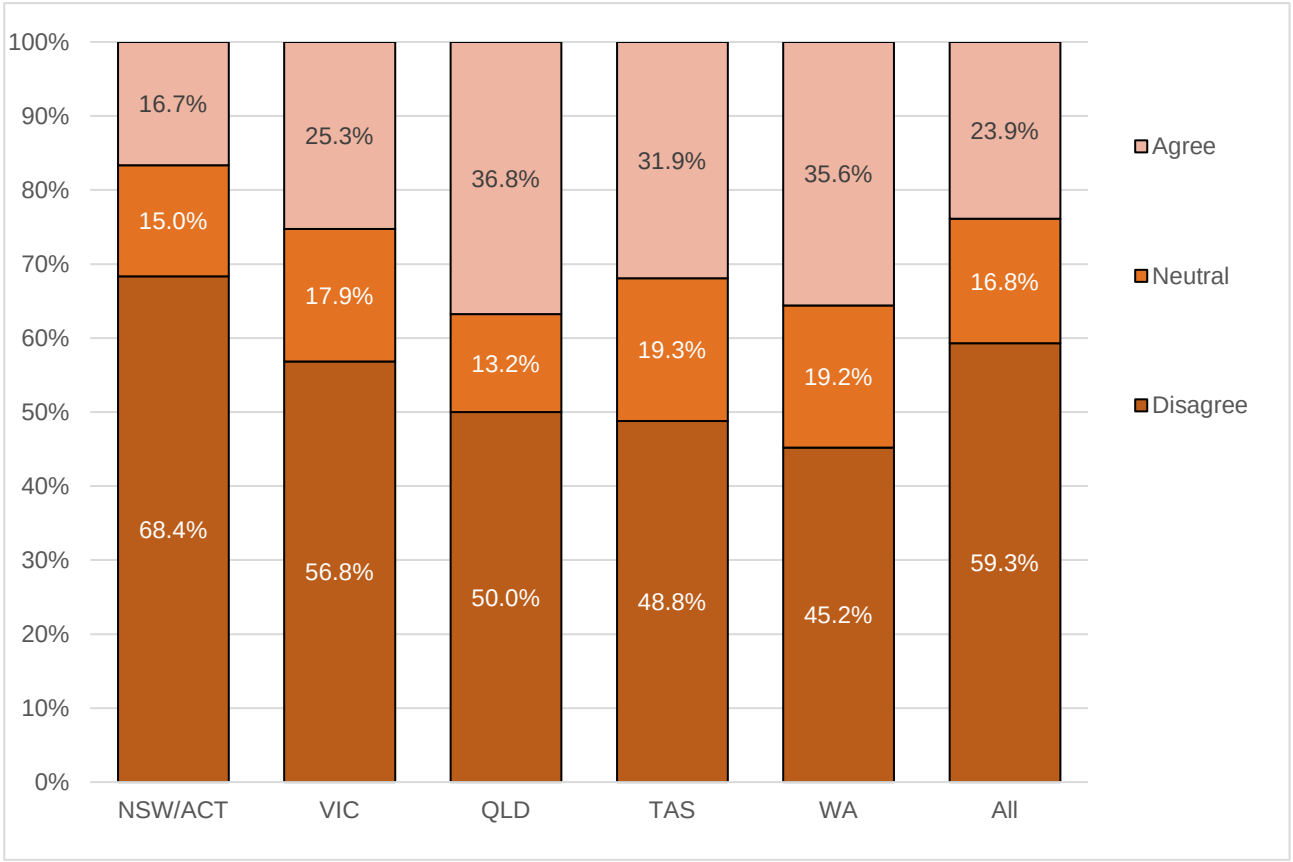

Figure 3.3 “I am paid fairly for the work I do”

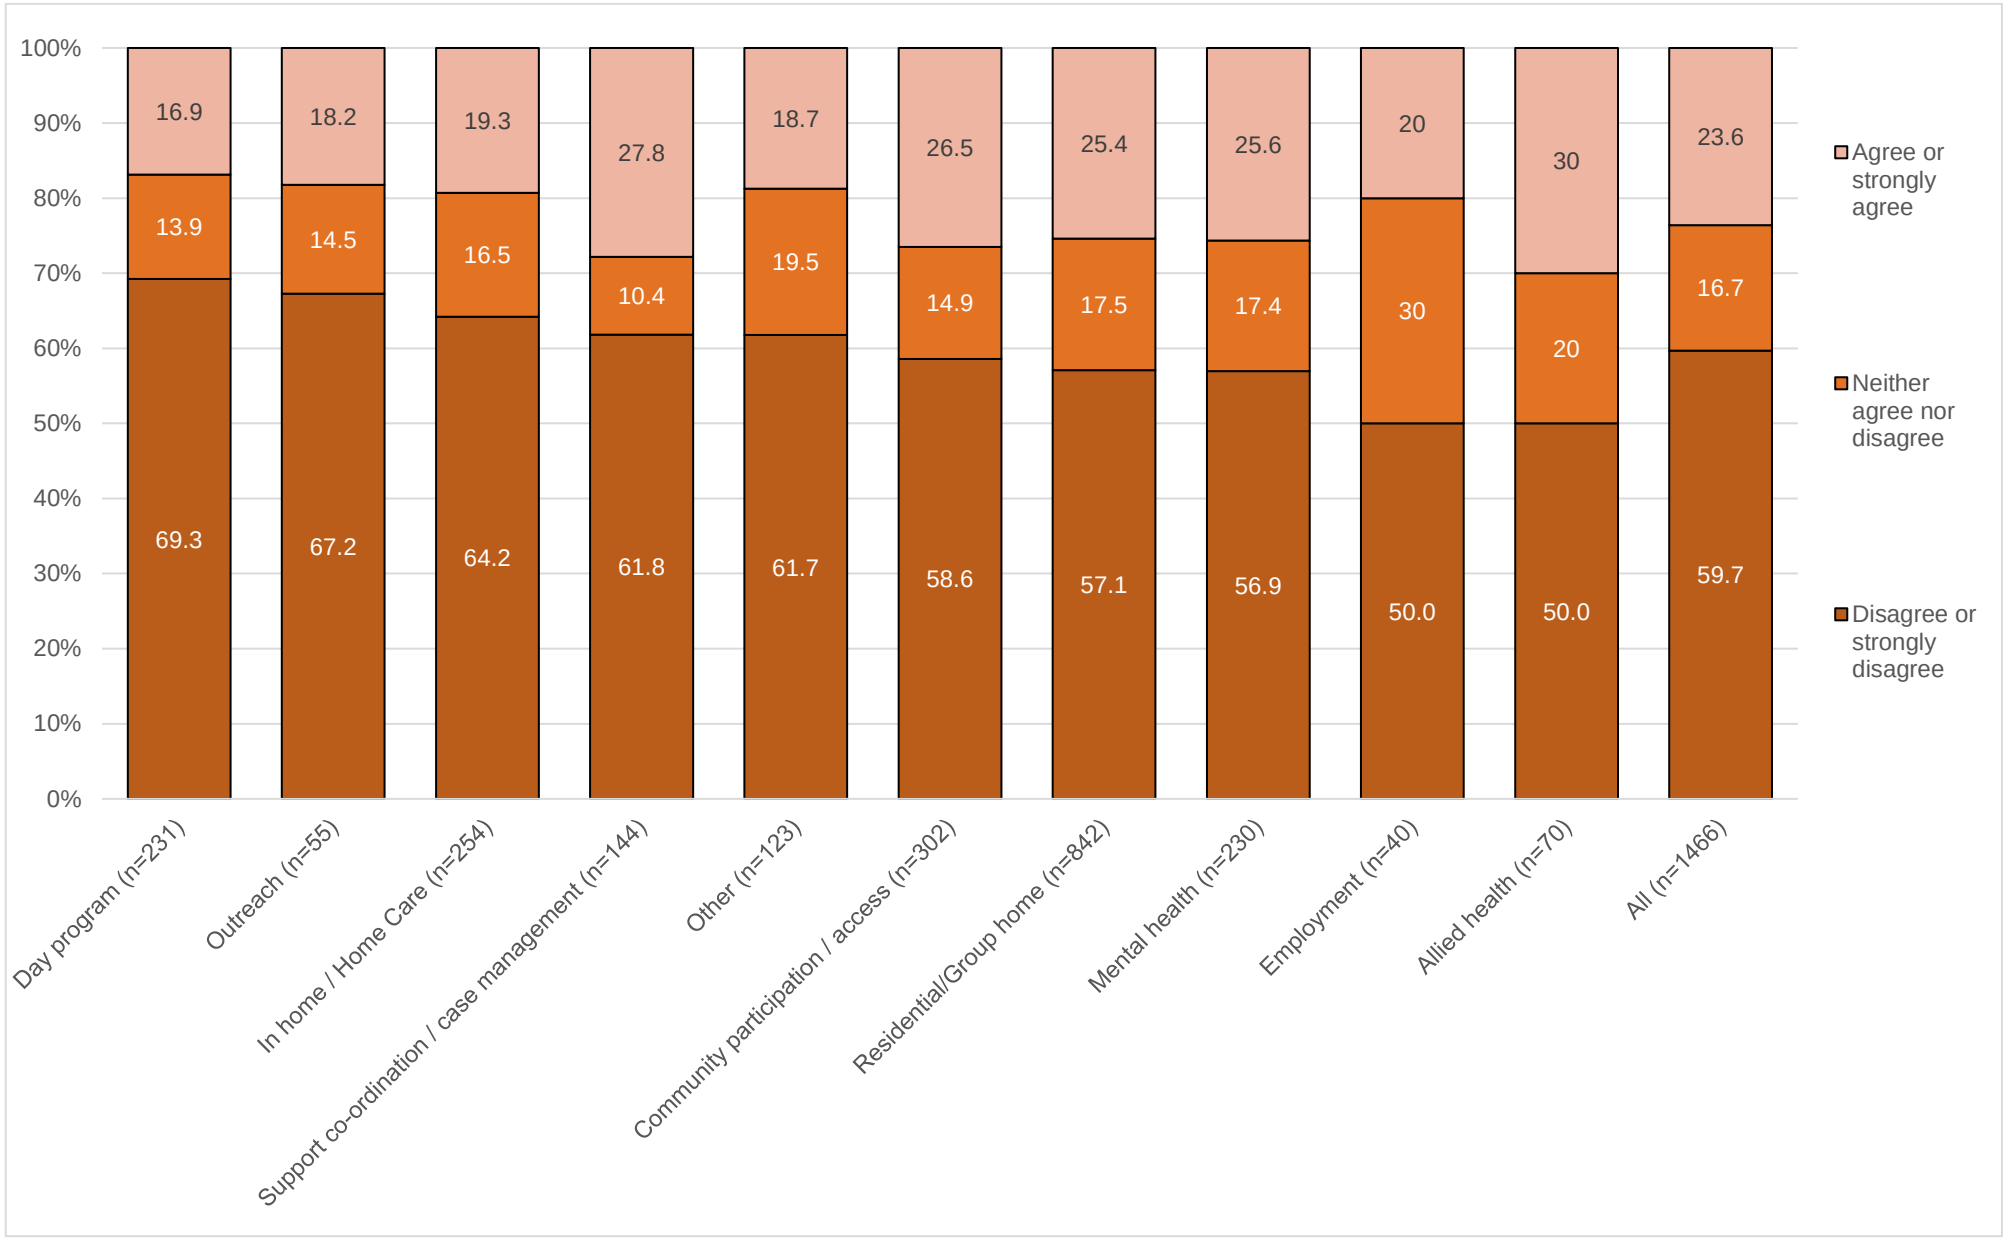

Figure 3.4 “I am satisfied with my overall level of take-home pay”

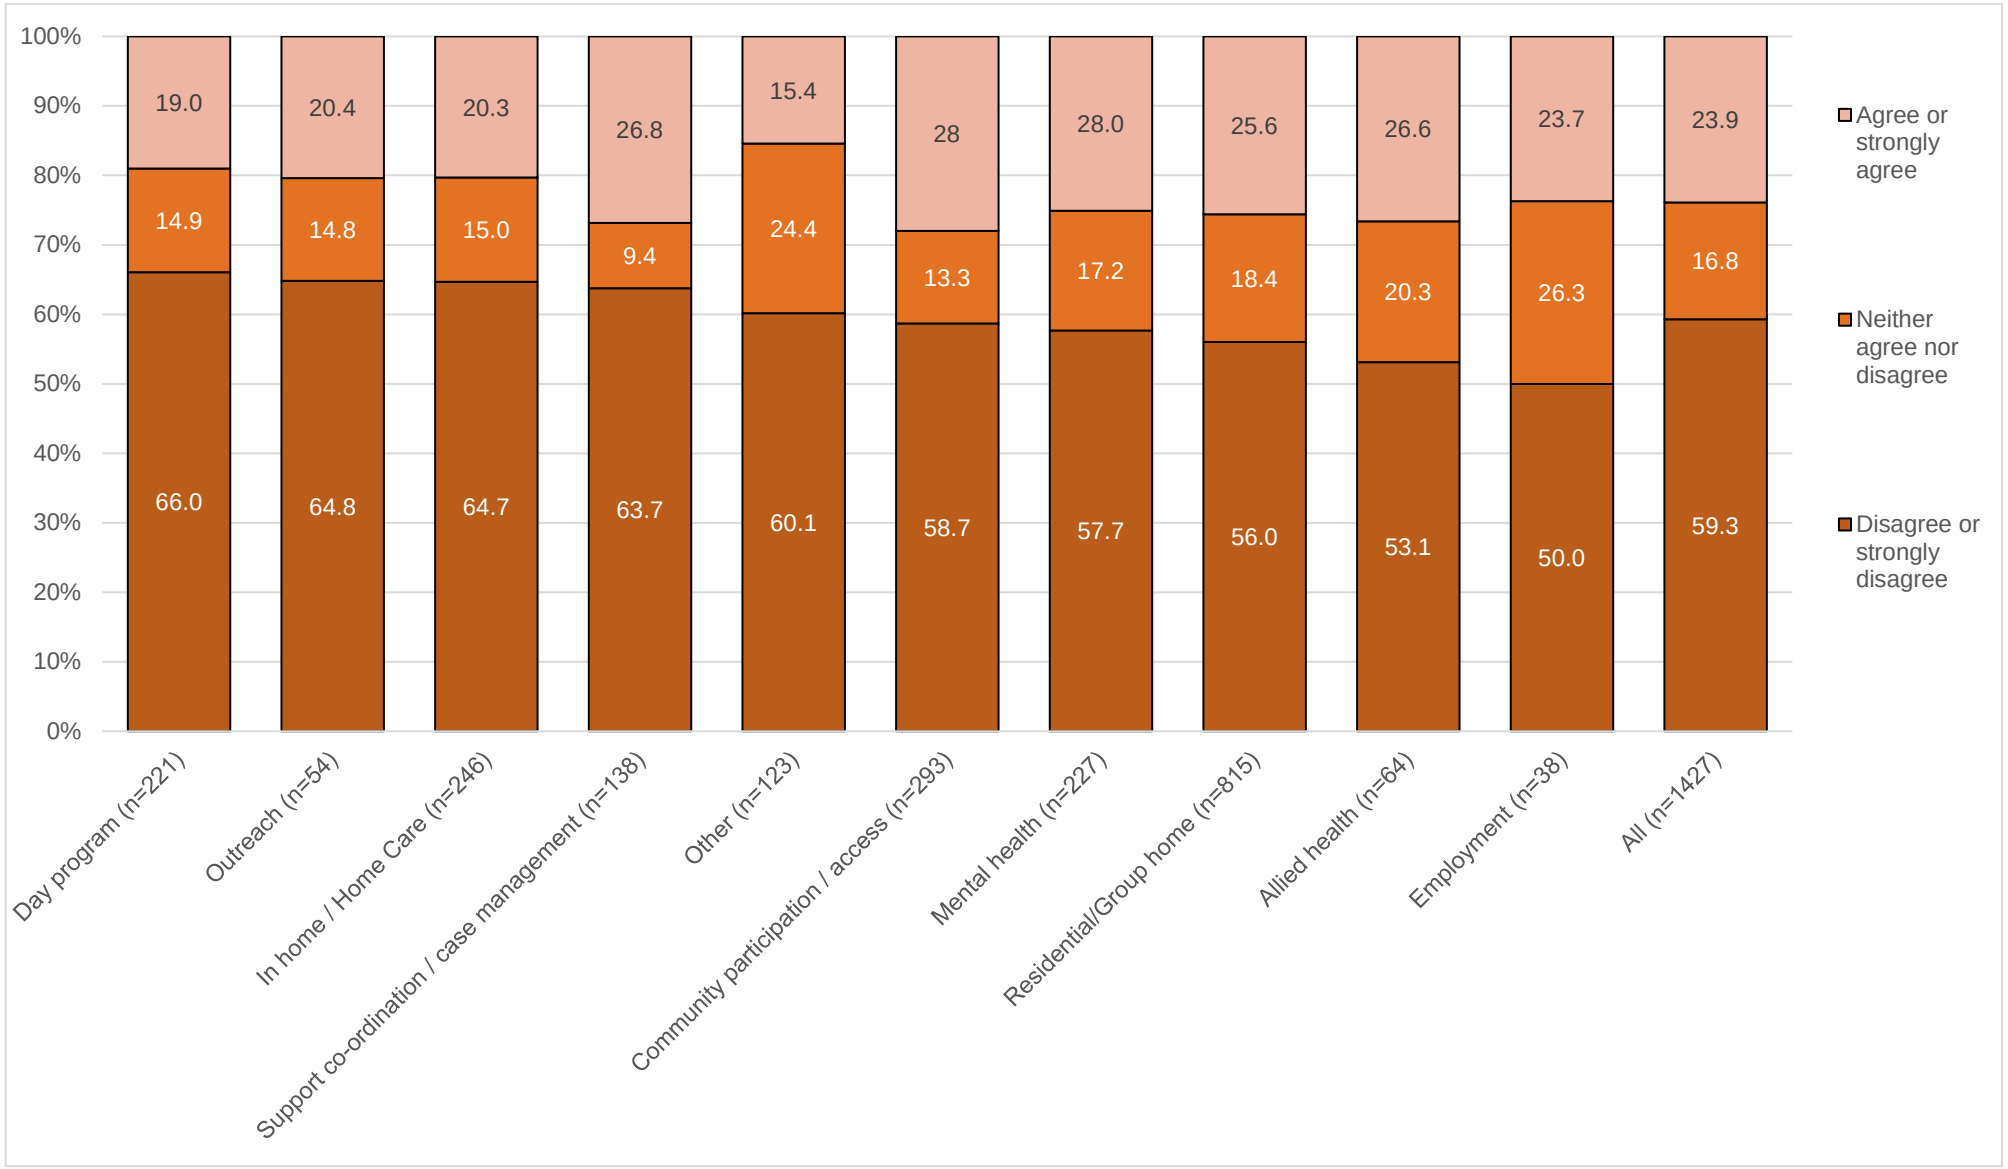

4. Perceptions of working under the NDIS

The survey captured respondents' perceptions of working conditions under the NDIS, through levels of agreement with three statements:

- Under the NDIS, I don't have enough time to do everything in my job (capturing workload and work intensity)
- Under the NDIS, I worry about the future of my job (capturing job security), and
- Overall, the NDIS has been a positive change for me as a worker (as a summary measure of the impact of the NDIS on working life).

As shown in Figure 4.1, more than half of respondents agreed or strongly agreed that under the NDIS, they don't have enough time to do everything in their job (55.9%), and only a small minority disagreed (11.4%). A larger majority agreed that they worried about the future of their job (72.2%), and 12.4% disagreed. Very few agreed the NDIS was positive for their working lives, with 10.6% agreeing and 52.6% disagreeing. The relatively large proportion who were unsure (36.9%) may have found it difficult to judge, for example if they were new to disability work or if the NDIS was new in their area, or if they had difficulty assessing the mixed impact of the Scheme on their work.

Differences in levels of agreement with the statements reported by workers in different disability settings tended to be small, shown in Figure 4.2. Figure 4.3 shows differences between respondents by their jurisdiction of residence. On all measures and in each jurisdiction, most reported the NDIS was having adverse impacts on their working lives. More detailed insight into experiences of working under the NDIS, in survey respondents' own words, is in Section 8.

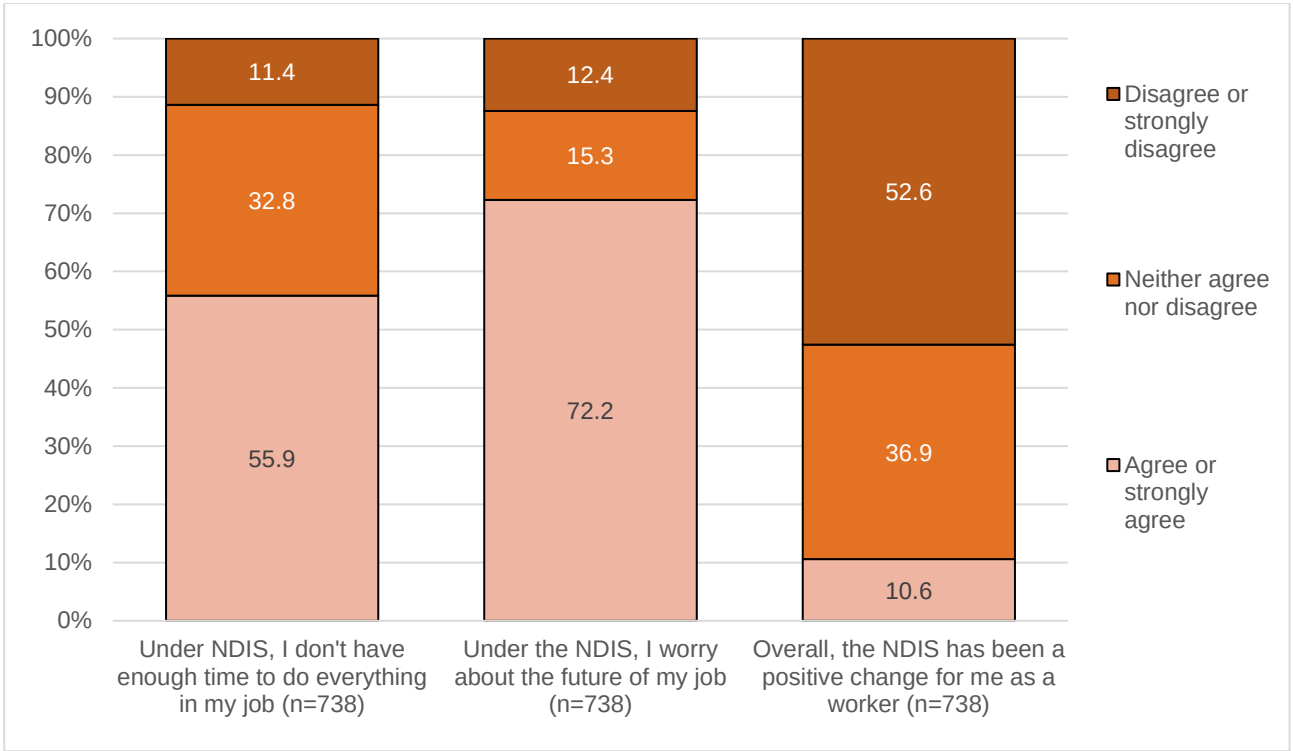

Figure 4.2 Proportion of respondents who agreed or strongly agreed with statements about working under the NDIS, by disability support service setting (%)

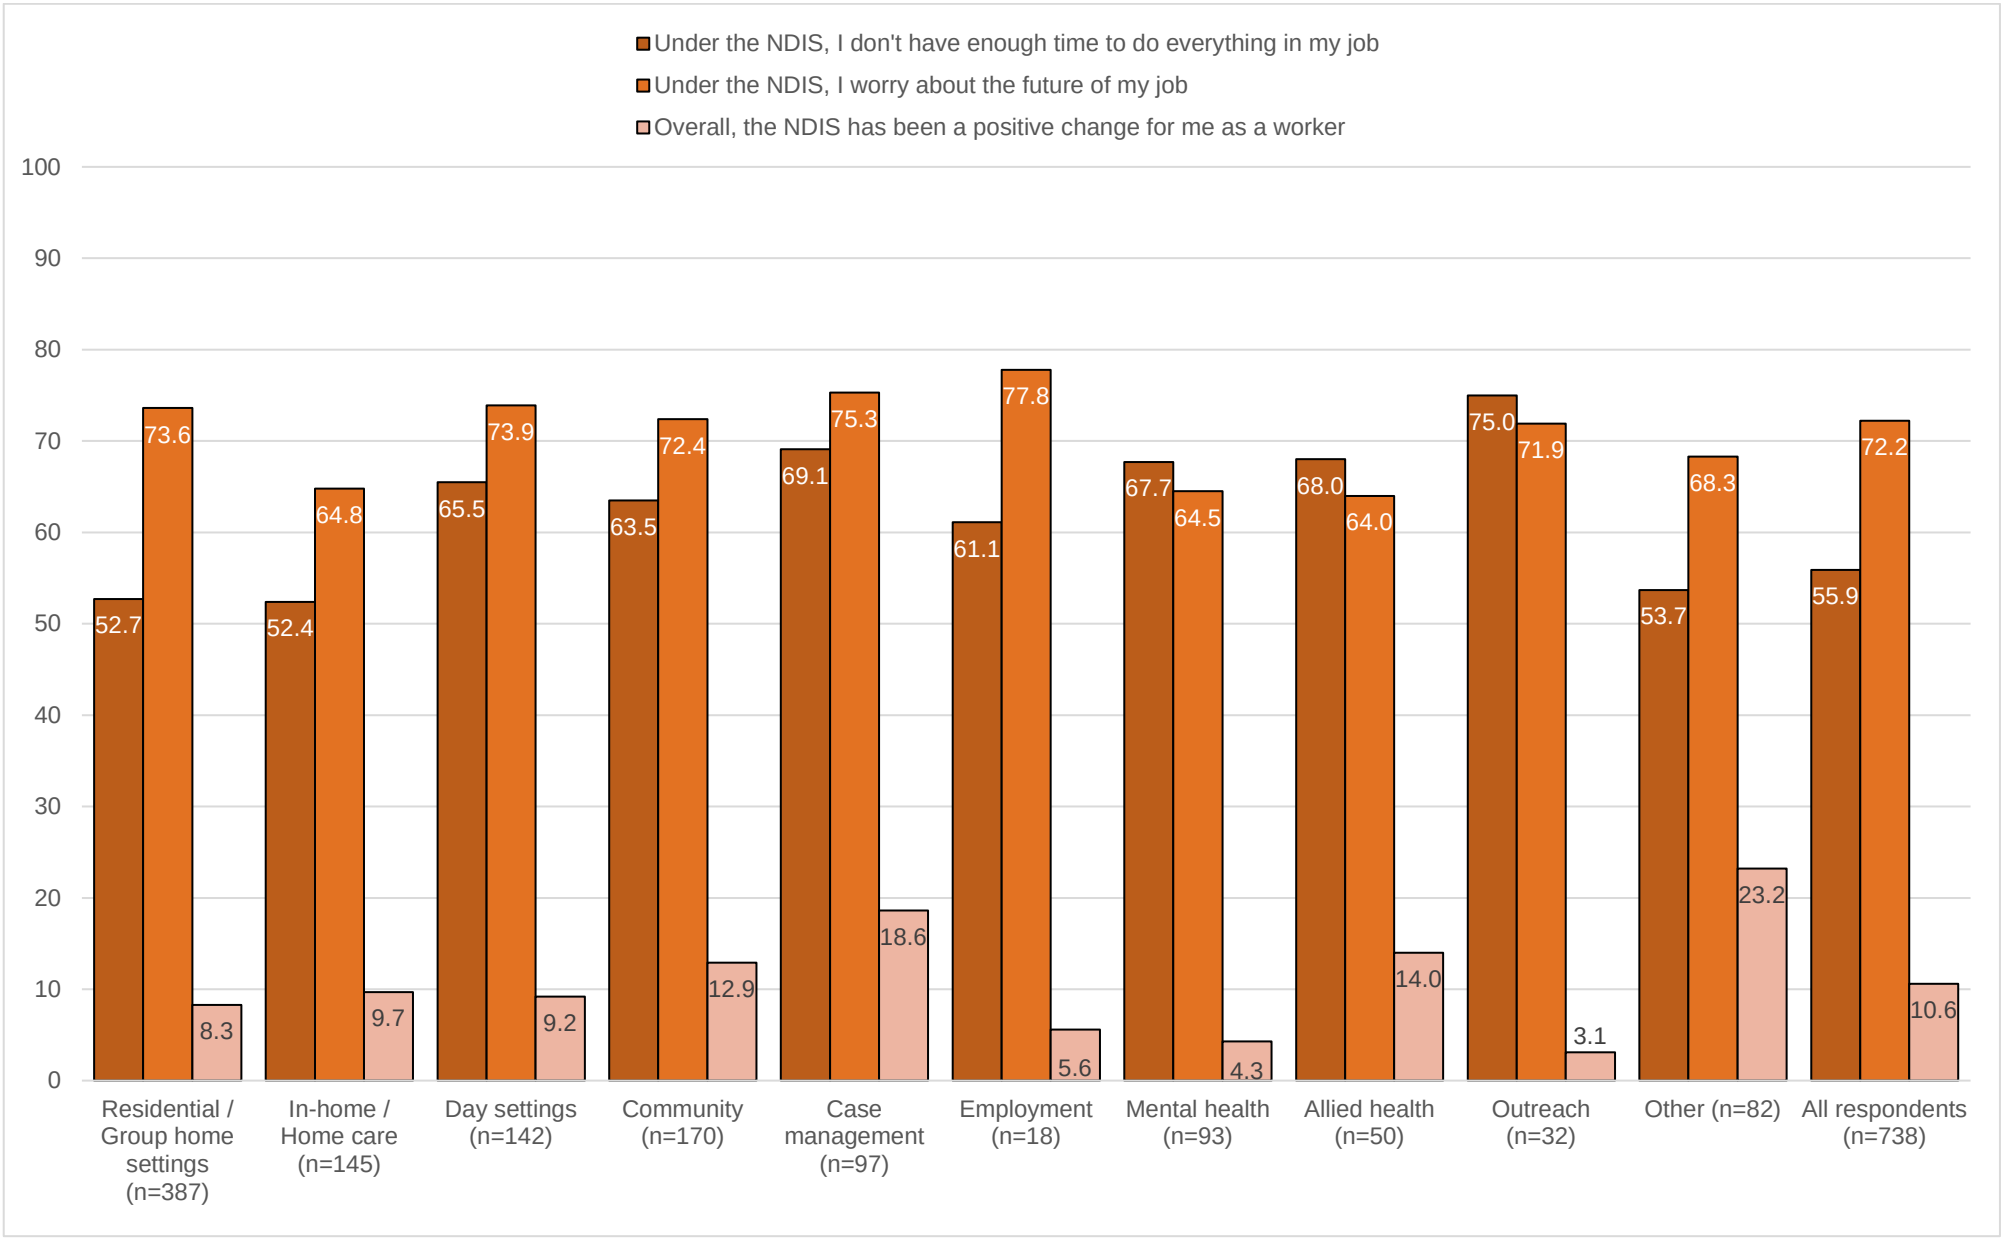

Figure 4.3 Proportion of respondents who agreed or strongly agreed with statements about working under the NDIS, by jurisdiction

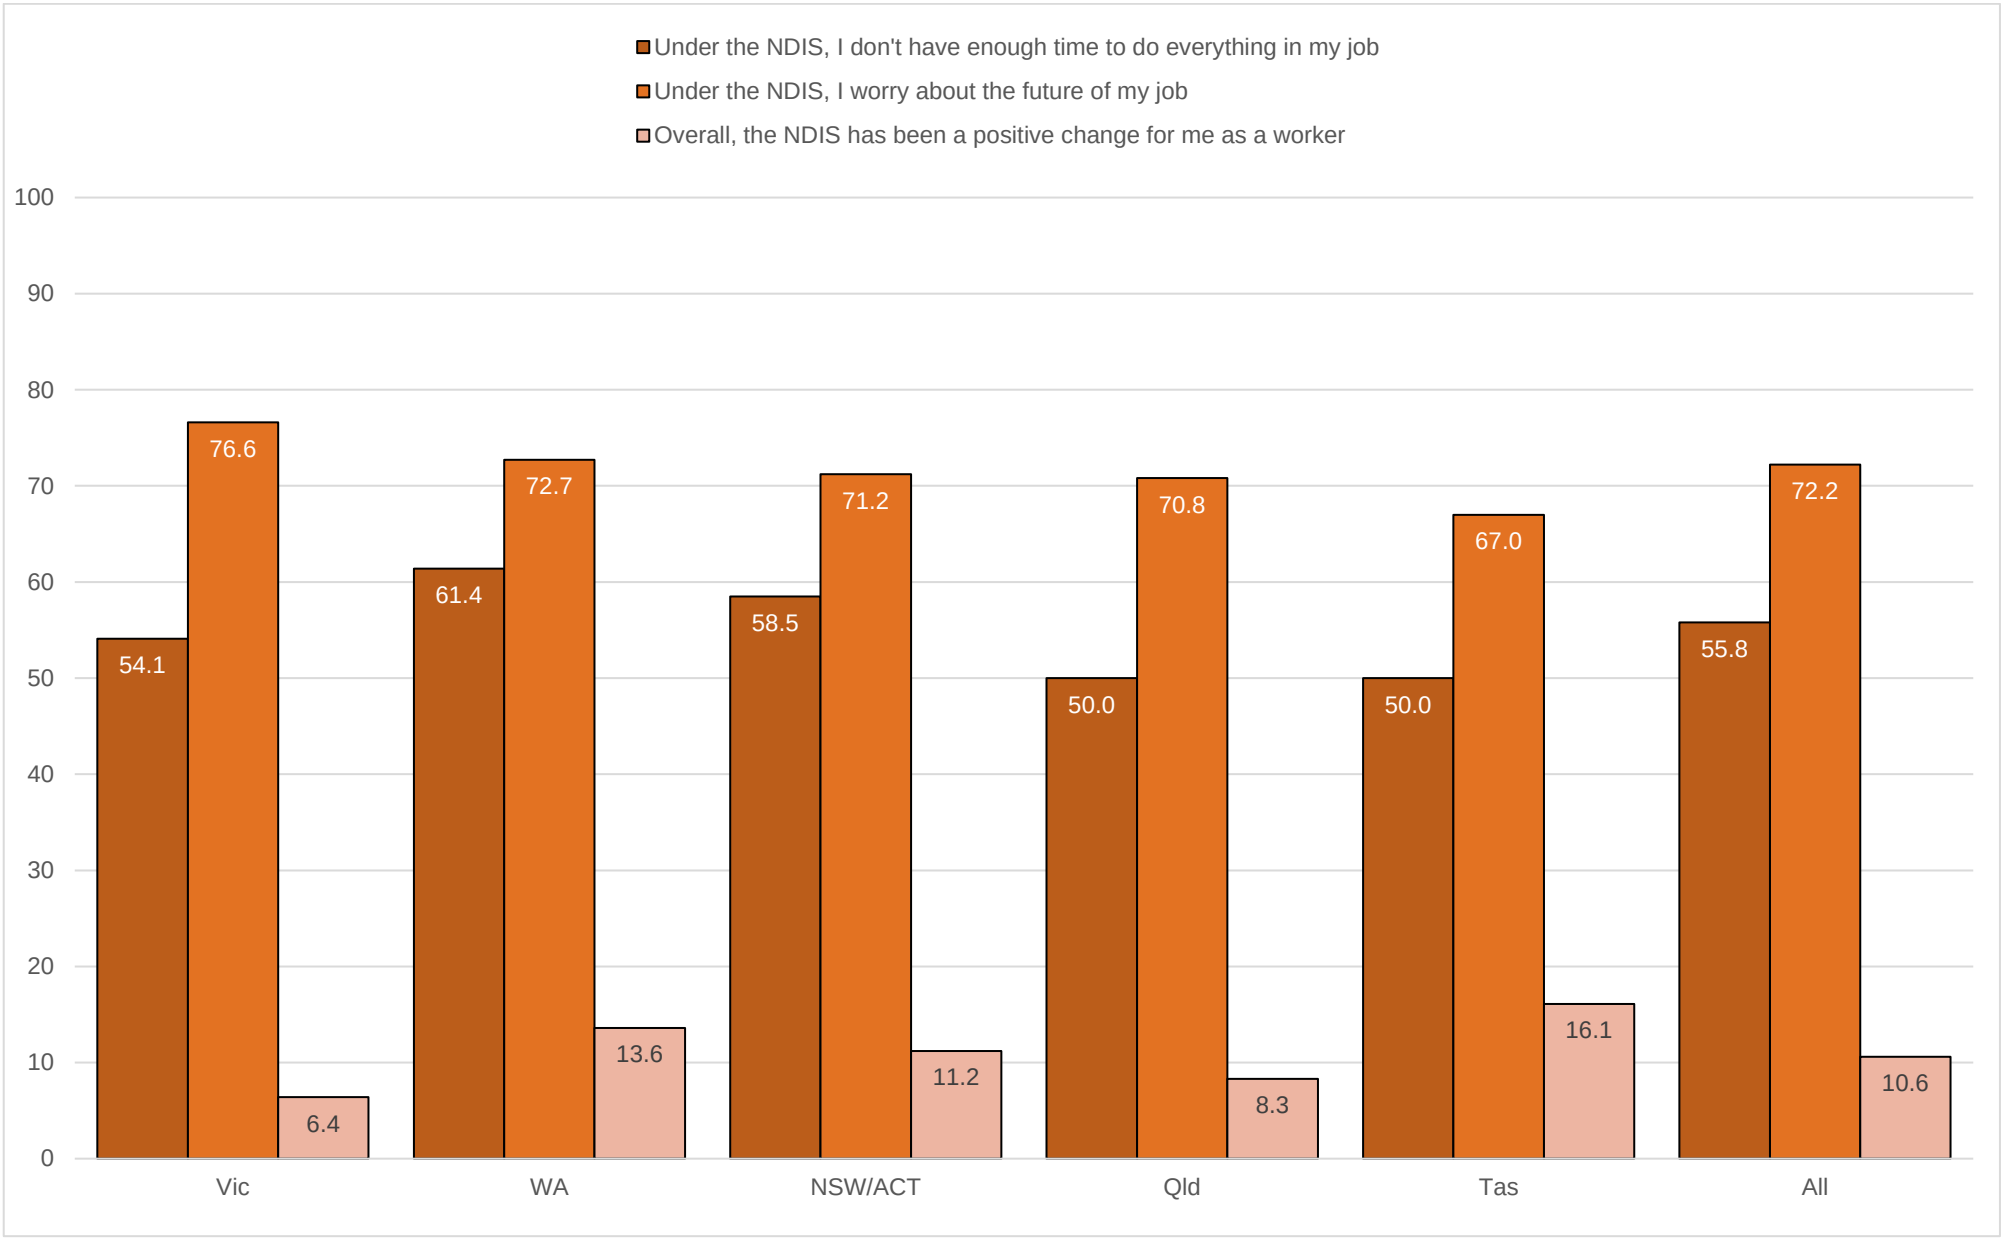

5. Perceptions of the impact of the NDIS on participants and families

As well as showing how workers widely perceive the NDIS to be impacting adversely on their working lives, the survey data also shows only a minority reported it was impacting positively on participants and families. Figure 5.1 shows only a quarter (24.7%) agreed or strongly agreed that the NDIS was positive for the participants they work with, and many more disagreed (37.8%). Similarly, only a minority agreed that families of participants were happy with the Scheme (14.6%) and 15.7% agreed that overall, the NDIS is better than the previous system.

Figure 5.1 Percentage of respondents which agreed with statements about impact of the NDIS

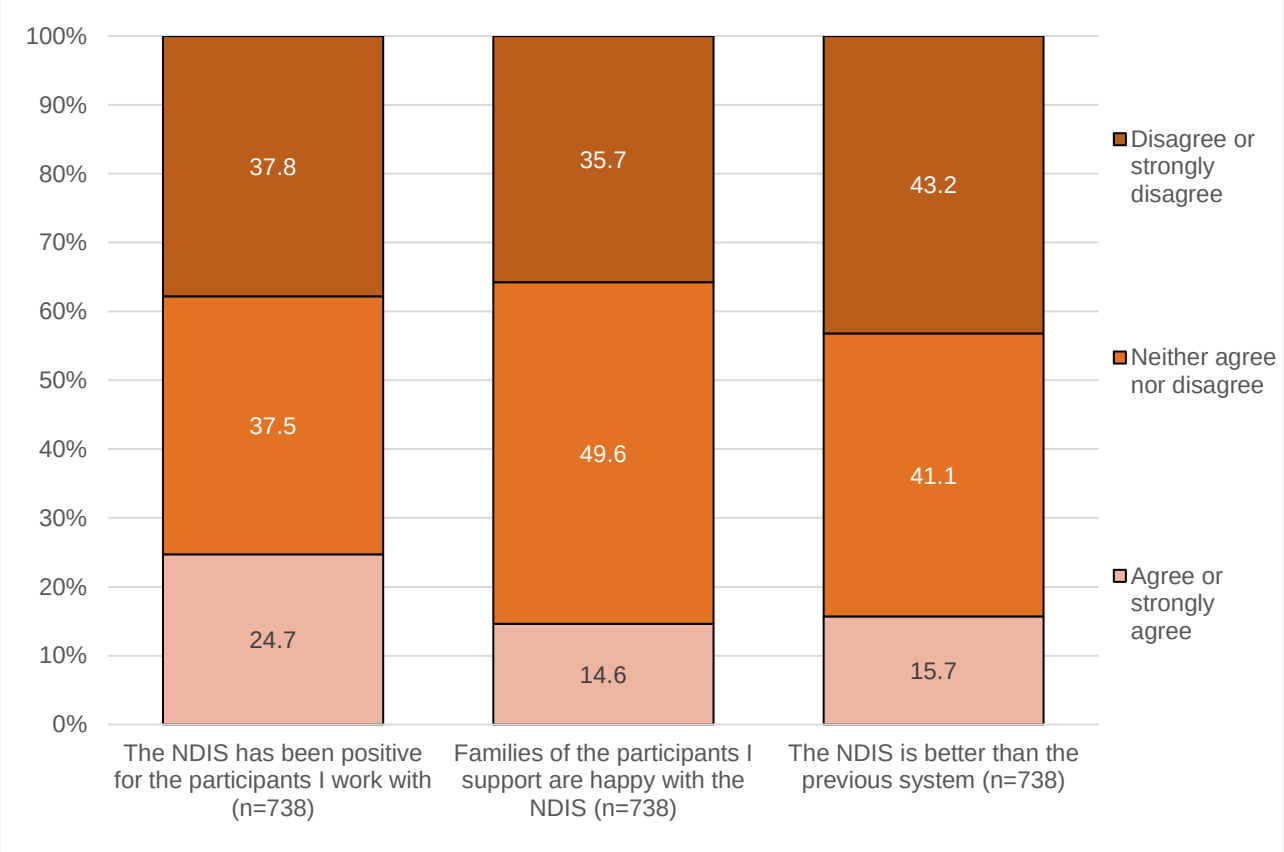

Figure 5.2 shows the proportion of respondents in each disability setting who agreed with the statements about the impact of the NDIS on participants and families. Among those in in-home, community, case management, allied health and 'other' settings, there were relatively high proportions of respondents who agreed the NDIS has been positive for participants, however, this remained a minority in all categories. Fewer agreed with the other statements, with variation by setting shown in Figure 5.2.

Figure 5.3 shows differences among respondents according to their jurisdiction of residence. Higher than average proportions of residents from Tasmania agreed with the statements, while agreement was lower for respondents from Victoria and Queensland.

Figure 5.2 Proportion of respondents which agreed or strongly agreed with statements about the impact of the NDIS on participants and families (%)

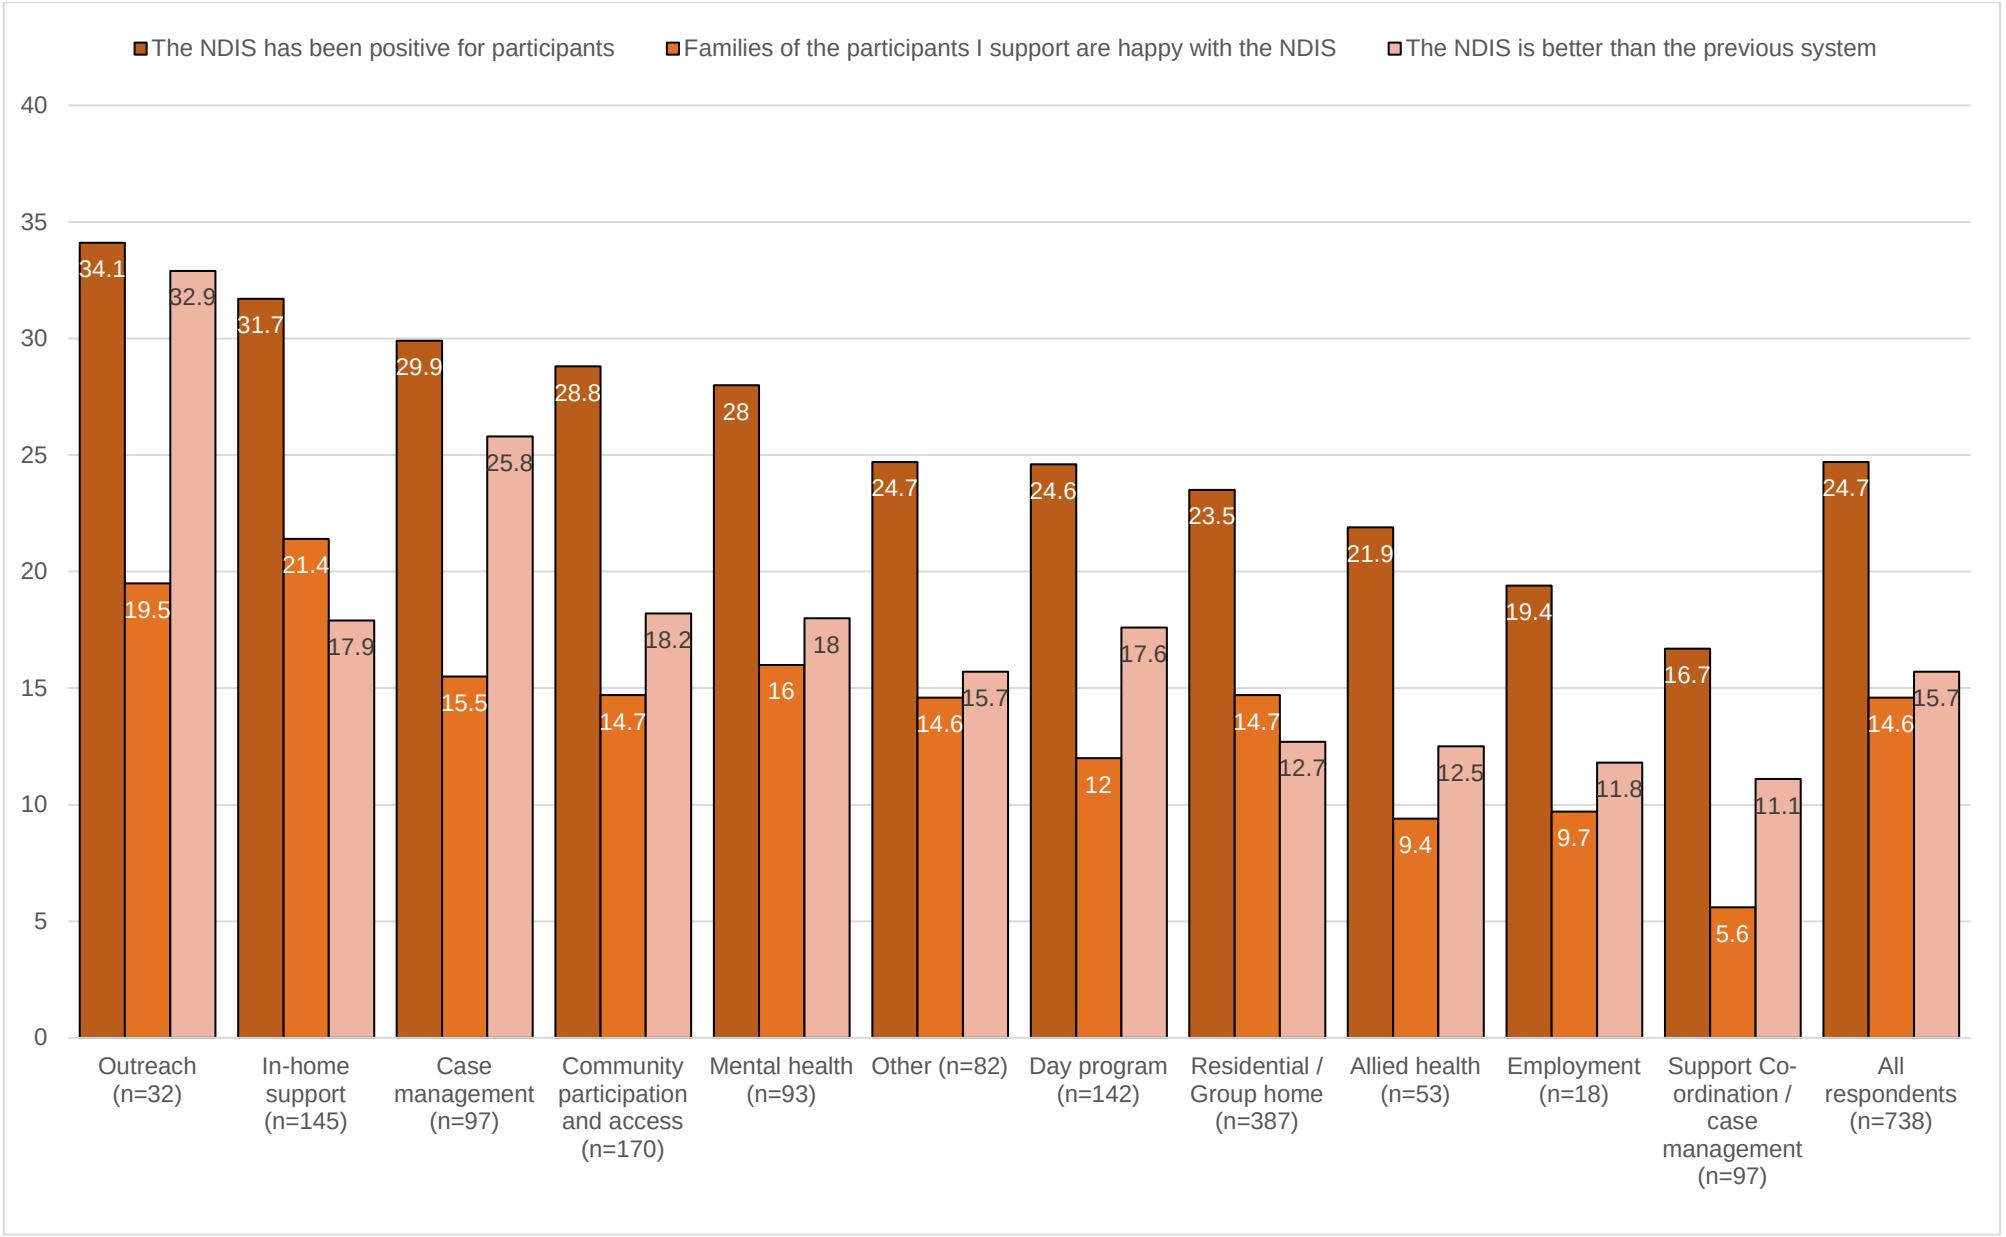

Figure 5.3 Proportion who agreed with statements, by jurisdiction of residence

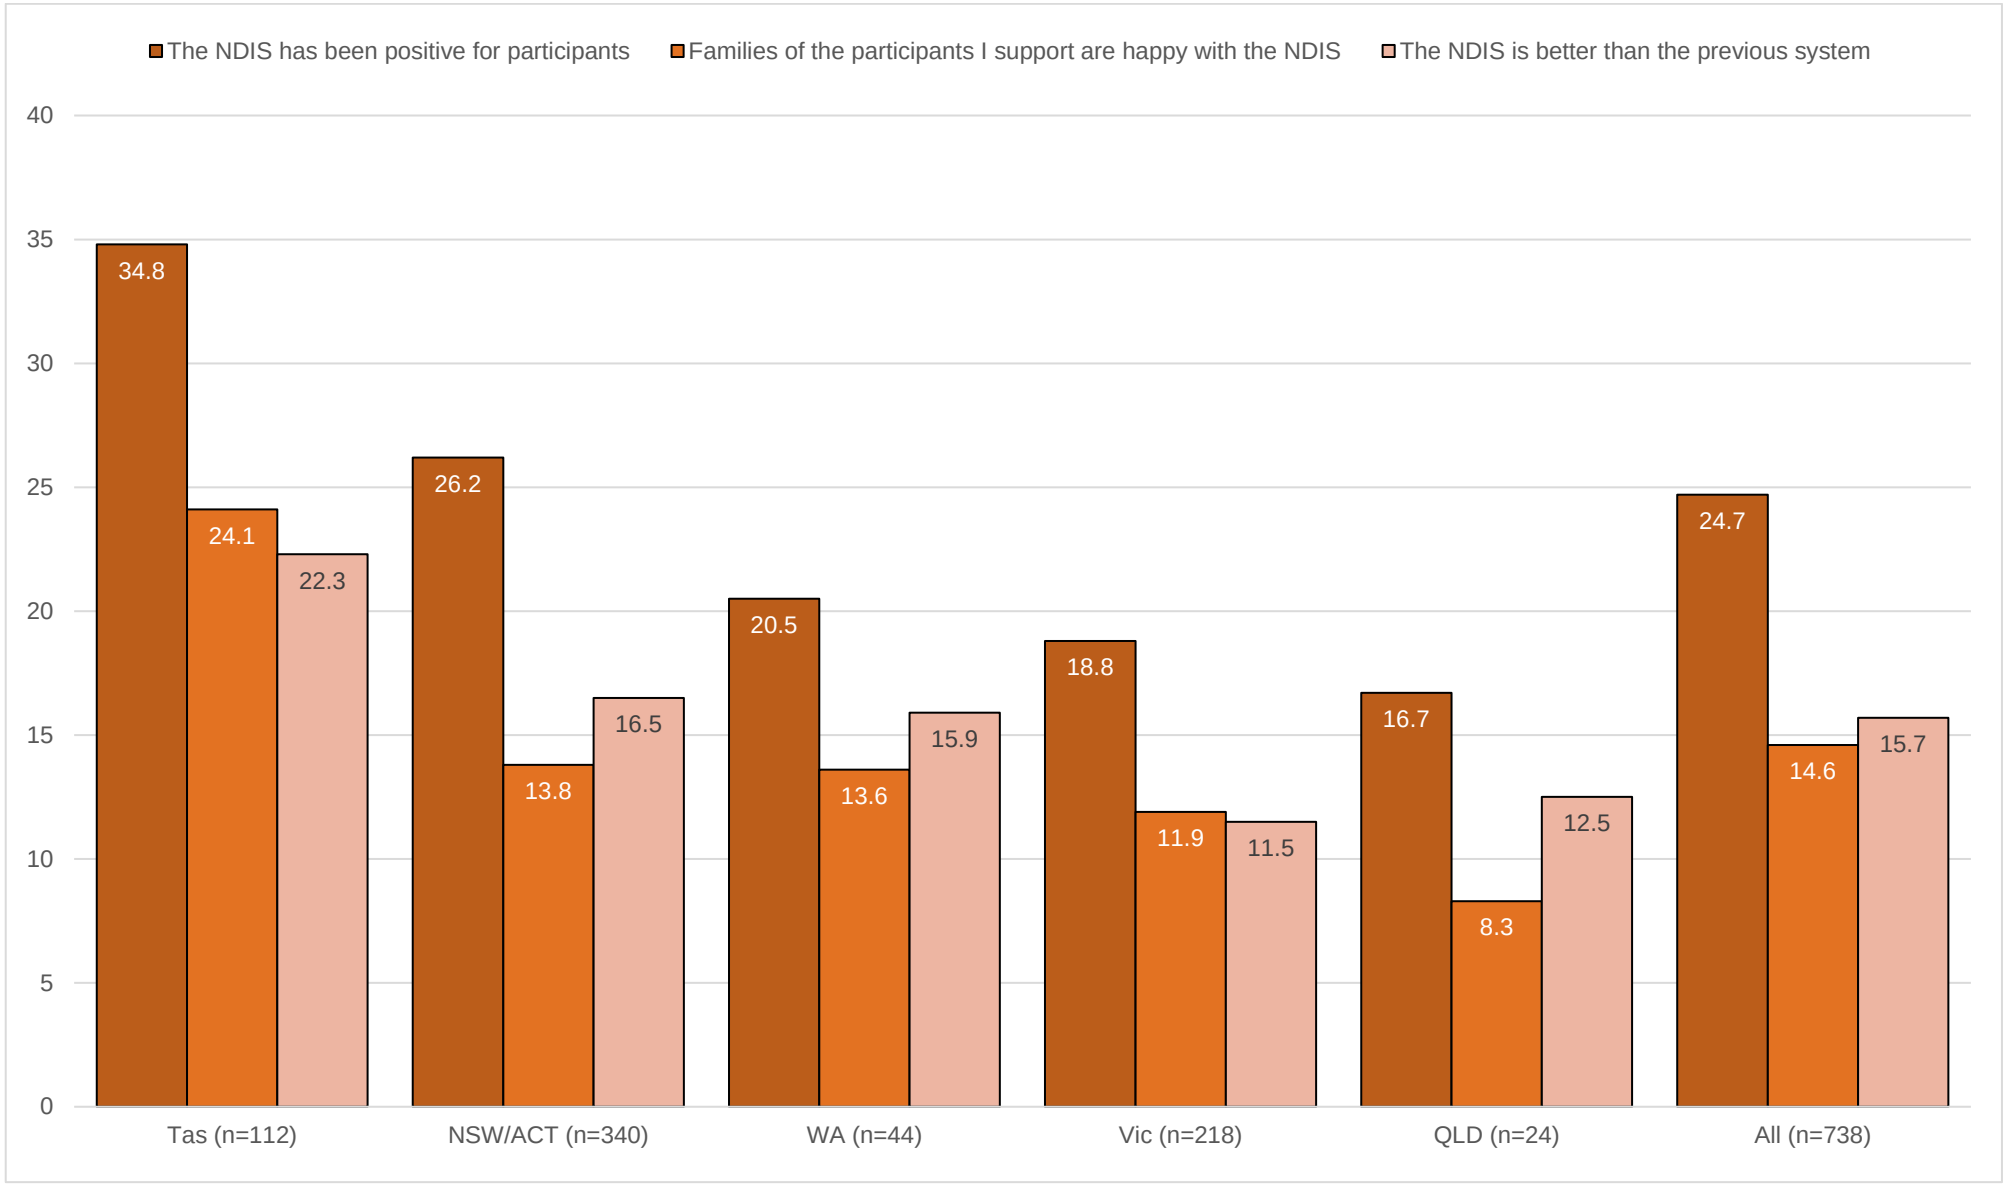

6. Intention to leave or remain in the disability sector

Respondents were asked "Do you intend to be working in the disability sector in five years' time?" Around half said they did intend to be working in the sector (51.5%), while 15.2% said they did not, and a third (33.3%) were unsure.

The main differences in intention to leave were according to age, with a smaller proportion of those aged 60 or over intending to work in disability in 5 years, presumably due to retirement (see Figure 6.1). Indeed, when those who reported they intended to leave were asked why, retirement was reported by 36.7%. Reflecting dissatisfaction with remuneration discussed in Section 3, 27.6% of those intending to leave said it was because they could get better pay and conditions doing work elsewhere. A further 13.1% pointed to the nature of the work, saying they would leave as the work was too difficult or risky, while 12.7% said they would leave due to limited career development opportunities. Smaller proportions were intending to leave because of the unsociable hours (5.9%).

The main reasons for staying were due to commitment to clients, with 60.7% reporting they intended to continue working in the disability sector as they were 'passionate about supporting people with disabilities' and a further 18.8% said because 'I enjoy the client contact'. 10.9% said they had the flexibility to meet personal and family commitments. A small minority (4.0%) said they receive good pay and conditions, 3.3% said it was the best job available, and 2.3% said they had good career development opportunities.

Figure 6.2 shows the proportion intending to remain in disability services, according to respondents' years of experience in disability, and whether or not they were working under the NDIS The proportion intending to stay was similar for staff working under the NDIS (52.2%) and those who were not (51.4%).

Figure 6.1 Proportion who intend to work in disability services in 5 years, by age group

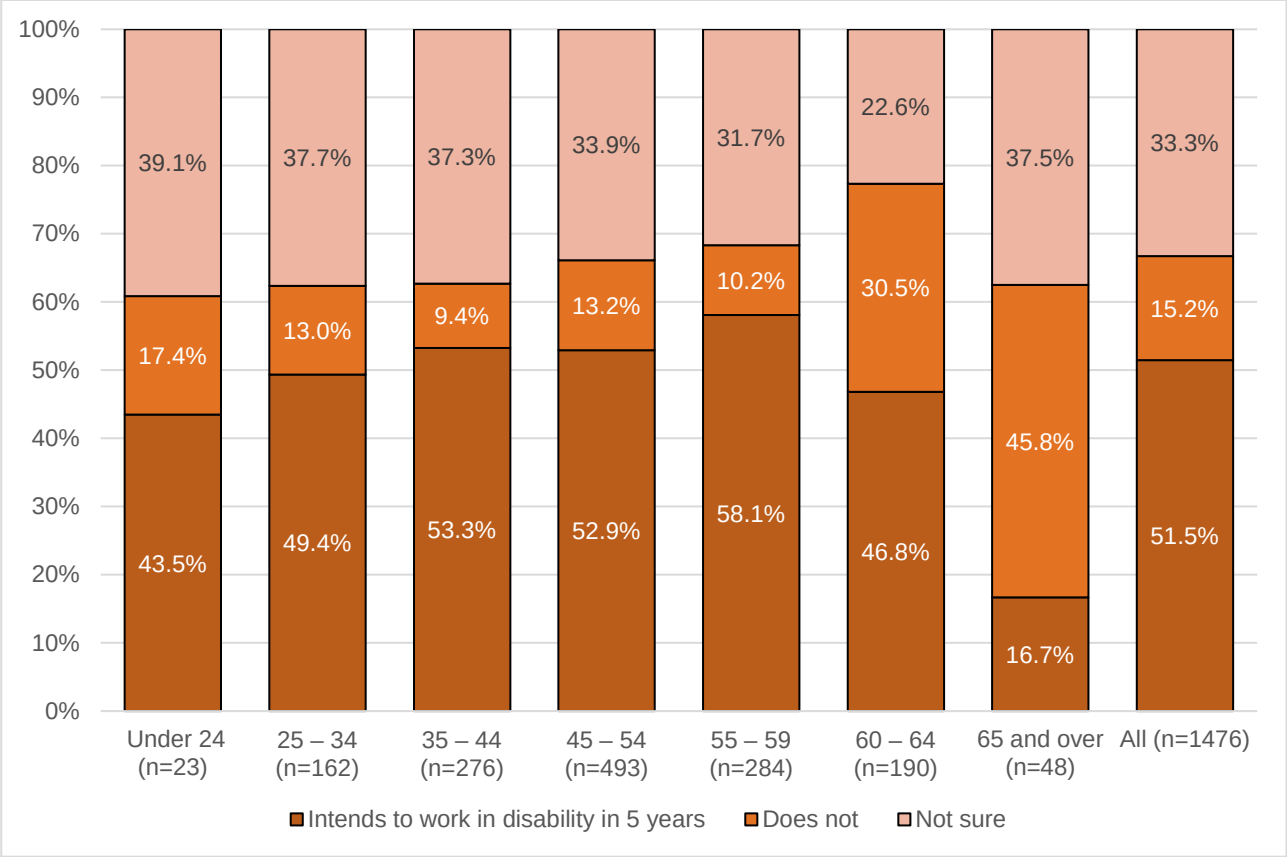

Figure 6.2 Proportion of respondents intending to be working in the disability sector in five years time, by years of experience in disability services and whether they were working under the NDIS

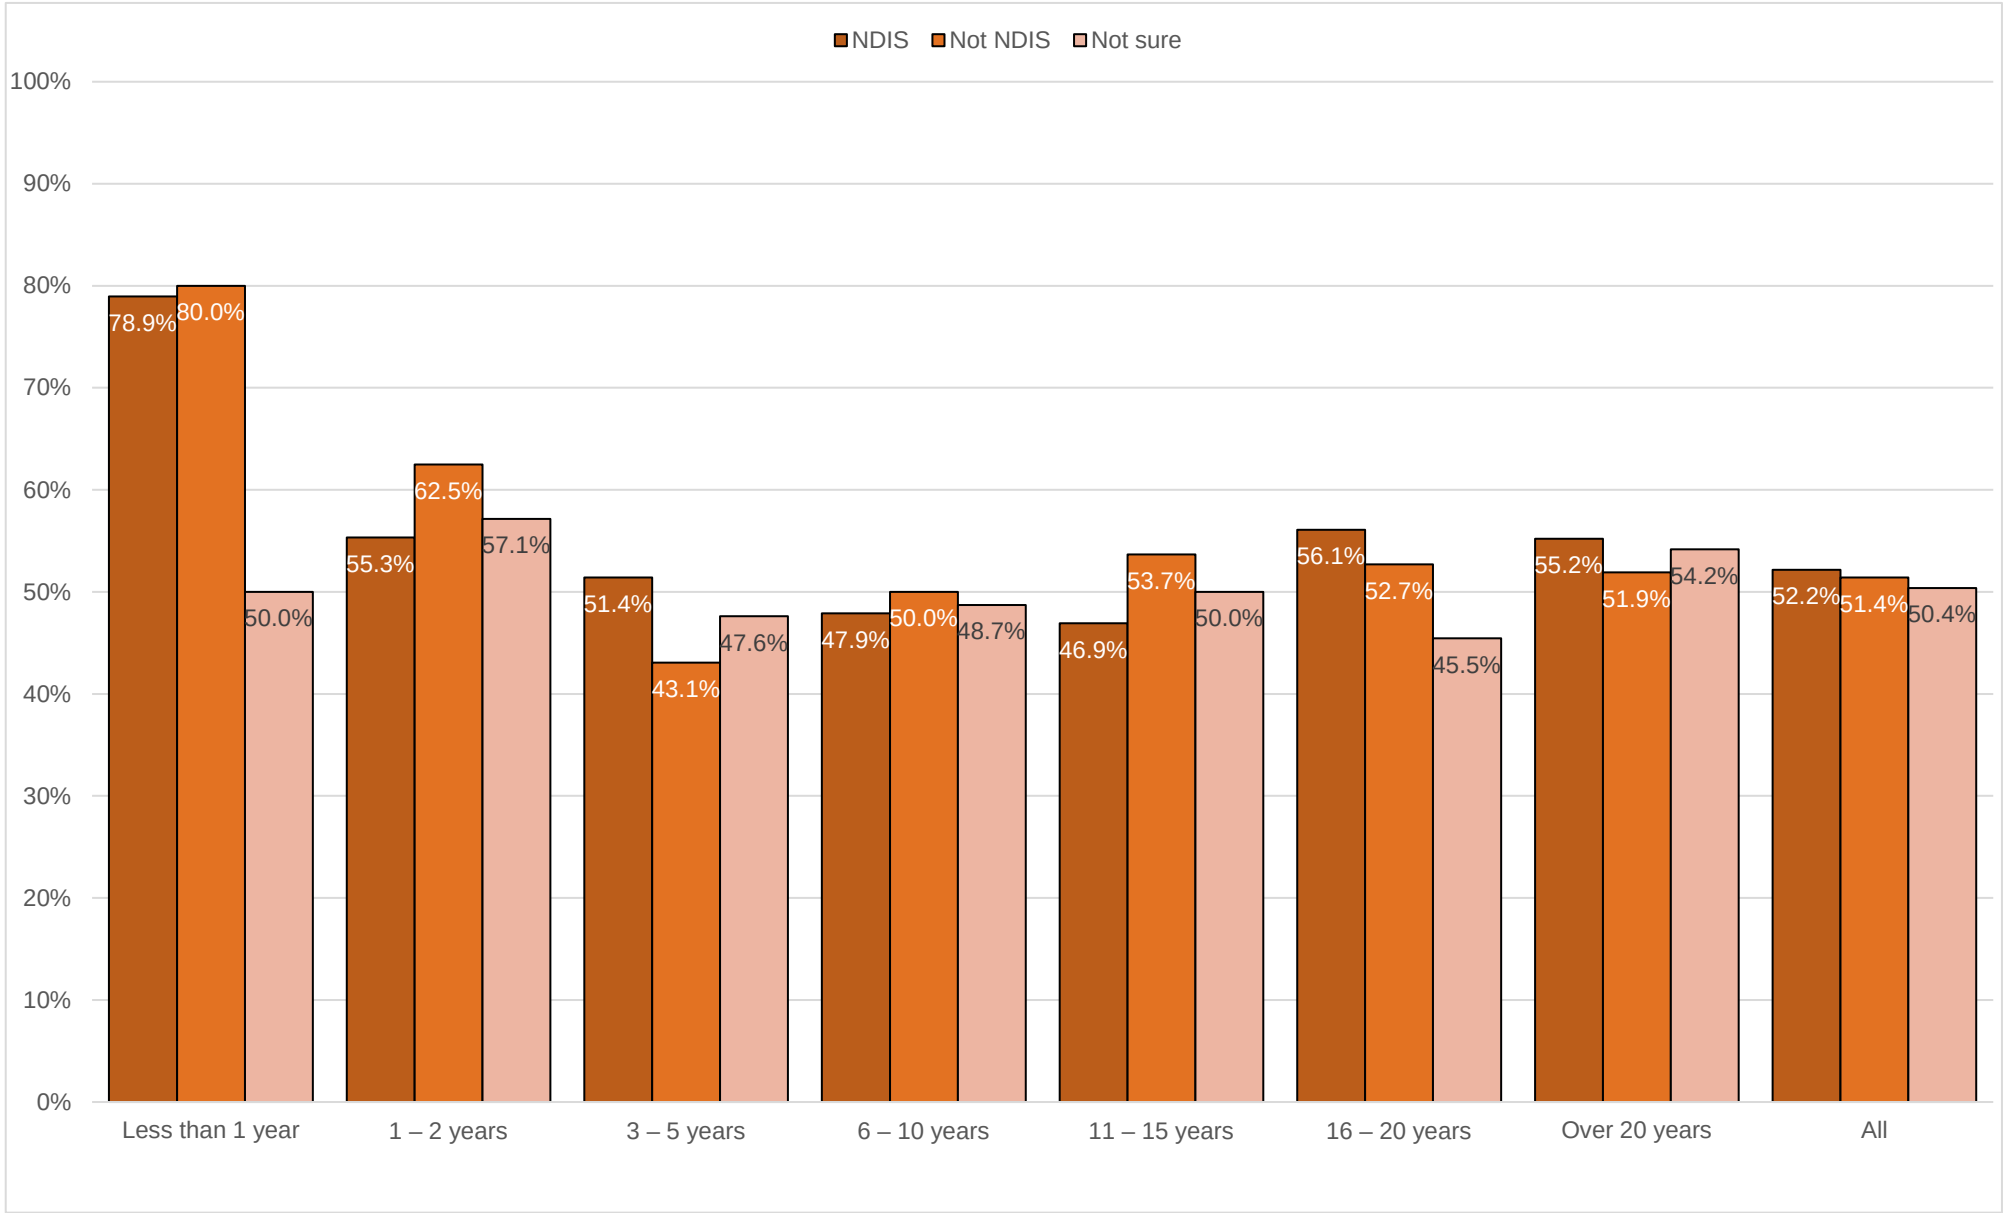


7. A closer look at supervision

As shown in Section 2.3, 28.5% of respondents said they currently supervise other staff, while about the same number (27.3%) did so sometimes. These supervisors (including those who always and sometimes supervised other staff) were asked further questions about the nature of their supervisory responsibilities, including how many people they supervised, and whether they experienced any challenges in providing proper supervision due to lack of time and the number of people they were supervising.

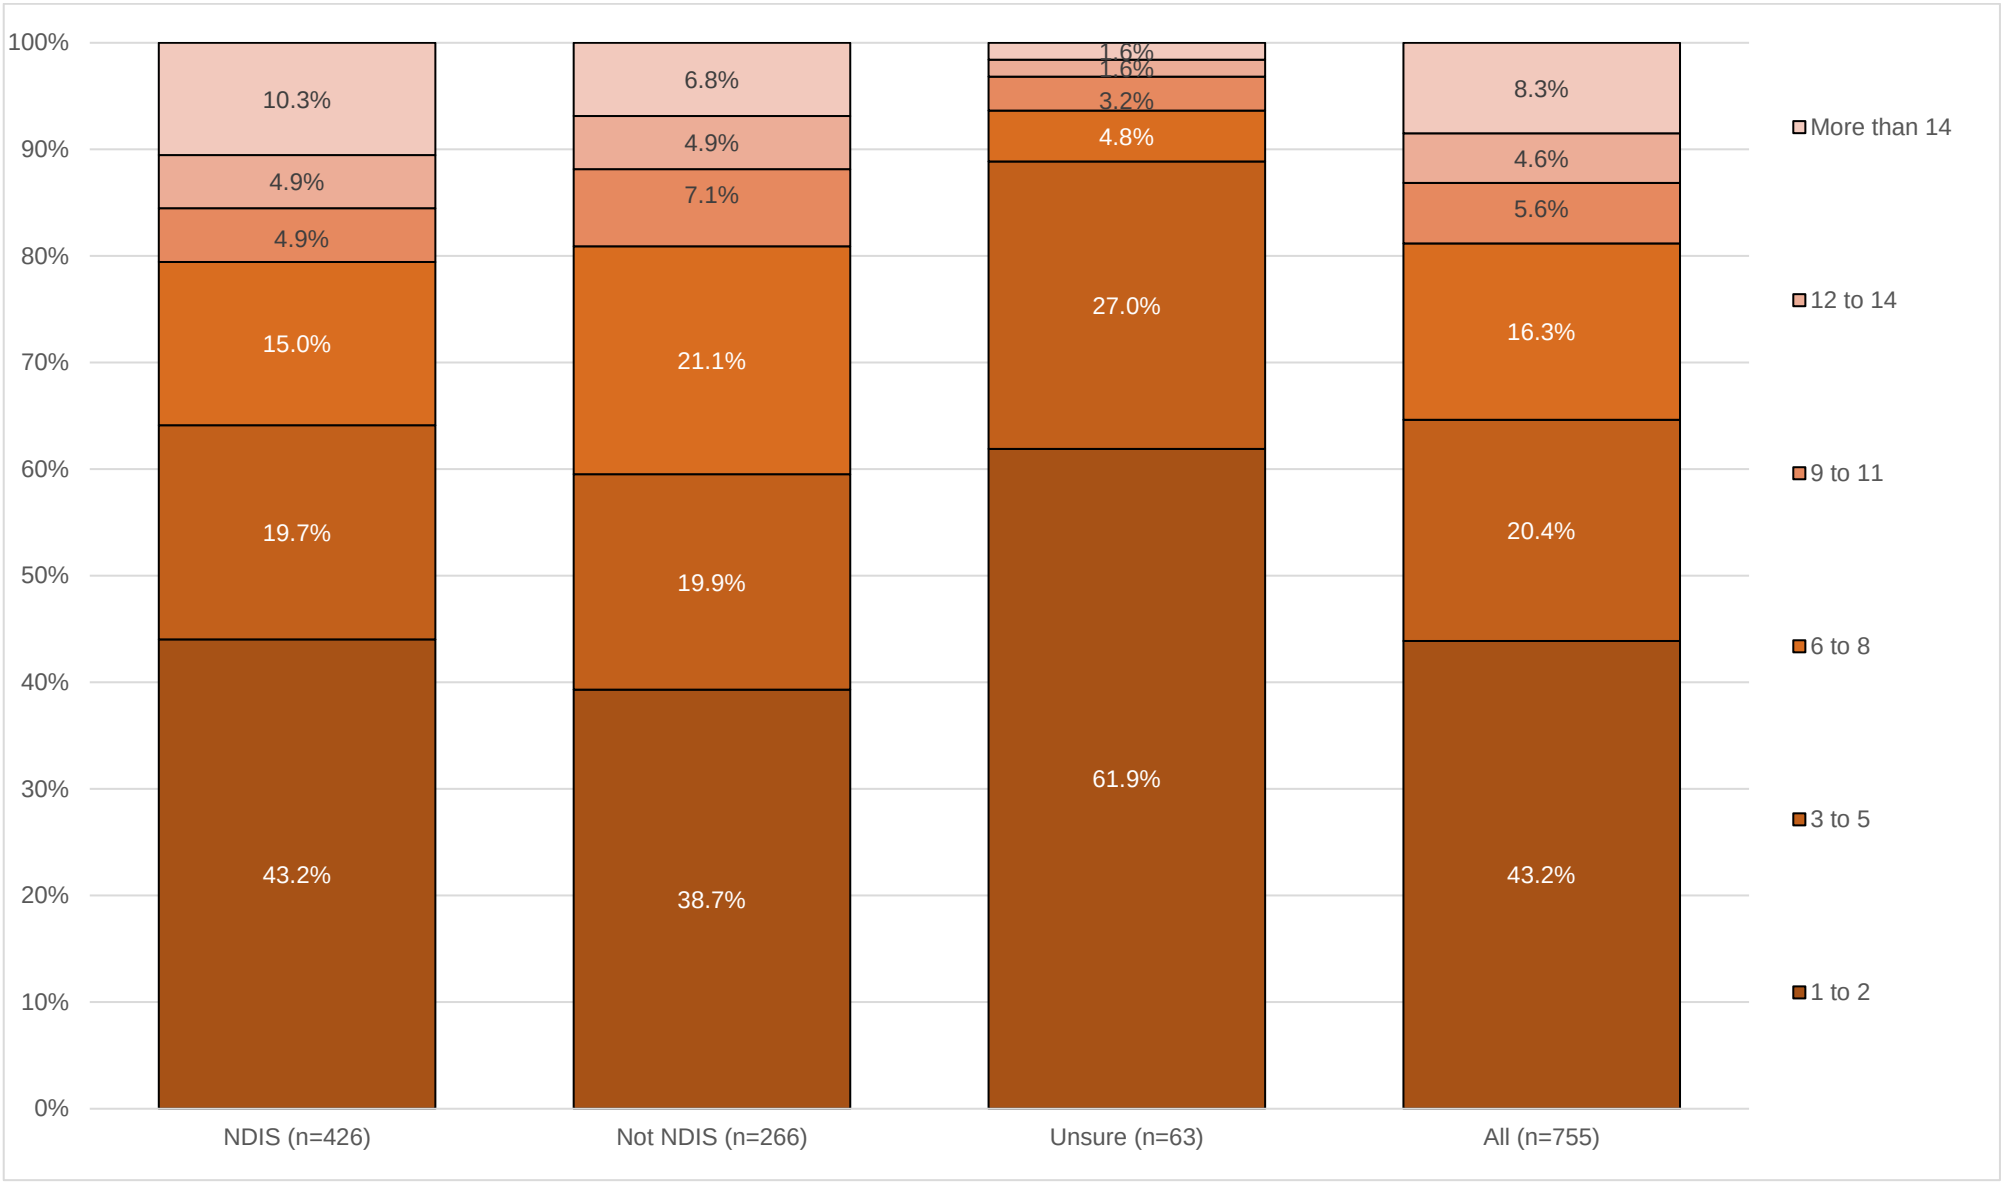
7.1 Numbers of staff supervised

The numbers of subordinates reported by supervisors working under the NDIS, and those who were not, is shown in Figure 7.1 (including information for those who 'sometimes' provided supervision). Overall, most supervisors reported only a few subordinates: 43.2% supervised one or two staff, and a further 20.4% supervised 3 to 5 staff. For this group, only 8.3% of supervisors supervised more than 14 staff[4]. However, this was higher for those under the NDIS, 10.3% of supervisors had more than 14 supervisees, compared with 6.8% of those not working under the NDIS.

Figure 7.2 provides the same indicators but excludes those who reported 'sometimes' supervising other staff. This allows a focus on the numbers of subordinates supervised by staff whose roles consistently involved supervision. For this group, 20.0% of those who worked under the NDIS supervised more than 14 staff, compared with 12.0% of those not under the NDIS.

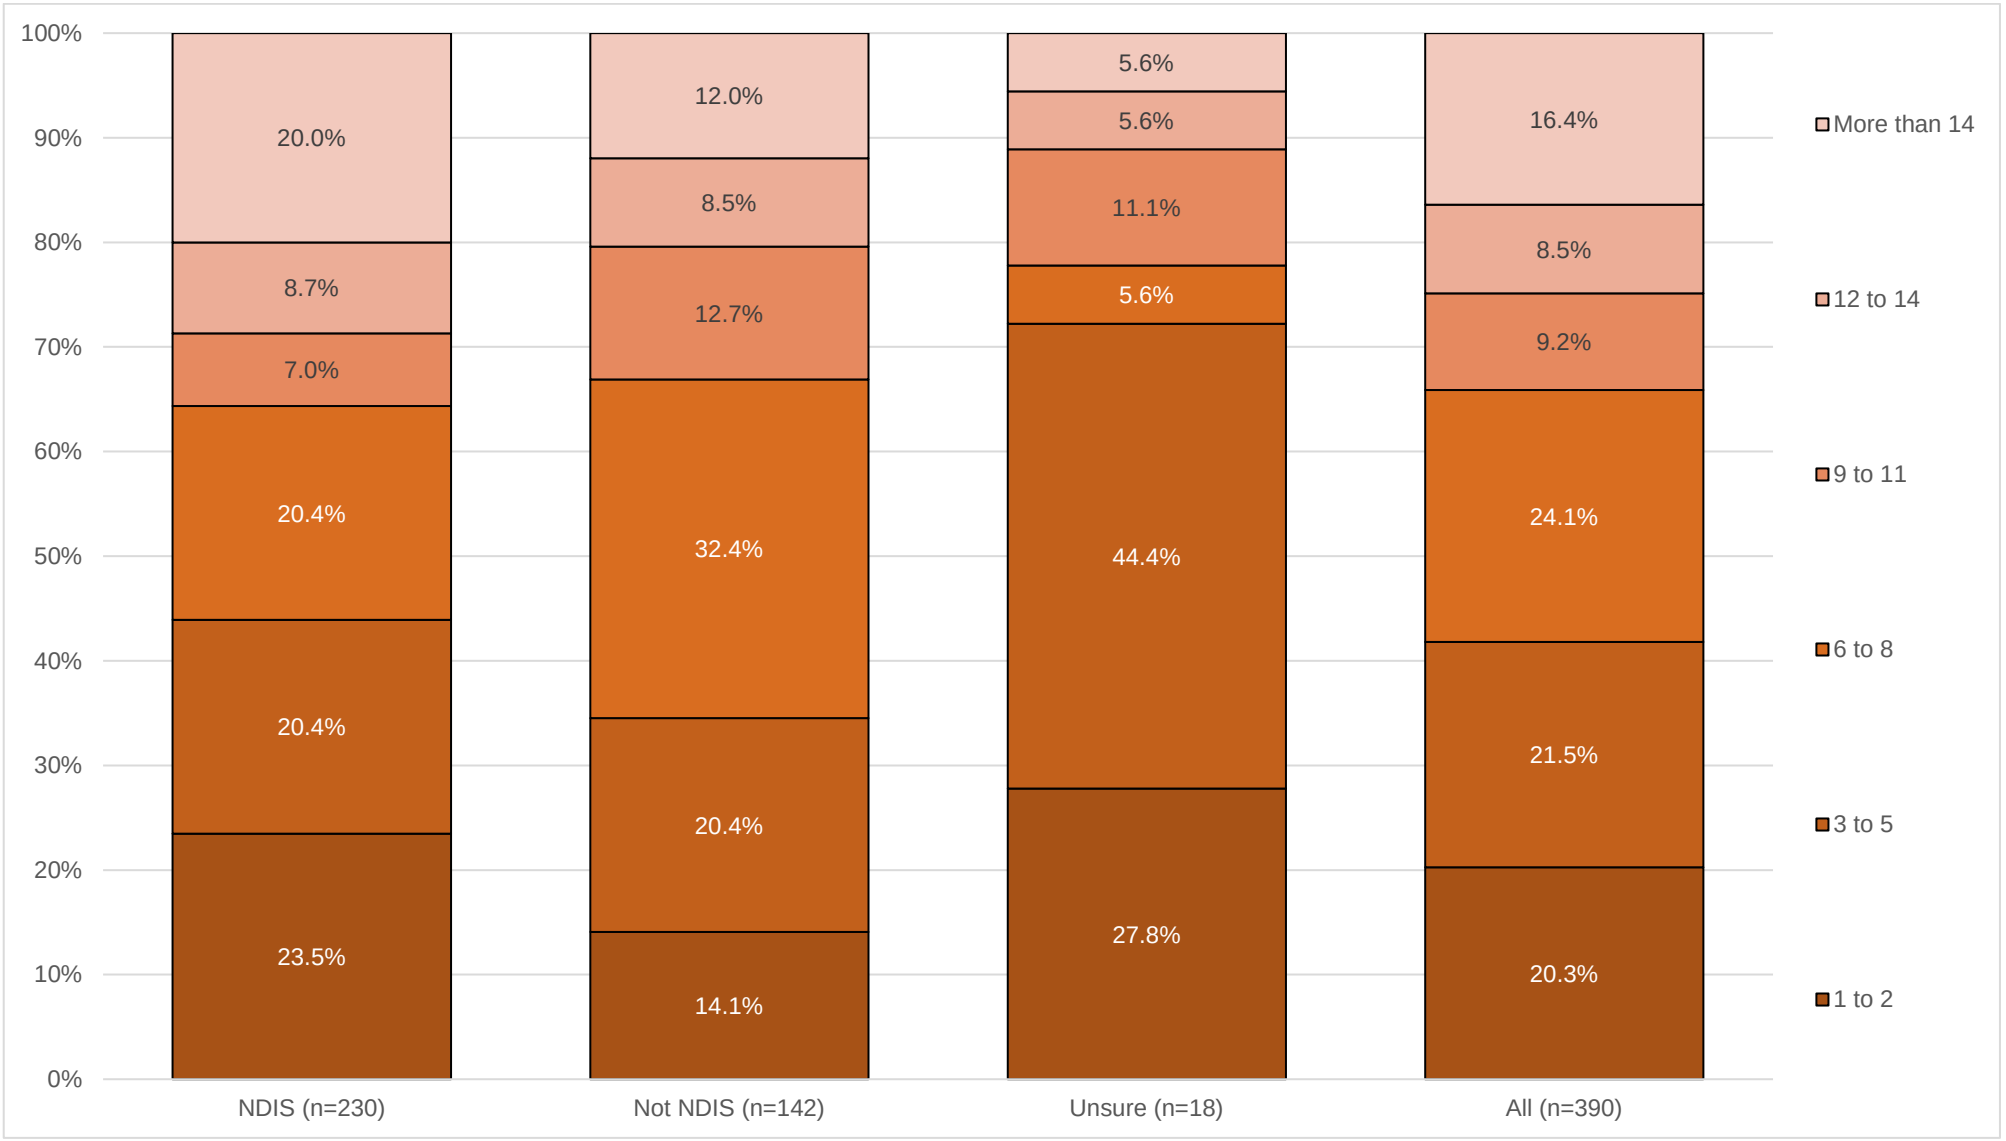
[4] Supervision of more than 14 staff is of interest because the National Disability Insurance Agency's pricing model assumes supervisors directly supervise 15 staff, and provides resources accordingly. See NDIA (2014) NDIA report on the methodology of the efficient price: National Disability Insurance Agency.

Figure 7.1 Number of staff directly supervised, by whether or not respondent was working under the NDIS, all supervisors^ (%)



^NB: This includes supervisors who always or sometimes provided supervision.

Figure 7.2 Number of staff directly supervised, by whether or not respondent was working under NDIS, supervisors^ (%)



^NB: This includes supervisors who always provided supervision only (ie those who sometimes provided supervision are excluded).

7.2 Pressure on supervision

The data shows that supervisors who directly supervise large numbers of staff experience difficulties in providing proper supervision. As shown in Figure 7.3, the proportion of supervisors who agreed that they can't provide proper supervision due to lack of time increased with the number of staff directly supervised. Among those supervising only 1 or 2 staff, 16.7% strongly agreed with the statement, and a further 38.5% agreed. Among those supervising more than 14 staff, many more strongly agreed or agreed: 38.7% and 45.3% respectively. Figure 7.4 shows that similarly, the proportion of supervisors who agreed or strongly agreed with the statement "I can't provide proper supervision because I have too many people to supervise" increased according to the number of supervisees. Well over half of those supervising over 14 staff (58.7%) agreed with the statement. Figure 7.5 and Figure 7.6 shows differences in agreement with the statements according to disability setting. On both measures, higher proportions of supervisors in day, residential and case management settings tended to agree.

Figure 7.3 Agreement with the statement "I can't provide proper supervision due to lack of time", by number of staff directly supervised (n=382)

8. Logistic regression

8.1 Understanding the factors affecting impact of the NDIS on participants

To better understand the factors affecting whether or not respondents perceived the NDIS to be positive for participants, multivariate analysis (logistic regression) was used. Logistic regression allows exploration of associations that multiple variables have on a binary categorical (non-numerical) outcome variable. In this case the outcome variable was a binary indicator distinguishing whether respondents agreed (or strongly agreed) with the statement "The NDIS has been positive for the participants I work with" (coded as 1), as opposed to those which did not agree with the statement (coded as 0).

8.2 About the model

The model includes control variables to account for the effects of worker demographics, disability setting, and working conditions, each of which could influence perceptions of the impact of the NDIS on participants. Binary indicators were included to control for the effect of gender, and working in NSW and Tasmania (as higher proportions of respondents in these areas reported the NDIS was positive). It also controlled for disability setting, whether respondents had worked in disability services for less than 2 years, or more than 10 years, and whether the respondent worked for more than one disability provider.

Working conditions were captured with a binary measure of pay justice, job security, time pressure, and capacity to provide quality supervision. Pay justice was constructed as a binary measure which grouped together (and coded as 1) those who agreed (or strongly agreed) with both the statements about pay "I am paid fairly for the work that I do" and "I am satisfied with my overall level of take-home pay". Those who did not agree with both measures were treated as not perceiving pay to be just (and coded as 0). To capture job security, a measure was constructed capturing those who agreed with the statement "Under the NDIS, I worry about the future of my job" compared with those who did not. Similarly, time pressure was captured with those who agreed with the statement "I don't have enough time to do everything in my job" coded as 1 (and the remainder coded as 0). A measure of quality supervision was constructed. Those who disagreed with the statement "I can't provide proper supervision due to lack of time" and "I can't provide proper supervision because I have too many people to supervise" were considered to provide quality supervision, and coded as 1.

8.3 Results

Results (odds ratios) are in Figure 8.1. Odds ratios greater than 1 (and which were statistically significant) indicate the factor was associated with increased odds of reporting the NDIS was positive, while those lower than 1 predict lower odds of doing so. The results show that three factors predict whether or not respondents perceived the NDIS to be positive for participants: state, pay justice, and job security. In particular:

- Residing in NSW and Tasmania were associated with increased odds ratios (of 2.7 and 2.5 times, respectively).

- Perceptions of pay justice also more than doubled the odds of perceiving the NDIS to be positive for participants, with odds ratios of more than 2.4 times.

Poor job security was associated with lower odds of reporting the NDIS had a positive impact on participants:

- Worrying about the future of one's job lowered the odds of reporting the NDIS was positive for participants (Odds Ratio=0.3).

Figure 8.1 Odds ratios: Employees who agreed with the statement "The NDIS is positive for the participants I work with"

9. Comments and concerns about working in the disability sector

Respondents were asked if they had any comments or concerns about their work in the disability sector and / or the NDIS. Overwhelmingly, respondents used the opportunity to comment: 913 workers provided comments (60.0%). The themes below reflect areas of concern. Note that each quote comes from a different person, with quotes selected to exemplify key themes expressed from the group as a whole.

9.1 General concerns about the NDIS

Respondents expressed significant concerns about the working in the disability sector and under the NDIS. Several respondents expressed confusion about the NDIS and the process of change, for example:

> The organisation I'm with are not providing informing us what we employees should be doing to prepare for the roll out in our region, not sure they know what they are doing.

> Everyone feels that they are in the dark about the NDIS, no one knows what's happening, or where they will be standing in the future, whether our jobs or pay will be secure, who knows, because no one is telling us anything

As well as reflecting uncertainty about the process of change, respondents' comments provide insight into the range of adverse impacts workers see the NDIS to have on the quality of services and the quality of jobs. Some explained that although they agreed with the principles of the NDIS, the Scheme did not appear to be implemented in positive ways, as financial considerations were eclipsing the needs of clients. Many expressed concerns about the resource model. They saw funding levels for people with disability to be inadequate, which raised concerns about clients' ongoing and future capacity to purchase the quality and quantity of services required. Examples of this sentiment are in the following statements:

> I fear it is mostly a cost saving scheme for the government. Theoretically it should work well, but at the moment it appears to be underfunded.

> I am concerned that people will not receive adequate packages. I work in respite and there appears to be questionable future funding for this service.

> The NDIS has turned an industry which use to be about caring and nurturing into an industry which only cares about profit for the provider.

Concerns about resourcing of the NDIS centred on the impact on people with disability. One respondent explained:

> The funding for the NDIS needs to meet the needs of people with disabilities. The government needs to take a reality check and they need to remember that they are dealing with the lives of very vulnerable people. If the NDIS is funded correctly it will

> be a fantastic step forward if the funding is not there then people with disabilities will have to take a giant step backward to time before deinstitutionalisation!!!
>
> Many of my clients have wondered why they have to change and what are their choices if they don't go with the NDIS? Many of my clients cannot read or write or are very limited, they have no family and the NDIS was not designed for these types of clients. The NDIS should have been more carefully worked through but all clients have been lumped in the one boat. Many have been very stressed about the change and all that goes with it. They feel they have no choice but to go along with it.

As well as being concerned about the impact of the NDIS on people with disability, workers also expressed concerns about the impact on family members:

> People with high support needs will get less hours of support. There will be pressure for the mothers of people with disabilities in particular to look after their son or daughter for more hours.
>
> I am concerned about vulnerable families and how they will be able to articulate their needs and negotiate the system. Both staff and participants are very confused about how the NDIS will work.

Another respondent, working in a community participation / community access setting, also focused on the impact of the NDIS on parents of children with disability, and described their frustration at discovering plans were unsuitable for meeting their children's needs:

> The NDIS is the worst thing this country has done. I am constantly on the phone with parents, crying out of frustration as they feel that they have lost support, have nowhere to turn for help and basically do not totally understand the scheme as it stands. I have had one parent at the edge of totally giving up and was so concerned with his state of mind that he was referred onto support for himself. The amount of times I have heard families say, "I am so tired of fighting for my child". We have that many families who have appealed their plans as Local Area Coordinators and Planners have been employed with minimal or no experience in the disability sector. How can families receive a plan that suits their needs when the person who is supposed to be guiding them through the process has so little experience?

Other workers also expressed concerns about the quality of the planning process, pointing out how planning was conducted without ensuring support for participants, and without a face to face meeting:

> I feel that anyone changing to the NDIS needs support while being interviewed on the phone. There is no face to face meetings and the people doing the interviewing know nothing about the person being interviewed. This can be very misleading if the person being interviewed does not give a full history of their situation.

Another respondent outlined how the NDIS was reproducing inequalities, as people with disability who had strong family advocates had better access to Scheme resources:

> I have concerns about families not receiving the support they need to navigate the 'system'. From accounts with numerous families I have learned that NDIA support/funding is more likely to be received by families who 'jump up and down', which indicates to me that it is a reactive, not proactive system. For such an amazing concept, I think it is really important for access to the NDIA to provide equality, otherwise the same inequalities that have always been in the disability sector will continue to occur.

Several workers commented that the NDIS was failing particular groups of people with disability, in particular by failing to recognise the complexity of need. As one explained:

> NDIS has been created with a particular set of disabilities in mind, or at least as a priority, but in the case of intellectual disability there is not enough consideration given to the complexities of supporting those with complex care needs. Where participants are unable to self-manage or advocate strongly for themselves, supervisory staff are not being given the resources to properly provide choices and to collect the evidence that quality services are being delivered. What was sold as an opportunity to address the inequalities inherent in the block-funded arrangements has instead delivered a cost-cutting exercise; whether through accident or design, the lofty ideals of the NDIS are not being going to be achieved for a great many participants unless the paucity of funding to provide the best outcomes is rectified.

As well as people with intellectual disabilities, workers also noted the difficulty of engaging with the NDIS for people with mental health or psychiatric needs, older clients, people who were homeless or disconnected from family, and those unable to advocate for themselves.

9.2 Concerns about service quality

In their comments, workers expressed strong concerns about service quality under the NDIS. Perceptions that clients' needs would not be met under the Scheme were widespread, reflected in comments like:

> The only concern that I currently have is that the people that I work with, I'm worried that their needs won't be totally met.

Those working with NDIS participants had witnessed changes in practice which they attributed to the Scheme, while others commented that changes had been made by their organisation in anticipation of the NDIS rollout. Some commented that people with disability were 'treated like numbers' in ways antithetical to the ambitions of personalisation, while others noted high risks, including poor staff training, reductions in staff numbers, and grouping clients together in inappropriate ways. One respondent, who had been a casual worker in an accommodation setting for 10 months and was new to disability services, explained that she had never been shown how to manually assist in moving people in and out of wheelchairs. Another, working in a day program setting explained how services were being organised in ways which raised behaviour-related risks:

> The day programs I work at supports participants with high support need and challenging behaviours. Due to the lack of funding some of these participants receive we are currently grouping the participants up. This can be difficult as some of them do not like to be grouped up and this can cause behaviours which is not

> detrimental to the worker who could be on their own supporting this group but also the other participants in the group.

Risks were also seen to arise relating to the use of temporary casual and agency staff, and staff turnover, which were seen to undermine standards of care:

> Standard of care drops significantly when new, temporary and unfamiliar staff work with residents. The calibre of agency staff is significantly lower than that of ongoing employees. In my team, this is not just a job; it is a career that we are passionate about. We commit to our residents long term for consistent improvement and quality life experiences. I am concerned that NDIS will casualise the workforce, leaving staff disengaged, devalued and bitter, and clients in the care of people who are not committed to positive outcomes.

Others explained:

> There appears to be a trend of more agency and casual pool staff working then permanent employment. This impacts on clients' health and well being. Increased assaults at work results from staff who don't know clients enough to support them especially clients with behaviours of concern. Job security and not being able to retire is impacting staff health and wellbeing. Working on weekends impacts on family togetherness. The pay scales have not increased but the cost of living has and staff are struggling to meet basic living standards.

> The hourly rate payable is so low that we have to take what we get in term of staffing. This is extremely dangerous in a sector that does not require any prerequisite qualifications, skills, or knowledge, and will undoubtedly (especially with such little time to effectively supervise staff) result in people dying either directly or indirectly from staff actions (or lack of action). The NDIA will see a devolution of large residential services, which are filled with trained and qualified medical staff, mental health professionals, psychologists, psychiatrists and social workers. The people from these places are going to NGO's who have untrained and unqualified staff looking after these highly vulnerable and complex people, most of whom have been in the disability sector for a couple of weeks by the time they commence supporting them, coming from fast food/hospitality services, newspapers, and (even scarier) security services where brute force was the preferred option of dealing with people.

The use of untrained staff was seen as a major risk:

> I feel that our ability to support Individuals with mental health concerns has been undermined and negated by the new methodology of the NDIS. New staff that have been employed to fill the newly created gaps, they are not trained and are creating confusion with out supported Individuals. Apparently there is no training funded for these new staff members which I find absolutely horrendous. I have studied for approximately 5 years in this position. I am very worried about how this will impact on the individuals that we support. Also, that the sector will not retain quality staff members.

9.3 Concerns about pay and conditions

Survey respondents expressed significant concerns about their working conditions and remuneration under the NDIS. These concerns are captured in the following statements, which highlight degradation of working conditions in a range of ways, through subcontracting and self-employment, use of private vehicles, unpaid administrative time, loss of hours, and loss of penalty rates:

> I am concerned about changes to my working conditions under the NDIS. Forced to use own vehicle to provide support. Associated costs e.g. business rego and insurance, cleaning, wear and tear. Not paid until I reach the home of my next client. Not paid for admin time. I believe that the NDIS can be beneficial for people with a disability and may offer great opportunities. However the disability support staff seem to be the ones that have to make all of the sacrifices, money, time and workload.

> I am concerned about there being sufficient work available and a possible big drop in pay and working conditions and the possibility the weekend pay rate dropping and the country taking a huge step back in time in terms of pay and workplace conditions and standards.

> I'm concerned that the 'hidden' rort of subcontracting will become the norm and already on the NDIA website there are banners excitedly promoting self-employment opportunities. Standards of care will drop exponentially and the people that will suffer will be the clients. I will not work for peanuts whilst putting myself at risk of physical assault and I think many long-term employees with many years experience will do the same.

Many explained how they had experienced degradation in their work-life balance, and associated work stress, lowering enjoyment of the work:

> In the past year our staffing has been cut back dramatically and the customers are not able to get all goals realised or quality one on one time with staff, also I am finding I am exhausted and on some days rushing aimlessly trying to complete all tasks pertaining to all customers within the daily time frame, it's becoming ridiculous. Starting to hate coming to work, some days. And that's just not who I am, I don't like what's happening to the industry, I hope the changes make work life conditions better once things settle down with the NDIS transition.

Indeed, the challenge of delivering quality services and supports were a reason people were leaving, including this respondent:

> I have just resigned as a NDIS LAC due to over work, lack of management support, focus on KPI's not participants , changing requirements in the job, lack of follow up / time for participants after planning session, huge discrepancies in $$$ attached to plans by NDIA planners for similar situations/disability.

Remuneration

Overwhelmingly, workers considered the pay they received to be inadequate given the level of complexity and risk in performing work in disability services, or were concerned that pay would drop as a result of the NDIS making remaining in the sector untenable:

> The NDIS does not allow employers to offer appropriate wages, especially high risk clients. $22-25 an hour for high personal risk - no way. I'd rather work at Woolworths.

> I enjoy the client contact and believe the pay is fair but would reconsider working in the sector if I was paid any less for what I do.

> The NDIS is only paying award wages and not what I am currently being paid. I fear that I along with many others, will be financially disadvantaged! I fear that quality of care will gradually deteriorate for the clients.

Many comments gave examples of poor employment and work organisation practices, including being employed at low pay grades and on short term or casual contracts. Some explained how changes in rostering had left them worse off, or that they were worried about how shorter shifts would erode their pay, for example:

> I am worried that the hours of work offered will consist of 1 to 2 or 3 hour shifts and hardly worth traveling for once you factor in travel time petrol and time wasted to get to other shifts.

> Recently, I had a roster change, a take it or leave it change even though I was already working a permanent roster, since then my yearly income has reduced by $8000. When I questioned this the coordinator said that [the organisation] doesn't care about penalty rates or your personal life outside of work. We have also been cut on weekends from 2 staff to 1 to look after 5 high support clients. Lack of support is getting worse.

Employment classifications

Several respondents identified how the NDIS had caused their organisation to downgrade their employment classification and freeze their pay rates. As one worker explained:

> I am concerned that the organisation I work for is trying to downgrade mine and co-workers grades by using the NDIS as an excuse to do so. They claim in order to be attractive to families to want to use us that it is better for us to be grade one or two rather than grade three as we are at the moment. I believe they are just in a race to the bottom with only their own company profits as their main focus. I have qualifications in disability as in a Cert 4 but they would prefer to employ people off the street with no experience and no qualifications because they are cheap. What sort of service is that going to be for our clients? It's a disgrace.

Similarly, others explained:

> My employer and many others in our region are reducing pay grades in anticipation of the roll out of the NDIS. For the last two years all new employees are paid at SCHADS 2.2 instead of the previous starting rate of 3.2. By attrition they are

> eroding pay rates in order to shore up their financial position to weather the end of block funding and the introduction of fee for service invoicing under NDIS. There now are almost no new permanent employment contracts and most new contracts are offered on a three month basis at the most.
>
> We have been advised that our hourly rate is higher than what the NDIS rate is so as grade 3 employees, we will be now classed as grade 2. We won't lose pay immediately however we won't be getting a payrise until grade 2 rates catch up to ours. We currently access cars from our organization on leaseback as we use our cars daily for our work. We are losing the cars too. We have also lost our first aid allowance and we no longer get our first aid training paid for by our employer. We are also concerned that we will only be paid per the actual hours spent with clients and not for the travel in between and office time etc. Currently I may only spend 6hrs directly with clients (3 clients at 2hr each) and am paid for my whole day 9am - 5.00pm as that reflects my roster.

Another explained how employers were attempting to save money by reclassifying disability work under the 'homecare' part of the SACS award, to enable shorter shift times:

> The casual nature of the work and the pay/minimum hours is very unsustainable. My employer claims it is legal to pay under the Homecare part of the award for some classifications of clients and therefore legitimise a minimum 1 hour shift. It is also very difficult to come to work (often travelling 30 kilometres) for a 2 hour shift, then having to wait around for the next shift 4-5 hours later. There is little consideration for the impacts on workers - the entire focus for the organisation is on filling shifts and building customer (participant) numbers.

Workloads and stress

As well as pay, many highlighted how their workloads had increased under the NDIS, or in anticipation of NDIS, resulting in high levels of stress:

> As a carer, I feel I am placed in impossible and stressful work situations - there are so few carers available that I feel compelled to accept work hours & travel times (often unpaid) due to a sense of obligation and loyalty to my clients. During many services, there is insufficient time to complete all I need to do and if I exceed the allocated time, I am not paid. I know my clients are very grateful and value my commitment but I feel carers are being taken for granted & have no voice at all.
>
> We are being loaded with more work and less time for the people we support and are told we just have to deal with it as its going to get worse for us support workers as it is now we don't have enough time in a day to do all they expect us to do and from management it is like it or lump it.
>
> I am concerned that our rate of pay will be less and we will be required to support more people eg instead of two per day face to face it may be increased to four, therefore decreasing the quality of support currently being provided. Also it appears that our organisation is going to be a mobile workforce and we will have to use our personal vehicles etc which will increase our personal expenses plus increase isolation of workers where we will not have the opportunity to debrief with each

> other face to face. Many more concerns. However the financial aspect is very concerning.

Many workers who responded to the survey linked their concerns to both transition to the NDIS and the associated privatisation which has occurred or which was pending:

> I am concerned that under NDIS we have to take on more clients as we are now privatised. There is a lot more pressure to take on new clients so that the case load has increased. There is less recognition of mental health issues that impact on our work. Before we could spend extra time if needed with a client in crisis, now it is all about hours and money. The pressure is immense and we are monitored to every minute via a carelink software system and we have to bill everything. I have never felt so pressured as I do now and the pressure is just not the clients but also the system that surrounds NDIS. I worry that whoever provides the cheapest service will get the clients and this it becomes all about money. Certainly the money and hours is what is now pushed and this seems to be the main thing. As a worker this is very disappointing and has changed the face of disability work for the worse.

> Concerned that the residents that I support will have a poor standard of care should [my organisation] privatise. I have supported the same client group for 10 years and know their support requirements, service providers and family well. I would seek different employment opportunities available to me if [my organisation] was privatised.

Concerns about unpaid work

A strong theme within workers' comments about the adverse impact of the NDIS on wages and conditions was the amount of unpaid work required. Employees expressed concerns that expectations of unpaid work were increasing, including for travel and administration which were necessary elements of service delivery. Examples of comments that focused on this are as follows:

> The system does not provide funding for anything other than direct support, therefore all the ancillary tasks such as note writing, documentation, communication with other stakeholders must be done in the employee's own time. In my case I spend at least one hour each day unpaid doing file notes etc. This needs to be looked at as all of this documentation is mandatory.

> My biggest issue has been agency work where you use your own car and do not get paid between jobs. Sometimes I have been paid 1-2 hrs for spending over half a day doing job related activities. I see conditions getting worse under these conditions.

Job security and underemployment

Many employees also expressed significant concerns about job security and the security of their shifts and income, in the disability sector and under the NDIS. One respondents, who provided disability services for more than one employer, explained:

> My jobs feel very insecure, I'm forced to remain a casual as part time jobs are less available and can drop my hourly rate to just $20. In every job I've had we are

> ALWAYS understaffed and torn between multiple employers. Support worker turnover is fast, especially when there are management issues and this is detrimental to the clients and their continuation of care. I love my work but I'm so shocked at how ruthless service providers can be!

Workers perceptions that hours were under pressure, and that shifts were not secure, were reflected in the following comments:

> In one role I am employed in they are not offering part time permanent positions only casuals and they have reduced my rostered time by 1/2 an hour each day.

> I started on a 136 hour a month contract and lowered it to 120 and was told I could always put it up if needed the hours are always there which was not true, they would not let me increase my contract. They have just hired people on a 8 hour a month contract and 30 hour contract and they pick up extra shifts. I have always tried to be a reliable and valued employee but not feeling it now.

> I am concerned that I may lose the stability of the current shifts that I have once the NDIS roll out. For example if the client cancel the support and giving enough notice to the organisation.

Others expressed similar sentiment:

> I am a single parent and am worried that I will not maintain my current level and entitlements and salary which will affect me and my family directly.

> My concerns are job security and my future employment I still have almost 30 years of work ahead of me so it's important now!

> Currently not getting enough hours since the introduction of NDIS because of the 10hrs break in between shift that they just introduced

Together, these responses reflect significant concerns among employees about a wide range of quality and employment issues seen to arise from the NDIS, or which workers were anticipating would arise from rollout in their area.

10. Conclusions

Overall, these findings provide insight into the characteristics and experiences of workers in the disability service sector and in particular, their experiences of working under the National Disability Insurance Scheme. While differences between those working under the NDIS and other disability workers were not consistently evident, the results show a range of quality and workforce risks of the Scheme. While workers' primary concerns were with falling standards of service for people with disability, the survey also shows workforce problems such as high supervisory loads under the NDIS, multiple job holding, and major concerns about job quality, work time and financial security. Moreover, the regression analysis suggests that for this sample of highly experienced workers at least, decent pay and job security are associated with higher perceptions of outcomes for NDIS participants.

The findings indicate the importance of working conditions in the disability sector, and the links between working conditions and the quality of service provision. The results suggest some ways forward, including keeping supervisory loads at reasonable levels, and ensuring experienced workers are retained in the transition to the NDIS. This could be built on with an ongoing and ideally longitudinal program of research, to monitor workforce issues and working conditions in the disability sector through the process of change, and to assess the impact of interventions to improve working conditions and workforce quality and sustainability as a determinant of high quality disability services.

Report designed using art by Moira Nelson. Moira is a Canberra artist who describes herself as a social artist. She likes to produce art within a social and communal setting where she can be 'enlivened and inspired by the diversity of personalities involved'. She creates work that talks about the story of being human, with a particular emphasis on communication. Her interest in this stemmed from a car accident at age 20 which left her with a brain injury impacting on speech and memory. In addition to her own artistry, Moira volunteers and facilitates art programs for disadvantaged and disabled people, children and the wider community.

Please note that there is the potential for minor revisions of data in this report.

The Hon Greg Hunt MP
Minister for Health, Minister for Sport
Parliament House
Canberra 2600

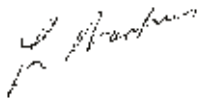
Dear Minister,

On behalf of the Board of the Australian Institute of Health and Welfare, I am pleased to present to you *Australia's welfare 2017*, as required under Subsection 31(1A) of the *Australian Institute of Health and Welfare Act 1987*.

This edition continues the AIHW tradition of delivering high quality evidence and value-added analysis on welfare issues, together with insights into how future data could better meet the needs of policy analysts, researchers and the public.

I commend this report to you as a significant contribution to national information on welfare-related issues, and to the development and evaluation of welfare policies and programs in Australia.

Yours sincerely,



Mrs Louise Markus
Chair
AIHW Board

Chapter 5: Ageing and aged care

Chapter 6: Housing and homelessness

Chapter 7: Indigenous Australians

Chapter 8: Disability and carers

Chapter 9: Indicators of *Australia's welfare*

Preface

In 2017, the Australian Institute of Health and Welfare (AIHW) celebrates a milestone, marking 30 years since the Australian Institute of Health Act came into effect on 1 July 1987. The AIHW gained its 'welfare' role in 1992, and since 1993 has published a biennial flagship report on welfare, the *Australia's welfare* series. *Australia's welfare 2017* is the 13th such report. This year's edition illustrates just how far we have come in producing authoritative statistics on the welfare of Australians since the modest beginnings of the inaugural 1993 report.

The 2017 edition continues the AIHW tradition of delivering quality evidence on welfare issues and, in line with the Institute's new strategic directions, demonstrates the AIHW's core capabilities of being leaders in health and welfare data, drivers of data improvement, expert sources of value-added analysis, champions for open and accessible data and information, and trusted strategic partners.

The AIHW's flagship reports are independent and highly regarded national compendiums on health and welfare: they are compiled from dozens of data sources and draw together a variety of perspectives at both the national and local level. They also serve as 'report cards' on the health and welfare of Australians—they investigate trends and consider how Australians are faring as a nation. Although *Australia's welfare 2017* shows that most of us are doing well, the report highlights the diversity of disadvantage that exists in our communities, including among Indigenous Australians, vulnerable young people, people with disability, Australia's homeless population, and those experiencing family and domestic violence.

Australia's welfare 2017 is framed around 'welfare' in its broadest context. The report is underpinned by the concept that a person's wellbeing results from the interplay of many interrelated individual, societal and environmental factors that extend well beyond the provision of financial assistance and welfare services.

As in previous editions, *Australia's welfare 2017* presents reliable and detailed information on population factors that influence the demand for welfare services, welfare spending and the composition of the community services workforce. It then looks at welfare with respect to various population groups and sectors, including children and youth, education and training, employment, housing, ageing and aged care, and disability. A chapter is dedicated to the welfare of Indigenous Australians, and the report concludes with a comprehensive analysis of welfare indicators based on a framework developed by the AIHW and published for the first time in *Australia's welfare 2015*. This latest edition reports on the 'wellbeing' domain of the framework for the first time, after consideration of Australian and international work in this area.

Australia's welfare 2017 follows a similar structure to recent biennial reports, combining short statistical 'snapshots' with 'feature articles' that explore topical issues in more detail. It considers the factors that help determine welfare from an individual, a family and a community's perspective, and looks at how Australia delivers and funds welfare services. It examines challenges ahead, such as those faced by the welfare workforce. It also looks at opportunities and challenges from a data and information perspective—and how organisations such as the AIHW can best fill gaps in welfare data.

This edition of *Australia's welfare* provides an overview of what we know about family, domestic and sexual violence—an area of signficant community and policy interest in Australia and across the world. The article notes the AIHW's role in this sector, and the work it is doing to bring data sources together.

The report also looks at how to better understand health and welfare data. In today's world of 'big data', governments, businesses, the community and individuals all have an important role to ensure that data are used safely, efficiently and effectively to improve outcomes for all Australians. The report discusses what it means to turn 'big data' into 'smart data', and focuses on the growing need to integrate data sets to produce person-centred data, while protecting privacy. It highlights the gaps in national data, including who needs welfare support, people who face entrenched or persistent disadvantage, and the pathways that people take through the welfare and related systems. It also highlights opportunities for data linkage across national and jurisdictional data sets.

I am pleased to note that *Australia's welfare 2017* includes two feature articles authored by academic experts: 'Persistent disadvantage in Australia: extent, complexity and some key implications' (Professor Alan Hayes and Dr Andrew Hacker) and 'The changing nature of work and worker wellbeing' (Professor Mark Wooden). We extend our thanks to these authors, and also to Associate Professor Judith Yates for her contribution to 'The changing shape of housing in Australia'.

Australia's welfare 2017 is accompanied by an *Australia's welfare 2017—in brief* mini report that summarises key statistics and concepts from the main report, and a variety of online resources.

I would like to thank the many experts who provided the AIHW with valuable advice when drafting this report, and note that their contributions are recognised in the Acknowledgments section.

The AIHW is committed to improving the usefulness and relevance of its flagship reports and welcomes feedback on *Australia's welfare 2017* via flagships@aihw.gov.au.

External contributors
Professor Alan Hayes and Dr Andrew Hacker of the University of Newcastle authored Chapter 1.6 'Persistent disadvantage in Australia: extent, complexity, and some key implications'.

Professor Mark Wooden of the University of Melbourne authored Chapter 4.1 'The changing nature of work and worker wellbeing'.

Associate Professor Judith Yates of the University of Sydney contributed to the article Chapter 6.3 'The changing shape of housing in Australia'.

External reviewers

The following experts are thanked for reviewing articles for *Australia's welfare 2017:*

Ms Catherine Andersson—Productivity Commission

Professor Judy Cashmore—University of Sydney

Ms Marilyn Chilvers—NSW Department of Family and Community Services

Dr Mayet Costello—Australia's National Research Organisation for Women's Safety

Mr David Engelhardt—SA Department for Education and Child Development

Dr Jenny Gordon—Productivity Commission

Professor Kostas Mavromaras—Flinders University

Debra Reid—D A Reid and Company

Professor Peter Saunders—University of New South Wales

Ms Peta Winzar—Community Housing Industry Association

The following Australian Government departments and agencies were also involved in external review of relevant *Australia's welfare 2017* material:

- Australian Bureau of Statistics
- Department of Education and Training
- Department of Employment
- Department of the Environment and Energy
- Department of the Prime Minister and Cabinet
- Department of Social Services
- Digital Transformation Agency
- NHMRC National Institute for Dementia Research
- Productivity Commission

Quality assurance

The report content was largely prepared by AIHW staff, and was subject to a rigorous internal review and clearance process. Additional external peer reviewers were used to validate and strengthen the content of the report.

Data sources

The best available information has been used to inform the report, drawn from a range of data sources that are referenced throughout the report. Most of the data sources are national collections managed by the AIHW and the Australian Bureau of Statistics (ABS). These are supplemented by other data collections, as appropriate.

Each of the data sources used in the report has strengths and limitations that affect how the data can be used and what can be inferred from the results. The AIHW takes great care to ensure data are correct and conclusions are robust.

Although this report is published in 2017, many of the statistics refer to 2015 or earlier. This is because some data, such as population-based surveys and the ABS Census of Population and Housing (the Census), are collected every 3–5 years or less often. Given the comprehensive nature of this report, and the time it takes to prepare a compendium report of this scale, it is also possible that some other reports may be released by the AIHW or others with more recent data. For example, due to the timeframes for preparing this report, it was not possible to integrate the 2016 Census data with data presented in *Australia's welfare 2017* (see Box A).

Box A: 2016 Census data—first release and 2016 Census-based population estimates

Data from the 2016 ABS Census of Population and Housing were released on 27 June 2017. Due to the AIHW's drafting timeframes for *Australia's welfare 2017*, it was not possible to include updated Census data within the main body of this report.

There were some notable findings from the 2016 Census that relate to several topic areas covered within the report, as highlighted below. Future iterations of *Australia's welfare* will be able to draw on these data in more detail.

Population estimates

On 27 June 2017, the ABS released preliminary Estimated Resident Population (ERP) re-based on the 2016 Census. Preliminary ERP for Australia was 24.4 million at 31 December 2016. Estimates for 2017 are not yet available but may differ from the projected number of 24.8 million at June 2017 used for this report and based on ABS population projections from the 2011 Census. New age and sex estimates for the total population, and estimates of the Indigenous population, were not available in time for the release of *Australia's welfare 2017*.

Family and household composition

According to the 2016 Census, there were 8.29 million households in Australia on Census night of which 5.9 million were family households, 2 million were lone-person households, and just under 0.4 million were group households. Of family households, 45% were couples with children, 38% were couples without children, and 16% were single parent families. The distribution of household type did not change between 2011 and 2016.

Housing tenure

The 2016 Census data showed a home ownership rate of 66%—comprising 35% with a mortgage and 31% of households that owned their home outright. Home ownership rates have been falling over time. While the overall home ownership rate has declined from 69% in 1991 to 66% in 2016, rates of outright home ownership have seen a larger drop, from 41% to 31% over the 25-year period; by comparison, rates of home ownership with a mortgage have risen from 28% in 1991 to 35% in 2016. Renters make up 31% of households compared with 27% in 1991. See Chapter 6.3 'The changing shape of housing in Australia' for more information.

The rate of home ownership for Indigenous households increased from 36% (25% with a mortgage and 11% without) in 2011 to 38% (26% with a mortgage and 12% without), in 2016.

Overcrowding

In 2016, overcrowding in households, based on those households needing one or more extra bedrooms, was 3.8%, up from 3.4% in 2011. Overcrowding was much higher for Indigenous households at 10.4% (down from 11.8% in 2011).

Additional material online

This edition of *Australia's welfare* has a comprehensive online presence, including links to related web pages and supplementary tables that present the data underlying the charts in each chapter.

Australia's welfare 2017 is available online. Individual PDFs are available for individual articles, for easy downloading and printing.

Visit *Australia's welfare 2017* online at www.aihw.gov.au/reports/australias-welfare/australias-welfare-2017.

Executive summary

Welfare in Australia

- The Australian Government and state and territory governments spent an estimated $157 billion on welfare in 2015–16 (cash payments, welfare services, and unemployment benefits), up from $117 billion in 2006–07. This is an average growth rate (in real terms) of 3.4% per annum.
- Per person expenditure on welfare rose an average of 1.7% a year over the 10-year period in real terms (from $5,663 to $6,566 per Australian resident).
- Welfare spending now accounts for a larger proportion of gross domestic product than before: 9.5% in 2015–16 compared with 8.6% in 2006–07.
- In 2015, the welfare workforce represented 4.1% of the total workforce in Australia, an estimated 478,000 workers. The number of workers has increased by 84% since 2005.

See Chapter 1 for more information.

Vulnerable groups

- About 4.4% (1 in 23) of Australians are estimated to experience deep and persistent disadvantage, as measured by social exclusion. However, this masks much higher rates among some population groups—for example, 24% of people living in public housing (more than 5 times the national average), 15% of people dependent on income support (more than 3 times), and 11% of Indigenous Australians (more than twice) live with deep and persistent disadvantage.
- Children under 15 in single-parent families were more than 3 times as likely to be in relative income poverty as those in two-parent families (41% compared with 13%) in 2013–14.
- About 46,500 children were in out-of-home care as at 30 June 2016. Indigenous children were 10 times as likely to be in out-of-home care (57 per 1,000 children) as non-Indigenous children (5.8 per 1,000) in 2015–16.
- Young people aged 10–17 under youth justice supervision during 2014–15 were 15 times as likely as the general population to be involved with the child protection system in the same year.

continued

Vulnerable groups (continued)

- One in 6 Australian women have experienced physical or sexual violence from a current or former cohabiting partner since the age of 15. This compares with 1 in 19 men.
- Indigenous people living in *Very remote* areas are 1.4 times as likely to be unemployed and 1.5 times as likely to receive a government pension or allowance as their main source of income as Indigenous people living in *Major cities*.

See Chapters 1, 2 and 7 for more information.

Education and employment

- In 2015, 4 in 5 children (78%) starting school were considered to be 'on track' developmentally, slightly higher than in 2009 (76%).
- Results for national literacy and numeracy testing in Years 3, 5, 7 and 9 have largely plateaued for students since 2008, and in the Programme for International Student Assessment test, Australia's 2015 results were significantly lower than those for 2009.
- 2.2 million people aged 15–64 were enrolled in formal study towards a non-school qualification in 2016—1.3 million (59%) were attending a higher education institution such as a university.
- There were 168,800 people commencing apprenticeships and traineeships in 2016—the lowest number since 1998.
- The proportion of Indigenous people aged 20–24 who had attained Year 12 or an equivalent level of education rose significantly from 45% in 2008 to 62% in 2014–15. Progress is on track to halve the gap in Year 12 attainment between Indigenous and non-Indigenous young people by 2020.
- Many more jobs today are part time: 31% of all jobs in 2016 involved part-time hours compared with 10% in 1966.
- The proportion of workers who were underemployed is at its highest level since the late 1970s, accounting for 9.3% of all employed people in 2016.
- The labour force participation rate has more than doubled among people aged 65 and over in the past 30 years, from 5.1% in 1986 to 13% in 2016. This reflects greater life expectancies and delayed retirement compared with previous generations.
- The proportion of lower skilled people (highest qualification Year 10 and below, including Certificate I/II) who were employed fell from 59% in 2008 to 54% in 2016. People whose highest qualification was a Bachelor degree maintained a steady rate of employment over the same period (around 84% employed in 2008 and 2016).
- One in 20 (5.1%) people aged 15–19 were not engaged in any form of education, training or employment in 2016 compared with 7.7% in 2005. By comparison, the rate for people aged 20–24 (around 12%) was similar in both 2005 and 2016.

See Chapters 3, 4 and 7 for more information.

Ageing, disability and informal care

- Australia's population profile is changing. In 2017, an estimated 3.8 million Australians (15% of the population) are aged 65 and over, compared with 2.2 million (13%) in 2007.
- About 4.3 million Australians (18%) have a disability, and about 1.4 million people (5.8%) have a severe or profound core activity limitation. While the overall number of people with disability has increased from 4 million in 2003, the proportion of the population with disability has decreased over time (from 20% in 2003 to 18% in 2015).
- Dementia is a substantial challenge to Australia. Estimates suggest that in 2017, around 365,000 Australians have dementia. This number is projected to more than double to 900,000 people by 2050.
- In 2015, Australia had 2.7 million informal carers, of whom 856,100 were primary carers. One-third of primary carers spent 40 hours or more per week in their caring role, and one-third had spent 10 or more years in this role.

See Chapters 5 and 8 for more information.

Housing and homelessness

- Between 1994–95 and 2013–14, the proportion of Australians who owned their home outright fell from 42% to 31%, and more home owners financed their purchase with a mortgage (rising from 30% to 36%). The 2016 Census confirmed these trends (see Box A).
- Over the same period, the proportion of people renting from private landlords rose from 18% to 26%. Those renters experienced a 62% ($144) rise in average weekly housing costs, after adjustment for inflation.
- A smaller proportion of people aged 25–34 own a home today than 25 years ago—39% in 2013–14, compared with 60% in 1988–89.
- In 2015–16, 38% (106,000) of all clients seeking assistance from specialist homelessness services had experienced family and domestic violence. Of these clients, 92% were women and children, including 31,000 children under 15.
- Compared with other households, Indigenous households are less than half as likely to own their own home, more than twice as likely to rent, more than 7 times as likely to live in social housing, and more than 3 times as likely to live in overcrowded dwellings.

See Chapters 6 and 7 for more information.

How are we faring?

Based on an assessment of trends in the *Australia's welfare* indicators, we are faring well on many aspects of wellbeing:

- Purchasing power has improved over the last 30 years. Australia's net disposable income per capita, adjusted for inflation, has increased by 1.9%, on average, per year.
- Weekly household income rose for all income quintile groups between 1994–95 and 2013–14.
- Education levels among people aged 15–74 have been increasing over time, from 55% holding a non-school qualification in 2009 to 59% in 2016.
- The level of school attendance for young people in youth justice detention rose between 2011–12 and 2015–16 (96% to 98% for students of compulsory school age and 93% to 99% for students of non-compulsory school age).
- The proportion of employees working 50 hours or more per week (in paid employment) dropped between 2004 and 2017—from 26% to 20% for males and 8% to 7% for females.
- We are living longer and enjoying more years without disability: years of life lived without disability rose by 3.9 years for males and 3 years for females between 2003 and 2015.
- Australia enjoys high air quality compared with many other OECD countries and our greenhouse gas emissions have been gradually falling since 2000.
- Crime victimisation rates fell between 2008–09 and 2015–16 for most types of serious crime, such as physical assault and malicious property damage.
- Our perceptions of safety have also improved. More than half of us (52%) reported feeling very safe or safe walking alone in our local area after dark in 2014, compared with 48% in 2006.
- The proportion of Indigenous households living in overcrowded conditions fell from 27% in 2004–05 to 21% in 2014–15.

However, a few aspects of our lives warrant closer attention:

- In 2013–14, 1 in 2 lower income rental households were in housing stress, that is, spending more than 30% of their gross income on housing costs. This is up from 42% in 2005–06.
- While the distribution of income in Australia has shown little change in recent years, income inequality has risen since the mid-1990s as measured by the Gini coefficient.
- Although employment rates have fluctuated over time, there has been an upward trend for youth unemployment rates and for long-term unemployment as a proportion of all unemployment between 2008–2009 and 2017.
- Volunteering rates among adults declined from 36% in 2010 to 31% in 2014.
- Men are more than twice as likely as women to report feeling safe walking alone at night (72% compared with 34% in 2014).

See Chapter 9 for more information.

Chapter 1

Welfare in Australia

1.0 Introduction

Australia is a diverse nation. Its more than 24 million people have diverse cultural, social and economic backgrounds, and live in a variety of communities. Each person has different abilities, resources, experiences and welfare needs. This chapter looks at the major concepts in understanding welfare across the Australian population.

So, what do we mean by a person's welfare? In the broadest sense, welfare refers to the wellbeing of people—being secure, happy, healthy and safe. This is why the terms 'wellbeing' and 'welfare' are often used interchangeably. *Australia's welfare 2017* is underpinned by the concept that a person's wellbeing results from the interplay of many interrelated individual, societal and environmental factors.

Welfare support provided or funded by governments is complex and wide ranging. Many may see it primarily as income support and tax concessions, but policies and programs for wellbeing extend far beyond this. For example, providing universal services for education and health—and targeted support for housing, employment, disability, ageing and aged care (among others)—is critical to the wellbeing of an individual and their family.

The Australian Government and state and territory governments, non-government organisations and individuals all contribute to welfare spending. In 2015–16, the Australian Government and state and territory governments spent more than $157 billion on welfare, up from nearly $117 billion in 2006–07. Welfare spending as a proportion of gross domestic product also increased over the period, from 8.6% to 9.5%.

This chapter profiles the welfare workforce—an estimated 478,000 people who work in early childhood education and care, residential care and a variety of other social support services, such as adoption support and disability assistance. The welfare workforce has grown by 84% (219,000 people) over the past decade. In 2015, it represented more than 4% of the 11.8 million people employed in Australia.

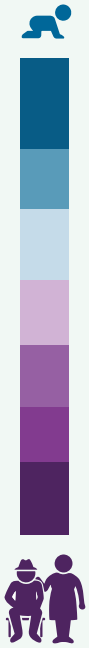
A special feature article commissioned for *Australia's welfare 2017* examines the extent and complexity of persistent disadvantage. It reports that several groups in the community face rates of deep and persistent disadvantage that are 2 to 5 times that of the national average. As the article makes clear, dealing with such disadvantage has potentially profound, positive social and economic effects.

Lastly, this chapter looks at the changing data landscape—in particular, the public data agenda, and the challenges and opportunities presented by 'big data'. It explores the ever growing expectation that organisations such as the AIHW can deliver high-quality information faster, while protecting individual privacy, and profiles the 'person-centred' data model for health and welfare services.

1.1 Who we are

Australia's welfare 2017 draws on a variety of data sources, about people, their wellbeing, and the welfare services they access. Major data sources drawn on are national collections managed by the AIHW and the Australian Bureau of Statistics (ABS).

Based on ABS projections, Australia's population in **June 2017** was around **24.8 million** people, of whom:



4.7 million are aged 0–14

3.2 million are aged 15–24

3.7 million are aged 25–34

3.3 million are aged 35–44

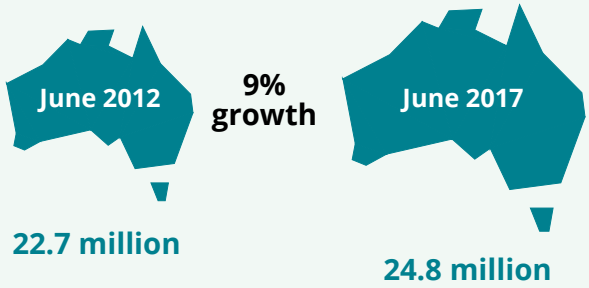
3.2 million are aged 45–54

2.9 million are aged 55–64

3.8 million are aged 65 or older

(ABS 2013).

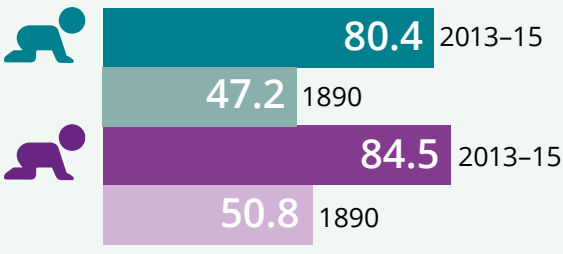
Australia's population has grown



In 2017, an estimated **3.1%** of Australians were Aboriginal and Torres Strait Islander—**761,300 people** (ABS 2014b).

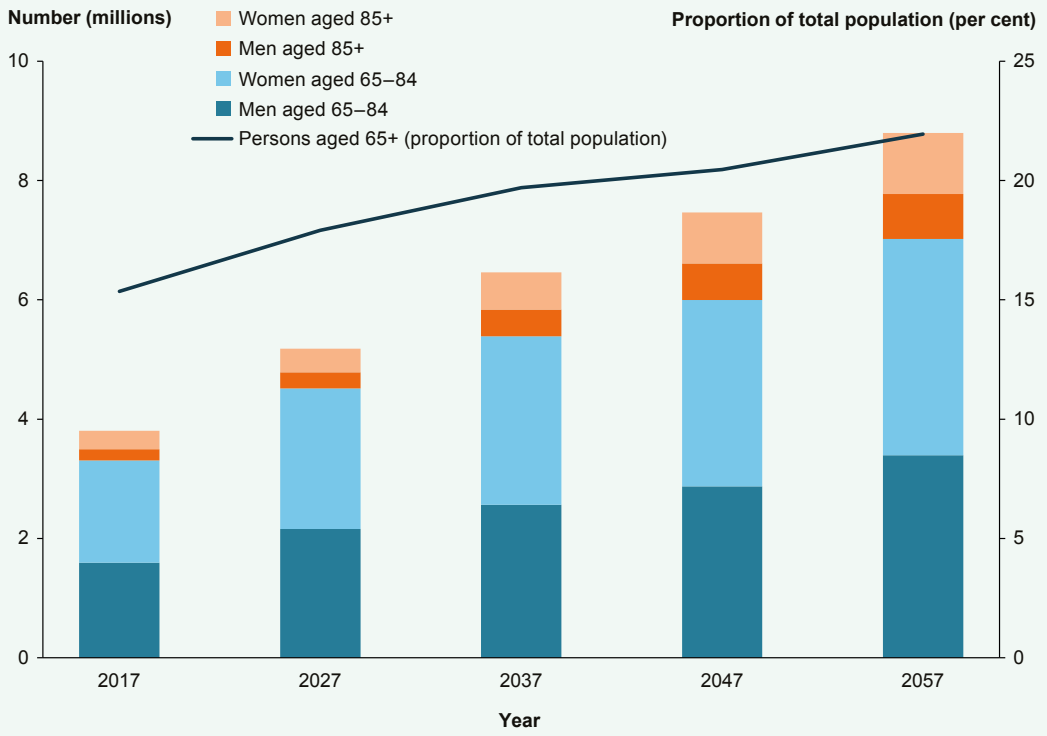
In 2016, **29%** of Australians were born overseas—**6.9 million people** (ABS 2017b).

In 2015–16, **207,325** people permanently migrated to Australia—189,770 (92%) from migration programs and 17,555 (8.5%) from humanitarian programs (Phillips & Simon-Davies 2017).



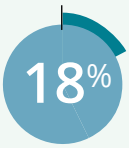
A **boy** born between 2013 and 2015 can expect to live **80.4 years** and a **girl 84.5 years** (ABS 2016c). This compares with 47.2 and 50.8 years, respectively, in 1890 (ABS 2014a).

Australia's population is ageing. Both the number of older Australians and the proportion of Australia's population aged 65 and over are growing. ABS projections for 2017 show that the 3.8 million people in Australia aged 65 and over make up 15% of our total population of 24.8 million. By 2057, the number of people aged 65 and over is projected to more than double to 8.8 million, making up 22% of the total population of 40.1 million. In 2017, there are around half a million very old (aged 85 and over) Australians, making up 2.0% of the population. This proportion is projected to increase to 4.4% by 2057 (Figure 1.1.1) (ABS 2013).



Source: AIHW analysis of ABS 2013.

Figure 1.1.1: Number and proportion of the population aged 65 and over, by age group and sex, 30 June 2017, 2027, 2037, 2047 and 2057



4.3 million Australians—around **18% of our population—had a disability** in 2015, of whom 1.4 million (5.8%) had a severe or profound core activity limitation (ABS 2016a).

In 2016, **31% (more than 1.2 million) of children aged 0–12** attended an approved child care service. Nearly 17,700 approved child care services were offered (Productivity Commission 2017).

In 2016, nearly **3.8 million students were enrolled in more than 9,400 schools across Australia** with nearly two-thirds of students (65%) in government schools, 20% in Catholic schools and 14% in independent schools (ABS 2017c).

In 2015, **78%** of children starting primary school were **'on track' developmentally**; **22%** were developmentally vulnerable on one or more domains, with this proportion being the same as in 2012, and an improvement on 2009 (24%). The rate of Indigenous children found to be developmentally vulnerable on one or more domains has fallen, from 47% in 2009 to 43% in 2012 and 42% in 2015 (AEDC 2016).

In 2016, around **3.3 million** (31%) of the 10.5 million Australians aged 15–74 with a non-school qualification had a Certificate III/IV and **4.6 million** (44%) **had a Bachelor degree or higher**. The proportion of the total population aged 15–74 holding a Bachelor degree or above has **more than tripled** in the last 30 years, from 7.2% in 1986 to 26% in 2016 (ABS 2016b).

As at April 2017, **77%** of Australians aged 15–64 **were participating in the labour force** (people working and actively looking for work). Almost **1 in 3** (31%) employed people in this age group **worked part time**, compared with 10% in 1966. The unemployment rate was **5.7%**—or an average of 730,000 unemployed Australians in this age group each month (ABS 2017a).

In 2013–14, in real terms, **the average disposable household income** (after adjusting for the number of people in the household) was **$998 per week**, compared with $746 in 2003–04 (in 2013–14 dollars). Low-income households had an income of $407 per week ($323 in 2003–04), middle-income households $843 per week ($657) and high-income households $2,037 per week ($1,432) (ABS 2015).

1.2 Where we live

Where we live affects our wellbeing. Many of the factors that shape our lives and wellbeing—such as job opportunities, community networks, air pollution and access to clean water and personal safety—are influenced by where we live (OECD 2015).

Most Australians live in capital cities. As at June 2016:

		Growth from 2006
	**71%** lived in *Major cities* **17.2 million people**	**21%**
	**18%** lived in *Inner regional* areas **4.4 million people**	**14%**
	**8.7%** lived in *Outer regional* areas **2.1 million people**	**8.5%**
	**1.3%** lived in *Remote* areas **319,000 people**	**5.2%**
	**0.8%** lived in *Very remote* areas **202,000 people**	**10%**

(ABS 2017b).

Similarly, the majority of Aboriginal and Torres Strait Islander people live in *Major cities* (35%). However, a high proportion of the Indigenous population live in *Inner regional* areas (22%), *Outer regional* areas (22%), *Remote* areas (7.7%) and *Very remote* areas (14%). By comparison, less than 2% of the non-Indigenous population live in *Remote* or *Very remote* areas of Australia (ABS 2013).

Our households and families

According to Australian Bureau of Statistics (ABS) household and family projections, in 2017, the majority (71%, or 6.7 million) of the 9.4 million Australian households are family households, 25% (2.3 million) are single-person households and 4.3% (403,000) are group households (ABS 2015c).

The number of households in Australia is projected to grow by up to 3.3 million over the next 20 years, to between 12.6 million and 12.7 million in 2036. Family households are still expected to be the most common household type over this time—nearly 70% of households in 2036 (up to 8.8 million). But the household type projected to grow most is Australians living alone, increasing by up to 45% over the next 20 years to between 3.3 million and 3.4 million by 2036. This mainly relates to the ageing of the population, as many older Australians live alone (ABS 2015c).

In 2016, the vast majority of families were couple families (84%) and, of these, 44% had dependants living with them (see Box 1.2.1; Figure 1.2.1). Of the nearly 949,000 single-parent families, 65% had dependants living with them (ABS 2017a).

In 2016, there were an estimated 52,400 same-sex couples (0.9% of all couple families), an increase from 39,400 in 2012 (ABS 2017a).

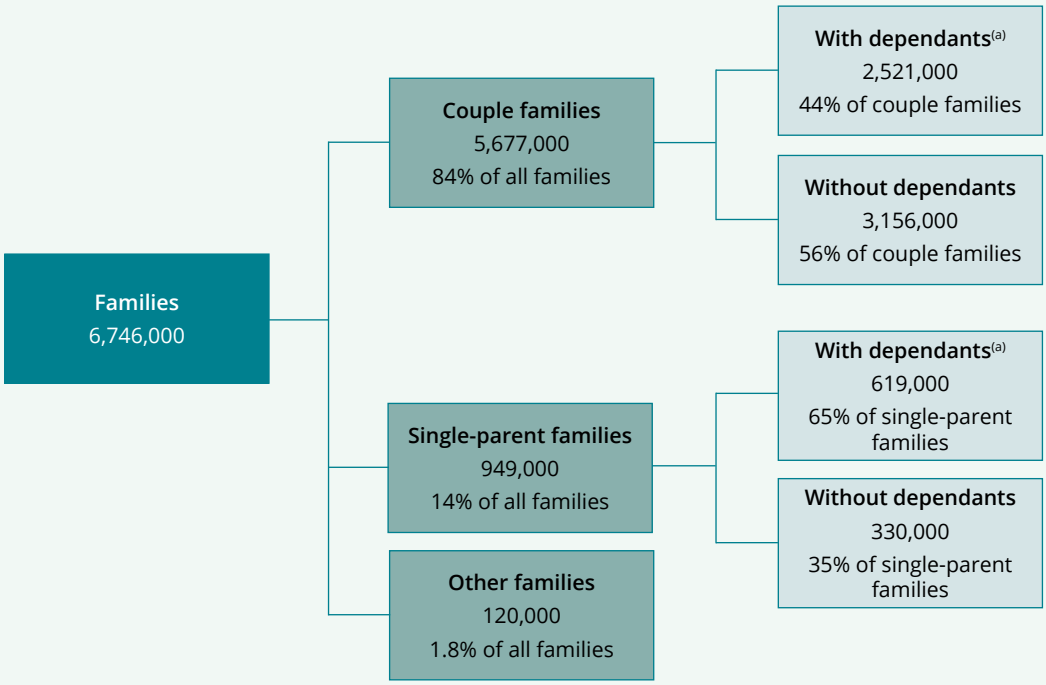
Box 1.2.1: What is a family?

The ABS defines a family as 'a group of two or more persons that are related by blood, marriage (registered or de facto), adoption, step or fostering, and who usually live together in the same household. This includes all families such as newlyweds without children, same-sex partners, couples with dependants, single mothers or fathers with children, and siblings living together. At least one person in the family has to be 15 years or over. A household may contain more than one family' (ABS 2017a).

Families are classed as having, or not having, dependants, and there are two types of dependant: children aged under 15, and students aged 15–24 who are at school or studying full time at a tertiary institution and living with their parents/guardians. Children aged over 15 who are not full-time students are not considered 'dependants' even if they still live at home.

A single-parent family can be classified as 'without dependants'—for example, a 50-year-old woman living with her 30-year-old daughter.

An 'other family' is defined as 'a family of other related individuals residing in the same household. These individuals do not form a couple or parent–child relationship with any other person in the household and are not attached to a couple or one-parent family in the household' (ABS 2015a).



(a) Includes children aged under 15 and dependent students aged 15–24.
Note: Numbers and percentages may not add to totals due to rounding.
Source: ABS 2017a.

Figure 1.2.1: Structure of Australian families, 2016

Indigenous households

According to the 2011 ABS Census, compared with other households, Indigenous households are:

- less likely to be single-person households (14% compared with 25%)
- more likely to consist of 2 or more families (6% compared with 2%)
- more likely to contain 5 or more people (23% compared with 10%).

Families in Indigenous households were more likely than families in other households to include children aged under 15 (59% compared with 38%) and more likely to be single parent families with children aged under 15 (28% compared with 8%) (see Chapter 7.1 'Community factors and Indigenous wellbeing').

Our homes

Fewer Australians own their own home today than 20 years ago. In 2013–14, 67% of Australians owned their home (with or without a mortgage) compared with 71% in 1994–95. Households today are less likely to own their home outright and are more likely to be financing the purchase of their own home with a mortgage (Table 1.2.1) (ABS 2015d).

The proportion of households renting has been increasing over the past 20 years, particularly for those renting from a private landlord (ABS 2015d) (see Chapter 6.3 'The Changing shape of housing in Australia').

Table 1.2.1: Home ownership in Australia

Tenure and landlord type	1994–95 (%)	2013–14 (%)
Own home outright	41.8	31.4
Own home with a mortgage	29.6	35.8
Renting from private landlord	18.4	25.7
Renting from a state or territory housing authority	5.5	3.6

Source: ABS 2015d.

Indigenous home ownership

Data from the National Aboriginal and Torres Strait Islander Social Survey show that, in 2014–15, almost one-third of Indigenous households owned their own home, either with a mortgage (20%), or without (10%). Nearly 7 in 10 Indigenous households were renters—30% lived in social housing, while the remainder (39%) were private renters or rented from another type of landlord.

The rate of home ownership among Indigenous households (30%) was less than half that for other households (68%) and was similar to the proportions in 2012–13 and 2008 (both 32%) (SCRGSP 2016) (see Chapter 7.1 'Community factors and Indigenous wellbeing').

Homelessness

Being homeless can severely affect a person's mental and physical health, education and employment opportunities, as well as their ability to participate fully in social and community life.

On Census night 2011, close to 105,000 Australians were classified as homeless. These people lived as follows:

- 41,400—in severely crowded dwellings (those that require 4 or more extra bedrooms to accommodate the residents)
- 21,300—in supported accommodation for the homeless
- 17,700—in boarding houses
- 17,400—temporarily with other households
- 6,800—sleeping rough
- 700—in temporary lodgings (ABS 2012).

About 279,000 Australians were supported by homelessness agencies in 2015–16—that is, 1 in 85 people in the Australian population. This compares with about 236,000 clients in 2011–12, or 1 in 94 people in the Australian population.

Currently, the single biggest client group for these services is people experiencing family and domestic violence (38% of all clients; 106,000 people). The number of family and domestic violence clients has increased by 33% since 2011–12 (see Chapter 2.7 'Family, domestic and sexual violence').

Specialist homelessness service (SHS) clients with a current mental health issue are the fastest growing client group within the SHS population, growing at an average rate of 13% per year since 2011–12. In 2015–16, 26% of all clients (72,400 people) had a current mental health issue (see Chapter 6.2 'Homelessness').

What is missing from the picture?

Overall, the availability of information on the demographic, social, economic and welfare status of Australians is good, but there are some gaps. For example, there is little information on people who experience homelessness who do not seek help from service organisations. According to the ABS 2014 General Social Survey, two-thirds of people who had experienced homelessness in the last 10 years (about 950,000 people) did not seek assistance during their most recent experience of homelessness, compared with the 476,000 people who did (ABS 2015b).

Statistics on the wellbeing of smaller subgroups of the population and changes to their living circumstances over time can be difficult and/or costly to obtain. For example, further information is needed on pathways in and out of homelessness and the longer term outcomes for service users. Further information about population cohorts using multiple, cross-sector services is also needed.

The AIHW is actively contributing to the knowledge and understanding of the clients of multiple services, such as drug and alcohol treatment services and child protection services, by undertaking data linkage projects using de-identified information about the users of these services. For more information about data linkage, see Chapter 1.7 'Understanding health and welfare data'.

Where do I go for more information?

The ABS collects information on Australia's population through its 5-yearly Census of Population and Housing (the last Census was conducted in 2016). It also has extensive data on a range of welfare-related topics, including housing and income. More information is available on the ABS Census website and the ABS website.

The AIHW's biennial Australia's health and Australia's welfare reports include detailed analyses of Australia's population in the context of these two sectors. The reports are available for free download at the AIHW website.

Extensive information on the welfare of Indigenous Australians is also available on the AIHW website.

1.3 Understanding welfare

Welfare and wellbeing

In the broadest sense, welfare refers to the wellbeing of people—the state of 'faring well'; for example, being secure, happy, healthy and safe. Hence, the terms 'wellbeing' and 'welfare' are often used interchangeably (Econlib 1999–2012). The Organisation for Economic Co-operation and Development (OECD) (2015a) states that 'well-being is multidimensional, covering aspects of life ranging from civic engagement to housing, from household income to work-life-balance, and from skills to health status'.

A range of interdependent factors can affect wellbeing. At the individual level, these include a person's knowledge, attitudes, behaviours and responses to life events. Factors on a broader scale might include access to education, employment, secure housing, the environment, community networks and safety.

'The circumstances under which people grow, live, work and age, and the systems put in place to deal with illness' (CSDH 2008) help to determine an individual's health, and are important contributors to wellbeing. Many of these elements are shaped by social and economic forces; they are also shaped by government direction (CDSH 2008). Policies at all levels of government can substantially influence the wellbeing of individuals and, hence, the broader population.

Australia's federated governing system sees responsibility for policy, services and assistance shared between different levels of government (see Figure 1.3.3). Adding to this, these government agencies face a range of complex challenges in trying to meet the needs of the population. Challenges include changing population demographics (such as population ageing and decreasing family size), the changing nature of the Australian workforce, housing affordability issues, and government fiscal constraints.

Given this context, welfare support provided or funded by governments in Australia is complex and broad in nature. Some may see 'welfare' as primarily income support and tax concessions. But government policies and programs for wellbeing extend well beyond this. Universal services (such as education and health) and those more specifically focused on support for housing, employment, disability, ageing and aged care (among others) are, together, often critical to the wellbeing of an individual and their family. Mindful of this, governments are increasingly moving toward more comprehensive policies and programs to improve wellbeing overall. This requires coordinated efforts to address the factors that cause disadvantage and inequality (Buckmaster 2009).

Conceptual framework for *Australia's welfare*

The concepts of welfare can be organised in many different ways. Figure 1.3.1 presents the conceptual framework used for this report. It shows the complexity of welfare as a concept—and that wellbeing, in general, results from the interplay of many interrelated factors. See also Chapter 9 'Indicators of *Australia's welfare*', which presents indicators underpinning this conceptual framework.

The framework acknowledges that welfare services and assistance—a large focus of this article—are not the only policy and program areas that governments and others (including non-government and for-profit organisations) adopt to improve wellbeing. Other policy and service areas, such as health and education services, interact with and influence the need or demand for welfare services.

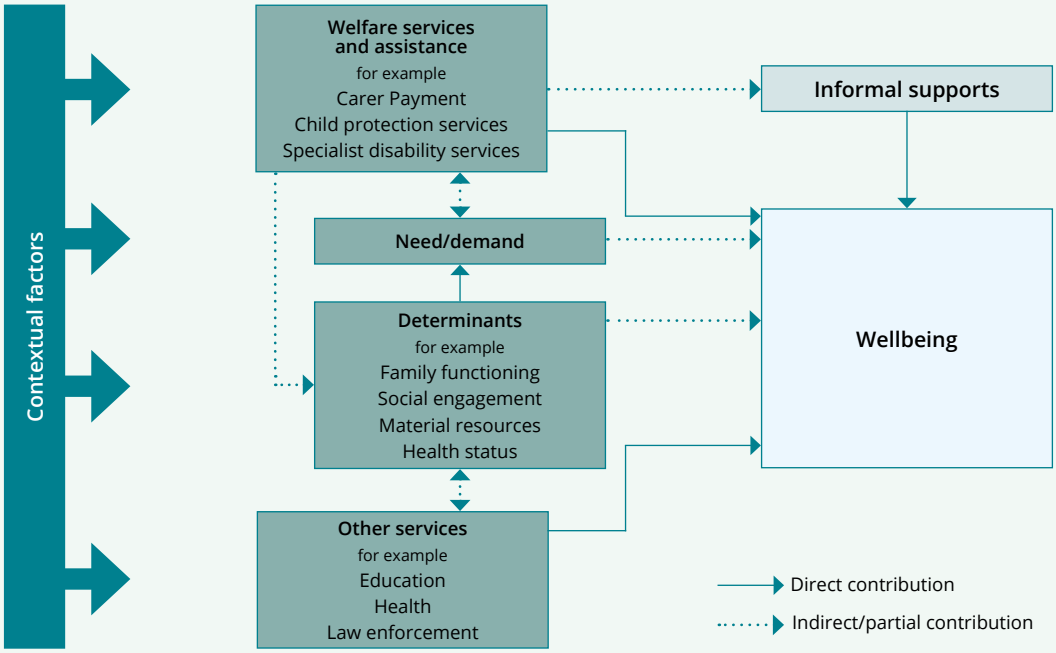

Figure 1.3.1: Conceptual framework for *Australia's welfare*

The framework recognises the overarching importance of contextual factors—such as sociodemographic trends (for example, population ageing and immigration patterns), policy settings and general economic conditions (for example, Gross National Income and labour market efficiency)—which can influence the allocation of welfare expenditure and workforce availability. Contextual factors can help to enable or inhibit people's ability to meet their everyday needs. For example, a neighbourhood with good footpaths and close access to parks, open spaces or recreational facilities can promote healthy behaviours, such as walking and physical activity (NHFA 2009), that affect wellbeing.

The need and demand for services are mediated by informal supports and the availability of welfare and other services—both at the individual and community level. For example, programs that help people with disability to maintain their housing tenancy can lead to more secure long-term housing arrangements and greater independence, and thereby lessen demand for informal and other formal support services.

Determinants play a central role in the framework (Figure 1.3.1). These are factors that can positively or negatively affect a person's wellbeing, and thus increase or decrease the likelihood that he or she will need welfare assistance. For example, a person's health status affects their ability to work, earn an income or contribute to their community. These are all factors that research shows are closely linked to wellbeing. Another example is family functioning: strong family functioning and cohesion contribute directly to wellbeing, and may also protect family members from needing welfare services because the family is a source of support (physical, emotional, financial, and so on). Loss of this support due to family breakdown may lead to a family member's requiring welfare assistance, such as shelter or income supplementation.

For many determinants, the action can be in both directions. For example, having access to social networks is associated with positive benefits like enhanced self-esteem, and access to emotional support; however, negative social interaction is also associated with outcomes such as poorer mental health and psychological wellbeing (Lincoln 2000).

Health, welfare and wellbeing

Health, welfare and wellbeing are strongly interrelated. The World Health Organization (WHO) defines health as 'a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity' (WHO 1948). This definition recognises that being in 'good health' is linked with having positive wellbeing, and that, conversely, health status is closely linked with an individual's wellbeing status. More recently, the WHO defined positive mental health as being 'a state of well-being in which the individual realizes his or her own abilities, can cope with the normal stresses of life, can work productively and fruitfully, and is able to make a contribution to his or her community' (WHO 2001). This later definition recognises the fundamental role of social contribution and engagement to wellbeing (see Chapter 4.1 'The changing nature of work and worker wellbeing'; Chapter 7.1 'Community factors and Indigenous wellbeing'; Chapter 8.2 'Participation in society by people with disability', and Chapter 9 'Indicators of *Australia's welfare*').

Welfare services and assistance

Many people do not need support, or their need for support may vary as their circumstances and life stage change. If support is needed, it can come from a variety of sources—both formal (government and other organisations) and informal (family, friends and community groups)—and vary in nature and extent. This support in times of need can bolster a person's wellbeing. In fact, for people facing major challenges or suffering from long-term hardship, support in the form of welfare services and assistance is likely to be fundamental to wellbeing (see Chapter 1.6 'Persistent disadvantage in Australia: extent, complexity and some key implications' for more information).

As already noted, welfare services and assistance (income support, tax concessions and welfare services) are just one part of a larger network of services and assistance provided by governments and non-government organisations to improve the wellbeing of individuals, groups and, thus, the Australian population.

This report presents a comprehensive picture of available information on welfare services and assistance, with reference to closely related policy and program areas, such as health and education. To begin, a brief overview is provided of the key types of welfare services and assistance in Australia today.

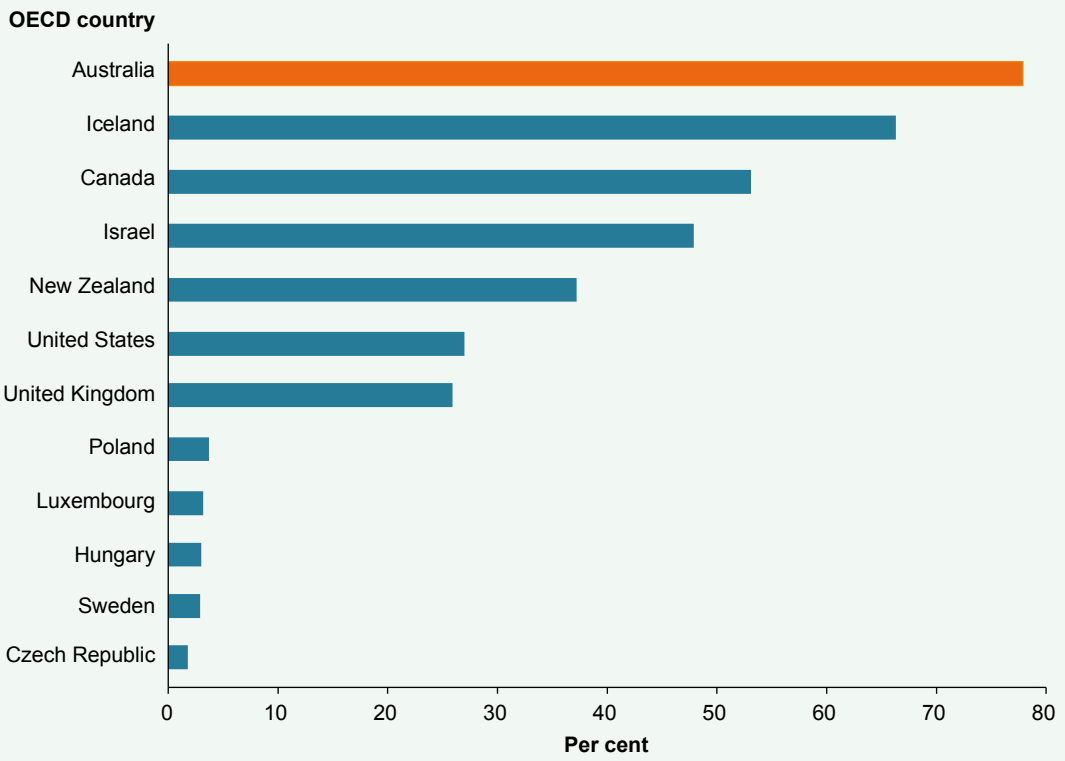
Income support and tax concessions in Australia

Australia's income support payments are financed from government revenue, with no separate social security contributions. This differs from what occurs in many other OECD countries, where employers and employees partly finance the system, and some benefits are tied to past earnings; for example, in parts of Europe, the United States and Japan, people who have earned relatively higher incomes receive more if they need to access benefits (Whiteford 2015).

The income support system redistributes income via the tax system (from people who are well-off to people who are most disadvantaged), and acts as a 'safety net' for people not able to support themselves (DSS 2017b). In Australia, income support payments are subject to means testing, a process used to determine eligibility for benefits. Means testing helps to ensure that resources are focused on supporting people with relatively lower incomes and fewer assets. It plays a more prominent role in Australia than in other countries, particularly in continental Europe. In fact, Australia is the highest means testing country in the OECD, with around 80% of spending on cash benefits (for example, age pensions and veterans' payments) determined by means testing (OECD 2014) (Figure 1.3.2).

Australia's transfer payment system also differs from those in the majority of other OECD countries. Australian Government transfer payments are financed solely from general revenue, rather than relying on contributions via a social security system financed by employers and/or employees. Australia's compulsory superannuation contributions also work to reduce the reliance on the Age Pension over time (Productivity Commission (Australia) 2015) (see also Chapter 1.4 'Welfare expenditure'). Because cash benefit payments in Australia are at a flat rate (not based on prior earnings) and generally means tested, Australia's spending on these benefits is comparatively low compared with spending in other OECD countries. (Australia was the 6th lowest spender in 2014, at 8.6% of Gross Domestic Product, or GDP (Whiteford 2015)).

As well, in 2011, around 42% of social benefits in Australia went to the lowest (or most disadvantaged) quintile of households. This compares with slightly more than 20% of benefits, on average, going to the lowest quintile of households across all OECD countries. Further, only 3.8% went to the highest 20% of households in Australia—the lowest figure of all OECD countries and well below the OECD average of 20% (CEDA 2014; OECD 2014).



Source: Adapted from OECD 2014.

Figure 1.3.2: Public spending on income and means-test benefits as a proportion of public social spending on cash benefits, by selected OECD countries, 2012 or latest year available

Major income support payments

The most commonly accessed income support payment types are the Age Pension, Newstart Allowance and Youth Allowance. The Age Pension is by far the largest income support payment, with the most recipients (2.6 million eligible senior Australians, as at December 2016) (DSS 2017a). However, 2 in 5 (42%) people who received the Age Pension in 2015–16 were on a part rate. This means, that due to means testing, they receive only part of the payment. The proportion of the population receiving a part rate has been increasing over time. This is mostly due to new retirees who reach pension age having higher levels of income and assets than retirees before them, which, in turn, can be largely attributed to the design of Australia's compulsory superannuation system (Productivity Commission (Australia) 2015; DSS 2016b).

There is also a range of supplementary payments. These comprise various additional long- or short-term payments, including those made during transitional periods to help with particular life situations or costs. The Family Tax Benefit A is the supplementary payment type with the largest recipient group (1.5 million families received assistance with the cost of raising children, as at December 2016) (DSS 2017a). Other types of supplementary payment include Paid Parental Leave and the Carer Allowance. There are also many payments accessed less often for people in time of need, such as the Crisis Payment (a one-off payment for people in severe financial hardship), the Bereavement Allowance and the Double Orphan Pension.

Tax exemptions and concessions

Various tax exemptions, deductions, offsets, concessional rates and deferral of tax liabilities are provided for welfare purposes. For example, a taxpayer may be entitled to claim a tax offset when they support a close family member receiving a disability support pension. Offsets are also available for eligible taxpayers who are seniors or pensioners, low-income earners, or beneficiaries of particular payments and allowances (ATO 2016). Governments at all levels, and some private organisations, also issue concession and health cards to eligible Australians. These provide access to discounts—mainly for medication and health services (DHS 2017).

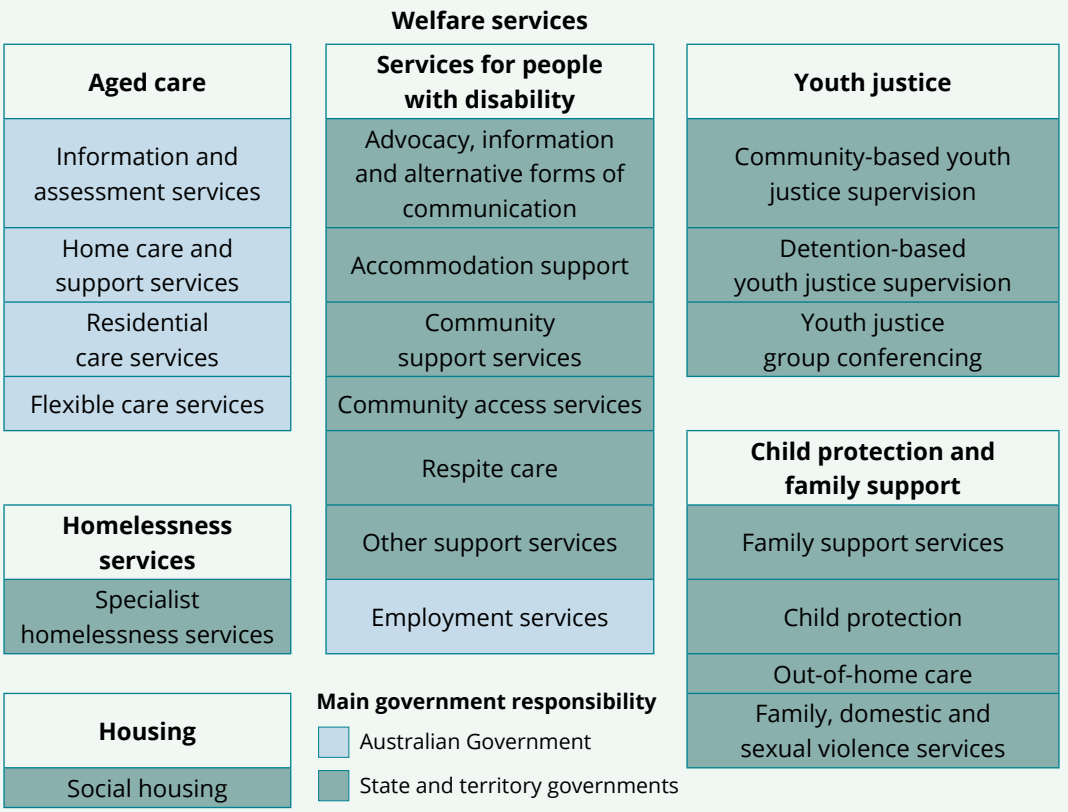
Based on modelled tax expenditures (which are underpinned by a set of assumptions, and may exclude some alternative tax arrangements), tax expenditures in 2015–16 accounted for around 30% of welfare expenditure—up from 27% in 2014–15 (AIHW welfare expenditure database). The Treasury estimated that tax expenditure or concessions by the Australian Government for welfare amounted to $47 billion in 2015–16 (for more information on tax concessions and welfare expenditure, see Chapter 1.4 'Welfare expenditure').

Welfare services

Welfare services (often referred to as 'community services') are provided to vulnerable individuals and families of widely differing ages and social and economic circumstances. As well as helping individuals and families directly, services may also indirectly help others in need. For example, they may help to develop community networks and infrastructure that help to access services.

Some services (such as those for health and education) help to enhance wellbeing for individuals throughout their life. There are also those specifically seen as 'welfare' or 'social' services. These services respond to need across people's lives, aim to encourage participation and independence, and assist in creating a cohesive society (DSS 2015).

Figure 1.3.3 presents a summary of the major welfare service types provided in Australia that are discussed in more detail in this report, together with income support and supplementary payments (described above). These service types closely align with the outcome priorities of the Department of Social Services: social security (financial support), families and children, ageing and aged care, disability and carers, and housing (DSS 2015).



Note: The services listed under 'services for people with disability' are based on current National Disability Agreement categories. The current transition to the National Disability Insurance Scheme, taking place over a 5-year period, will transform the type and nature of disability services, as well as the overall government responsibility (which moves to the Australian Government).

Source: Adapted from SCRGSP 2016.

Figure 1.3.3: Major welfare service types in *Australia's welfare*, by main government responsibility

Delivery of welfare services

The responsibility for funding and managing these services mainly lies with Australian or state and territory governments; however, arrangements for the delivery of welfare services are complex. In many cases, services are delivered by non-government organisations, or NGOs (profit and not-for-profit). These NGOs are predominantly 'approved providers'—meaning they have been formally authorised, contracted and/or funded by government to provide particular services. Further, service delivery can be shared between these NGOs or local governments and state and territory governments. The relative involvement of organisations varies from program to program, and between states and territories. Private investment in welfare services is also a relatively new and growing area (see 'Social investment approaches' later in this article).

It is also worth noting that beneath the high-level services described in Figure 1.3.3 are services that can and do cross service types and sectors. For example, respite care provides a formal break for clients and their families in the context of out-of-home care, disability support services, aged care services, and for young informal carers. Similarly, support for family, domestic and sexual violence may be delivered in specialist homelessness and other service settings, as well as being provided though family support services (see Chapter 2.7 'Family, domestic and sexual violence': Figure 2.7.4). There are also other services that foster wellbeing in, or across, other sectors.

Note that while this report discusses areas of policy and program interest outside of these specific welfare services, its focus is generally on welfare outcomes (for example, entering employment, readiness for school, or attaining school qualifications).

Current and future reforms

Reforms to the delivery of Australian welfare services in recent years have aimed to introduce a more person-centred approach in providing welfare services. The National Disability Insurance Scheme, which is being rolled out at a national level between 1 July 2016 and July 2020, is one example of how this approach has been adopted in the disability sector (see Chapter 8.1 'People with disability'; Chapter 1.7 'Understanding health and welfare data').

Another trend emerging among governments responsible for social policy—both nationally and internationally—is developing new and innovative ways to fund and deliver welfare services.

Social investment approaches

Over recent years, there has been growing interest in a 'social investment' approach to complex welfare issues. In its most general sense, social investment involves spending on programs up front to provide better long-term outcomes for a given population. This has the added benefit of achieving future savings for government, as better outcomes mean reduced future reliance on government services and/or income support. For example, a United States study estimated that the long-term benefits of an early childhood program focused on vulnerable families yielded a return on investment of over 13% per annum, while showing substantial and sustained improvements in outcomes for the families, including in health, education, employment and contact with the criminal justice system (Garcia et al. 2016). Research in the United Kingdom has also shown benefits from prenatal interventions for 'at risk' mothers, with regular visits from a family nurse before and after the birth of a child (and continuing to the child's second birthday) showing a wide range of positive outcomes for both mother and child (EIF 2017).

The major principles behind social investment have been established for some time, with their application expanded in recent years. Internationally, this includes the European Commission's establishment of a social investment package in 2013. It incorporates the development of a strong evidence base to determine what interventions work when aimed specifically at children. This social focus has now been transformed into the European Pillar of Social Rights, which sets out an ambitious agenda across three major reform areas—equal opportunities and access to the labour market, fair working conditions, and adequate and sustainable social protection (European Commission 2016, 2017).

Social impact bonds

The expansion of 'investment' to incorporate privately-funded bonds is relatively new but a rapidly growing initiative. First developed in 2010 by the United Kingdom Government, these 'social impact bonds'—also known as 'social benefit bonds'—are offered to private investors, who provide capital to fund specific projects in return for a future financial return paid on delivery of specific social outcomes.

Australian governments have begun to introduce social impact bonds, with some early successes evident.

- Australia's first social impact bond was the Newpin Social Benefit Bond—a program to reunite families and prevent entry into statutory out-of-home care. The program restored a total 130 children to their families in New South Wales between 2013 and 2016, while delivering an above-target return to investors of 12.2% in 2016 (OOSII 2017).
- In early 2017, the South Australian Government launched Aspire—Australia's first social impact bond to focus on the homeless population. It aims to improve health, employment, justice and housing outcomes for up to 600 individuals over a 4-year period (SVA 2017).
- The Victorian Government has announced its intention to develop its first social impact bond in 2017. It will work collaboratively with an NGO consortium in focusing on improved outcomes for young people leaving out-of-home care (Premier of Victoria 2017).

Welfare investment approaches

Alongside the expansion of social investment has been the introduction of Australia's Priority Investment Approach, modelled on the New Zealand welfare investment model. While 'social investment' and 'welfare investment' are increasingly being used interchangeably, in an Australian and New Zealand context, the latter is more narrowly focused.

Welfare investment refers to specific programs that use detailed actuarial modelling to provide a baseline estimate of individual lifetime welfare costs to guide the targeting of packages of services at the group or individual level. They are set up to project and track actual government savings over the long term, providing information that feeds back into better targeting and more effective services. They also allow innovative approaches to reduce long-term welfare dependency to be tested (OECD 2015b, 2017) (see also Box 1.3.1).

The adoption of welfare investment principles is proving to be applicable at state level. The Victorian Government has drawn on the principles from the New Zealand and Australia-wide models to establish the Victorian Social Investment Integrated Data Resource. This Data Resource—a large, integrated state-wide data set—is intended to be used to identify priority groups for early intervention, create a model of expected future costs, and apply this to develop packages of services that better support people in these groups.

Box 1.3.1: Investment approaches to welfare

A welfare investment model aims to reduce the reliance of a population on government welfare payments. This is done by estimating—via statistical modelling—how many people will be likely to rely on these payments into the future (and for how long), and then developing interventions (investments) to reduce this contact as much as possible.

New Zealand model

New Zealand's welfare investment model introduced a world-first approach by estimating lifetime costs of the working-age population who are, or are likely to be, reliant on social security payments (Taylor Fry 2016). In late 2011, the New Zealand Government announced a welfare package coupled with a baseline valuation report (Taylor Fry 2011), with an overall target of reducing future government liabilities by $NZ 13 billion by 30 June 2018 (SSC 2016).

Australia's Priority Investment Approach

The development of an Australian welfare investment model was a major recommendation of the McClure report into Australia's welfare system (Reference Group on Welfare Reform 2015). It cited the New Zealand model as having substantial potential in an Australian context. In 2015–16, the Australian Government announced funding to implement the Australian Priority Investment Approach. This included an initial actuarial valuation of the Australian Government's social security system. The total future lifetime cost of providing social support for the whole model population was estimated to be $4.8 trillion as at 30 June 2015 (DSS 2016c).

In 2016–17, a further $96.1 million was committed to creating a 'Try, Test and Learn Fund' to finance the development and implementation of innovative targeted early intervention programs. The first tranche (round) of the 'Try, Test and Learn Fund' is focused on three priority groups:

- young carers aged under 25 who started receiving the Parenting Payment at age 18 or under and who are still receiving an income support payment
- young parents aged under 25 who are receiving a Carer Payment or are at immediate risk of going onto the payment
- young students aged under 25 who have moved, or are at risk of moving, from study to an extended period on an unemployment payment.

Trials of new policy responses, which will be developed from a shortlist of ideas, are scheduled to be rolled out in the second half of 2017 (DSS 2016a). The Australian approach differs from the New Zealand model in that it has not set specific targets for cost or recipient reduction. Rather, its overall goals are to: improve lifetime wellbeing through targeted interventions to increase the capacity of people to live independently of welfare (especially through employment), manage the risk of intergenerational welfare dependency, and reduce long-term social security costs. The Australian model also projects future welfare use for the entire Australian resident population, including both current recipients and people not currently in the system.

Some concerns have been raised about the potential of the investment approach to produce unexpected or perverse outcomes. It has been noted that reducing eligibility for some types of benefits could result in the emergence of other social issues (for example, an increase in homelessness) (Productivity Commission (New Zealand) 2015; Taylor Fry 2011). In an Australian context, the Australian Council of Social Service has also noted concerns that the initial focus on young people does not consider the immediate needs of other sections of the population; for example, older jobseekers (ACOSS 2014).

What is missing from the picture?

Many welfare-related data sources are restricted by their focus on a single, specific area, often related to the receipt of a single service at a defined point in time. This limits the ability to analyse and report meaningful information about an individual's wellbeing.

Linking data from multiple sources (data linkage) can provide more information about an individual or institution than one data source alone. In certain cases, this can provide a time sequence, helping to show a 'pathway' (for example, the sequential contact an individual makes with services across systems) and provide insights into cause and effect. The AIHW has undertaken several data linkage projects—for example, linking data from youth justice, child protection and specialist homelessness services to better understand the characteristics of vulnerable young people across all three sectors (see 'Where do I go for more information?'). Further linkage may provide more meaningful data on health and welfare service requirements and outcomes at an individual level (see Chapter 1.7 'Understanding health and welfare data' for further discussion on current data gaps).

Where do I go for more information?

Up-to-date information on payments and allowances for all income support programs, including eligibility criteria, can be sourced from the Department of Social Services and Department of Human Services websites. A guide to Australian Government payments is available on the Department of Human Services website.

Access the DSS website for information on government support for families and children, seniors, communities and vulnerable people, homeless people, people with disability and carers.

AIHW reports on welfare service usage and clients can be found at www.aihw.gov.au. Topics of interest may include:

1.4 Welfare expenditure

The Australian and state and territory governments contribute to welfare spending, as do non-government organisations and individuals. The Australian Government primarily contributes through cash payments relating to its areas of responsibility, as defined in the Australian Constitution (which include family allowances, unemployment benefits and pensions), although it also contributes some expenditure on welfare services. The states and territories focus more on providing welfare services. Government expenditure on cash payments and welfare services is reported in this article as welfare expenditure.

Both the Australian Government and state and territory governments often choose to provide welfare services by funding organisations in the non-government sector to deliver them. The non-government sector also contributes some welfare services expenditure from its own sources, including fees charged to individuals. However, there are limited data available on expenditure by the not-for-profit non-government sector (see Box 1.4.4) and the for-profit non-government sector, such as aged care providers. Expenditure on welfare services by the non-government sector from its own sources (including expenditure by individuals) is therefore not included as welfare expenditure in this article.

At the time of writing, the most recent welfare expenditure data available for state and territory governments and for Indigenous Australians was for 2012–13, as published in the *2014 Indigenous expenditure report* (SCRGSP 2014), and in *The health and welfare of Australia's Aboriginal and Torres Strait Islander peoples: 2015* (AIHW 2015). State and territory data were estimated for 2011–12 and for 2013–14 to 2015–16 using available trend data. Based on the estimated data, in 2015–16, state and territory governments spent $17.8 billion on welfare, all on services with no expenditure on cash benefits (42.1% of government expenditure on welfare services and 11.3% of government expenditure on welfare overall). This outlay is similar to the proportions in 2012–13, when data sourced from the *2014 Indigenous expenditure report* indicated proportions of 44.4% and 11.7%, respectively. (See also Chapter 7.5 'Income and employment for Indigenous Australians' for more details on the number of Indigenous Australians who receive income support payments and other benefits from the Australian Government.)

Where possible, the welfare expenditure estimates have been developed to be consistent with the AIHW's Welfare Expenditure Series of publications, in which welfare expenditure was last reported in full for the 2005–06 financial year (AIHW 2007). This has been done to maintain a consistent time series with data from 2005–06 and before. As a result, however, these estimates of welfare expenditure may not match the coverage of 'welfare' in other sections in this report or in other AIHW publications.

Cash payments covered are those provided by the Australian Government to assist older people, people with disability, people who provide care for others, families with children, war veterans and their families, and people who are unemployed (see Box 1.4.2).

Welfare services covered include supported accommodation, family support, early intervention programs, outreach services, counselling, youth programs, child care services, home and community care services for older people, and specialist services for people with disability (see Box 1.4.3).

This article covers the amounts spent on financial assistance and welfare services; however, it does not assess the adequacy or effectiveness of this expenditure.

Expenditure is reported in constant prices (that is, adjusted for inflation) except where noted (see Box 1.4.1).

Box 1.4.1: Current and constant prices

'Current price' refers to expenditure reported for a particular year, unadjusted for inflation.

'Constant price' estimates in this article indicate what the equivalent expenditure would have been had 2015–16 prices applied in all years; that is, it removes the inflation effect. The phrase 'real terms' is often used where constant prices are referred to. Constant price estimates for expenditure have been derived using deflators produced by the Australian Bureau of Statistics (ABS). The Consumer Price Index was used for cash payments and the government final consumption expenditure implicit price deflator was used for welfare services.

Trends in welfare expenditure

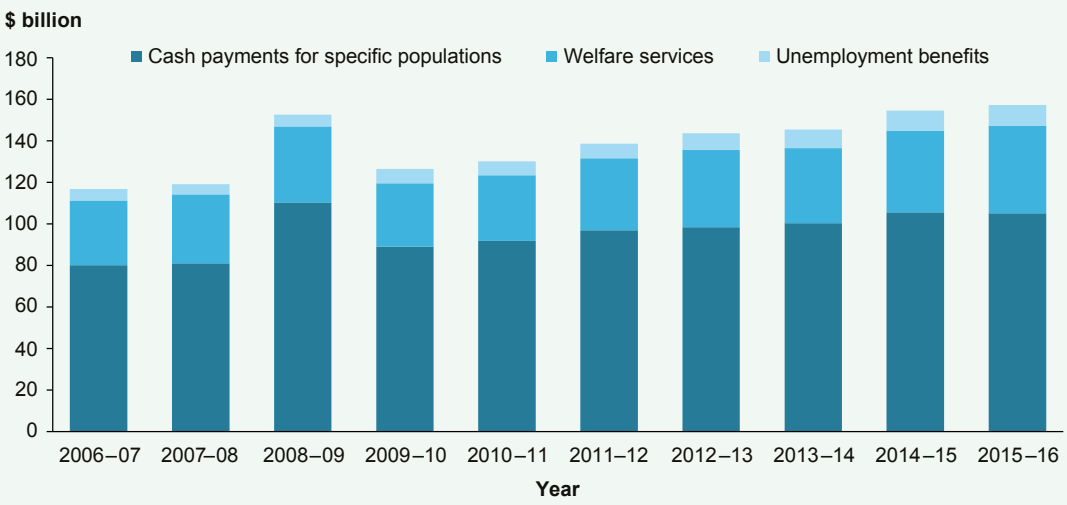
In 2015–16, expenditure by Australian and state and territory governments on welfare was $157.2 billion, up from $116.8 billion in 2006–07 (constant prices—see Box 1.4.1 for information). It included 66.8% ($105.1 billion) in cash payments for specific populations (not including unemployment benefits), 26.9% ($42.2 billion) in welfare services and 6.3% ($9.9 billion) in unemployment benefits (Figure 1.4.1).

Welfare expenditure increased between 2006–07 and 2015–16, with an average annual growth rate of 3.4% in real terms. There was a notable increase in 2008–09, when the Australian Government implemented several initiatives as part of a response to the Global Financial Crisis (GFC). These initiatives increased expenditure substantially in that year.

Expenditure grew faster than the population, which grew at an average of 1.7% a year over the 10-year period. This resulted in per person expenditure rising an average of 1.7% a year over the 10-year period in real terms (from $5,663 to $6,566 per Australian resident) (Supplementary Table S1.4.4).

Welfare expenditure grew more quickly than the overall economy over the same period. Gross Domestic Product (GDP) grew by 2.7% in constant prices each year between 2006–07 and 2015–16, compared with 3.4% annual growth in welfare spending. As a result, welfare expenditure grew from 8.6% of GDP in 2006–07 to 9.5% in 2015–16 (Figure 1.4.2).

As a proportion of taxation revenue, government spending on welfare was 29.3% in 2006–07. It then rose in response to the GFC, contributed to by both increases in welfare spending and slow taxation revenue growth. The spending-to-revenue ratio remained higher in the following years, ending the period at 35.1% of revenue in 2015–16.



Notes

1. Estimates for states and territories have been modelled for 2011–12 and for 2013–14 to 2015–16.
2. 'Cash payments for specific populations' includes associated Commonwealth Rent Assistance, as well as one-off payments made as part of the Economic Security Strategy in 2008–09.
3. Only expenditure on Newstart Allowance and associated Commonwealth Rent Assistance is included in 'unemployment benefits'.
4. Constant price estimates are expressed in terms of 2015–16 prices (see Box 1.4.1).

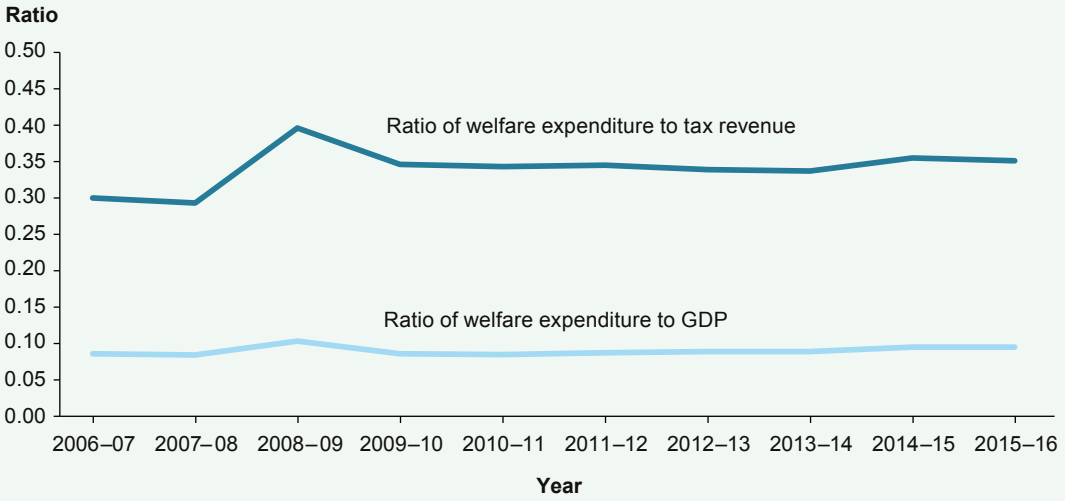
Figure 1.4.1: Government welfare expenditure, by type of expenditure, constant prices, 2006–07 to 2015–16



Note: Estimates for states and territories have been modelled for 2011–12 and for 2013-14 to 2015-16.

Source: AIHW welfare expenditure database.

Figure 1.4.2: Ratio of government welfare expenditure to tax revenue and GDP, 2006–07 to 2015–16

Cash payments

In 2015–16, the total amount spent by governments on cash payments, excluding unemployment benefits, was estimated at $105.1 billion, down slightly from $105.5 billion the previous year but up from $80.0 billion in 2006–07 (Figure 1.4.3). The contribution of cash payments to total welfare spending was 66.8% in 2015–16, which was relatively unchanged from 2006–07 when it was 68.6%.

Of the estimated $115.0 billion spent on cash payments (including unemployment benefits) in 2015–16, $46.4 billion was for older people, $30.9 billion was for families and children, $26.0 billion for people with disability, $9.9 billion was spent on unemployment benefits, and the rest was on 'other' cash payments (Figure 1.4.3).

Between 2006–07 and 2015–16, spending grew at an average rate per year by 5.7% for people with disability, by 3.5% for older people and by 1.2% for families and children. Spending on 'other' cash payments fell by 3.6% on average per year (Table S1.4.3).

Box 1.4.2: Which cash payments are included?

The estimates of cash payments in this article include expenditure by the Australian Government, such as for the Age Pension, Disability Support Pension, Veterans' Affairs pensions and Carer Allowance.

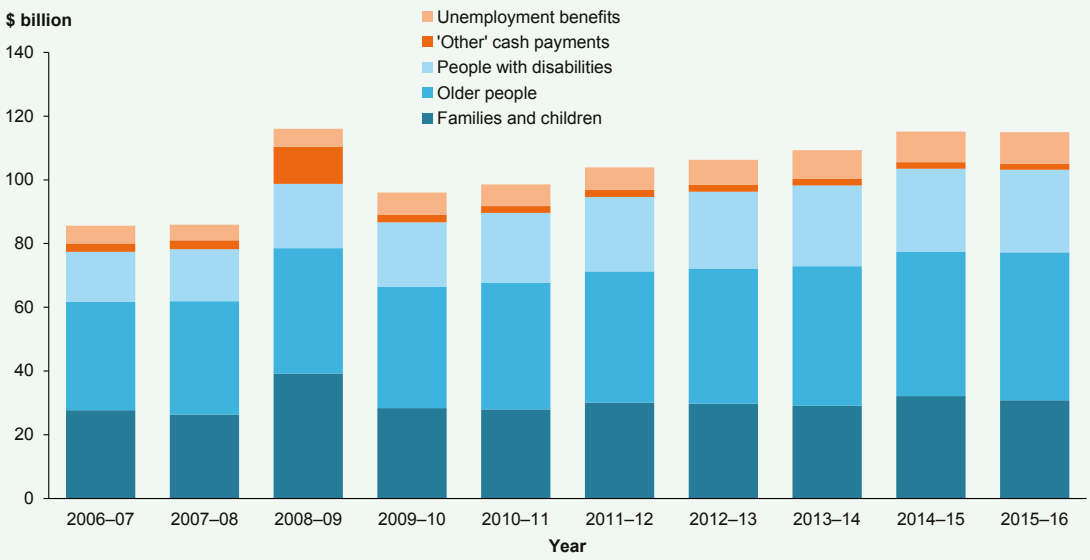
To maintain comparability over time, the Child Care Benefit and Child Care Rebate are included in the estimates of welfare services expenditure (rather than cash payments) since, historically, these payments were paid to the service providers rather than directly to households.

Also, to maintain comparability over time, Youth Allowance, Austudy and ABSTUDY are not included in the estimates in this article (although information on these allowances is included in Chapter 4.2 'Key employment trends').

Youth Allowance (Student) is available to eligible young people aged 16 to 24. It provides financial support for students to participate in full-time education, training or apprenticeships. In 2015–16, $2.4 billion was spent on Youth Allowance for students.

Youth Allowance (Other) is available to eligible young people aged 16 to 21 who are looking for work or undertaking other activities to improve their employment prospects. In 2015–16, $1.0 billion was spent on Youth Allowance (Other) (DSS 2017c).

Austudy provides financial assistance to full-time students and apprentices aged 25 and over ($0.6 billion in 2015–16) and ABSTUDY provides support to Indigenous people who are studying or undertaking a full-time apprenticeship ($0.3 billion in 2015–16) (DSS 2017a).



Notes

1. Estimates for states and territories have been modelled for 2011–12 and for 2013–14 to 2015–16.
2. Constant price estimates are expressed in terms of 2015–16 prices (see Box 1.4.1).
3. Data include associated Commonwealth Rent Assistance.

Source: AIHW welfare expenditure database.

Figure 1.4.3: Government cash payments expenditure, by major area of expenditure, constant prices, 2006–07 to 2015–16

Unemployment benefits

Between 2006-07 and 2015-16, the total amount spent on unemployment benefits (Newstart Allowance) grew from $5.6 billion to $9.9 billion in real terms. There are two main contributing factors. Firstly, there was an increase in the number of unemployed persons; the average annual unemployment rate increased from 4.8% in 2006 to 5.8% in 2016 (See Chapter 4.2 'Key employment trends': Figure 4.2.1). Secondly, there was a large number of Parenting Payment recipients who transferred to Newstart Allowance between 2011–12 and 2013–14 (DSS 2017b) (Table S1.4.4). While it is difficult to directly track this shift in expenditure between categories, there were similar, (though not quite as large) decreases in cash payments to 'Families and children' and 'Other' cash payments in the corresponding period.

In real terms, spending per person on unemployment benefits increased from $270 per Australian resident in 2006–07 to $414 per Australian resident in 2015–16.

Welfare services

In 2015–16, the total amount spent by governments on welfare services was estimated at $42.2 billion, up from $31.2 billion in 2006–07 and $39.4 billion in the previous year (Table S1.4.1). Most spending on welfare services is recurrent, and comprises payments for wages, salaries, operating expenses and running costs. The remainder is capital expenditure. Over the decade to 2008–09, government capital expenditure on welfare services was less than 2% of total welfare services expenditure (AIHW 2011). An estimate of capital expenditure for more recent years is not available.

Due to a lack of state and territory spending data for recent years, it is difficult to be certain what proportion of spending on welfare services was by the states and territories as opposed to the Australian Government. Based on the modelled data, in 2015–16, it is estimated that the state and territory governments were responsible for 42.1% of government expenditure on welfare services.

Box 1.4.3: What does expenditure on welfare services cover?

Welfare services encompass a range of services and programs to support and assist people and the community, such as family support services, youth programs, child care services, services for older people, and services for people with disability.

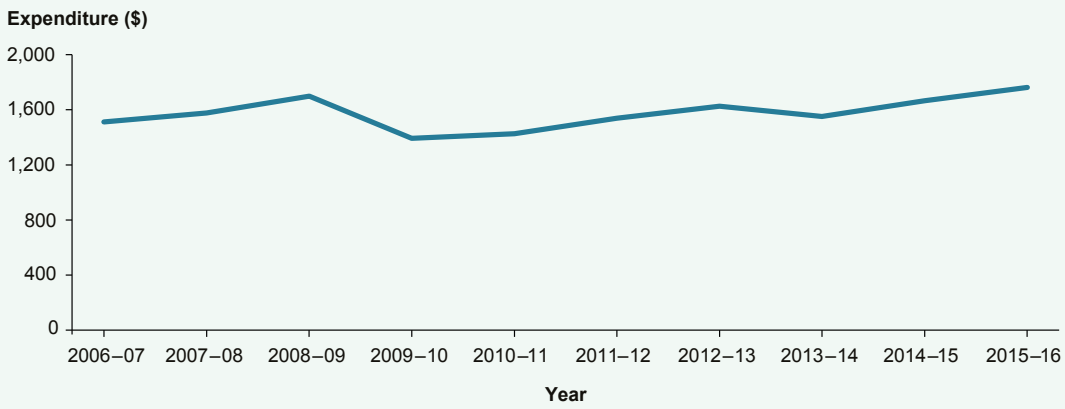
Welfare services expenditure presented in this article is reported for the target groups specified in the ABS Government Purpose Classification for welfare service financial transactions:

- family and child welfare services; for example, youth support services
- welfare services for the aged; for example, home and community care services
- welfare services for people with disability; for example, personal assistance
- welfare services not elsewhere classified (ABS 2005).

The welfare services estimates include government expenditure only (see Box 1.4.4 for information about non-government expenditure).

Welfare spending defined according to these four target groups does not necessarily include all government spending on services that may have a welfare benefit. For example, some programs relevant to people with disability—and that might be considered welfare services—are in the Government Purpose Classification categories of education, health or housing. Some types of welfare services that are covered elsewhere in this report (such as employment services) are also not included.

The average amount spent by governments on welfare services per Australian resident in 2015–16 was $1,763, up from $1,512 in 2006–07 and $1,667 in 2014–15 (Figure 1.4.4). The per person cost represents total spending on welfare services per person in the population. It does not reflect spending for each eligible person or spending per recipient.



Notes

1. Estimates for states and territories have been modelled for 2011–12 and for 2013–14 to 2015–16.
2. Constant price estimates are expressed in terms of 2015–16 prices (see Box 1.4.1).

Source: AIHW welfare expenditure database.

Figure 1.4.4: Government welfare services expenditure per Australian resident, constant prices, 2006–07 to 2015–16

Box 1.4.4: Non-government community service organisations

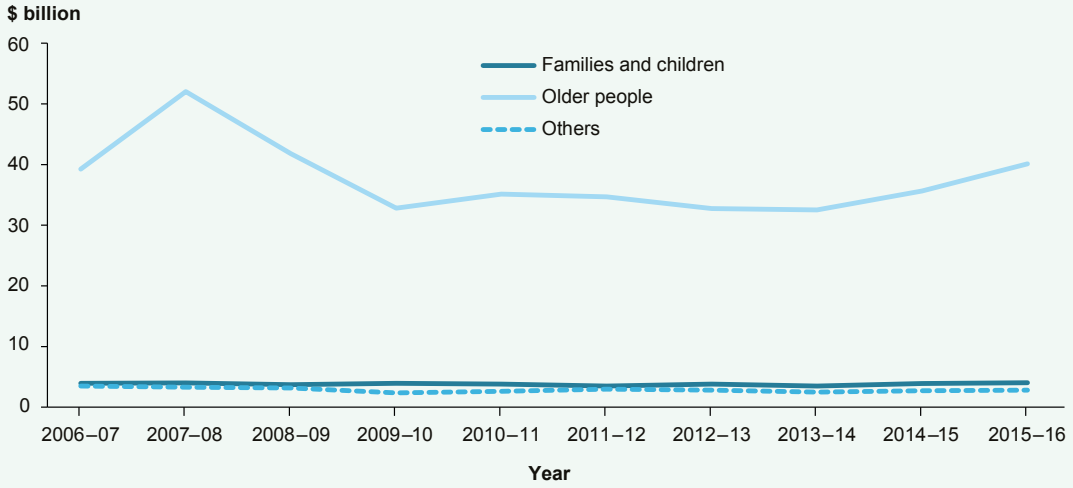
Non-government organisations, particularly non-government community service organisations (NGCSOs), play an important part in delivering welfare services. As indicated earlier, governments fund a large part of the services delivered by NGCSOs. This expenditure is included in the analysis of welfare services expenditure in this article. NGCSO expenditure that comes through fees paid by clients or NGCSOs' own sources, such as fund-raising, is not included. This is because comprehensive information on those sources of funds is not readily available in a way that is consistent and comparable with other information in this article. The most recent year for which comprehensive data for NGCSOs are available was 2008–09 (AIHW 2011), though some data on not-for-profit NGCSOs is available for 2012–13 (ABS 2015).

Tax concessions

Various tax exemptions, deductions, offsets, concessional rates and deferral of tax liabilities are provided for welfare purposes. The Australian Government Treasury estimated that tax expenditure or concessions by the Australian Government for welfare amounted to $47 billion in 2015–16. This does not include any tax expenditures by state, territory or local governments. This amount is not included in the estimates of total welfare spending in this article as it is generally in the form of foregone potential revenue rather than expenditure (Treasury 2017).

Most of the tax concessions total ($35 billion, or 75%) was for concessions for superannuation, which aim to assist people to save for or fund their retirement. Of the remainder, $4.0 billion (9%) was for concessions for families and children (Table S1.4.6). Tax concessions for families and children include exemption from taxation for disaster relief and child care assistance payments.

Australian Government tax concessions for welfare peaked in 2007–08 (Figure 1.4.5). The decline in concessions in 2008–09 and 2009–10 reflects the effects of the GFC, in particular, slower growth in the profits of superannuation funds (Treasury 2012).



Notes

1. 'Others' refers to welfare-related concessions expenditure not specifically aimed at families and children, or older people.
2. Constant price estimates are expressed in terms of 2015–16 prices (see Box 1.4.1).

Sources: Australian Treasury, 2010 to 2017.

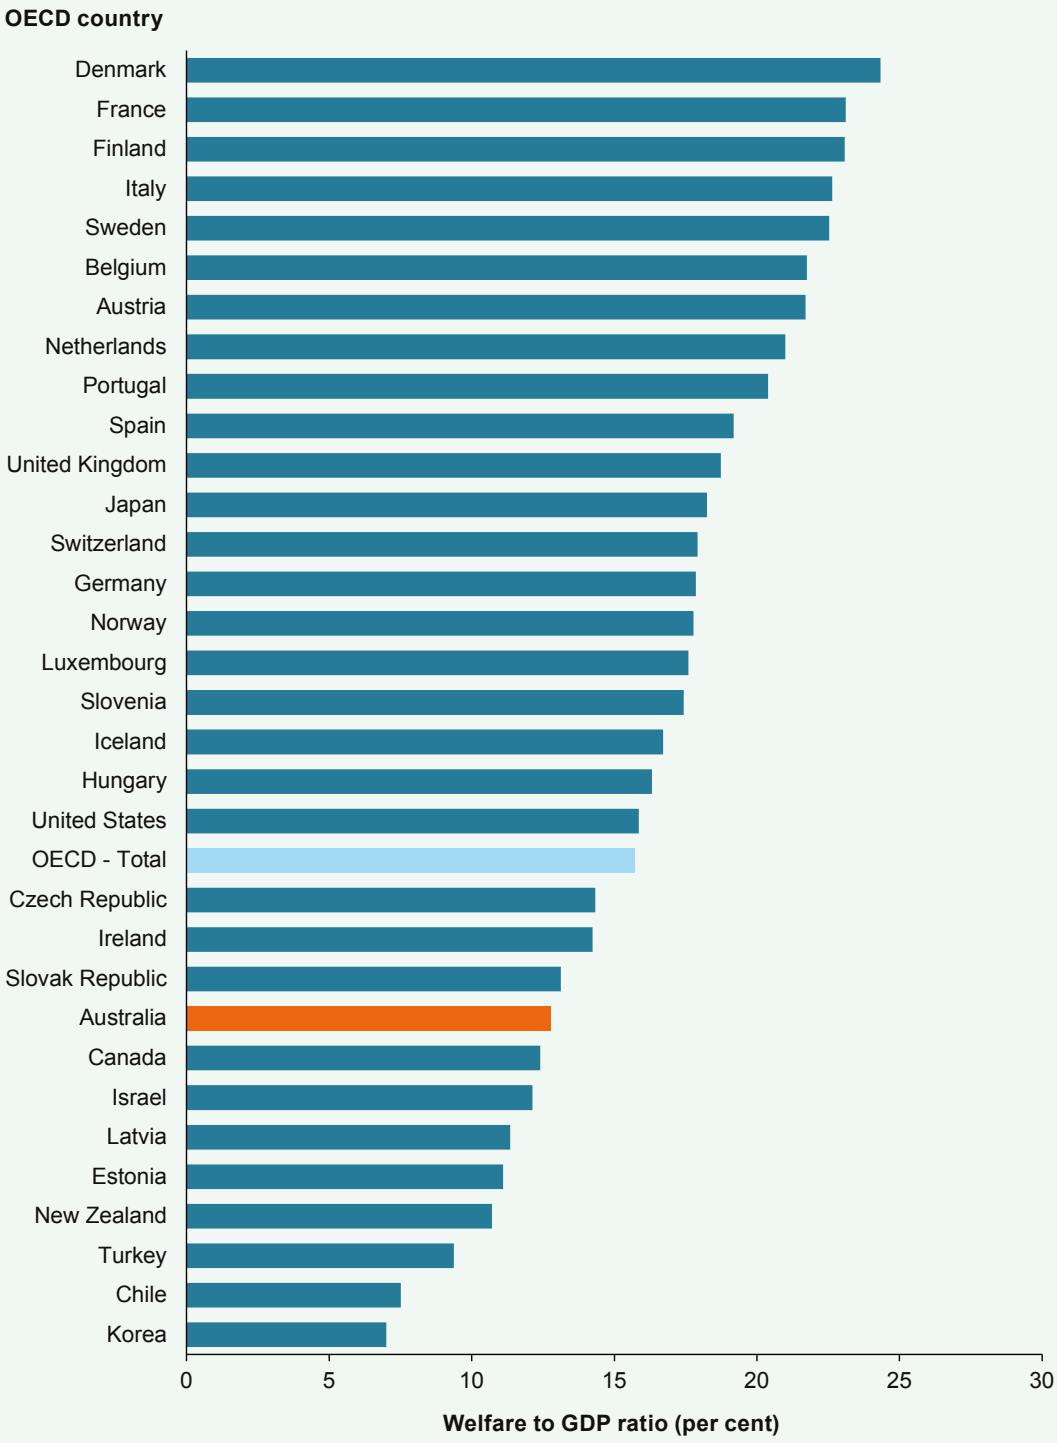
Figure 1.4.5: Tax concessions by the Australian Government for welfare, by type of concession, 2006–07 to 2015–16

International comparisons

There are many difficulties in comparing the welfare spending of different countries. Social support structures in many countries are complex, and not necessarily comparable. Systems generally involve mixtures of:

- government and non-government funding arrangements—including programs funded directly by governments, tax-based systems, employer-focused schemes and fee for service systems
- redistribution models—social support structures in some countries focus on redistribution between sections of the society at particular, but often differing, times. For example, in Australia, unemployment benefits transfer resources via the tax system from the employed to the unemployed. Other schemes act to redistribute resources over the life course (such as through savings and superannuation-based schemes)
- targeted versus non-targeted support arrangements—many countries use means testing to target support, but do it in different ways with different thresholds.

Organisation for Economic Co-operation and Development (OECD) data for 2013 show that welfare expenditure in Australia was 12.8% of GDP (using the OECD methods for calculating expenditure that differ from the methods used for estimates elsewhere in this article). This was lower than the OECD median of 17.1% (Figure 1.4.6) and puts Australia's welfare expenditure in the lowest third of all OECD countries (OECD 2017).



Note: Excludes health, active labour market programs and housing from OECD Social expenditure database. Data for Greece, Mexico and Poland are not yet available.

Source: OECD Social Expenditure database 2017.

Figure 1.4.6: Welfare expenditure as a proportion of GDP, OECD countries, 2013

The Australian social security system differs from those in most countries of Europe and in the United States in several ways, including:

- the benefits are generally more targeted through means testing than being based on factors such as past earnings (see Chapter 1.3 'Understanding welfare')
- the system is largely funded by general government revenue rather than by contributions by employers or insured employees
- benefits are not time limited.

Australia has a different demographic and employment structure than many other OECD countries. For example, the proportion of the population who are aged differs; so do unemployment rates. This drives differences in aged and unemployment pension structures. Whiteford (2014) argues that these differences contribute to making the Australian system relatively efficient in terms of the distribution of benefits to the most needy, suggesting that the below-average spending understates the impact of the spending in terms of its more targeted nature.

What is missing from the picture?

Estimates of non-government expenditure sourced through fees or fund-raising are an important information gap, as are estimates of expenditure on capital. For example, the currently available data do not allow analysis of how expenditure on welfare services by individuals has changed over time. It is unclear whether individuals are now paying a greater proportion of the cost of welfare services or less. It is also unclear how much is being spent on capital—infrastructure and equipment to support welfare provision—and who is paying.

Some important disaggregations (such as between Australian and state/territory government expenditure) have not been included in this article due to a lack of up-to-date data.

Where do I go for more information?

More information can be found in *Welfare expenditure Australia 2005–06* and in the AIHW report: *The health and welfare of Australia's Aboriginal and Torres Strait Islander peoples: 2015*.

1.5 Welfare workforce

An estimated 478,000 people were employed in the welfare workforce (see Box 1.5.1) in 2015. This workforce has grown by 84% since 2005 (259,000 employed people in 2005). About 2,000 people per 100,000 population were employed in the welfare workforce in 2015 (an increase of 56% since 2005); of the people employed, about 5 in 6 were female. Overall, the welfare workforce represented 4.1% of the total 11.8 million people employed in Australia in 2015.

Box 1.5.1: Defining the welfare workforce

There is no single definition of the welfare workforce. In this article, it is defined as people who are employed both in a community service industry and a community service occupation, such as an early childhood education and care worker in the preschool education industry.

Community service industries were identified using the Australian and New Zealand Standard Industrial Classification (ABS 2006); community service occupations were identified using the Australian and New Zealand Standard Classification of Occupations (ABS 2013).

The definition excludes some people in a community service occupation who are not employed in a community service industry, such as nurses employed in the health sector (hospitals) or counsellors in the school education sector. Likewise, it excludes some people employed in a community services industry who are not in a community services occupation; for example, accountants, administration staff and tradespeople.

In this article, community service industries have been grouped into three categories:

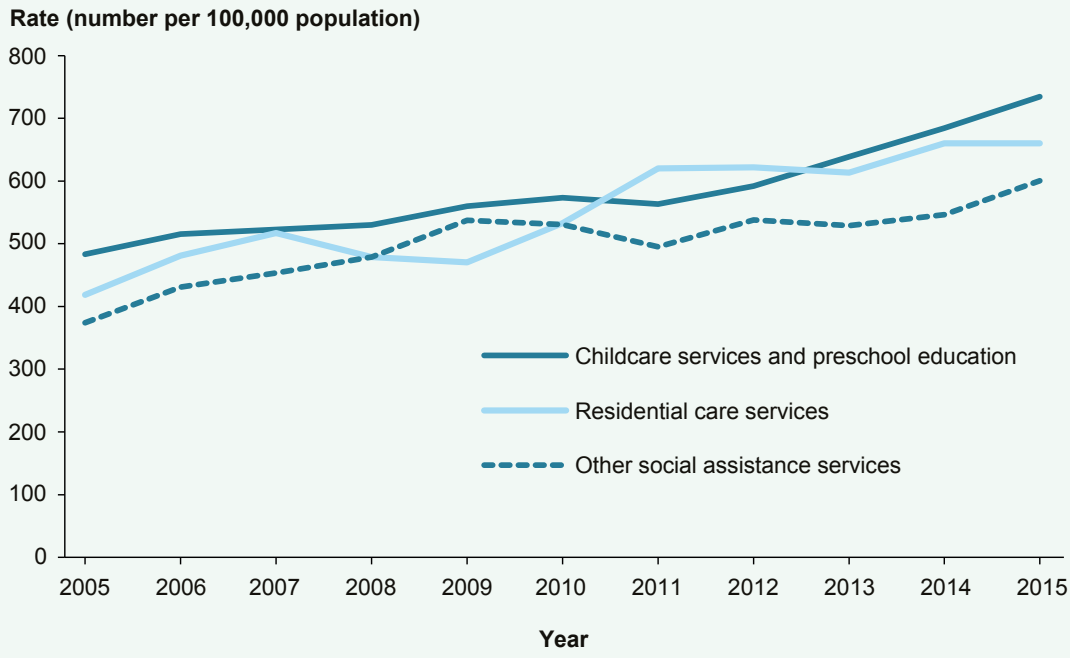
- child care services and preschool education, which includes child care services, operation of nurseries, child-minding services and accredited pre-primary school education
- residential care services, which includes aged care residential services and other forms of residential care services
- other social assistance services, which includes a variety of social support services such as adoption services, adult day care centres, and disability assistance services.

The data source used for information on this workforce is the ABS Labour Force Survey (ABS 2016). This Survey collects information on the number of people employed in occupations and industries and not full-time equivalent staff rates. For this article, 'employed people' refers to a head count of workers.

Community service industries

The industry with the largest welfare workforce in both 2005 and 2015 was the *Child care services and preschool education* industry; however, it varied somewhat throughout the period as the workforce numbers fluctuated (Figure 1.5.1).

The welfare workforce per person rates of all three community service industries (see Box 1.5.1) grew between 50% and 60% over 2005–2015: 52% for the *Child care services and preschool education* industry (from 484 to 734 employed people per 100,000 population), 58% for the *Residential care services* (from 419 to 660) and 60% for the *Other social assistance services* industry (from 374 to 600).



Source: AIHW analysis of ABS Labour Force Surveys 2005 to 2015.

Figure 1.5.1: Number of employed people in the welfare workforce per 100,000 population, by type of community service industry, 2005 to 2015

Community service occupations

Early childhood education and care workers was the largest community services occupation group in the welfare workforce in 2015, at 711 employed people per 100,000 population (Table 1.5.1). *Early childhood education and care workers* were almost exclusively employed in the *Child care services and preschool education* industry in 2015.

The *Aged and disabled carers* occupation group was the second largest group, growing from 196 to 515 employed people per 100,000 population between 2005 and 2015. This group is expected to grow substantially with the rollout of the NDIS, with the Productivity Commission estimating that 1 in 5 new jobs created in Australia over the next few years will need to be in the disability care sector (Productivity Commission 2017).

The number of *Nursing support and personal care workers* also grew, from 132 to 239 employed people per 100,000 population between 2005 and 2015. Of the remaining occupations, Table 1.5.1 shows that half of them experienced growth over the period, while the other half were in decline.

Some occupations were distributed across multiple industries. *Aged and disabled carers*, for example, were distributed mostly between *Residential care services* and *Other social assistance services*. Around 70,000 workers, or 15% of the total welfare workforce, were *Aged and disabled carers* working in the *Other social assistance services* industry (Figure 1.5.2).

Table 1.5.1: Number of employed people in the welfare workforce per 100,000 population, by type of community service occupation, 2005 and 2015

Occupation	2005	2015	Growth (%)
Early childhood education and care workers	453	711	57
Aged and disabled carers	196	515	163
Nursing support and personal care workers	132	239	82
Registered nurses	231	173	–25
Welfare support workers	87	132	51
Social workers	24	60	152
Welfare, recreation and community arts workers	25	49	96
Enrolled and mothercraft nurses	46	27	–41
Counsellors	26	32	24
Psychologists	14	6	–60
Special care workers	6	3	–43

Notes

1. Early childhood education and care workers include child carers, child care centre managers and early childhood (pre-primary school) teachers.
2. Diversional therapists, education aides, special education teachers and Indigenous health workers are included as community service occupations in totals; however, the number of workers in these occupations within community service industries is small and not reported separately.
3. Data shown are the annual average of quarterly data for 2005 and 2015.

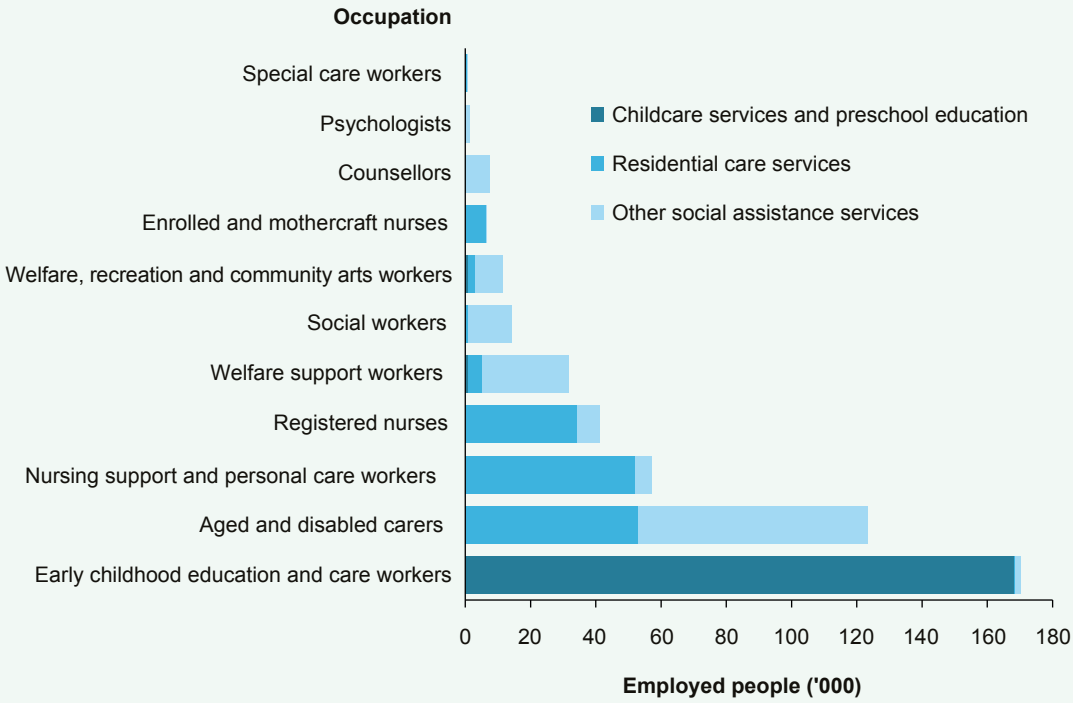
Source: AIHW analysis of ABS Labour Force Survey 2005 and 2015.

What is missing from the picture?

While some information is available from the ABS Labour Force Survey, routine monitoring of details of the welfare workforce, and from the perspective of the whole sector, is limited. In the health sector, there is a mandatory national registration system for certain health professionals, with a range of workforce information updated at the time of annual registration renewal. This type of information is not consistently collected for the welfare workforce but could usefully inform workforce planning.

Where do I go for more information?

More information about the Australian workforce is available from the ABS Labour Force Survey.



Notes

1. Early childhood education and care workers include child carers, child care centre managers and early childhood (pre-primary school) teachers.
2. Diversional therapists, education aides, special education teachers and Indigenous health workers are included as community service occupations in totals; however, the number of workers in these occupations within community service industries is small and not reported separately.
3. Data shown are the annual average of quarterly data for 2015.

1.6 Persistent disadvantage in Australia: extent, complexity and some key implications

Alan Hayes and **Andrew Hacker,** Family Action Centre, University of Newcastle

Why does disadvantage persist for some but not others? And, what might be done about it? This article describes the extent of persistent disadvantage in Australia, examines a range of complex contributing factors, and discusses some key implications for dealing with persistent disadvantage.

Extent of persistent disadvantage in Australia

Australia has had a longstanding focus on disadvantage. This focus gained momentum with Henderson's work on measuring poverty—a distinct but related concept (Commission of Inquiry into Poverty & Henderson 1975; Johnson 1996). Disadvantage is complex, with no universally preferred definition or approach to measurement. Rather, there is a range of approaches to conceptualising it, and various measures can often be complementary (McLachlan et al. 2013). A detailed discussion of each approach is beyond the scope of this article; however, describing some well-established examples may show the difficulties in measuring persistent disadvantage (for more detailed discussions on the different concepts and measures, see McLachlan et al. 2013; Saunders 2011).

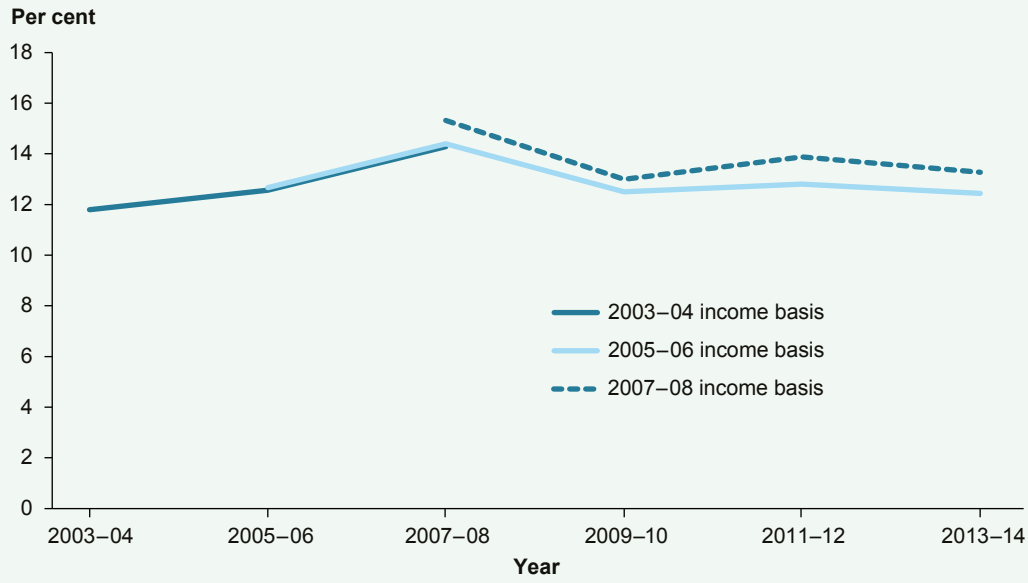
Absolute and relative poverty measures

One common proxy measure for disadvantage is poverty of income, measured in absolute or relative terms (McLachlan et al. 2013). Absolute poverty is commonly defined as not having enough income to cover the cost of a given basket of goods that provides an agreed minimal level of decency (in this sense, the measure is not completely absolute as it is relative to changing views of decency). Based on absolute poverty rates in the Household Income and Labour Dynamics in Australia (HILDA) survey, the proportion of people in absolute income poverty in Australia has been estimated to have dropped from 13% in 2001 to 3.9% in 2014 (Wilkins 2016).

However, the picture is different if considering relative income poverty. In Australia, this measure usually assesses the proportion of households with an equivalised income that is less than 50% of the national median equivalised household income (McLachlan et al. 2013). Considering Australian rates of relative income poverty from 2003–04 to 2013–14, 'the overall

picture on a ten-year trend basis is one of a persistent and entrenched poverty rate around 12%' (Figure 1.6.1) (ACOSS 2016: p.17). Similar analysis by the Melbourne Institute has indicated that, from 2001 to 2014, trends have generally been toward slowly reduced relative poverty in Australia (despite a rapid rise in 2007), but that relative poverty has nonetheless remained between 10.3% and 13.0% (Wilkins 2016). Further, there has been an estimated increase of more than 2 percentage points in the proportion of children living in relative poverty (2004 to 2014), with an estimated 17% of children aged under 15 currently living in households below the poverty line (ACOSS 2016).

The apparent lack of decline in relative poverty in Australia contrasts with absolute poverty reductions and has occurred despite more than 25 consecutive years of economic growth. As an example of economic growth, Australians born in 1991 now have an average household disposable income about twice what it was when they were born, even after accounting for rising prices and population growth (ACOSS 2016).



Note: Figure shows an estimate of the proportion of people living in households with incomes below the poverty line of 50% of national median income.

Source: ACOSS 2016.

Figure 1.6.1: Poverty trend (50% of median, after housing costs), all persons, Australia, 2003–04 to 2013–14

Measures of relative income poverty have been used for international comparisons (Förster & d'Ercole 2009; McLachlan et al. 2013). The Organisation for Economic Co-operation and Development (OECD) has estimated that the proportion of people facing relative income poverty in Australia in 2014 was 12.8% (compared with an OECD average of 11.4%) (ACOSS 2016). This placed Australia fourteenth highest (or among the middle third of countries), despite its relative prosperity compared with other nations in the OECD. While the characteristics of the compared nations certainly differ, the fact that six countries had relative income poverty proportions of 8% or less suggests that reductions in relative income poverty may be possible.

However, these measures of income poverty (whether absolute or relative) are cross sectional snapshots (even if repeated over time). They do not directly indicate how many people are persistently impoverished since individuals can, and do, move in and out of poverty. An alternative is to measure the duration of poverty. The Melbourne Institute analysed HILDA data from 2002 to 2013 for persons aged over 18 who entered poverty, reporting the number of years before they exited it ('poverty spell durations') (Wilkins 2016). While the majority of people entering poverty (61%) had a spell of 1 year, others had spells lasting 2 years (17%), 3 years (7.4%), 4 years (4.4%), 5 years (2.5%) or 6 or more years (8.2%). Wilkins (2016) also provides a second, similar analysis, but using duration of receiving income support payments.

Whether measuring snapshots of absolute or relative poverty or the duration of poverty, all such measures are proxies of disadvantage since they rely on measuring income. Measures based solely on income are limited in assessing disadvantage as they do not account for financial resources other than income (for example, savings or home equity) nor for the range of non-financial factors that may contribute to disadvantage (for example, poor health, low education or limited community participation) (Förster & d'Ercole 2009; McLachlan et al. 2013).

Measuring persistent disadvantage

A multifaceted approach to measuring persistent disadvantage has been employed by the Productivity Commission, using the Social Exclusion Monitor (SEM) (Box 1.6.1). Table 1.6.1 shows estimated proportions of segments of the Australian population facing deep and persistent social exclusion from 2001 to 2010, based on the SEM (McLachlan et al. 2013). The table lists population groups where estimates were at least twice that of the national estimate. Groups with estimates above (but less than twice) the national estimate are not shown, but include single adults (aged 18 to 64), single adults aged over 65, all adults aged over 65, and migrants (from a non-English-speaking background).

Box 1.6.1: Social Exclusion Monitor

The SEM provides a composite measure of disadvantage based on seven dimensions: material resources, employment, education and skills, health and disability, social support, community participation, and personal safety perceptions. Disadvantage (social exclusion) is scored from 0 to 7, with scores of 2 or more defined as deep exclusion and of 3 or more as very deep exclusion (for further details on the SEM, see McLachlan et al. 2013; Scutella et al. 2013). The Productivity Commission estimated that between 2001 and 2010, deep exclusion levels among Australians aged 15–64 affected:

- almost 3% for 5 years or more (465,000 people)
- around 1% for 7 years or more (165,000).

The average duration for deep exclusion was 1.7 years, and 1.4 years for very deep levels of exclusion (McLachlan el al., 2013).

The Productivity Commission also reported on yearly shifts between various levels of social exclusion, from 2001 to 2009. It found that the largest proportion of people facing deep or very deep social exclusion in any given year experienced less exclusion (lower SEM scores) the year after. These findings were consistent with the Melbourne Institute's analysis of durations of poverty (Wilkins 2016) and analyses of the Panel Study of Income Dynamics (PSID) in the United States (for example, Duncan & Vandel 2012; Gottschalk et al. 1994). However, the Productivity Commission also found that, of people who were very deeply socially excluded in any given year, 31% remained so the following year and that, of people who were deeply socially excluded, 37% remained so the following year and 8% moved on to being very deeply socially excluded (proportions being a year-on-year average across the period) (see McLachlan et al. 2013: Table 3.7).

Table 1.6.1: Proportion of people aged 15 and over facing deep and persistent disadvantage, by selected population groups, 2001 to 2010

	Group	Facing deep and persistent disadvantage (%)
	Living in public housing	23.6
	Dependent on income support	15.3
	Unemployed	11.5
	Lone parents	11.3
	With a long-term health condition or disability	11.2
	Indigenous Australians	10.8
	Highest educational attainment Year 11 or below	9.3
	All Australians	4.4

Notes

1. Deep and persistent disadvantage is defined as being an individual aged 15 and over and having a SEM score of 2 or more for 4 or more years between 2001 and 2010.
2. Groups are not mutually exclusive.

Source: McLachlan et al. 2013.

Complexity of persistent disadvantage

Disadvantage is a multifaceted phenomenon with both individual and environmental factors interacting in complex ways to alter its likelihood and persistence.

Individual attributes

The likelihood that external risk factors will result in persistent disadvantage seems to be amplified or mitigated by various individual characteristics. These interactions between environmental and individual characteristics are further complicated given that, while some individual characteristics are largely stable over time (for example, ethnicity and sex), others may or may not change (for example, attitudes) and yet others will certainly change (for example, age, employment status, family status).

Indigenous status

Indigenous Australians (aged 15 and older) had more than twice the prevalence of deep and persistent social exclusion (10.8%) compared with that for all Australians (4.4%) (see Table 1.6.1).

On virtually any measure of disadvantage, Aboriginal and Torres Strait Islander Australians are over-represented, and this disadvantage appears to persist (SCRGSP 2016). For example, while educational attainment for Indigenous Australians is increasing, large educational gaps remain between Indigenous and non-Indigenous people (see Chapter 7.4 'Closing the gap in education'). In 2014–15, 47% of Indigenous people aged 20–64 either had a Certificate level III or above or were studying at any post-secondary level—a 21% increase from 26% in 2002. However, a similar rise of 18% was also seen for non-Indigenous people of the same age, from 52% in 2002 to 70% in 2014–15. So this educational gap has remained largely steady (SCRGSP 2016).

Similarly, the Indigenous employment rate (48%) in 2014–15 was much lower than the non-Indigenous employment rate (73%), and the gap has not changed substantially since 2008 (PM&C 2017). Median equivalised gross weekly household incomes for Indigenous Australians are two-thirds of those for non-Indigenous Australians ($556 vs $831 in 2014–15) (see Chapter 7.5 'Income and employment for Indigenous Australians'). More than 1 in 5 (22%) Indigenous Australians reported experiencing physical or threatened violence in 2014–15, a rate 2.5 times higher than for non-Indigenous Australians (SCRGSP 2016). As at 30 June 2015, Indigenous Australians made up more than one-quarter (27%) of the adult prison population, and the imprisonment rate for Indigenous Australian adults was 13 times that for non-Indigenous adults. In 2014–15, the juvenile detention rate for young Indigenous Australians was 25 times that for their non-Indigenous counterparts (see Chapter 2.6 'Youth justice supervision' and Chapter 7 'Indigenous Australians').

Sex

Research indicates that females are consistently more likely to live in households below the poverty line than males. This is primarily due to their generally lower rates of employment, lower wages and the associated impacts of their greater family caring commitments (ACOSS 2016). Nationally, in 2014, the rates of poverty for females were estimated to be 1 percentage point higher than those for men (13.8% vs 12.8%, respectively) (ACOSS 2016). Similarly, deep and persistent social exclusion has been found to be more prevalent for females (5.2%) than for males (3.7%) (national prevalence: 4.4%) (McLachlan et al. 2013).

Cobb-Clark et al. (2016) explored the relative durations, for females and males, of two key markers of persistent poverty: housing insecurity (for example, living with friends or in a motel) and homelessness (for example, sleeping on the street or in crisis accommodation). They found that, on average, females leave circumstances of housing insecurity around 2 months sooner than males. In contrast, they tended to remain homeless for around 1.4 months longer than males (although this was not statistically significant). The study attributed the longer duration of homelessness for females to their being more likely to enter crisis accommodation (characterised by relatively longer stays) while males were more likely to be sleeping rough (characterised by shorter durations).

Attitudes

Unlike other individual factors such as ethnicity, sex or age, attitudes can be directly influenced by public policy. Changes of attitude may, in turn, alter behaviours, which may change the course of disadvantage. For example, Baron and Cobb-Clark (2010) found that Australian high school students who more strongly believed they could control life events were more likely to complete Year 12 by age 18 and to obtain a university entrance rank. Further, entrance ranks tended to be higher for students reporting stronger beliefs about control. In contrast, a study of the behaviours of Dutch students facing financial disadvantage due to changes to university funding found that students with an 'all-will-be-well' attitude were less likely to act to tackle this perceived concern (Stroebe 2013). This was independent of the perceived extent of the concern, or the perceived effectiveness of action. Similarly, a study in the Midwestern United States found that where low-income mothers attributed their own poverty to romantic relationships or to children, this was positively associated with beliefs about upward mobility, while self-focused attributions were negatively associated with such beliefs (Mickelson & Hazlett 2014).

Age

Data suggest that older age (particularly beyond the traditional age of retirement at 65) somewhat increases the likelihood of poverty (ACOSS 2016). People aged over 65 (at 13%) are more likely to experience poverty than people of typical working age (25–64: 12%) (though less likely than children aged under 15: 17%). Similarly, people aged over 65 have been found to be the least likely to exit poverty (Wilkins 2016), and people aged over 60 represent 'close to two-fifths' of people who are deeply and persistently disadvantaged (McLachlan et al. 2013).

Similar patterns have been observed with homelessness. Cobb-Clark et al. (2016) have reported evidence that the likelihood of people experiencing homelessness or housing insecurity quickly moving to more stable accommodation decreases with age (that is, the older a person, the longer before they secure stable housing). Similarly, while the current proportion of people seeking specialist homelessness services who are older (aged over 55) is relatively small (8% in 2015–16), this group represents one of the fastest growing populations seeking help from specialist homelessness agencies (AIHW 2016b). This group has shown an average annual growth rate of 9.5% since 2011–12, more than twice the rate of the general population seeking specialist homelessness services. This may be of greater concern for such disadvantaged people given the evidence that greater age may be associated with a greater likelihood that disadvantage will persist.

Family characteristics

Family structure and relationships

People living in lone-parent families are more likely to experience disadvantage. As at June 2016, the majority (83%) of the 618,900 one-parent families with dependants in Australia were single mother families (ABS 2017b). Australian children living in lone-parent families are more than 3 times as likely to be in poverty as children in two-parent families (41% vs 13%) (ACOSS 2016). This is consistent with international evidence that, compared with two parent families, poverty tends to be higher for households headed by single parents (Corcoran & Chaudry 1997) and that children living in the absence of fathers are more likely, as adults, to move downward in the income distribution (Hancock et al. 2013).

> ***The prevalence of deep and persistent social exclusion for lone-parents (11%) is more than twice the national prevalence (4.4%) (Table 1.6.1).***

Divorce and separation are associated with greater likelihood of experiencing disadvantage, and evidence suggests the impacts may span multiple generations. Previous research has consistently shown that the likelihood of separation in adulthood is greater for adults whose own parents have separated (D'Onofrio et al. 2007; Wolfinger 2005, 2011). Of the few studies of the effects of divorce on multiple generations, Amato and Cheadle (2005) reported that lower educational attainment and more marital discord among grandchildren may be correlated with divorce among their grandparents. In a study that highlights the complex interactions between life events (such as relationship breakdown) and individual factors (in this case, age and sex), de Vaus et al. (2014) found that females who experienced a relationship breakdown late in life—especially those who did not re-partner—were more likely to move into poverty than males who had a relationship breakdown in their later years.

The quality and type of parenting and nurturing has important impacts on the life chances of children. Being disadvantaged does not necessarily diminish the quality of parenting; however, caregivers need sufficient education, time and support to ensure the health and wellbeing of children (Engle et al. 1999; Harper 2004a). Persistent poverty, exclusion and disadvantage may increase the stresses and strains on caregivers and reduce the resources and supports they need to optimally nurture child development.

Family income and housing

A growing number of international and Australian studies have examined the relationships between the incomes of consecutive generations (Andrews & Leigh 2009; Broom & Jones 1969; Cobb-Clark 2010; Corak 2013; Huang et al. 2016; Leigh 2007; Mendolia & Siminski 2016; OECD 2010). In summary, these studies provide two main findings. First, they suggest that there is a correlation between the income of one generation and the next. Second, they suggest that the strength of this correlation is associated with the income inequality of a country, such that greater income inequality is associated with a stronger correlation between generational incomes—in other words, greater inequality between higher and lower incomes is associated with reduced income mobility between generations, as measured by the Gini coefficient (see Chapter 9.2 'Indicators of *Australia's welfare*'). While estimates of social mobility for Australia have varied over the last decade, all the estimates suggest that Australia has relatively greater social mobility than countries such as Italy, the United States and the United Kingdom, but less than the Nordic countries.

Using PSID data, Duncan et al. (2010) assessed the consequences of child poverty for a range of adult outcomes while controlling for average later childhood and adolescent family incomes as well as a large range of demographic variables. They found that early childhood poverty was associated with both lower earnings and lower work hours in adulthood.

Source of income is associated with disadvantage.

> ***For people dependent on income support, the prevalence of deep and persistent social exclusion (15%) is more than 3 times as high as the national prevalence of such exclusion (4.4%) (Table 1.6.1).***

Analysis by Cobb-Clark (2010) indicates that, relative to young people from families with no income support, people from families with intensive, multi year income support tend to have poorer education and health outcomes, and engage in more risky behaviours. Importantly, however, this study indicated that young people from families with intensive income support also have a decreased sense of control over life events. This was associated with a lower likelihood of completing year 12 and lower university entrance ranks. The study suggests that these attributional and educational attainment factors are likely to be more important mediators of poor education, health and behavioural outcomes than the receipt of welfare payments.

In terms of housing, children who experience homelessness tend to have a lower likelihood of employment as adults, with men being more at risk than women (Cobb-Clark & Zhu 2015).

> ***The highest prevalence of deep and persistent social exclusion was for people living in public housing (24%) (Table 1.6.1).***

Life events

People living in disadvantaged circumstances are more likely to experience multiple adverse life events (Baxter et al. 2012; Moloney et al. 2012). Moreover, adversity is far from randomly distributed, with people in disadvantage experiencing both a higher frequency and higher severity of adverse events, while simultaneously having a lower likelihood of effective protective influences that enable them to bounce back. In short, vulnerability tends to beget further vulnerability (Baxter et al. 2012).

Job loss

Loss of employment is a major life event that has marked impacts on families.

> ***For people aged over 15, the prevalence of deep and persistent social exclusion was more than twice as high among people who were unemployed (11%) as the national prevalence (4.4%) (Table 1.6.1).***

Living in jobless households is associated with children tending to have both poorer social-emotional wellbeing, and health and educational outcomes (Gray & Baxter 2012; Gray et al. 2011), particularly in families where joblessness endures (Gray & Baxter 2011). These effects may extend across multiple generations, with research by Hancock et al. (2013) finding that 'being in a jobless family was also associated with experiences of grandparent joblessness'. Factors that predict future joblessness include current joblessness, along with lower education level and long-term individual health problems (Hérault et al. 2015) (see Chapter 9.2 'Indicators of *Australia's welfare*').

Changes in health

The prevalence of deep and persistent social exclusion for people with a long-term health condition or disability (11%) is more than twice that of the national prevalence (4.4%) (Table 1.6.1).

Good health is a key asset and ill health is the single most widespread hazard affecting poor households (Harper 2004b). Reduced health is a key driver of downward social mobility. This is because reduced health diminishes the workforce participation of individuals and their carers, which alters household dependency ratios. In Australia, data indicate that 81% of people who are deeply and persistently socially excluded have a long-term health condition or disability (McLachlan et al. 2013).

Relationship conflict and violence

Exposure to physical, emotional and/or psychological violence is associated with the intergenerational transmission of poverty. In Australia, domestic violence is the main reason that women and children leave home and is consistently cited among the most common reasons for seeking support from specialist homelessness services (AIHW 2016a; Spinney 2012). Domestic violence has negative impacts on children's educational performance. It is also associated with being more likely to have to repeat grades, discipline problems, and poor child mental health (Aldaz-Carroll & Morano 2001). Where violence leads to family breakdown, it further contributes to persistent intergenerational disadvantage through impacts such as asset loss, inheritance loss, reduced income, and reduced social networks (Bird & Shinyekwa 2005). Johnson et al. (2008) identify domestic violence as one of five 'typical' pathways into homelessness in Australia, along with mental health, substance abuse, youth (first experience of homelessness when aged under 18), and housing crisis pathways (see also Mackenzie and Chamberlain (2001) for domestic violence as a major factor in family breakdown; see Chapter 2.7 'Family, domestic and sexual violence').

Educational opportunity and human capital

A lack of education is associated with greater risks of disadvantage. People with inadequate education are more likely to experience unemployment, low income, poor health and high rates of involvement with the criminal justice system (Vinson 2007). In the United States, persistent poverty is highest among people who have not completed high-school (Bird 2007). Consistent with this, Australian research indicates that 61% of people who are deeply and persistently disadvantaged have low educational attainment (Year 11 or below).

The prevalence of persistent deep disadvantage among Australians with low educational attainment (9.3%) is twice that of the national average prevalence of such disadvantage (4.4%) (Table 1.6.1).

The effects of limited education may also be intergenerational, with household poverty and disadvantage associated with having parents with limited education (Aldaz-Carroll & Morano 2001; Emerson & Souza 2005; Falkingham & Ibragimova 2005; Handa et al. 2004).

In contrast, increased education is widely considered to be a protective factor in later life (Bird 2007). In many countries, schooling correlates strongly with adult earning potential and actual income (Aldaz-Carroll & Morano 2001; Emerson & Souza 2005). Education may also reduce the risk of housing insecurity (Cobb-Clark et al. 2016). Educational opportunities for girls and women are important in interrupting persistent disadvantage, and more educated mothers are more likely to send their children to school (Christiaensen & Alderman 2004; Rose & Dyer 2008) (for more information on education, see Chapter 3 'Education in Australia').

Wider risk factors

As well as factors associated with individuals and their immediate families, circumstances and settings, several wider factors can affect persistent disadvantage. These include the local neighbourhood, and structural economic changes.

Location and disadvantage

Evidence suggests that, relative to urbanised areas, disadvantage is more prevalent (Saunders & Wong 2012) and persistent (Tanton et al. 2012) in regional and remote parts of Australia. However, people experiencing disadvantage can be co-located with others who are more mobile, making it difficult to precisely describe disadvantage in locational terms (McLachlan et al. 2013).

Saunders and Wong (2012) analysed how deprivation and social exclusion among Australian adults varied (based on 2010 Poverty and Exclusion in Modern Australia (PEMA) survey data). They found that people in rural areas or villages experienced the highest prevalence of deprivation, generally higher rates of social disengagement, the highest rates of service exclusion, and higher rates of economic exclusion. In contrast, people living in the inner city experienced the lowest prevalence of deprivation and generally lower rates of social disengagement (for an extended locational analysis of the PEMA data, also see Saunders & Wong (2014)).

Tanton et al. (2012) examined entrenched disadvantage and found that multiple-life-stage-disadvantage is more prevalent in *Remote* and *Very remote* areas of Australia, and not as prevalent in most (though not all) capital cities. Most people living in *Major cities* were in areas that were not designated as 'disadvantaged' for any life-stage. Consistent with Tanton et al. (2012), Vinson and Rawsthorne (2015) provide evidence of the prominence of disadvantaged localities in rural areas and on the fringes of metropolitan areas.

Changes to economic and labour market conditions

Labour markets do change, and certainly have changed in Australia (see Chapter 4.1 'The changing nature of work and worker wellbeing'). For example, in 1966, manufacturing accounted for around one-quarter of all jobs (ABS 2007); as at February 2017, it accounted for 7.5% of jobs (ABS 2017a). In the 1980s, casual employment (that is, employment without entitlement to annual or sick leave) climbed steadily, representing 13% of employees in 1982, and 20% in 1989 (Dawkins & Norris 1990). Since that time, the proportion of casual employees has remained at around 20% (Wooden 2016). The proportion of jobs requiring higher skills and qualifications has grown, possibly associated with the expansion of disruptive technologies such as automation (Department of Employment 2016). Such changes do not necessarily result in disadvantage. However, for people already on a pathway toward disadvantaged circumstances, risks may be even further increased by such economic changes, if they or members of their family do not have the skills, capabilities or qualifications needed to make a shift in line with changing labour market conditions.

Some key implications

Dealing with complex issues such as persistent disadvantage has potentially profound and positive social and economic effects. As a parallel example, Brown et al. (2012) reported on the anticipated benefits of government action to reduce health inequities, concluding that if Australia adopted WHO recommendations to tackle the social determinants of health this would potentially mean:

- some 170,000 extra Australians could enter the workforce, generating $8 billion in extra earnings
- around $4 billion in annual savings in paying welfare support
- around 60,000 fewer people admitted to hospital annually, resulting in savings of $2.3 billion in hospital expenditure
- 5.5 million fewer Medicare services each year, resulting in annual savings of $273 million
- 5.3 million fewer Pharmaceutical Benefit Scheme scripts filled each year, resulting in annual savings of $184.5 million each year.

One key implication of the complexity of persistent disadvantage is to recognise that many of the contributing factors are dynamic and, therefore, amenable to change. Conceptualising disadvantage as a state that can dynamically change over the life course is foundational to public policy in this area since it is these alterable factors—both within and around individuals—that public policy can most directly consider.

Multidimensional approaches to measurement

The complex and dynamic character of persistent disadvantage calls for a multidimensional approach to measurement and monitoring (Martinez & Perales 2015). Such an approach informed the widely adopted SEM, used to estimate the prevalence of deep and persistent disadvantage for various groups highlighted throughout this article. Measures such as the SEM highlight that there may be both clear differences and overlaps in the trends of different dimensions of disadvantage. For example, a recent analysis of HILDA data showed that the domains of health and disability, material resources, social support, and education and skills all contributed to increased disadvantage between 2001 and 2013. However, these were offset by relative decreases in disadvantage over the same period related to safety perceptions, employment, and community participation (Martinez & Perales 2015). Considering the trends and relationships between various dimensions of disadvantage may more fully inform practice.

Australia has extensive data resources, including its existing longitudinal collections (for example, Growing up in Australia, the Longitudinal Study of Australian Children; the Australian Longitudinal Study on Women's Health; the HILDA survey and the Longitudinal Surveys of Australian Youth, along with the collections of the Australian Bureau of Statistics). Australia has also developed longitudinal social security administrative data to support the Priority Investment Approach (see Chapter 1.3 'Understanding welfare'). While bearing in mind issues of ethics and privacy, integrating government administrative data sets via data linkage and/or combining them with other evaluative or research data has the potential to provide better understanding of different forms of disadvantage. This could guide initiatives that target persistent disadvantage in Australia (see Chapter 1.7 'Understanding health and welfare data').

Priority population groups

As indicated in Table 1.6.1, the prevalence of deep and persistent social exclusion is substantially greater than the national average for several identifiable groups:

- public housing tenants
- people dependent on income support
- unemployed people
- lone parents
- persons with a long-term health condition or disability
- Indigenous people
- people with low educational attainment.

These demographic indicators flag segments of the population that may benefit from more focused efforts to reduce disadvantage. Clearly, where individuals fall into multiple categories, further prioritising how best to support them may need to be considered. The wider context also warrants consideration. Rural and remote communities, as well as suburbs on the outskirts of capital cities, may be areas where initiatives to tackle disadvantage could be of benefit (Saunders & Wong 2012; Tanton et al. 2012; Vinson & Rawsthorne 2015).

Possible approaches to reducing disadvantage

The OECD (2010) recommended considering a range of approaches to increasing social mobility. Several of these recommendations focused on education, namely:

- prioritising education that facilitates social and economic mobility
- supporting education 'at both ends' through facilitating both early childhood education and greater completion of secondary schooling
- enabling greater equity of access to tertiary education
- facilitating greater local autonomy to match educational resources to local need
- enhancing teacher quality generally, and particularly encouraging quality teachers to work with school populations from disadvantaged backgrounds.

Surrounding these educational approaches, other approaches recommended for consideration include:

- urban planning that increases the heterogeneity of school populations
- taxation approaches that provide incentives and pathways from welfare to work
- child care arrangements that simultaneously support employment and child education (Duncan et al. 2007; OECD 2010).

Adopting a multi-strategic approach to reducing persistent disadvantage

As discussed, persistent disadvantage is complex. It is both multifaceted and dynamic. A diverse range of individual attributes, family characteristics, life events, and wider geographic and economic factors interact to increase the risk of moving into and remaining in disadvantage.

Recent changes in social policy have focused on better targeting of policy and practice. This change has been influenced by the multi-strategic New Zealand Investment Approach. As reinforced in the McClure Report, this approach has four pillars of welfare reform:

- welfare system simplification
- skill development and ability
- strengthening employer engagement
- incentives and community support through encouragement of philanthropy and volunteering (McClure et al. 2015) (see also Chapter 1.3 'Understanding welfare').

However, as suggested by the range of possible approaches to reducing disadvantage outlined above—covering areas including education, urban planning, taxation and child care—dealing with persistent disadvantage would likely benefit not only from adopting a multi-strategic approach to welfare, but also to tackling issues of public concern more broadly. Problems as complex as persistent disadvantage clearly require a coordinated approach that involves authentic community engagement, shared aspirations and goals, evaluation systems that facilitate strategic learning, prioritising locally effective activities, and facilitating necessary change (Cabaj & Weaver 2016; Kania & Kramer 2011). In Australia, a coordinated approach has been evaluated, with longitudinal outcomes (from 2002 to 2011), providing emerging evidence that such an approach may be able to reduce persistent disadvantage (Homel et al. 2015). From a data perspective, much of this could be facilitated through better integrated data sources—for example, linkage between service data at state/territory and Commonwealth government level.

Given that social and economic disadvantage are dynamic states rather than fixed traits of individuals, the circumstances and contexts that contribute to persistent disadvantage can be directly considered. Multidimensional measures of persistent disadvantage (for example, SEM) can be illuminated by considering the range of factors that contribute to persistent disadvantage, tracking these over time, and identifying demographic indicators around which persistent disadvantage tends to cluster. The value of multidimensional measures could be further enhanced through integration with Australia's existing longitudinal data collections and with administrative data and other collections, including those of the AIHW and the Australian Bureau of Statistics.

Practice models based on coordinated approaches may provide a framework to deal with persistent disadvantage and have an emerging evidence base for their effectiveness. Approaches that prioritise targeted, multi-strategic initiatives to move people from persistent disadvantage carry promise for delivering substantial social and economic benefits.

Where do I go for more information?

More information can be found in key documents at the following websites: AIHW, ACOSS, OECD, from the Productivity Commission, and from several other reports (full details of which are provided in the references): *The cost of inaction on the social determinants of health* (Brown et al. 2012); *Collective impact 3.0: an evolving framework for community change* (Cabaj & Weaver 2016); *A new system for better employment and social outcomes* (McClure et al. 2015); *Deep and persistent disadvantage in Australia* (McLachlan et al. 2013); *Dropping off the edge* (Vinson & Rawsthorne 2015).

1.7 Understanding health and welfare data

Changing data landscape

In today's world of 'big data', governments, businesses, the community and individuals have access to more data than ever before. 'Big data'—the unprecedented volume, diversity and speed of data generation—is growing at a rapid pace, with the volume of digital data expected to almost triple in size between 2017 and 2020 (Productivity Commission 2017; Reimsbach-Kounatze 2015).

As its 2015 public data policy statement makes clear, the Australian Government is well aware of this trend, and of the pressing need to exploit this 'strategic national resource' (PM&C 2015a). It sees potential benefit in making non-sensitive data 'open by default' by not restricting its use or redistribution. Indeed, there may be substantial economic returns in making 'high-value' data sets (such as detailed geospatial data) more publicly accessible and enabling them to be analysed by a range of freely available tools. While the need to manage 'big data' is clearly evident, the key issue for all data users is to ensure these data are used in the most effective manner; that is, 'smart data'.

The Australian Government's agenda is to improve and, where appropriate, simplify data sharing arrangements (PM&C 2015b). It emphasises the importance of developing partnerships with government and non-government stakeholders, especially researchers (PM&C 2016a). For example, the creation of the new Data Integration Partnership of Australia in the 2017 Budget signals an ongoing commitment to '…improving policy, programs and service delivery through the better use of government data to assist in delivering a more productive economy' (DOF 2017).

There is a growing interest in unstructured data—for example, social media posts and web searches. This is being fostered by the development of machine learning techniques, where computers can track through large amounts of information for meaning, without needing explicit programming.

Privacy, security and social licence

The Australian Government's public data agenda faces substantial challenges. There is ever growing pressure to deliver high-quality, useable information faster, while ensuring that individual privacy is protected. The Productivity Commission's *Inquiry on Data Availability and Use* (Productivity Commission 2017) highlights the critical importance of obtaining 'social licence' from the community. It is suggested that, on the whole, people are willing to make their information available, but on several conditions. They need to trust how it will be handled. They need to feel that they have control over how and who will use it. They also need to see (and ideally directly benefit from) its potential value.

Improved security is becoming more and more important as the volume of digital data expands. People who collect sensitive personal information must keep their security technology up to date. However, these steps, along with tighter privacy legislation, can only go so far to prevent breaches. These are often due to human error and cannot always be foreseen. The Productivity Commission concludes that the best approach is to assess the level of data required for different uses. In other words, risk will be minimised if sensitive information is only collected when necessary. Risk management needs to be a central focus of all data collection activity.

Increased interest in person-centred data

Alongside the mounting volume of data are growing expectations about how these data assets will be used. More emphasis is being put on ensuring that public data will be used to improve outcomes for Australian people. For example, comprehensive data are essential to develop social investment models and evaluate the impacts of programs or policies for various population groups.

Figure 1.7.1 shows the elements of policy and program areas for a person-centred data model. These form much of the 'content' of the evidence base needed to understand the experiences of the population and various cohorts within it. Across these elements, questions can be formed around:

- the characteristics of a population cohort—such as age, sex and geographical location
- determinants of the needs for support, and factors influencing outcomes—covering social, behavioural and individual factors
- interactions with the health and welfare 'system'—for example, eligibility and access, barriers (such as cost or distance), unmet need, pathways through the system
- outcomes from interactions with the system—notably education, employment and social/participation outcomes; and health and general wellbeing
- aspects of the system that can either help or hinder intended outcomes—including policy parameters, funding models, system resources (for example, workforce levels, skills and distribution), system performance (efficiency, integration/coordination, safety/quality, responsiveness), informal carer capacity.

This model recognises that the various components may interact, and that the level of support required will differ according to individual circumstances.

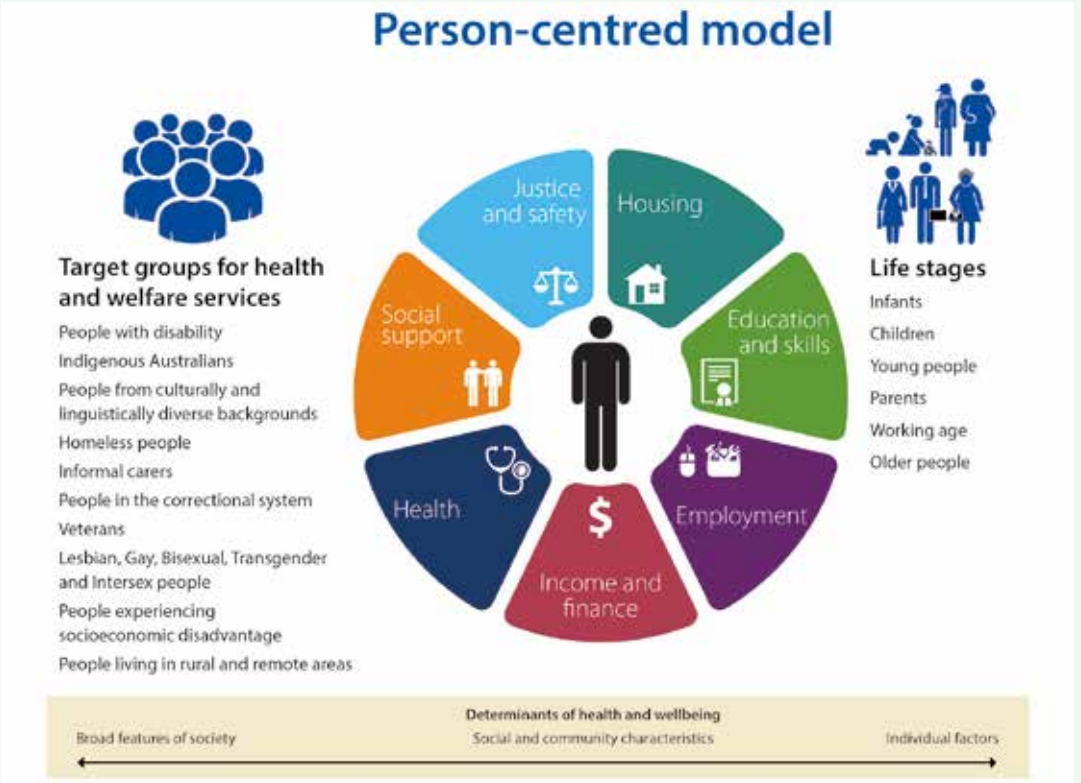

Figure 1.7.1: Person-centred data model

Types of data sources

Broadly speaking, major health and welfare data sources in Australia are either administrative data (such as collected when running a service or program) or survey data (for a targeted sample on a given topic). Each type of data has advantages and disadvantages. Choosing which one to use often comes down to purpose and the capability of each collection to measure what is needed.

The rapid growth of digitally accessible data is likely to allow much broader uses of administrative data sources (as well as to explore the potential of unstructured data). But joining administrative and survey data can provide deeper insights. This technique is used effectively, for instance, in the Business Longitudinal Analytical Data Environment. This data set combines administrative data from the Australian Tax Office with business survey data from the Australian Bureau of Statistics to tell a rich story about the characteristics and outcomes of businesses across Australia (Kalisch 2016).

Data can also be described as cross-sectional or longitudinal. A cross-sectional data source represents a particular population at a specific time. A longitudinal data source collects data on the same subjects repeatedly over time. Most Australian data collections are cross-sectional. But longitudinal studies are becoming more prevalent, as their usefulness in many policy contexts becomes more recognised. They can help governments to understand

how individuals respond to different situations over time; they can also identify individual pathways, and (in some instances) be directly linked to changes and outcomes after specific policy interventions (FaHCSIA 2013). Over the past 20 years, there have been concerted efforts in Australia to collect longitudinal data on a range of populations. Among these efforts was the formation, in 2014, of the National Centre for Longitudinal Data. This Centre promotes further use of longitudinal data in Australia and supports collaborative projects between researchers and policy makers (DSS 2017).

Getting the most out of data

The level and accessibility of data in 2017 is substantial. It needs, however, to be meaningfully used, not only to create evidence that informs decisions, but also to improve outcomes that can be interpreted in a policy context (as above, it needs to be 'smart' data). Data users need the skills to handle and analyse data in general; they also need to be aware of the relevant policies and contextual background (AIHW 2016a). It is essential that work in this regard is framed by strong data governance arrangements that meet legislative requirements and align with community expectations around privacy, confidentiality and data security.

Data standards

Data standards play a critical role in the meaningful use of data. 'Metadata' (data about data) allows users to have a consistent understanding of the meaning and representation of underlying data. It is a key part of making data sources as clear and usable as possible. In fact, a generally accepted principle in statistical collections is that quality metadata leads to better data.

Metadata supports consistent and transparent collection of data across national, state and territory boundaries and, in some cases, across a substantial number of agencies' data systems. For example, the Specialist Homelessness Services Collection draws on data from around 1,500 disparate non-government agencies across Australia. The comparable collation of this information supports the evidence base about people seeking homelessness services.

Data access and data sharing

The Australian Government's public data agenda is still in its early stages. But it offers many opportunities to enhance data access, paying close attention to privacy and data security. It is expected that by making non-sensitive data 'open by default', and creating integrated data sets that are widely accessible, many data gaps can be filled. Having much richer and integrated longitudinal data in future will help to answer more complex research questions. It will also better enable person-centred data to be collected and analysed. Important strategies will be to continue to improve and maximise the use of existing data sets while being proactive in identifying those that could be integrated.

All levels of government see more open data as a priority. For example, data.gov.au has been created as a central access point for a range of public data sets drawn from Australian, state/territory and local government data sets. The growing demand for individuals to control their own data is being acknowledged. This includes knowing which individuals or agencies can access this information (as seen in models such as My Health Record).

Arrangements for data sharing are progressing. One of the first major Australian Government initiatives is the Multi-Agency Data Integration Project. This involves creating an enduring, linked data set that draws information from several government data sources to answer key policy questions that can only be done by linking multiple sources. It is expected that this integrated data set will be made available to researchers via a 'trusted user' model—which allows broad data access while keeping strong privacy provisions (ABS 2016; PM&C 2016b). Some Australian and state/territory governments—Western Australia and New South Wales in particular—have already set up data integration models to answer complex policy questions, setting good examples of how multi-agency data integration models can work (Productivity Commission 2017).

A demonstration project is underway to test the linkage of a data set based on hospitals data routinely provided to the AIHW by jurisdictions with Medical Benefits Schedule (MBS) and Pharmaceutical Benefits Scheme (PBS) data. The linked data set would be a source of patient-centred information about services provided by Australia's hospitals, medical and other services subsidised through the MBS and pharmaceuticals dispensed under the PBS. This would enhance the ability to examine patient journeys through the Australian health system.

Data linkage

Data linkage (also called data matching, data integration or record matching) is a process that allows users to combine information from multiple databases, while preserving privacy, to tell a much more powerful story than would be possible from a single source (AIHW 2014). As indicated earlier in this article, linking multiple data sources can enable more meaningful person-centred analyses, which cannot be carried out on individual data sets in isolation. Integrating data in this way can help policy makers to improve their understanding of a range of issues. These include patient- or person-centred outcomes, individuals' life courses, and the patterns of a person's interactions with various service sectors. There are many recent examples that show the substantial value that can be gained from linking multiple data sources (see Box 1.7.1 for a selection).

The number and variety of data linkage activities have increased rapidly in recent years. Three Commonwealth Integrating Authorities were set up between 2012–2014 (the AIHW, the Australian Bureau of Statistics and the Australian Institute of Family Studies). These authorities provide a secure environment in which the development of linkage projects can be fostered. Western Australia undertook over 800 projects between 1995–2016 under its WA Data Linkage System (WADLS), while the SA–NT DataLink consortium has delivered results for over 40 projects since it was set up in 2009 (DLWA 2016a, 2016b; University of South Australia 2017). Data linkage is a powerful tool. Yet challenges remain, before its benefit can be maximised. The time taken to gain approvals to use data for linkage is one pressing issue. It can affect the ability of researchers to analyse data and release results in a timely way. Another issue is the re-use of linked data for follow-up projects, a matter that is being widely discussed. Currently, most data linkage projects are funded as one-off activities. They therefore need full re-approval to use data before researchers can carry out further investigations (AIHW 2016c; Productivity Commission 2017).

Box 1.7.1: Selected recent examples of major data linkage projects

Specialist Homelessness Services and Youth Justice clients

An estimated 187,500 young people aged under 18 accessed homelessness services over a 4 year period, or about 30% of all clients. This data source was linked with the Juvenile Justice National Minimum Data Set. From this linkage, it was learned that 5,133 of these young people also had some contact with youth justice supervision. This group, compared with other specialist homeless clients of the same age, had 5 times the rate of drug and alcohol issues, double the rate of mental health issues and an overall need for more intensive support. Governments and service providers can use this analysis to design and provide more targeted responses at an individual level. For example, ensuring that mental health services are available for people exiting youth justice services and seeking homelessness support.

Human papilloma virus (HPV) vaccination program and cervical abnormalities

This study, based on Victorian HPV vaccination and Pap test data, was a world first. It showed that a population-based HPV vaccination program has produced a fall in cervical abnormalities within 5 years of its start.

MBS and the Australian Cancer Database

MBS data on 680,000 computerised tomography (CT) scans were linked to the Australian Cancer Database. This showed that exposure to CT scans in childhood increased the incidence of cancer.

Diabetes care outcomes

This pilot study involved linkage across a range of health data sources to evaluate whether new models of care deliver better quality outcomes for people with diabetes than existing practices. The study enabled several evidence-based recommendations to be developed around the integration of diabetes care and funding mechanisms.

Sources: AIHW 2014, 2016, 2016d; McKinsey and Company 2011.

Major gaps in health and welfare data

Filling data gaps

In the context of health and welfare data gaps, several themes have been identified in recent years. These include gaps in:

- the availability of prevalence data (for example, users of primary health care, and Australians who experience child abuse and neglect)
- the ability to measure meaningful outcomes for people who receive health and welfare services
- the ability to measure and track unmet demand for services
- the availability of data to measure pathways and transitions within and across different service types and across jurisdictions (AIHW 2013, 2015).

Statistical agencies work closely with data users to give priority to filling data gaps across a range of data sources. The broader accessibility of data gives governments the chance to engage with stakeholders more widely and meaningfully than ever before to better ascertain and meet their needs. For example, gaps in information collected at the local level can be determined (along with strategies to fill them) by communicating directly with Primary Health Networks and sharing relevant data with them. This strategy will allow researchers and policy experts to better target groups of interest. It will also enable them to adapt their approaches to produce much more meaningful, outcomes-based information.

Data linkage has enormous potential, but much more needs to be done to fully exploit its benefits. Data gaps in relation to services and outcomes for people with disability provide one example of these potential opportunities, and the challenges faced (Box 1.7.2).

Box 1.7.2: Filling data gaps in the disability sector

People with disability may access a range of specialist disability and mainstream health and welfare services. The creation of the National Disability Insurance Scheme (NDIS) and its subsequent national rollout highlights the opportunity and challenges of producing person centred data about services used by people with disability.

Currently, disability services data are collected at a jurisdictional level. They are collated from state/territory and Australian Government data sources via the National Disability Services National Minimum Data Set (DS NMDS). This data set provides an annual breakdown of people who access specialist disability services funded by Australian and state/territory governments. Information collected includes the characteristics and care needs of people with disability, the type and nature of support provided to them, and the mix of services they have received over the year.

The creation of the NDIS provides a chance to capture more comprehensive and meaningful data about people with disability (including outcomes) as they shift to the new model of service delivery. During the transition period, National Disability Agreement service users will continue to be captured in the DS NMDS.

The challenge from a national data perspective will be, firstly, how to capture important data about people who are ineligible for the NDIS once the rollout is complete. Then it will be a question of how best to fill long-standing gaps in available data on the use of mainstream health and welfare services by people with disability.

Future opportunities

The rapid growth in digital data will continue to accelerate. How to make optimal use of this huge and increasingly unstructured source of information is a major challenge. But it also presents an opportunity to develop better ways to analyse and present data, and to partner with a wider range of collaborators. These are issues yet to be fully dealt with. It will be an iterative process, as the full extent of how data will be used in the coming decades cannot be envisaged. Ensuring that data are used as effectively as possible will require a mix of leadership, trust and openness at all levels of government and beyond.

Where do I go for more information?

Latest news and resources on Australia's public data agenda can be found on the Department of the Prime Minister and Cabinet's Public Data web page. Currently available public data sets are also accessible via http://data.gov.au.

More information on Australia's key longitudinal data sets is available via the Department of Social Services' National Centre for Longitudinal Data.

Further information on the AIHW's data linkage program, including information for prospective researchers, can be found on the AIHW website data linking page, or by contacting the AIHW Data Integration Services Centre (linkage@aihw.gov.au).

Chapter 2

Children, youth and families

2.0 Introduction

How a family functions—and its social and demographic characteristics—are critical to the health and wellbeing of its members. The adversity faced by many families in Australia can be profound and have widespread repercussions. Challenges might be to secure housing tenure or employment, access social services and support, achieve financial security, develop parenting skills or deal with family conflict and violence. The effects (both positive and negative) on children and young people of their family relationships and interactions, school performance and social interactions, and whether they are safe from harm can be lifelong.

This chapter opens with a discussion of key national statistics in early childhood education and care—both of which play a crucial role in child development. Over three-quarters of 4 year-olds (77%) are enrolled in a preschool program in Australia and nearly half of all children aged under 13 attend some type of child care. The majority of children are 'on track' developmentally when they start primary school, but about 1 in 5 are vulnerable on one or more developmental domains.

This chapter highlights the importance of providing a stable and secure home for the 46,500 children in statutory out-of-home care. About three-quarters of the almost 31,000 children who had been continuously in care for 2 or more years as at 30 June 2016 had experienced more than one placement in their most recent episode of care.

Two groups of vulnerable young Australians are profiled—children in child protection and young people in the youth justice system. Young people who become involved in the youth justice system are more likely than the general population to have been homeless and been under child protection. They are also at risk of continued and more serious involvement in the criminal justice system later in life. Nearly 5,500 young people aged 10 and over are under supervision on an average day in Australia, though that number has fallen over the past 5 years. Despite this, males, Indigenous young people, and young people from low socioeconomic areas continue to be over-represented in youth justice.

This chapter concludes with a feature article that examines family, domestic and sexual violence in Australia. This is an area of heightened community concern and a key priority for all levels of government in Australia. About 1 in 6 Australian women have experienced physical or sexual violence from a current or former cohabiting partner, compared with around 1 in 19 men.

2.1 Children in child care and preschool programs

Early childhood education and care plays an important role in a child's cognitive and social development and supports the workforce participation of parents. Participation in early childhood education programs has been found to improve school readiness, expressive and receptive language, and positive behaviour for all children (Urbis Social Policy 2011). In Australia, early childhood education services are provided by government and non-government organisations in a range of settings, including kindergartens, preschools and child care centres (ABS 2015). Child care can be broadly categorised as either formal or informal (Box 2.1.1).

An early childhood education and care service may offer more than one service type. The most common type of integrated service is preschool delivered within a long day care centre.

Box 2.1.1: Formal and informal child care

Formal child care is regulated care away from the child's home. It is primarily provided to children aged 0–12 through five models:

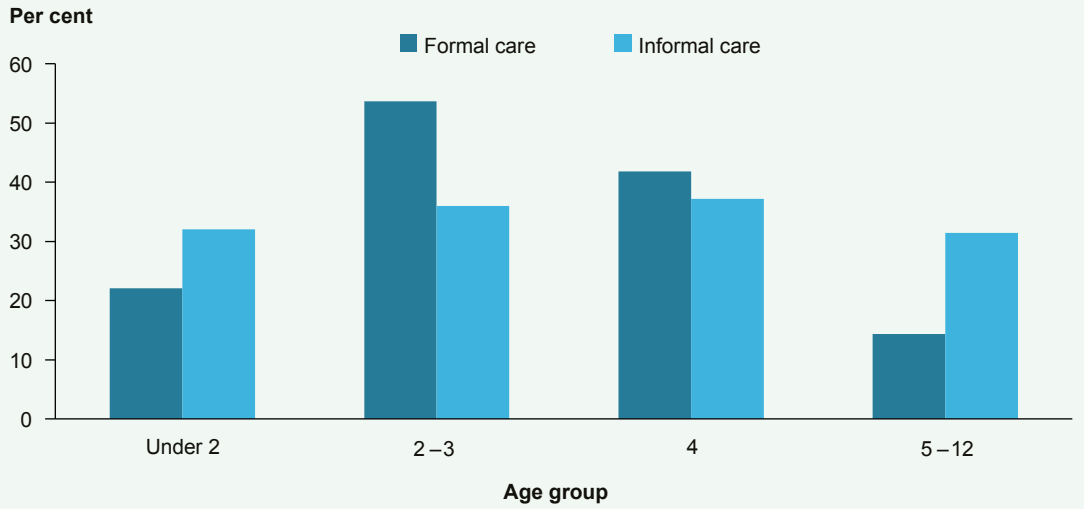
- long day care
- family day care
- occasional care
- outside school-hours care
- preschool.

Informal paid or unpaid care is non-regulated care that is arranged by a child's parent or guardian, either in the child's home or elsewhere (ABS 2015). It comprises care by:

- grandparents
- (step) brothers or sisters
- other relatives (including a parent living elsewhere).

Children in child care

In 2014, 48% (or 1.8 million) of all children aged 0–12 usually attended some type of child care (Box 2.1.1), a decrease from 52% in 2011; 52% 'did not usually attend any care' in 2014. Patterns of use of formal and informal care varied by age. Under the age of 2, 22% of children 'usually attended formal child care' and 32% 'usually attended informal child care'. The highest level of overall care attendance was among 2- and 3-year-olds, of whom 54% usually attended formal child care and 36% attended informal child care (Figure 2.1.1).



Source: ABS 2015.

Figure 2.1.1: Children aged 0–12 who usually attended child care, by care type and age group, 2014

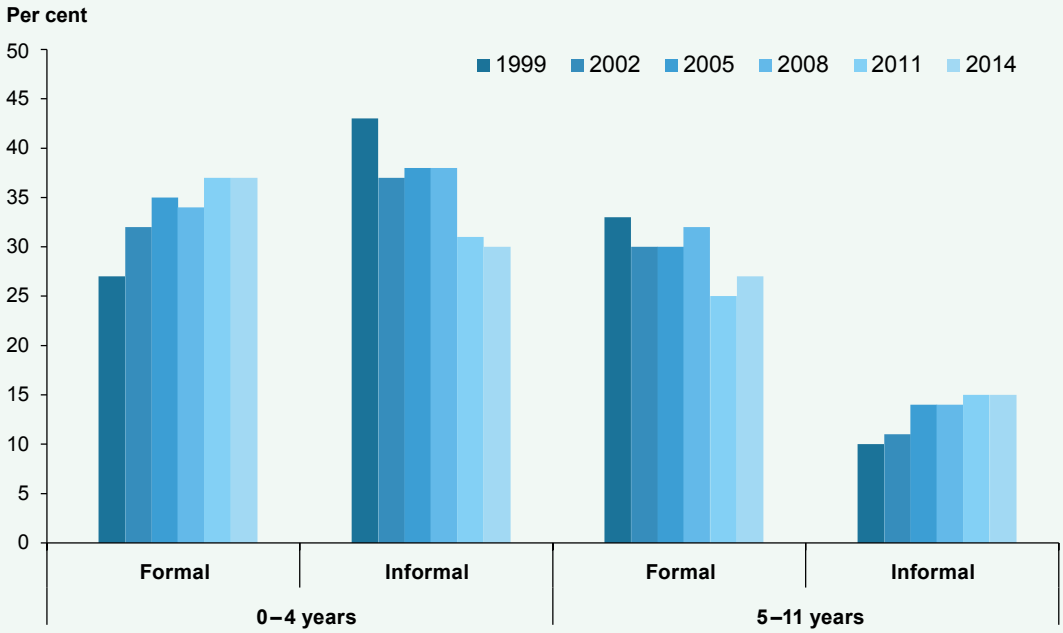
Trends in formal and informal care

Between 1999 and 2014, there was an increase in the proportion of children attending formal care, and a decrease in children being cared for by relatives. This was particularly the case for 0–4-year-olds:

- In 2014, 37% of children aged 0–4 attended formal child care—an increase from 27% in 1999. This period saw an increase in young children attending long day care (from 18% to 31%).
- The proportion of 0–4-year-olds receiving informal care (for example from grandparents or other relatives) decreased between 1999 and 2014, from 43% to 30% (Figure 2.1.2).

For 5–11 year olds, the increase in formal care between 1999 and 2014 was mostly due to an increase in children attending before and/or after school care—up 63%, from 8% to 13% (ABS 2015).

Grandparent care has been the most dominant type of informal care since 1999. In 2014, almost 1 in 4 (23%) 0–4-year-olds and 1 in 6 (16%) 5–11-year-olds were cared for by their grandparents (ABS 2015).



Notes

1. Due to changes in data collection, time series data are not available for (a) type of care attended last week and (b) for children aged 0–11.
2. Formal care does not include preschool for time series analysis.
3. Some children attend both formal and informal care and will be counted in each sector.

Source: ABS 2015.

Figure 2.1.2: Proportion of children aged 0–4 and 5–11 in child care services, by care type—1999, 2002, 2005, 2008, 2011, and 2014

Family characteristics and care type

The proportion of children attending formal child care was similar for children in couple or one parent families (24% and 23%, respectively) (ABS 2015). In 2014, children in one-parent families were more likely to attend informal child care (44%) than children in couple families (30%). Grandparents were the most common source of informal child care (23% in one parent families and 22% in couple families) in 2014 (ABS 2015).

The employment status of children's parents and the composition of their family appear to influence the use of child care. Sixty per cent (60%) of children in couple families where both parents were employed attended child care—32% attended formal care and 40% attended informal care (children could attend more than one type of care). In one-parent families with the parent in employment, 72% of children aged 0–12 attended some type of care—29% attended formal care and 57% attended informal care.

Preschool participation

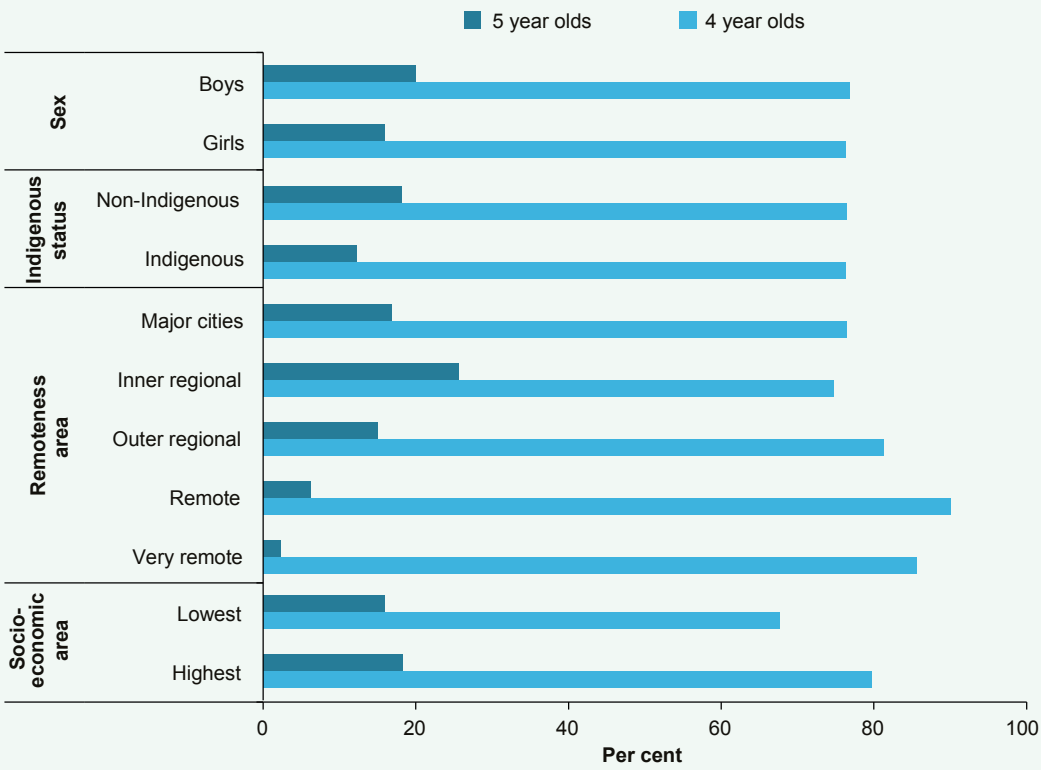
An early childhood education or preschool program is defined as a program delivered in the year before full-time school (YBFS) in a diversity of settings, including long day care centres, stand-alone preschools and preschools that are part of schools. The program is to provide structured, play-based early childhood education delivered by a qualified early childhood teacher in accordance with the Early Years Learning Framework and the National Quality Framework. Preschool programs are tailored to meet the learning needs of younger children.

Since 2008, the Australian Government has provided more than $2.8 billion to assist states and territories achieve universal access to quality early childhood education programs through a series of National Partnership Agreements on Universal Access to Early Childhood Education.

Universal access aims to ensure that all children participate in a quality, early childhood education program in the YBFS, with a focus on participation by Indigenous, vulnerable and disadvantaged children. The program is delivered for 600 hours per calendar year (or 15 hours per week for 40 weeks). Participation in a quality program is a major first step in laying the foundations for future learning, including children's school readiness and transition to full time school, as well as future school success.

In 2016, more than 297,000 children were enrolled in a preschool program in the YBFS (Figure 2.1.3). Of these children, around 243,000 were aged 4, and nearly 55,000 aged 5—representing 77% of all children aged 4 and 18% of all children aged 5. Of all these children, almost 15,000 were Aboriginal and Torres Strait Islander children (76% of Indigenous 4-year-olds and 12% of Indigenous 5-year-olds)(ABS 2017).

Children in couple families were more likely to have participated in a preschool or preschool program (88%) if one or both parent(s) were employed, compared with neither parent being employed (45%). Of children in couple families with one parent employed, 86% attended a preschool or a preschool program. In one-parent families, around three-quarters of children participated in a preschool or a preschool program whether the parent was employed or not (75% and 76%, respectively). More than 1 in 4 preschool program enrolments in Australia were free of fees and over half had out-of-pocket costs ranging between $1 and $4 per hour, on average. Children participated in a preschool for an average of 15 hours per week at an average cost to parents and guardians of $65 per week (ABS 2015).



Source: AIHW analysis using ABS TableBuilder. Source data in TableBuilder was ABS cat. no. 4240.0.55.003—Microdata: preschool education, Australia, 2016.

Figure 2.1.3: Proportion of children aged 4 and 5 participating in a preschool program in the YBFS, by sex, Indigenous status, remoteness area and socioeconomic area, 2016

What is missing from the picture?

While there are data available on the number of enrolments, there are limited reliable data available on actual attendance rates in preschool programs. Data on attendance are collected in the labour force survey during one week of the year, which may not represent the attendance patterns across the year.

Information about the working arrangements used by parents to help care for their child was not available for parents who were out of scope of the labour force survey for any reason (for example, parents who were members of the permanent Defence Force were not included in the survey).

More work needs to be done to evaluate the effectiveness of preschool programs and to investigate ways to increase participation in programs for vulnerable and at-risk children who stand to gain the most from quality preschool.

Data on unmet demand for child care are scarce, including information on reasons for being inaccessible, how long parents are waiting to access child care, and the region where additional care is required. As well, very few child care centres operate outside traditional working hours, and the impact on families who work unusual hours or shift work and require child care is unknown.

Where do I go for more information?

More information on early childhood education is available at www.education.gov.au and www.abs.gov.au. Information on payments available to families can be found on the Department of Human Services website: www.humanservices.gov.au.

2.2 Transition to primary school

The transition from early childhood education to primary school is a time of potential challenge and stress for children and families. Evidence suggests that children who have a positive start to school are likely to engage well and experience success later in life (Farrer et al. 2007). This transition involves not only how children move into and adjust to new learning environments but also how families and schools interact and cooperate. These are all interlinked for building competencies and preparedness in children, schools and families. The starting age for the first year of school varies between 5 and 6 years across the states and territories.

This article provides an overview of 'school readiness'. It focuses on whether children are developmentally on track, at risk or vulnerable, based on results from the 2015 Australian Early Development Census (AEDC) (Box 2.2.1).

Box 2.2.1: School readiness

The AEDC is a population measure that looks at how young children have developed by the time they start their first year of full-time school. The Australian Government delivers the AEDC in partnership with the states and territories, the Centre for Community Child Health and the Telethon Kids Institute, to examine how young Australian children have developed as they start their first year of full time education.

The AEDC data are collected using a validated instrument to assess development in 5 broad areas (domains): physical health and wellbeing, social competence, emotional maturity, language and cognitive skills, and communication skills and general knowledge. The AEDC measure of school readiness is defined as the proportion of children developmentally on track on 4 or more (of the 5) domains. School readiness has been demonstrated as a strong predictor of a child's later literacy, numeracy and other cognitive and behavioural outcomes (AEDC 2015).

In the first data collection cycle in 2009, cut-off scores were set for each of the 5 domains:

- children falling below the tenth percentile were categorised as 'developmentally vulnerable'
- children falling between the tenth and twenty-fifth percentile were categorised as 'developmentally at risk'
- all other children were categorised as 'developmentally on track'.

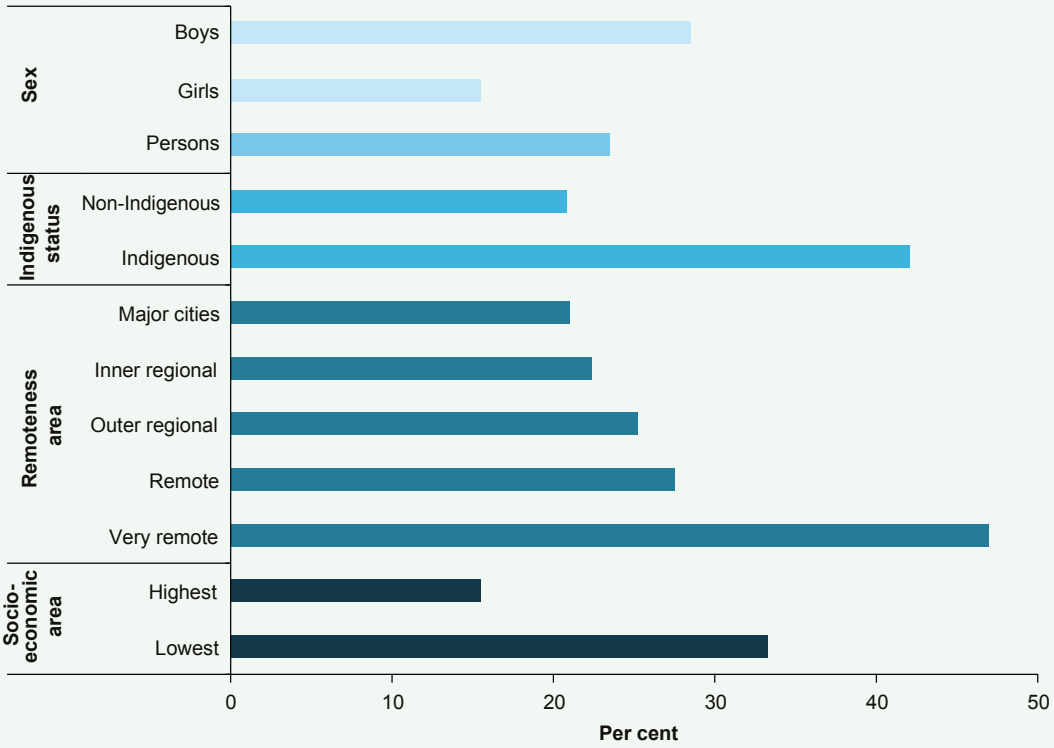
The cut-off scores set in 2009 provide a reference point against which later AEDC results can be compared. These have remained the same across the three collection cycles

Source: AEDC 2016.

Developmental vulnerability

In 2015, 22% of Australian children entering primary school (around 63,000 children) were assessed as vulnerable on 1 or more domains (with 11% vulnerable on 2 or more). The proportions of children assessed as developmentally vulnerable were similar for the social competence (9.9%), emotional maturity (8.4%), communication skills and general knowledge (8.0%), and physical health and wellbeing (9.7%) domains. A smaller proportion of children were considered vulnerable in the language and cognitive skills domain (6.5%).

- In 2015, a higher proportion of boys (29%) were developmentally vulnerable on 1 or more domains than girls (16%) (Figure 2.2.1).
- Developmental vulnerability on 1 or more domains among Indigenous children dropped over the three censuses, from 47% in 2009, to 43% in 2012, and 42% in 2015. It also fell among children with a language background other than English, from 32% in 2009, to 30% in 2012, and 28% in 2015 (AEDC 2016).
- Children living in the lowest socioeconomic areas were around twice as likely to be developmentally vulnerable on 1 or more domains than children living in the highest socioeconomic areas (33%, compared with 16%) (Figure 2.2.1).
- Results differed by state and territory. For example, 37% of Northern Territory students (1,200 students) were vulnerable on 1 or more domains compared with 20% of New South Wales students (18,400) (AEDC 2016).



Source: AEDC 2016.

Figure 2.2.1: Proportion of children assessed as developmentally vulnerable on 1 or more AEDC domain, by sex, Indigenous status, remoteness area and selected socioeconomic areas, 2015

Overall, the proportion of developmental vulnerability reduced between 2009 and 2012. There has been a small decrease in the proportion of children developmentally vulnerable on 1 or more domains (from 24% in 2009 to 22% in 2012) and the proportion of children developmentally vulnerable on 2 or more domains (from 12% in 2009 to 11% in 2012). The proportion vulnerable on 1 or more domains remained stable in 2015, at 22% (AEDC 2016).

Of the 5 domains, the proportion of children who were developmentally vulnerable increased in 2 of the domains between 2009 and 2015.

- The proportion of children who were developmentally vulnerable on the social competence domain increased from 9.5% in 2009 and 9.3% in 2012 to 9.9% in 2015. This change was more pronounced in larger jurisdictions.
- The proportion of children developmentally vulnerable in physical health and wellbeing increased from 9.4% in 2009 to 9.7% in 2015.
- After decreasing from 8.9% in 2009 to 7.6% in 2012, the proportion of children vulnerable in the emotional maturity domain increased to 8.4% in 2015.
- Improvements have been made in children's communication skills and general knowledge, with 8.5% of children developmentally vulnerable on 1 or more domain in 2015—a decrease from 9.0% in 2012 and 9.2% per cent in 2009.
- Gains have also been made in children's language and cognitive skills in 2015 (6.5%), with a decrease in developmental vulnerability from 6.8% in 2012 and 8.9% in 2009 (AEDC 2016).

What is missing from the picture?

Recently the AEDC was linked with the Longitudinal Survey of Australia's Children. Targeted research projects using this data asset would allow examination of the long-term outcomes of early developmental vulnerabilities. Further linking these data with early intervention data could potentially show the most effective ways to ameliorate these vulnerabilities. Establishing data linkage protocols similar to those produced via the numerous SA–NT Datalink projects (https://www.santdatalink.org.au/) could enable greater use of matched data to follow long-term outcomes.

Where do I go for more information?

More information on transition to school in Australia, along with other childhood health, development and wellbeing indicators, is available as part of the Children's Headline Indictors at www.aihw.gov.au/chi/. The now discontinued report, *A picture of Australia's children 2012*, is also available for free download at the AIHW website.

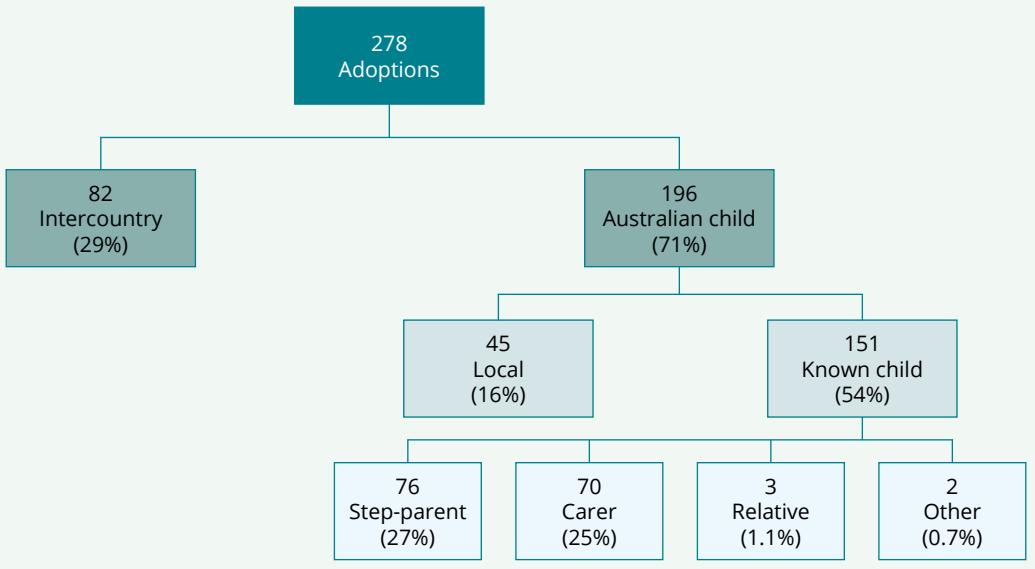
2.3 Adoptions

Adoption is one of the options used to provide permanent care for children not able to live with their families. It is a process where full parental rights and responsibilities for a child are legally transferred from the child's parent/s to his or her adoptive parent/s. Other options for permanent care include long-term care and protection orders (see Chapter 2.5 'A stable and secure home for children in out-of-home care').

Types of adoption

There were 278 adoptions in Australia in 2015–16. An adoption of an Australian child can be either a 'known child adoption' (where the child and the adoptive parent/s were previously known to each other) or a 'local adoption' (where the child and the adoptive parent/s are not known to each other). Children can also be adopted from overseas—an intercountry adoption (Figure 2.3.1). Generally, with intercountry adoptions, the child and the adoptive parent/s are not known to each other.

Among Australian children, there were 151 known child adoptions and 45 local adoptions in 2015–16. Most known child adoptions were by step-parents and foster carers (27% and 25% of all adoptions, respectively). In 2015–16, there were 82 intercountry adoptions, 90% of which were from Asian countries.



Note: Per cents may not add to totals due to rounding.

Figure 2.3.1: Adoptions in Australia, 2015–16

Trends in adoption

Adoptions have declined by 74% over the last 25 years, from 1,052 in 1991–92 to 278 in 2015–16 (Figure 2.3.2). Similar declines have occurred for both Australian child and intercountry adoptions (73% and 76%, respectively). Known child adoptions represent an increasing proportion of all adoptions, as the overall number of adoptions continues to fall. They accounted for 54% of adoptions in 2015–16, compared with 18% in 2006–07. Within known child adoption, adoption by carers (such as foster parents) rose from 21% in 2006–07 to 46% in 2015–16, while step-parent adoption fell from 76% to 50% over the same period.

These changes are due to a complex interplay of factors. These include views on the circumstances in which adoption might be considered appropriate, and the availability of both contraception and legalised abortion, and financial support for single parents. They also include increasing labour force participation of women, reproductive innovations, and efforts to improve the outcomes for children in out-of-home care through alternative legal orders or adoption by carers. Similarly, economic and social changes have enabled children who might otherwise have needed intercountry adoption to remain with their family or be adopted in their country of origin.

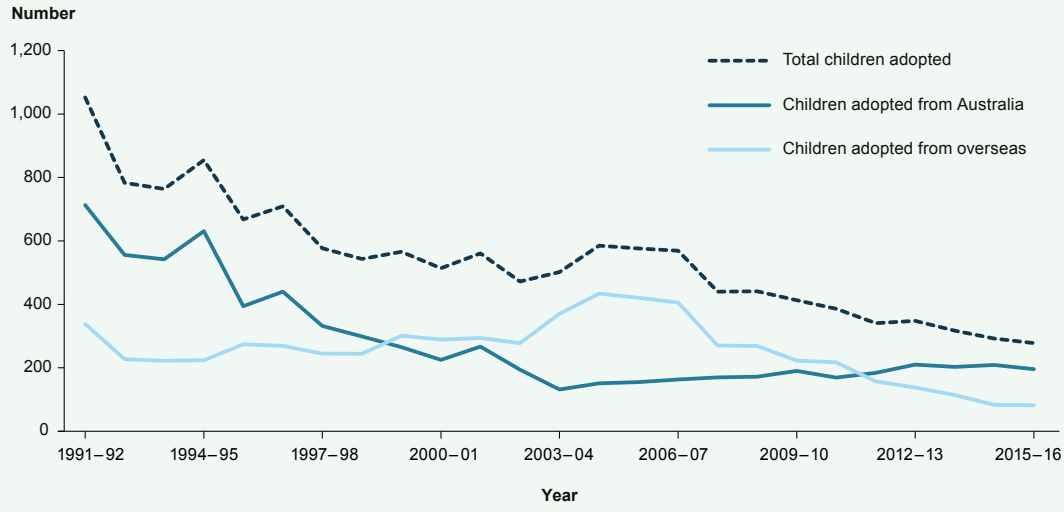


Figure 2.3.2: Number of children adopted in Australia, 1991–92 to 2015–16

Characteristics of adoptees and adoptive parents

In 2015–16, 3 in 5 (60%) adopted children were boys. The difference was more pronounced among children aged under 10 (63% boys), than children 10 and over (55%). The age profiles of adoptees also varied by type of adoption—100% of local adoptees, 71% of intercountry adoptees and 8.6% of known child adoptees were aged under 5. For intercountry adoption, the proportion of infant (aged under 12 months) adoptions declined from 47% in 2005–06 to 8.5% in 2015–16.

The majority of intercountry adoptions in Australia have consistently been from Asia, in line with global adoption trends. In 2015–16, 90% of intercountry adoptions were from Asian countries. The most common countries of origin were the Philippines (24% of intercountry adoptions), Thailand (22%), Taiwan (20%) and South Korea (17%). The main country of origin has changed over time, from China or the Philippines between 2005–06 and 2009–10, to Taiwan or the Philippines since.

The characteristics of adoptive parents also varied with the type of adoption. In 2015–16, 48% of local adoptive parents and more than 80% of intercountry adoptive parents were aged over 40. This proportion increased from 62% in 2006–07 for intercountry adoptive parents but has remained largely unchanged for local adoptive parents (47% in 2006–07).

What is missing from the picture?

Little is known in Australia about the long-term outcomes of adoptions, including the proportion of adoption disruption (breakdown between placement and legal finalisation of adoption) or legal dissolution of adoptions over time.

Data on expatriate adoptions (when an Australian living abroad for 12 months or more adopts a child through an overseas agency) and known child intercountry adoptions (where the child and adoptive parent/s are previously known to each other) are also limited. These types of adoptions are generally excluded from the data for intercountry adoptions described in this section.

Where do I go for more information?

More information on adoption in Australia is available on the AIHW website www.aihw.gov.au/adoptions/. The report *Adoptions Australia 2015–16* is also available for free download.

2.4 Child protection

In Australia, statutory child protection is the responsibility of state and territory governments. Departments responsible for child protection assist vulnerable children who are suspected of being abused, neglected or harmed, or whose parents are unable to provide adequate care or protection.

Children receiving child protection services

Children may receive a combination of child protection services, including 'investigations', 'care and protection orders', and 'out-of-home care'. Investigations can lead to 'substantiations' if there is sufficient reason to believe that a child has been, or is at risk of being, abused, neglected or harmed. Definitions of key terms are available in the Glossary.

In 2015–16:

- About 162,200 (or **1 in 33**) **Australian children** aged 0–17 **received child protection services**.
- **Children receiving child protection services were most likely to be infants** under the age of 1 (38 per 1,000 children) and were least likely to be aged 15–17 (21 per 1,000).
- **Almost three-quarters** (73%) of children receiving child protection services were **repeat clients**. This means that they had previously been the subject of an investigation or were discharged from a care and protection order or a funded out-of-home care placement.
- **Three in 5** (60%) children receiving child protection services **were subject to an investigation only**; that is, their cases had been, or were in the process of being, assessed to determine whether further intervention was required.

Substantiations

In 2015–16, around 45,700 children were the subject of a substantiation—an increase of 21% over a 5-year period, from about 37,800 in 2011–12. The rate at which children were subject to a substantiation rose from 7.4 per 1,000 children in 2011–12 to 8.5 per 1,000 in 2015–16 (Figure 2.4.1).

Emotional abuse was the most common primary type of abuse or neglect substantiated (45%), followed by neglect (25%), physical abuse (18%) and sexual abuse (12%).

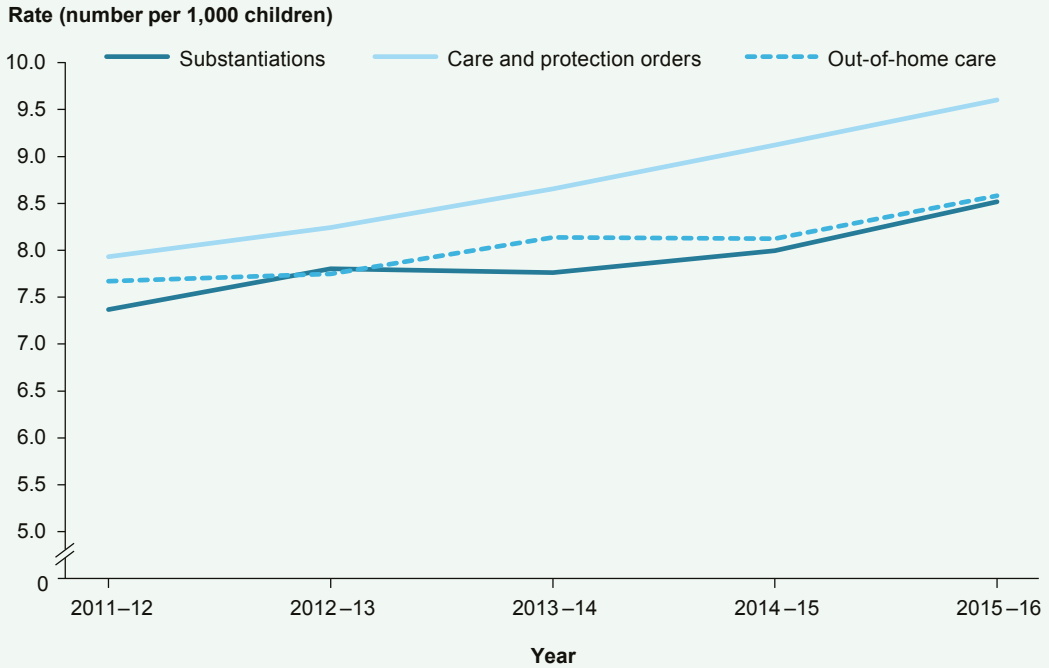
Care and protection orders

About 52,000 children were on care and protection orders as at 30 June 2016—an increase of 27% from around 41,000 as at 30 June 2012. The rate of children on care and protection orders increased over the 5 years to 30 June 2016, from 7.9 to 9.6 per 1,000 children (Figure 2.4.1). Two-thirds (64%) were on finalised guardianship or custody orders (most of which were long term), 19% of children were on third-party parental responsibility orders (again mostly long term), 12% were on interim and temporary orders, and 5.2% were on other types of orders.

Out-of-home care placements and carers

As at 30 June 2016, there were about 46,450 children in out-of-home care—an increase of 17% from 39,600 as at 30 June 2012. There were 7.7 children in out-of-home care per 1,000 children as at 30 June 2012, which rose to 8.6 per 1,000 as at 30 June 2016 (Figure 2.4.1; see also Chapter 2.5 'A stable and secure home for children in out-of-home care').

The vast majority (94%) of children in out-of-home care were in home based care—39% in foster care and 49% in relative/kinship care.



Note: The rates of children who were the subject of substantiation are based on during the year counts, while the rates of children on care and protection orders and in out-of-home care are based on counts as at 30 June.

Figure 2.4.1: Rates of children who were the subject of substantiations, were on care and protection orders or were in out-of-home care, 2011–12 to 2015–16

Some groups are over-represented

Compared with non-Indigenous children, Aboriginal and Torres Strait Islander children were:

- 7 times as likely to be the subject of substantiations
- 9 times as likely to be on care and protection orders
- 10 times as likely to be in out-of-home care.

Compared with children living in *Major cities*, children in combined *Remote* and *Very remote* areas were:

- 4 times as likely to be the subject of substantiations
- 2 times as likely to be in out-of-home care.

What is missing from the picture?

The AIHW is continuing work to enhance national child protection reporting in priority areas identified under the *National Framework for Protecting Australia's Children 2009–2020* (COAG 2009). These efforts include improving data on disability status and cultural and linguistic diversity, and linking to other data sets to measure the health and welfare outcomes for children receiving child protection services. All data which are currently lacking or of unusable quality.

Where do I go for more information?

More information on child protection in Australia is available at www.aihw.gov.au/child-protection/. The report *Child protection Australia 2015–16* is also available for free download at the AIHW website.

COAG (Council of Australian Governments) 2009. Protecting children is everyone's business: National Framework for Protecting Australia's Children 2009–2020. Canberra: COAG.

2.5 A stable and secure home for children in out-of-home care

Some children are not able to live in safety and security with their parents. There are several reasons for this. It may be that children have been, or are at risk of being, abused or neglected and need a more protective environment. It may be that parents are incapable of providing adequate care for them, or that alternative accommodation is needed during times of family conflict. When these situations occur, state and territory departments responsible for child protection may intervene and place children in out-of-home care.

Out-of-home care is overnight care for children aged 0–17, where financial support from state or territory departments responsible for child protection is given or offered to the carer. It can include kinship care (provided by relatives of the child), foster care, family group homes and residential care. During 2015–16, more than 55,600 children (10.4 per 1,000 children) were supported in out-of-home care placements (AIHW 2017). More than one-third (36%) of all children in out-of-home care as at 30 June 2016 were Aboriginal and Torres Strait Islander children and more than half (52%) were boys (AIHW 2017). The number of children in out-of-home care across Australia has increased considerably over recent years—overall, 5,300 more children were in out-of-home care in 2015–16 than in 2012–13 (an increase of 11%) (AIHW 2014, 2017). For more information on child protection, see Chapter 2.4 'Child protection'.

Social and economic impact

The social and economic costs associated with out-of-home care are substantial. There is the personal cost for children and their families. There is also a sizable cost to the community, in providing child protection services at the state and territory level ($4 billion in 2015–16, see Box 2.5.1) and welfare and other services related to the long-term poorer outcomes for many children who have been in care.

Research shows that negative experiences in early life (including child abuse and neglect) increase the likelihood of developmental delays and of difficulties with learning, memory and self regulation (Center on the Developing Child at Harvard University 2016; McLachlan et al. 2013). This can have longer term impacts on health and wellbeing and on a person's ability to be a productive member of society—representing a substantial cost to government in terms of workforce participation, health care and social assistance (Kezelman et al. 2015; McLachlan et al. 2013). Box 2.5.1 presents the recurrent cost of out-of-home care in 2015–16 and recent estimates of the longer term costs associated with negative childhood experiences.

Box 2.5.1: Estimating the cost of abuse and neglect

- In Australia, the national recurrent expenditure on out-of-home care services alone was $2.7 billion in 2015–16—a real increase of $240.2 million (9.7%) from 2014–15 (SCRGSP 2017). The total cost of child protection, including out-of-home care services, was almost $4 billion.
- The longer term cost to government of negative family functioning was estimated to be $5.4 billion per year in 2010 (Access Economics 2010).
- The cost of unresolved trauma from physical, sexual and emotional abuse has been estimated at $6.8 billion per year (Kezelman et al. 2015).

The experience of out-of-home care has been shown to further affect the health and wellbeing of children unable to live with their parents. However, differences between children who experience abuse or neglect and who are later placed in out-of-home care and children who remain at home may contribute to this effect. These differences include the type and severity of the abuse or neglect experienced and socioeconomic characteristics (Berger et al. 2009).

Of particular concern are children who have extended periods in out-of-home care, and who may 'drift in care', moving between multiple home-based placements or between home-based and residential care (Strijker et al. 2008). These circumstances have been linked with negative outcomes in a range of areas, including:

- mental health and wellbeing (Leve et al. 2012; McGrath-Lone et al. 2015; Reilly 2003; Staines 2016)
- educational attainment (Leve et al. 2012; McGrath-Lone et al. 2015; Reilly 2003; Smith & McLean 2013; Staines 2016)
- access to suitable accommodation (Staines 2016)
- employment (Courtney et al. 2001; Reilly 2003; Staines 2016)
- life satisfaction and relational stability (Leve et al. 2012).

The negative outcomes may be severe and include:

- homelessness (Courtney et al. 2001; Reilly 2003)
- disproportionately high rates of substance abuse (Staines 2016)
- over-representation in youth justice systems (Courtney et al. 2001; Reilly 2003; Staines 2016)
- vulnerability to further abuse and violence (Courtney et al. 2001; Reilly 2003)
- premature death (McGrath-Lone et al. 2015).

The Prison Reform Trust in the United Kingdom reported recent findings that there had been little or no improvement in outcomes for children in care in recent years and this was compounded by placement instability (Staines 2016).

Young people who enter the income support system before the age of 18—in particular, young people leaving out-of-home care—are a group requiring support to prevent long-term dependence on income support (Reference Group on Welfare Reform 2015). Australia does not yet have comparable evidence of the outcomes for children in care or changes over time (see 'What is missing from the picture?' at the end of this article). Longitudinal data are critical to understand the outcomes for children in care and the efficacy of policies and systems to support them. Linkage of administrative data sets held by government agencies can maximise the information available to better understand the characteristics and pathways of disadvantaged groups (McLachlan et al. 2013).

Importance of a stable and secure home

Developing secure relationships, including those with non-parent carers, can mitigate or reverse negative outcomes such as those already mentioned (Center on the Developing Child at Harvard University 2016). This is because a 'child who has been subject to trauma and loss requires a deep, meaningful and sustained primary attachment relationship to heal' (McPherson & MacNamara 2014: 224). Therefore, a key aim for children in out-of-home care is to achieve a stable, long-term care arrangement. The processes that state and territory departments responsible for child protection take to achieve this goal are broadly termed 'permanency planning'.

The importance of permanency for children and young people in out-of-home care is widely recognised in Australia and internationally. The concept emerged in the United States in the 1970s, where there was increasing concern that children unable to live with their families were 'drifting in care', with multiple, unstable foster care placements over extended periods (Roth 2013).

In Australia, the impact of out-of-home care on children and young people, as well as the direct and indirect cost to the community, has been examined over many years in parliamentary inquiries, Council of Australian Governments (COAG) reforms and coronial inquests. In 2015, Australia's Senate Inquiry into Out-of-home Care (Senate Community Affairs References Committee 2015) showed heightened policy interest in providing ways to achieve long-term care, with safety of the child and stability of placement as prime objectives. The Inquiry concluded that placement stability and emotional security in the early years are critical to a child's development and important in securing positive outcomes (Senate Community Affairs References Committee 2015). It also recommended that a project be undertaken to develop a nationally consistent approach to legal forms of permanence—including guardianship orders and adoption—and to research improving access to those placements (Senate Community Affairs References Committee 2015).

In November 2016, Community Services ministers of Australian and state and territory governments agreed to develop a set of guiding principles to drive permanency arrangements for children in out-of-home care. These included a focus on permanency and stability, on the timeliness of permanent care decisions and on improving outcomes for Indigenous families and children. Further, it was agreed that reform efforts be directed toward improving consistency in permanent care arrangements across jurisdictions, and to investigating possible schemes for mutual recognition of the suitability of carers.

Permanency planning—what are the options?

Permanency planning, in the context of child protection, is defined as 'the process of making long-term care arrangements for children with families that can offer lifetime relationships and a sense of belonging' (Tilbury & Osmond 2006: 266). Permanency may be understood in terms of both the legal framework for individual care arrangements (for example, a care and protection order or an adoption order), and the actual placement stability achieved. It is important to note, however, that placement stability can occur without a long-term legal order and, conversely, that a long-term legal order does not necessarily result in placement stability.

Legal permanency

The legal framework of permanency is based on the orders that establish long-term care arrangements. For national reporting purposes, short-term care and protection orders (which anticipate reunification with the family) are for 2 years or less. Long-term orders seek to set continuity or stability of care, where the carer and the care arrangements are unchanged over an extended period, once safe reunification with the child's family has been ruled out. However, as noted, not all long-term orders provide placement stability in practice.

Placement stability

Placement stability refers to stability in both the care relationship and residential location. In general, the fewer placements a child has, the greater is his or her stability. However, measures of placement stability are confounded in the available national data by a number of factors. These include placement changes to enhance the child's wellbeing (including reunification attempts), respite provision, sibling co-location efforts, and attempts to find a 'forever home'. Achieving long-term care—particularly when the child is placed outside the kinship network—requires extensive planning. Considerable efforts are made to achieve a match between child and carer to increase safety and security, while reducing the risk of placement disruption.

Permanency planning in practice

There are jurisdictional differences in the approach and terminology used for child protection practices in Australia. Yet, some concepts, both in planning for permanency and in the actions taken to achieve long-term care arrangements, are shared (AIHW 2016c). These can be broadly grouped as:

- reunification with the family of origin
- long-term alternative care on third-party parental responsibility or guardianship/ custody orders
- adoption orders.

These three broad options have very different legal bases and practical outcomes (see Box 2.5.2).

Box 2.5.2: Options for achieving permanency

Reunification

Reunification is a planned process to safely return a child home after a period of time in care to be with their birth parent(s), family or former guardian (and enabling the child to stay); this occurs when it is in the child's best interests, and where it will safeguard his or her long-term stability and permanency (AIHW 2016c). By returning to the family of origin, the child may be deemed to have exited care. Parental rights and responsibilities may resume as normal, although in some cases a care and protection order can remain in place for a period.

Third-party parental responsibility orders

These orders transfer all duties, powers, responsibilities and authority (to which parents are entitled by law) to a nominated person(s) whom the court considers appropriate. The nominated person may be an individual, such as a relative, or an officer of the state or territory department (AIHW 2017).

Guardianship/custody orders

Guardianship orders involve the transfer of legal guardianship to the relevant state or territory department or non-government agency. Custody orders generally refer to orders that place children in the custody of the state or territory department responsible for child protection, or a non-government agency. These orders usually involve the child protection department being responsible for the daily care and requirements of the child, while the parent retains legal guardianship (AIHW 2017).

Guardianship or custody orders can be for specific periods. For national reporting purposes, these are classified as:

- **long-term orders:** transfer guardianship/custody until the child is 18. In some jurisdictions, this may also include orders for a specified period of more than 2 years
- **short-term orders:** transfer guardianship/custody for a specified 'short-term' period of 2 years or less.

Adoption orders

Adoption is a legal process involving the transfer of the rights and responsibilities for the permanent care of a child from the child's parent(s) to his or her adoptive parent(s). The legal relationship between the child and the parent(s) is severed and any legal rights that existed from birth regarding the birth parent(s), such as inheritance, are removed. The legal rights of the adopted child become the same as they would be if the child had been born to the adoptive parent(s) (AIHW 2016a).

Known carer adoption

This is adoption by the foster parent(s) or other non-relative(s) who has been caring for a child in out-of-home care, and been responsible for the daily care and control of the child for the period specified by the relevant state/territory department before the adoption (AIHW 2016c). (In some jurisdictions, adoption from care may not be viewed as part of permanency planning, or, while legally available, it may be rarely used in practice—in particular, for Indigenous children and young people.)

As well, due to the inherent uncertainties in securing permanency, dual planning processes are common. This is especially the case, given the critical importance of age considerations and the need to minimise delays in putting decisions into practice. Jurisdictions may plan for safe reunification while actively seeking to identify potential long-term alternative care.

Permanency planning is not a static process. Children may move from one care and protection order to another and/or from one placement to another. This may be due to efforts to find the most suitable long-term care, or to placement disruption. Further, children who have exited out-of-home care due to reunification or adoption may re-enter out-of-home care at a later stage. This would then require further consideration about how permanency may be achieved.

Challenges in achieving permanency

Children who have experienced abuse and neglect are one of the most vulnerable groups in the community (COAG 2009); those who are subsequently placed in out-of-home care have a broad range of needs (Bath 2015). Caring for these children can be particularly challenging, due to behavioural issues or additional needs arising from disability or developmental delay (Bath 2015; DHS 2016). Some children may also find it hard to form attachments with carers (Meredith Carter & Associates 2015). Carers may thus carry a greater burden of care when parenting children who are unable to live with their birth parents (DHS 2016; Meredith Carter & Associates 2015).

Permanency planning needs to be individualised and must consider all these issues, along with the child's age and whether siblings may be placed together (Murphy et al. 2012; Pritchett et al. 2013; Selwyn et al. 2014). However, permanency decisions also need to be timely; research indicates that a child's age—in particular, age at entry to care—is a strong predictor of placement disruption (Selwyn et al. 2014). The older a child is when adopted, the greater the likelihood of adoption breakdown (Unwin & Mişca 2013).

The challenges to achieving permanency for children in out-of-home care can result from a blend of barriers at the child, family and agency level (seen in 'crisis-driven placements') and difficulties in matching suitable carers with children who already experience health and behavioural issues (Thomson et al. 2016).

Kinship carers report stress, financial strain, health concerns and poor resources as common experiences, with problems compounded by lack of preparation and training (AIFS et al. 2015; Dunne & Kettler 2006; McPherson & MacNamara 2014). Agency level barriers within child welfare systems add to the challenges, including the complexity of processes and the availability of adequate supports and services for children and carers alike (Murphy et al. 2012).

Overall, the availability of out-of-home carers is declining, as the number of children entering care and the complexity of their needs increase (Fernandez 2014; Tregeagle et al. 2014). Together, these challenges potentially increase the average number of placements a child may experience, reflecting a lack of placement choices and the additional placement efforts required (Fernandez & Atwool 2013).

Who are the children needing long-term care?

Reunification (or safe return home) is the policy priority for children in out-of-home care across all states and territories. This will not be achieved for some children, so permanent alternative care arrangements will be needed.

Across all states and territories, policies for permanency planning indicate that children who have been in care for 2 or more years need a decision on their long-term care arrangements (AIHW 2016c) (see the Glossary for relevant out-of-home care definitions).

Almost 31,000 (67%) of the 46,500 children in out-of-home care as at 30 June 2016 had been continuously in care for 2 or more years (AIHW 2017). Of children who have been in 'long-term care' (that is, for 2 or more years):

most (70%) were aged between 5 and 14, with a median age of 10 (see Supplementary Table S2.5.1)

more than one-third (36%) were Indigenous (Table S2.5.2)

94% were living in home-based out-of-home care, including 43% with relatives/kin (Table S2.5.3)

almost three-quarters (74%) had experienced more than 1 placement in their most recent episode of care (Table S2.5.4).

What do we know about the level of permanency achieved for these children?

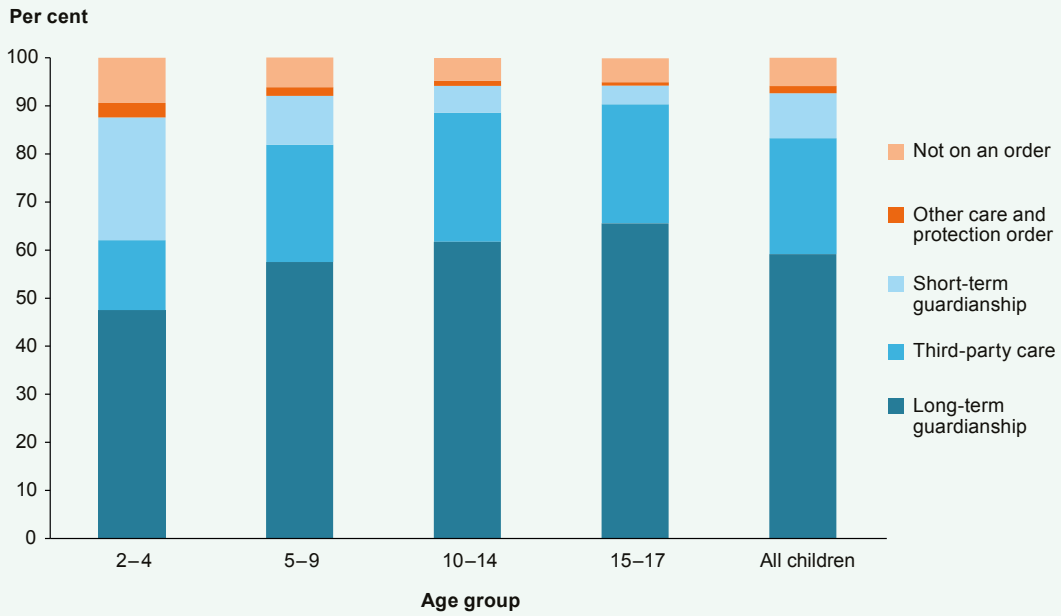
This section presents available data on the long-term care arrangements for children in out-of-home care, and adoption by known carers.

Children remaining in out-of-home care

The available data indicate that most children in out-of-home care for 2 or more years, including children who have had more than 1 care arrangement, achieved some level of stability of care, if not permanency.

Of the children who had been in care for 2 or more years, most (83%) were on a long-term care and protection order:

- one-quarter (24%) were in a third-party parental care arrangement—home-based care where parental responsibility had been transferred to the carer
- around three-fifths (59%) were on long-term finalised guardianship or custody orders (Figure 2.5.1).



Note: This figure includes only children who had been continuously in out-of-home care for 2 or more years as at 30 June 2016.

Source: AIHW Child Protection Collection 2016.

Figure 2.5.1: Children aged 2–17 in long-term out-of-home care, by legal arrangement and age group, 30 June 2016

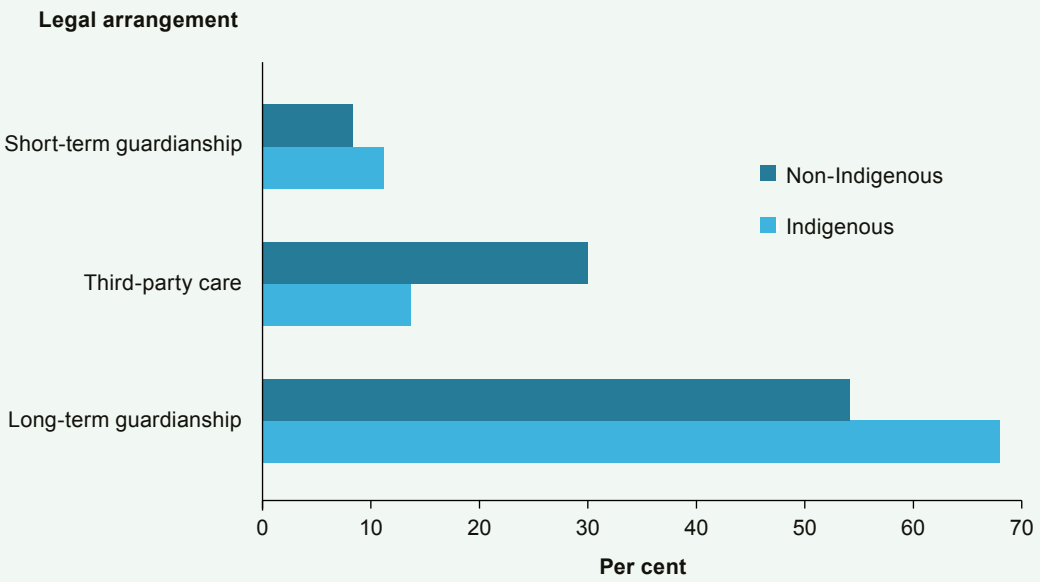
Similar patterns were generally seen across age groups. However, children aged 2–4 were less likely to be on a long-term third-party parental responsibility order and more likely to be on short-term guardianship/custody orders than older children. Young people aged 15–17 were more likely to be on a long-term guardianship order and living in residential care than other children (Table S2.5.5).

Most (88%) children on a long-term guardianship or custody order were living in home-based care with a foster or relative/kinship carer. A smaller proportion (8.1%) were living in residential care or family group homes (Table S2.5.6). Children living in home-based care (that is, in a family setting with a carer) are seen to have better developmental outcomes than children living in residential care with paid, rostered staff (AIFS et al. 2015; Cashmore 2011; DHHS 2014). Residential care may be used for children who have complex needs or to keep large sibling groups together.

Figure 2.5.2 shows that, when compared with non-Indigenous children, Indigenous children were:

- more likely to be on long-term guardianship/custody orders (68% compared with 54%)
- less likely to be in long-term third-party care arrangements (14% compared with 30%).

These findings may reflect a difference in approach to achieving permanency for Indigenous children. Permanence for Indigenous children does not rely on individual relationships but rather to belonging to, and being cared for in, extended family and kin networks; hence, placement with family and community should be considered before other permanent care arrangements (SNAICC 2016).



Notes

1. This figure includes only children who had been continuously in out-of-home care for 2 or more years as at 30 June 2016.
2. This figure excludes children for whom Indigenous status was unknown; children on supervisory, interim and other types of orders or who were on administrative arrangements; and children who were not on a care and protection order as at 30 June 2016.

Source: AIHW Child Protection Collection 2016.

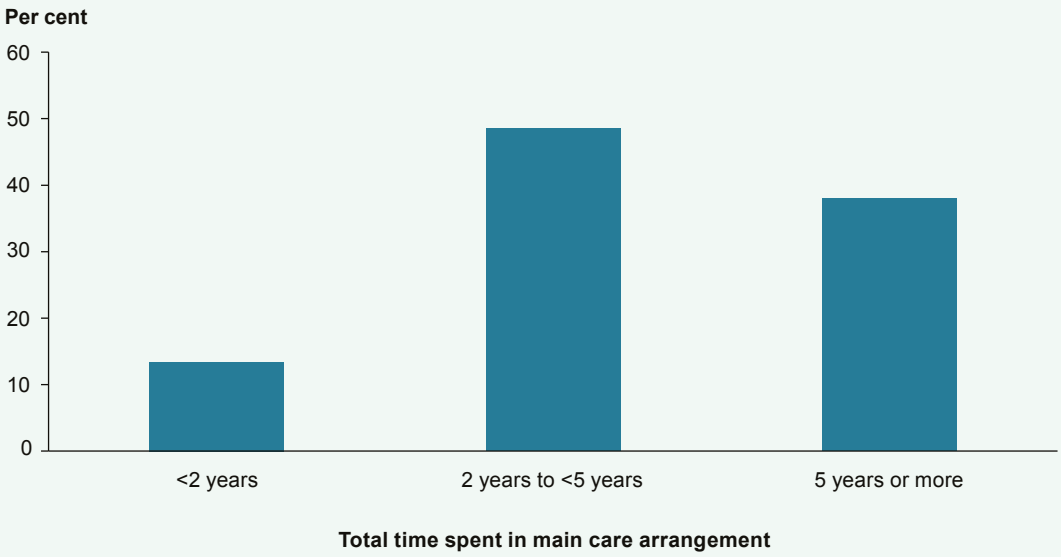
Figure 2.5.2: Children in long-term out-of-home care, by legal arrangement and Indigenous status, 30 June 2016

Most (87%) children who had been in care for 2 or more years had also spent at least 2 years in one main care arrangement (Figure 2.5.3).

This finding is based on the most recently available child protection data, which cover the 2 year collection period 2014–15 to 2015–16. These data include all placements that were open during this collection period, including those that began in a previous collection period. Therefore, time spent in each care arrangement can include time spent outside the 2 year collection period.

Multiple placements are generally viewed as representing instability for a child. However, in the national data, the higher number of placements that some children have experienced can also reflect:

- the use of regular respite care to support an existing long-term placement
- attempts to achieve a more permanent care arrangement (that is, a new placement with relatives/kin or other long-term carer)
- preparation for transition from care (for example, change in placement to independent living or residential care)
- shared care arrangements where children regularly spend a specified number of nights in more than one care arrangement.



Notes

1. This figure includes only children who had been continuously in out-of-home care for 2 or more years as at 30 June 2016.
2. For this analysis, 'main care arrangement' has been selected, based on the longest total duration (the sum of all care periods) spent in a care arrangement.
3. Time spent in the main care arrangement can include placements that began in a previous collection period and therefore can include time spent outside the 2-year collection period.

Source: AIHW Child Protection Collection 2016.

Figure 2.5.3: Children in long-term out-of-home care, by time spent in the main care arrangement, as at 30 June 2016

Views of children in out-of-home care

A recent survey of more than 2,000 children in out-of-home care indicated that 91% felt safe and settled in their current placement, 94% felt close to at least one family group (either the people they lived with, family members, or both) and 97% felt they had an adult who cared about what happened to them, now and in the future (AIHW 2016d).

Two longitudinal surveys currently underway in New South Wales and Victoria will also, in future, provide valuable insights into the experience of children and young people in out-of-home care.

New South Wales Pathways of Care longitudinal study

This large-scale longitudinal study is following a cohort of children and young people who entered out-of-home care for the first time ever between May 2010 and October 2011. Baseline information was collected at entry to out-of-home care and ongoing data are being collected on out-of-home care experiences and developmental wellbeing. These data include those on domains related to physical health, cognitive/learning ability, social–emotional wellbeing and safety. Data on their involvement in child protection, out-of-home care, health care, education and the justice system will be linked and matched to the survey results. The results of the study will be used to inform casework practice and enhance out-of-home care systems to improve outcomes for children in care (NSW FACS 2017).

Beyond 18 longitudinal study in Victoria

This is a study of young people who were aged 16–19 in 2015 and had spent time in out-of-home care in Victoria. Participants are asked to complete three surveys between 2015 and 2018 to document their views on being part of the child protection system and leaving care. Information collected will be related to their out-of-home care and life experiences, health, relationships and education. The study aims to improve the support provided to young people while they are in care, while they make the transition from care and after they leave care (AIFS & DHHS 2017).

Children adopted from out-of-home care

In Australia, 70 children were adopted from out-of-home care ('known carer' adoptions, see Box 2.5.2) in 2015–16. The number of 'known carer' adoptions rose between 2006–07 and 2014–15 (from 22 to 94), before falling to 70 adoptions in 2015–16 (see Chapter 2.3 'Adoptions') (Figure 2.5.4).

Source: AIHW Adoptions Australia data collection.

Figure 2.5.4: Known carer adoptions, 2006–07 to 2015–16

Australian jurisdictions differ in the extent to which they use adoption to achieve permanency for children in out-of-home care (AIHW 2016c; Box 2.5.2). The majority of carer adoptions were finalised in New South Wales, reflecting that state's policies for options to achieve stability.

The recent fall in known carer adoptions is due in part to the application of long-term guardianship orders to children in out-of-home care in New South Wales, from late 2014 (AIHW 2016a).

Placement stability in adoptions

Very little is known in Australia about placement stability in adoptions. Currently, the only Australian national data available are on intercountry adoptions at 12 months after placement of the child with the adoptive family (AIHW 2016a).

Disruption and dissolution of adoptions occur at different points in the adoption process but both result in either the child's return to (or entry into) out-of-home care or placement with new adoptive parents.

- Disruption is an adoption process that ends after the child is placed in an adoptive home but before the adoption is legally finalised.
- Dissolution is an adoption that ends after it is legally finalised.

Studies in the United States have reported disruption (in some cases including dissolution) rates between 6% and 11% (Coakley & Berrick 2008). Studies in the United Kingdom that separate disruption and dissolution report disruption rates of between 4% and 11% (Selwyn et al. 2014).

Changing perceptions of the role of adoption

Adoption of children from out-of-home care has been of increasing interest in recent years. This has been reflected in legislative changes in some jurisdictions. For example, on 1 April 2014, the New South Wales Parliament passed the Child Protection Legislation Amendment Bill 2014. The amendments aim to streamline the process of adopting children and young people in out-of-home care. Amendments in Western Australia (effective late 2012) reintroduced relative adoption as a legislative option and strengthened the carer adoption process (AIHW 2016a).

However, adoption is only one option in permanency planning for children in out-of-home care and is not as widespread in Australia as in England or the United States (Fernandez & Atwool 2013; Ross & Cashmore 2016).

In the United States, the majority of children adopted from out-of-home care were adopted by their foster carers; in the United Kingdom, the majority were 'stranger/matched adoptions' (Selwyn et al. 2014).

The most recent data for the United States indicate that nearly 54,000 children were adopted from foster care in 2014–15. As at 30 September 2015, there were 428,000 children in foster care, of whom more than 110,000 were waiting to be adopted (US Department of Health and Human Services 2016). Over a similar period, in England, more than 5,300 children, of almost 70,000 in care, were adopted (UK Department for Education 2015). This compares with Australia's 94 known carer adoptions for the same period, where 54,000 children were in out-of-home care (AIHW 2015, 2016b).

Opinions differ among legislators, policy makers, practitioners, academics and the community about the use and appropriateness of adopting children from out-of-home care (Ross & Cashmore 2016). This includes a concern not to replicate the Stolen Generations and Forced Adoption, which have been the subject of national apologies (Senate Community Affairs References Committee 2015; SNAICC 2016; Tregeagle et al. 2014).

Adoption may be considered to be in the 'best interests' for some children; however, it is not suitable for all, especially for children who do not wish to be adopted (Bonfili 2015). Some research has estimated that half of the children for whom restoration had been excluded were not suitable for adoption (Tregeagle et al. 2014). This may be due to existing family and/or kinship ties preventing adoption. For children who are placed with relatives/kin, adoption is not generally considered appropriate (AIHW 2016a), while the Aboriginal and Torres Strait Islander Placement Principle (Lock 1997) views the adoption of Indigenous children as a last resort. A child's age, history of abuse, and emotional /behavioural problems may mean that, for some children, long-term out-of-home care with skilled foster parents may be a better permanency option than adoption (Queensland Department of Communities 2011).

The availability of sufficient numbers of carers to adopt children, other than infants, has been questioned (Ainsworth 2016). Many potential adoptive parents prefer to adopt infants and younger children, while children identified as needing adoption may often be older and have had repeated restoration efforts and care placements, sometimes resulting in additional behaviour disorder issues (Tregeagle et al. 2014; Unwin & Mişca 2013). Casework assistance with contact, therapeutic, practical and emotional support, and financial assistance have all been identified as critical to the success of adoption (UCCYPF 2014), but may be reduced or become time limited on adoption (Ross & Cashmore 2016).

What is missing from the picture?

National child protection data are limited in the extent to which they can describe the level of permanency achieved. This is due to the difficulties in determining when a care arrangement has become permanent. The number of children who exited out-of-home care and were reunified with their family cannot be reported using existing national data. Similarly, data are not available on the number of children who experience disruptions to reunification attempts or long-term care arrangements.

National information about permanency-related concepts for children and young people in out-of-home care could be enhanced by the development of:

- nationally standardised definitions of permanency
- national data on the specific reasons children are placed in out-of-home care, including family characteristics
- national data on the reasons for changes in placement, which may help to identify placement changes made to promote permanency
- linked data to support comparisons of outcomes between children who have different experiences of out-of-home care and children who have never entered care
- linked data on the life course of young people exiting care at age 18
- a follow-up survey of children in out-of-home care, including qualitative components, increasing consistency of methodology across jurisdictions
- reportable data on adoption disruption and dissolution
- national data on the types and levels of family support services provided.

What is the AIHW doing?

The AIHW is continuing to work with state and territory departments responsible for child protection to:

- develop and implement an agreed 'reunification/permanency' indicator under Standard 1 of the *National Standards for Out- of-Home Care*
- expand reporting of known carer adoptions to better understand the children for whom this permanency option has been used
- provide a composite view of long-term care in national reports by:
  - reporting on long-term and short-term finalised guardianship/custody orders in *Child protection Australia*
  - reporting on adoption orders as well as care and protection orders in *Child protection Australia*
  - reporting on third-party parental responsibility orders in *Adoptions Australia*, to complement data on known carer adoptions including relevant research.
- improve the availability and comparability of national child protection data, with a focus on the framework for reporting on out-of-home care in Australia.

Linkage of child protection data with youth justice and specialist homelessness services data has been undertaken. The potential for linking out-of-home care data with other data sets related to health and welfare to enable outcomes reporting is also being explored.

Where do I go for more information?

More information about child protection is available at www.aihw.gov.au/child-protection/. The report *Child protection Australia 2015–16* and other recent publications are available for free download.

More information about adoptions is available at www.aihw.gov.au/adoptions/. The report *Adoptions Australia 2015–16* is available for free download.

2.6 Youth justice supervision

Young people who commit, or allegedly commit, a crime may be dealt with under the youth justice system. In Australia, youth justice is the responsibility of state and territory governments, and each jurisdiction has its own legislation, policies and practices. However, the general processes by which young people are charged and sentenced, and the types of legal orders available to the courts, are similar.

Young people can be charged with a criminal offence if they are aged 10 and older. The upper age limit for treatment as a young person is 17 in all states and territories except Queensland, where it is 16. Some young people aged 18 and older are also involved in the youth justice system. This may be due to the offence being committed when the person was aged 17 or younger, with supervision continuing once they turn 18.

Young people under youth justice supervision

On an average day in 2015–16, 5,482 young people aged 10 and older were under youth justice supervision in Australia, with a total of 11,007 supervised at some time during the year. Among people aged 10–17, this equates to a rate of 21 young people per 10,000 population, or about 1 in every 476 young people being under supervision on an average day.

Most young people under youth justice supervision on an average day were supervised in the community (84%). Although 17% were in detention on an average day (some were supervised in both the community and detention on the same day), more than 2 in every 5 young people (44%) under supervision experienced detention at some time during the year.

Young people may be supervised when they are unsentenced—that is, when they have been charged with an offence and are awaiting the outcome of their court matter, or when they have been found, or have pleaded, guilty and are awaiting sentencing. In 2015–16, more than half (57%) of young people in detention on an average day were unsentenced.

Some groups are over-represented

Compared with non-Indigenous young people, on an average day, Aboriginal and Torres Strait Islander young people were:

- 17 times as likely to be under supervision
- 15 times as likely to be supervised in the community
- 25 times as likely to be in detention.

Compared with young females, on an average day, young males were:

- 4 times as likely to be under supervision
- 4 times as likely to be supervised in the community
- 8 times as likely to be in detention.

Compared with young people living in *Major cities*, on an average day, people in *Very remote* areas were:

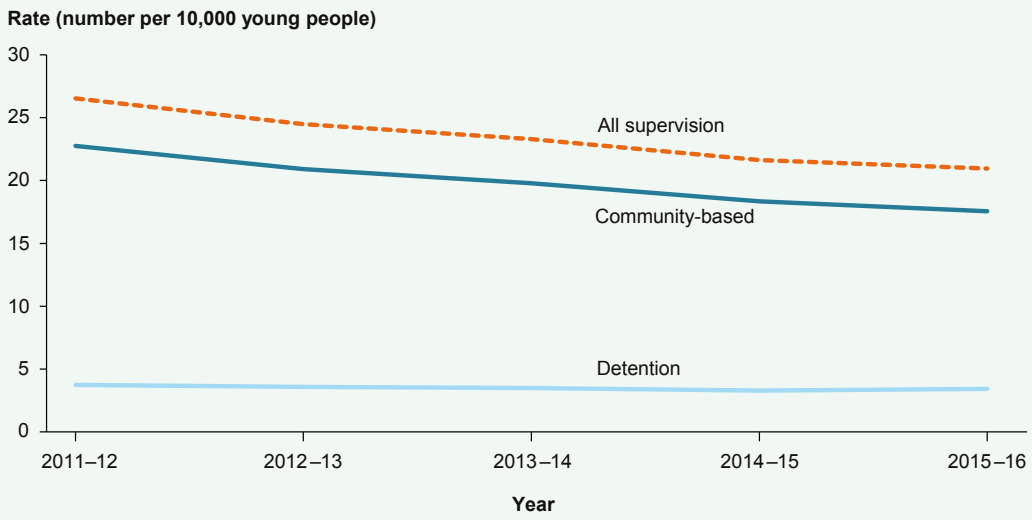
- 10 times as likely to be under supervision
- 10 times as likely to be supervised in the community
- 9 times as likely to be in detention.

Compared with young people living in the highest socioeconomic areas, on an average day, young people living in the lowest socioeconomic areas were:

- 6 times as likely to be under supervision
- 7 times as likely to be supervised in the community
- 6 times as likely to be in detention.

Fewer young people under supervision

Over the 5-year period from 2011–12 to 2015–16, the number of young people aged 10 and over under supervision on an average day fell by 21% (from 6,959 to 5,482), while the rate of those aged 10–17 under supervision fell from 27 to 21 per 10,000 (Figure 2.6.1). The number of young people aged 10 and over in community-based supervision on an average day fell by 23% (from 5,970 to 4,598) while the rate of those aged 10–17 fell from 23 to 18 per 10,000. Among those in detention, the numbers and rates also fell during the 5-year period, although to a lesser degree. The number of young people aged 10 and over in detention fell by 11% (from 1,024 to 914) and the rate among those aged 10–17 went from 4 to 3 per 10,000.



Note: National totals include non-standard data for the Northern Territory.

Figure 2.6.1: Rate of young people aged 10–17 under supervision on an average day, by supervision type, 2011–12 to 2015–16

Time under supervision

When all time spent under supervision is considered, young people who were supervised during 2015–16 spent a total of 182 days—or about 6 months, on average—under supervision. The average length of time under supervision has remained stable over the last 5 years, ranging between 180 and 182 days.

Young people spent more time, on average, under community-based supervision during the year (171 days) than in detention (69 days). For young people in detention, sentenced detention lasted substantially longer (103 days on average) than unsentenced detention (44 days).

Returns to sentenced supervision

Most young people who receive a supervised youth justice sentence serve only 1 sentence, and do not return to sentenced youth justice supervision. Of young people under sentenced youth justice supervision from 2000–01 to 2015-16 and born between 1990–91 to 1997–98, 61% received only 1 supervised sentence before the age of 18.

A sizeable minority of young people who entered sentenced youth justice supervision went on to receive a total of 5 or more supervised sentences before they turned 18. For young people whose first supervised sentence was detention, more than 1 in 4 (27%) received a total of 5 or more supervised sentences, compared with 1 in 7 (15%) of young people whose first supervised sentence was community based.

Involvement with child protection services

Some young people under youth justice supervision are also involved with the child protection system. Young people aged 10–17 under youth justice supervision during 2014–15 were 15 times as likely as the general population to be involved with the child protection system in the same year. Similarly, young people involved with the child protection system were 14 times as likely as the general population to be under youth justice supervision in the same year.

What is missing from the picture?

Data are limited on the health and welfare status and health service use of young people under supervision, and on their health and wellbeing outcomes once they exit youth justice supervision. Information on the pathways between youth justice supervision and adult correctives services is currently not available, due to the current lack of linkable national data on adult corrective services. The Northern Territory did not provide standard data for the Juvenile Justice National Minimum Data Set in 2015–16, but non-standard data have been included in national totals where possible. The AIHW will be working with the Northern Territory to enable the provision of standard data in future years. Non-standard data are not included in some analyses (such as for remoteness or socioeconomic areas) or data linkage studies, due to issues around completeness and comparability with standard data.

Where do I go for more information?

More information on youth justice in Australia is available at www.aihw.gov.au/youth-justice/. Recent youth justice publications, including the *Youth justice in Australia 2015–16* bulletin and state fact sheets are also available for free download at the AIHW Youth justice in Australia 2015–16 page at: http://www.aihw.gov.au/publication-detail/?id=60129558624.

2.7 Family, domestic and sexual violence

Family, domestic and sexual violence is a major health and welfare issue in Australia and globally. The World Health Organization (WHO) estimates that 30% of women who have been in a relationship have experienced physical or sexual violence from an intimate partner since the age of 15 (WHO 2013). Almost 1.5 million Australian women have experienced violence from a current or former partner since the age of 15 (ABS 2013b). Approximately 1 in 6 Australian women have been subjected to physical or sexual violence by a current or former cohabiting partner, compared with 1 in 19 men (ABS 2013b).

This article provides an overview of the available data and research on family, domestic and sexual violence, primarily where the violence involved a female victim and a male perpetrator. This scope is consistent with the focus of recent inquiries and associated policies: the evidence, overwhelmingly, is that women are the victims of family, domestic and sexual violence, and the perpetrators are men.

> If you are experiencing domestic or family violence or know someone who is, please call 1800RESPECT (1800 737 732) or visit the 1800RESPECT website.

What is family, domestic and sexual violence?

Domestic violence is usually defined by a set of violent behaviours between current or former intimate partners: one partner tries to exert power and control over the other through fear. Violent behaviour can include physical, sexual, emotional and psychological abuse. Behaviour toward the victim can include limiting their access to finances, preventing them from contacting family and friends, demeaning and humiliating them, and threatening them or their children with injury or death (COAG 2012).

Family violence is more broadly defined, and refers to violence between family members as well as between current or former intimate partners. For example, it can include acts of violence between a parent and a child. 'Family violence' is the preferred term for experiences of violence between Aboriginal and Torres Strait Islander people, as it covers the broad range of extended family and kinship relationships in which violence may occur (Closing the Gap Clearinghouse 2016) (see Chapter 7.1 'Community factors and Indigenous wellbeing' for more information about the experiences of family violence for Indigenous Australians).

Sexual violence refers to behaviours of a sexual nature carried out against a person's will using physical force or coercion (or any threat or attempt to do so). Sexual violence can be perpetrated by partners in a domestic relationship, former partners, other people known to the victims, or strangers.

Policy context

Family, domestic and sexual violence has become an increased community concern and a key priority for Australian and state and territory governments. There have been several recent national and state and territory inquiries into government responses to it. They all highlight the need to improve the integration of service responses for victims, to invest in prevention and early intervention, and to hold perpetrators more accountable (DPMS 2016; NSW Ministry of Health 2016; Social Development Committee of the Parliament of South Australia 2016; Special Taskforce on Domestic Violence in Queensland 2015; State of Victoria 2016).

The National Plan to Reduce Violence against Women and their Children—2010–2022 (the National Plan) was released in 2011 with a vision that Australian women and their children can live free from violence in safe communities (COAG 2012). The plan focuses on two main types of violence: domestic/family violence and sexual assault. These types of violence mainly affect women. The National Plan aims to achieve a 'significant and sustained reduction in violence against women and their children' (COAG 2012).

The National Plan provides a framework for coordinating governments to deliver on four action plans over the 12 years. Its focus is on the following six outcomes:

- communities are safe and free from violence
- relationships are respectful
- Indigenous communities are strengthened
- services meet the needs of women and their children experiencing violence
- justice responses are effective
- perpetrators stop their violence and are held to account.

The Third Action Plan 2016–19 under the National Plan was launched in October 2016. It outlines what governments, communities, businesses and individuals can do to reduce violence against women and their children through 36 practical actions, across six national priority areas, over the next 3 years.

What do we know?

Prevalence of family, domestic and sexual violence

Based on the Australian Bureau of Statistics (ABS) Personal Safety Survey (PSS) (see Box 2.7.1), since the age of 15:

- 1 in 6 (17%) Australian women, compared with around 1 in 19 men (5.3%) have experienced violence from a current or former cohabiting partner
- 1 in 4 (25%) women have experienced emotional abuse by a current or former cohabiting partner.

In the 12 months before the survey:

- women aged between 18–24 were the most likely age group to experience sexual and/or physical violence by any type of perpetrator (13%)
- women were also more likely to experience violence from a known person (4.0% of all women) than from a stranger (1.7%) (ABS 2013b).

For information on the family, domestic and sexual violence experiences of men in Australia, see Box 2.7.2.

Box 2.7.1: Measuring violence in the ABS Personal Safety Survey

The PSS is designed to provide national level data on the prevalence of, and information about, the most recent experience of violence. Some data refer to partner violence—that is, from a person the respondent currently lives with (or lived with), in a married or de facto relationship. Partner violence does not include violence between intimate partners who were not living together at the time of the incident—this relationship is classified as 'boyfriend/girlfriend or date'. The PSS asks people over the age of 18 about experiences of violence since the age of 15. It also asks about characteristics of their most recent incident of violence. The latest data come from the 2012 PSS, with the 2016 survey due for release late in 2017.

Source: ABS 2013b.

Box 2.7.2: What about male victims of family, domestic and sexual violence?

This article primarily focuses on women and children as victims of family, domestic and sexual violence; however, men can be, too. The 2012 PSS is one of the primary data sources of experiences of men as victims of violence, and how this differs from the experiences of women. This section highlights some of the key findings for male victims, based on reported experience of violence since the age of 15.

Males are more likely to experience violence than women

- Men are more likely to experience physical violence than women. Five in 10 men (or 4.1 million) have experienced some form of physical violence, compared with 1 in 3 women (3 million).
- Men are less likely to experience sexual violence than women, with 1 in 22 men (0.4 million) reporting that they had experienced sexual violence since the age of 15, compared with 1 in 5 women (1.7 million).
- Men are more likely to experience violence from a stranger (36% or 3 million). Women are more likely to experience it from someone they know (36% or 3.1 million).

Violence against men is less likely to be from their partner

- One in 19 (5.3%) men (448,000) have experienced violence from a current or former partner, compared with 17% of women (1.5 million).
- Fourteen per cent (14%) of men (1.2 million) had experienced emotional abuse from a female partner, compared with 25% of women from a male partner.
- Slightly less than half of men who had experienced emotional abuse from a female partner reported feeling anxiety or fear due to the abuse (46% for former partners and 43% for current partners). This compares with 76% of women who felt anxiety or fear due to emotional abuse from a former partner and 63% from a male current partner.

Source: ABS 2013b.

Understanding the prevalence and extent of victims' experiences of violence relies on data collected either through surveys, or for administrative purposes (such as police, health or specialised services data). Use of these data sources to measure the prevalence of family, domestic and sexual violence relies on:

- victims' perception of what constitutes this violence
- victims' willingness to disclose/report the incident
- how the incident is disclosed/reported (ABS 2013a).

Family, domestic and sexual violence can also be disclosed to agencies such as police, health, legal or other specialist services—or just to family and friends. It can also be reported through surveys. The PSS is the most comprehensive source of the experience of interpersonal violence in Australia. However, there are still communities of interest for whom the PSS does not collect detailed information. These include women with disability, women from culturally and linguistically diverse backgrounds, transgender and gender diverse people, and Indigenous peoples (Cox 2015). Dealing with these data gaps will foster a better understanding of experiences of violence for all women and their children.

Risk factors for family domestic and sexual violence

There is no one single cause of family, domestic and sexual violence. It is often a mix of interrelated factors—both individual and interpersonal. Individual factors include personal values and beliefs, mental health, drug and alcohol use. Interpersonal factors include learned patterns of behaviour within relationships. The broad consensus in the literature is that the underlying drivers of this violence reflect inequalities in the distribution of power, resources and opportunity between males and females and the way in which gender roles are formed (OurWatch, ANROWS & VicHealth 2015; VicHealth 2014).

Measures of gender equality can include differences in male and female life expectancy, employment, education, income and representation in political and senior management positions. The 2016 Gender Gap Index (World Economic Forum 2016) ranks Australia in the top third countries included (46th of 144 countries), achieving the highest scores of gender equality for educational attainment, but the lowest for political empowerment (women in parliament or ministerial positions).

Family, domestic and sexual violence can be experienced across all age, socioeconomic and demographic groups. However, there are some common elements associated with raised levels of this type of violence. It is often associated with alcohol and drug use—in 2012, 56% of women who had been physically assaulted by a man reported that alcohol or drugs contributed to the most recent incident of assault (ABS 2013b). As well, victims are commonly:

- young women, particularly women who are inexperienced in relationships or in a relationship where there is a substantial age gap between partners (Flood & Fergus 2008)
- unemployed women (or women who rely on government payments as their main source of income) (ABS 2013b)
- women born overseas (ABS 2013b)
- women with disability (ABS 2013b)

- Indigenous women—in 2014–15, the rate of hospitalisations for assaults related to family violence for Indigenous women was 32 times the rate for non-Indigenous women (SCRGSP 2016)
- women who are pregnant—in 2012, 25% of victims had their first experience of violence from a previous partner during their pregnancy (ABS 2013b).

Attitudes towards violence against women

Communities whose attitudes reflect greater levels of gender equality are more likely to have lower rates of domestic, family and sexual violence (UNIFEM 2010). Attitudes towards violence against women in Australia are measured every 4 years through the National Community Attitudes towards Violence Against Women Survey (NCAS)—the most recent data available are from the 2013 survey (VicHealth 2014). This survey measures community knowledge and attitudes towards violence against women, gender roles and relationships, and responses to violence. It also tracks changes in knowledge and attitudes over time (between 1995, 2009 and 2013). The next NCAS will be conducted by Australia's National Research Organisation for Women's Safety (ANROWS) in 2017.

Overall, the results of the 2013 NCAS were generally positive. Only 4% to 6% of Australians believe that violence against women is justified in certain circumstances (Table 2.7.1). The majority also acknowledge that physical and non-physical violence (such as constant criticism, stalking, intimidation, and controlling social contact) are serious behaviours and a form of violence against women. Almost all Australians (98%) stated that they would intervene if a woman they know was being assaulted. There is room for improvement, though. Twenty-one per cent (21%) agree that the violence can be excused if the perpetrator regrets it, and 18% believe that men should take control and be the head of the household (reflecting attitudes towards gender roles and relationships).

In general, attitudes towards violence against women are fairly consistent across Australia. This is irrespective of location, educational attainment and type of employment. There are particular groups, however, that are more likely to endorse attitudes that support violence against women, and have a poor understanding of what constitutes it. These groups are:

- men in general, particularly young men and men who have experienced multiple forms of disadvantage
- young people aged 16–24
- people from countries where English is not the main language spoken, especially people who have recently arrived in Australia.

Table 2.7.1: Summary of positive and concerning knowledge and attitudes towards violence against women in Australia, 2013

Aspect	Positive findings	Concerning findings
Knowledge of violence	Most Australians recognise that violence against women is more than just physical violence, and can be a wide range of behaviours designed to intimidate and control women. Women were more likely than men to recognise that violence can be non-physical as well as physical.	26% did not believe that someone who tries to control their partner by denying them money is a form of partner violence (34% for males,18% for females). 64% believed the main cause of violence against women is that some men cannot control their anger (65% for males, 64% for females).
Knowledge of the law	96% agree that domestic violence is a criminal offence (94% for males, 98% for females).	Nearly 1 in 10 believe that a woman cannot be raped by someone she is in a relationship with (10% for males, 8% for females).
Patterns and consequences of violence	89% of Australians believe that it is reasonable for the violent partner to be made to leave the family home (87% for males, 91% for females).	78% found it difficult to understand why women stay in a violent relationship (79% for males, 76% for females).
Attitudes for minimising/trivialising the violence	95% of Australians believe that violence against women is a serious issue (94% for males, 96% for females).	38% of Australians believe it is acceptable to track a female partner by electronic means without their consent (43% for males, 32% for females).
Circumstances in which violence can be justified or excused	Only 4% to 6% of Australians believe that violence against women is justified (depending on the scenario).	21% believe that domestic violence can be excused if the violent person regrets it (26% for males, 17% for females).
Responding to family, domestic and sexual violence	98% of Australians are prepared to intervene if a known woman was being assaulted by her partner (98% for males, 97% for females).	Only 57% of Australians would know where to get help for a domestic violence problem (53% for males, 60% for females). This percentage has fallen from 62% in 2009.

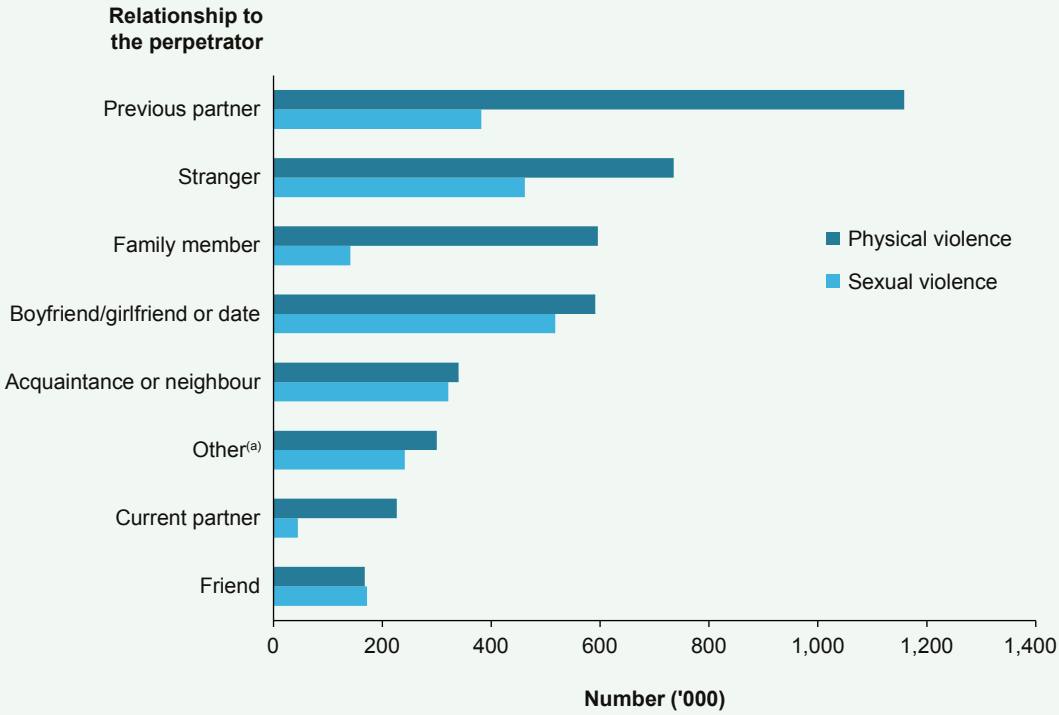
Note: Includes all survey respondents aged 16 and over.

Source: 2013 NCAS (VicHealth 2014).

Relationship to the perpetrator

Women were more likely than men to have experienced physical or sexual violence by a partner. An estimated 17% of all women aged 18 and over (nearly 1.5 million women) and an estimated 5.3% of all men of the same age (around 450,000) had experienced violence from a current or former cohabiting partner since the age of 15. Women were also more likely than men to have experienced violence by a partner in the 12 months before the survey. An estimated 1.5% of all women aged 18 and over had experienced violence by a partner, compared with 0.6% of all men of the same age in the 12 months before the survey (ABS 2013b).

The relationship between the victim and the perpetrator differs for women in cases of physical violence and for women who have ever experienced sexual violence (Figure 2.7.1). Of women who have ever experienced physical violence since the age of 15, the most common type of known perpetrator was a previous partner (1.2 million or 13% of all women). For women who had experienced sexual violence, more than half a million (5.9% of all women) reported that the perpetrator was their boyfriend/girlfriend or date, and almost half a million reported that the perpetrator was a stranger (5.3% of all women) (ABS 2013b).



(a) Includes counsellor/psychologist/psychiatrist, doctor, priest/minister/rabbi, prison officer, ex-boyfriend/ex-girlfriend and any other known persons.

Source: ABS 2013b.

Figure 2.7.1: Women who have experienced violence since the age of 15, by type of violence and relationship to the perpetrator, 2012

Impacts of family, domestic and sexual violence

Family, domestic and sexual violence affects more than just victims: perpetrators, families, workplaces and communities are all impacted in some way. These impacts include economic costs, homelessness, health consequences, and collateral effects on children. Some of these impacts are described in this section.

Economic

Family, domestic and sexual violence can have a major impact on victims and the broader community. It places a substantial workload on specialist services, hospitals and other health services, and the justice system. The cost of violence against women and their children in Australia in 2015–16 was estimated at $22 billion (KPMG 2016). Almost half of this cost ($10.4 billion) is linked to the ongoing health impacts of violence. The direct economic impact on victims of violence can also be substantial.

Women who had experienced violence in the past 2 years were more likely than women who had not to have higher levels of debt, more difficulty in paying bills, insufficient money for food, and to have requested material assistance from welfare agencies (Cortis & Bullen 2016). Further, Indigenous women, pregnant women, women with disability, and women who are homeless are under-represented in the PSS. Taking these groups fully into account may add $4 billion to these costs in 2015–16 (KPMG 2016).

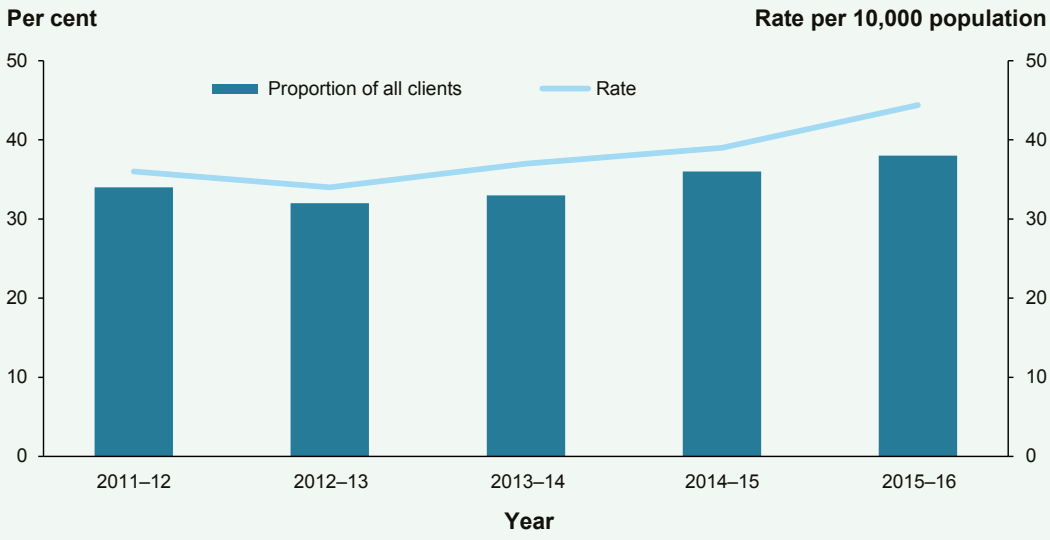
Housing and homelessness

Family, domestic and sexual violence is the leading cause of homelessness and housing instability in Australia (Spinney 2012). It is also consistently one of the most common reasons that clients seek help from specialist homelessness services (SHS) (AIHW 2016a). This sort of violence is most often experienced in the victim's home; hence, escaping it can be very difficult without social and financial support (ABS 2013b; Cortis & Bullen 2016).

SHS offer a range of supports. These include crisis and emergency accommodation, income support, counselling, referrals to legal services, connections to social housing providers, other specialised support, and referrals to specialist providers (AIHW 2016a) (see Chapter 6.2 'Homelessness' for more information about SHS).

In 2015–16, 38% of SHS clients (106,000) had experienced family and domestic violence and 92% of these were women and children (Figure 2.7.2). The number of family and domestic violence clients has increased by 33% since 2011–12 (AIHW 2016a).

In some cases, women can seek support to remain safely in the home with their children while the perpetrator is removed (through criminal justice responses); this option is commonly referred to as 'safe at home' (Breckenridge et al. 2016). Safe at home programs aim to maximise women's safety, allow for integrated service responses, prevent homelessness, and support women's economic security (Breckenridge et al. 2016).



Source: AIHW SHS Collection 2015–16.

Figure 2.7.2: SHS clients who had received assistance for family and domestic violence, 2011–12 to 2015–16

Health

Violence can have a severe impact on the physical, mental and behavioural health of women and children. The effects can be immediate and acute, long-lasting and chronic or, in some cases, fatal (WHO 2013). A study into the burden of disease (including illness, injury and premature death) for adult women who had been exposed to intimate partner violence in their lifetime (using 2011 data) found that:

- 1.4% of the total burden of disease in adult women was attributed to physical/sexual cohabiting partner violence (Ayre et al. 2016)
- anxiety disorders made up 35% of the burden attributed to cohabiting partner violence, followed by depression (32%) and self-inflicted injuries (19%) (Ayre et al. 2016)
- among women aged 25–44, intimate partner violence (includes boyfriend, date or cohabiting partner) was the leading risk factor, responsible for a greater contribution to the disease burden in this age group than alcohol use and tobacco use (Webster 2016).

Injuries leading to hospitalisation or death

Family, domestic and sexual violence can result in serious injury, and may lead to the hospitalisation or death of the victim. In 2013–14, more than 20,000 people (13,800 males and 6,300 females) were admitted to hospital for assault injuries (AIHW 2017b). The overall rate of assault injury among women and girls was 56 cases per 100,000 population, compared with 121 for men. For females hospitalised for assault injuries, 59% of hospitalisations involved a perpetrator who was a spouse or domestic partner (for cases where the perpetrator was specified). 'Parents' (195 cases) and 'other family members' (726 cases) accounted for nearly half of the remaining cases where the type of perpetrator was specified.

Between 2002–03 and 2011–12, there were around 2,600 homicides in Australia, two-fifths of which were classified as domestic or family homicides (Cussen & Bryant 2015). Sixty per cent (60%) of these domestic and family violence homicides were classified as intimate partner homicides (around 650 incidents). Of these intimate partner homicides:

- 75% of the victims were female
- 68% occurred in the victim's home
- 44% involved a prior history of domestic violence
- more than 1 in 3 had alcohol detected in either the perpetrator (36%) or the victim (35%).

Children living with violence

Exposure to family and domestic violence can have a substantial impact on a child's development, physical and mental wellbeing and schooling (Campo 2015). Children exposed to such violence have higher rates of social and emotional and behavioural problems than children with mothers who did not experience it (Shin et al. 2015). Children experiencing family and domestic violence are vulnerable to homelessness, which can further disrupt schooling, social networks and feelings of safety and belonging (AIHW 2016a; Campo 2015).

Evidence suggests that a substantial number of children are exposed to family and domestic violence. For example:

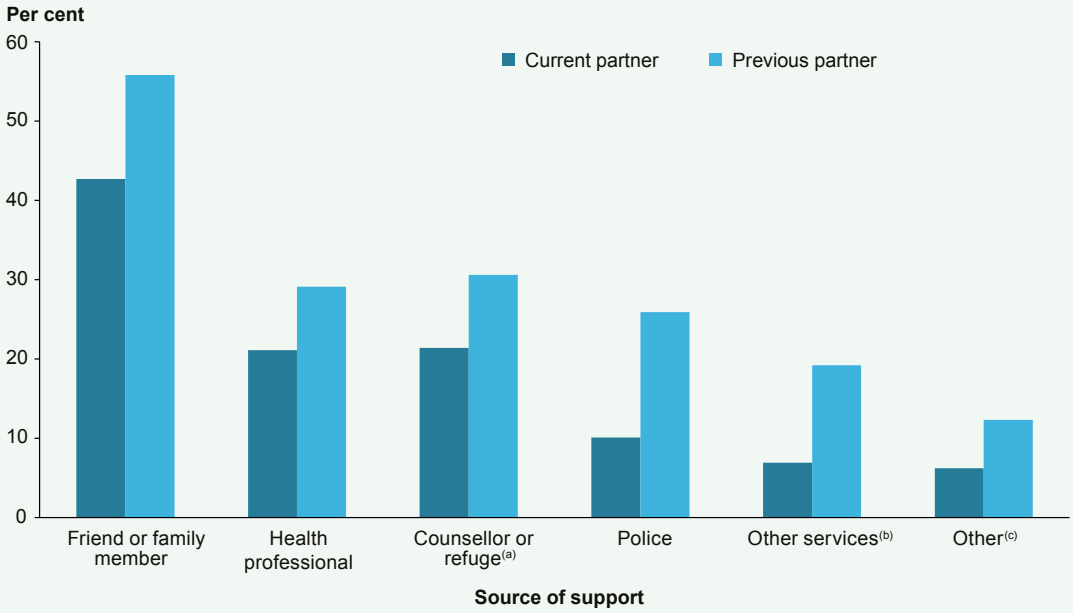
- 6 of 10 (more than 730,000) women who experienced violence from an ex-partner reported that they had children in their care at the time of the violence, and 77% of these women reported that their children had seen and heard the violence (ABS 2013b)
- 29% (about 31,000) of clients who sought assistance from SHS for family and domestic violence were aged 14 or younger (AIHW 2016a)
- emotional abuse (including exposure to family violence) was the primary abuse type for 45% (more than 20,300) of child protection substantiations (AIHW 2017a)
- more than half (54% or about 6,500) of young people who were both clients of SHS and child protection services had experienced domestic and family violence. This was higher than the proportion for SHS-only clients (44%) (AIHW 2016b).

Certain vulnerable groups continue to experience higher levels of violence and disadvantage. These include Indigenous children and young people; people in out-of-home care; people with disability; people who are sexually diverse, transgender, gender diverse and intersex; people from culturally and linguistically diverse backgrounds, and people living in rural and remote areas (AHRC 2016).

Support after family, domestic or sexual violence incidents

After a family, domestic or sexual violence incident, victims might seek support or disclose the incident to informal networks (such as friends and family) or to formal support services (such as health professionals, police, legal services and housing assistance). More than two-thirds (68%) of women who experienced physical violence from a male perpetrator had sought advice or support following the incident (ABS 2013b).

The most common source of support for women was from a friend or other family member (43% for current partner violence and 56% for previous partner violence) (Figure 2.7.3). These networks play a substantial role in helping women who have experienced family, domestic or sexual violence (Meyer 2010). Support services or support networks can assist women who have experienced violence to feel safe and live free of violence (Morgan & Chadwick 2009).



(a) Includes counsellor or support worker, telephone helpline, and refuge or shelter.
(b) Includes legal service, financial service and government housing and community services.
(c) Includes work colleague or boss, priest/minister/rabbi, and other.
(d) Partner violence refers to any incident of sexual assault, sexual threat, physical assault or physical threat by a current and/or previous partner.

Source: ABS 2013b.

Figure 2.7.3: Advice and support-seeking behaviours, women who have experienced partner violence(d) from a current or a previous partner since the age of 15, 2012

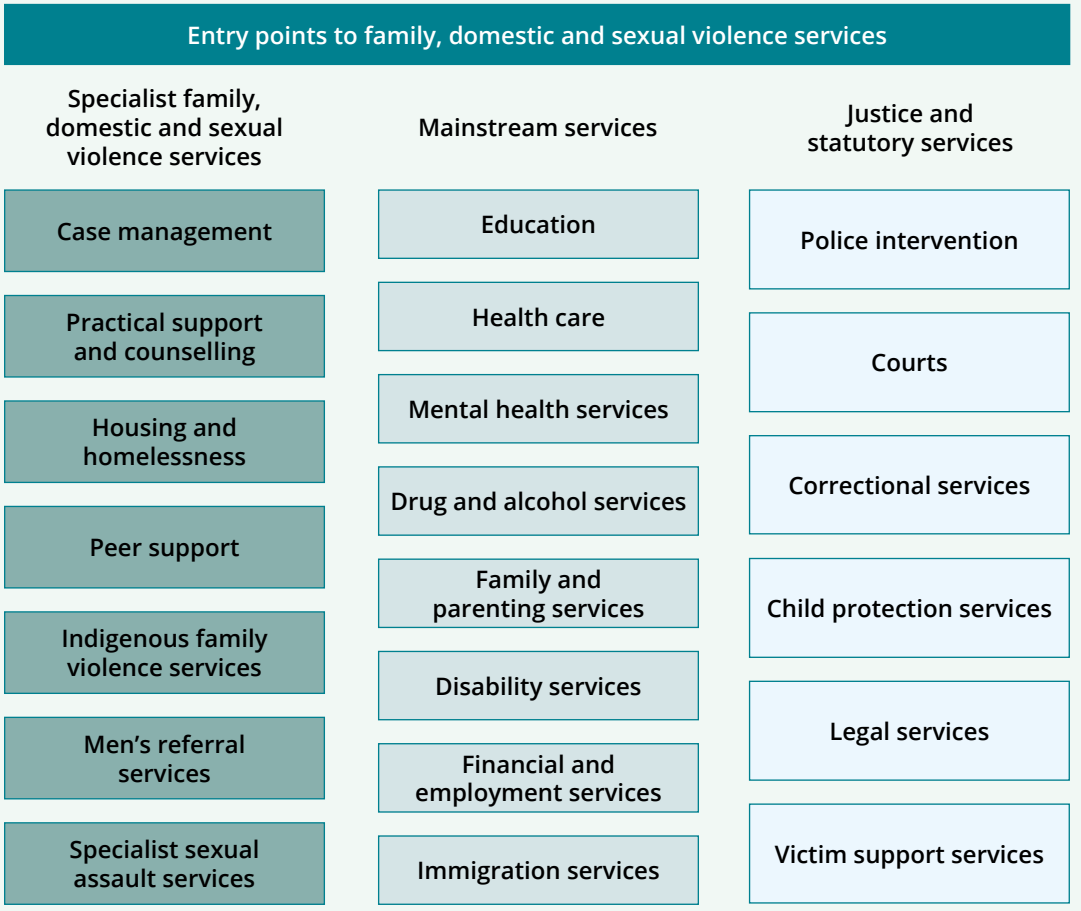
Family, domestic and sexual violence services

Women and their children need to feel safe and have access to appropriate services when reporting family, domestic and sexual violence, and perpetrators should be held to account for their actions. The three main service entry points for people experiencing this violence are:

- specialist domestic and family violence and sexual assault services (including refuges and other housing/homelessness services, crisis services, forensic services, counselling, financial assistance, and perpetrator intervention services)
- mainstream services (including health and education services)
- justice and statutory services (including police, family courts and child protection services) (Figure 2.7.4).

Although multiple entry points into services accommodate the diversity of needs for victims and perpetrators, they can be difficult to access and navigate (State of Victoria 2016).

Family, domestic and sexual violence policy and programs are delivered by government and non-government services across a wide range of sectors; therefore, it is important that service delivery is well integrated. An integrated response requires information and expertise to be shared among agencies to effectively assess risk, enhance efficiency, and improve the data collection to build evidence to deliver services better (PM&C 2016). Effective service integration also reduces the need for victims to have to re-tell their experience to multiple service providers, creating further trauma.



Source: Adapted from DHHS 2012.

Figure 2.7.4: Entry points for family, domestic and sexual violence services

Reporting to police

Police intervention is one of the key entry points into the family, domestic and sexual violence service 'system'. When incidents of such violence are not reported, perpetrators are not held to account for their behaviour by the law, and victims may not get access to the help and services needed to support them (Birdsey & Snowball 2013). Police have the authority to arrest and charge perpetrators, issue interim protection orders for the victims, and coordinate and facilitate referrals to specialist services.

In most cases, there is no specific offence type used for family, domestic and sexual violence. In published police data, such violence may be associated with the following offence types:

- homicide (including murder and attempted murder)
- acts intended to cause injury (including assault and stalking)
- sexual assault
- abduction/harassment/stalking
- property damage
- breach of violence and non-violence orders.

The quality of police data on the number of reported incidents and offences depends on police accurately classifying incidents and associated offences. As there is no consistent process to identify family, domestic and sexual violence across states and territories, caution should be exercised when interpreting such violence from recorded crime data.

According to data reported to police for offences related to family, domestic and sexual violence (for selected states and territories) in 2015–16:

- the most common offence type was *acts intended to cause injury* (ranging from 49% to 80% of all incidents reported)
- there were 4–5 times as many male offenders as female offenders
- the median age of perpetrators ranged between 31 and 34 (ABS 2017b).

Unfortunately, a considerable number of family, domestic and sexual violence incidents are not reported to police. Data from the PSS show that:

- only 20% of women who had experienced physical and sexual violence from a current partner had contacted the police
- only 42% of women who had experienced physical and sexual violence from a previous partner had contacted the police
- women were more likely to report to police if they had experienced more than one incident of partner violence. This was most evident for violence experienced by previous partners. Of the women who had experienced previous partner violence, 6.5% reported it to police after one incident compared with 36% who reported it after more than one incident (ABS 2013b).

Factors affecting reporting to police

In a study of victims attending domestic violence services, only half had reported the most recent incident of violence to police (Birdsey & Snowball 2013). Victims were more likely to report the incident if there was a current apprehended violence order against the perpetrator, if they were physically injured, if there was property damage, or if they thought their children were at risk. The most common reasons for not reporting the incident to police were:

- fear of revenge from the offender/fear of further violence (14%)
- embarrassment and shame (12%)
- thinking that the incident was too trivial/unimportant (12%)
- bad/disappointing experience with reporting previous incidents to police (10%) (Birdsey & Snowball 2013).

Family, domestic and sexual violence perpetrators in criminal courts

Data from the criminal courts show how perpetrators (or defendants) move through the justice system in incidents of family, domestic and sexual violence where criminal charges have been laid by the police. As for police data, there is no consistent process to identify charges related to family, domestic and sexual violence across states and territories. Therefore, caution should be used when interpreting family, domestic and sexual violence reporting from criminal courts data.

According to data reported from selected state and territory magistrates' courts in 2015–16 for offences related to family and domestic violence:

- *acts intended to cause injury* were the most common principal offence related to family and domestic violence
- defendants finalised for one or more offences related to family and domestic violence were more likely to be male than female across all jurisdictions (ranging from 84% to 89% of defendants)
- the majority of defendants were proven guilty (ranging from 72% to 87% of defendants)
- of the defendants proven guilty of *acts intended to cause injury*, the majority (ranging from 64% to 80%) were sentenced to a non-custodial order, except in the Northern Territory where 86% were sentenced to a custodial order (ABS 2017a).

What is missing from the picture?

There is no single source of truth on the prevalence of violence (Cox 2015). The ABS PSS does provide detailed information on specific incidents of violence every 4 years. There is little information, however, on the experiences of persons from culturally and linguistically diverse backgrounds; on people who identify as lesbian, gay, bisexual, trans and/or intersex; on older people (elder abuse); and on people with a disability (Mitra-Kahn et al. 2016). Information on the experiences of Indigenous people are collected in the ABS National Aboriginal and Torres Strait Islander Social Survey, but this is collected only every 6 years (ABS 2016a).

The family, domestic and sexual violence 'system' is diverse. It covers multiple sectors and represents multiple entry or intervention points. For most agencies involved, data collections do not specifically flag family, domestic and sexual violence cases. This represents a major lost opportunity to gain insights into patterns of service use.

Other key data gaps identified include risks and drivers of family, domestic and sexual violence (such as mental health, drug and alcohol use); characteristics of victims and perpetrators; and the outcomes of specialised services and interventions for victims, perpetrators and children.

There is also sparse information on the family, domestic and sexual violence workforce, in terms of its numbers, skills, qualifications and distribution.

What is the AIHW doing?

Family, domestic and sexual violence data are collected through the data systems used to support policing, justice, corrections, health and community services (including SHS). These systems are often not 'linked up', meaning that the individual pathways of women and their children experiencing violence—and of perpetrators—cannot be tracked across systems. This presents a major barrier in determining which interventions are most effective in supporting and protecting women and their children.

Under the National Plan, all governments in Australia are committed to developing a National Data Collection and Reporting Framework (DCRF), being led by the ABS (ABS 2014). This framework is the basis for building a common language and a coordinated and consolidated approach to service-level data collection. Building on the work of the ABS and the DCRF, the AIHW—in partnership with the Department of Social Services, the ABS, ANROWS and several jurisdictions—will develop an initial capability in the form of a national family, domestic and sexual violence data clearinghouse and national report. Subject to ongoing funding, the data clearinghouse is designed to:

- coordinate national reporting of family, domestic and sexual violence data
- provide a platform for improving quality and consistency of existing data collections
- develop a shared understanding of data gaps and priority data developments
- facilitate the linkage of data sets, subject to appropriate protocols
- promote researcher access to individual or linked data sets.

The AIHW has also been assisting the Department of Social Services to develop a set of progress indicators related to the *National Outcome Standards for Perpetrator Interventions* (COAG 2015). It will be preparing annual reports against these indicators, starting with 2015–16 data.

In June 2017, the AIHW participated in a WHO expert group in Geneva on methodological and measurement issues for statistics on violence against women. Data availability, plus identification of data gaps and limitations, need to be addressed for the purposes of national and international monitoring. AIHW is actively contributing in this space, sharing its expertise internationally.

Where do I go for more information?

More information about the PSS and the National DCRF for family, domestic and sexual violence is available from the ABS website at www.abs.gov.au.

Further information on violence against women and their children can be found on the ANROWS website at www.anrows.org.au.

More information about clients experiencing domestic violence in the SHS collection is available at www.aihw.gov.au/homelessness-publications/.

The report *Domestic and family violence and homelessness 2011–12 to 2013–14* and other recent publications are available for free download.

More information about the *National Plan to Reduce Violence against Women and their Children—2010–2022* is available at the Department of Social Services website.

For more information about the National Sexual Assualt, Domestic Family Violence Counselling Service, see the 1800RESPECT website.

Chapter 3

Education in Australia

3.0 Introduction

Participating and engaging in learning and formal education from an early age are central to a person's development and future ability to lead a productive and fulfilling life. Low school attainment and poor engagement with school can lead to poorer outcomes across the life course, including poverty and social exclusion.

This chapter looks at some of the key aspects of secondary and higher education and training in Australia—from secondary school attendance and completion, to options such as apprenticeships, traineeships and tertiary education. As the chapter shows, education can be a lifelong pursuit and there are many important factors in considering pathways from education to employment. For example, completion of schooling and higher levels of educational attainment (particularly tertiary level qualifications) open up broader employment opportunities and outcomes (such as higher relative earnings) in the future.

In 2016, the proportion of people studying for post-school qualifications was highest among people aged 20–24 (42%), but 15% of 25–34-year-olds, 8.1% of 35–44-year olds and 3.5% of 45–64-year-olds were also enrolled.

All Australian children must attend school until they complete Year 10. Young people must then participate in full-time education, employment or training (or a mix of these) until they are 17. Reflecting this, most (91%) people aged 15–24 were engaged in education and/or employment in 2016. As well, more young Australians aged 20–24 are completing Year 12, or its equivalent, than a decade ago. The Year 12 completion rates for young Aboriginal and Torres Strait Islander people have also risen over the past decade.

Young people not in education, employment or training (often referred to as the 'NEET' group) are seen to be completely disengaged from work and study. In 2016, 8.8% of 15–24-year-olds, 5.1% of 15–19-year-olds and 12% of 20–24-year-olds were not in education, employment or training.

This chapter also reviews how Australian children are faring in education, both at home and internationally. The National Assessment Program—Literacy and Numeracy (NAPLAN) tests are conducted each year for all students across Australia in Years 3, 5, 7 and 9. The results for 2016 were very similar to those for previous years. Big gaps remain for vulnerable groups, including for Indigenous Australians, students whose parents have low levels of education, students whose parents work in unskilled occupations, and children involved in the statutory child protection system.

On the world stage, Australia's performance of late has been mixed. It was one of 72 countries to take part in the 2015 Programme for International Student Assessment—a survey of 15-year-olds' competencies in reading, mathematical and scientific literacy. Although it scored above the average for 35 Organisation for Economic Cooperation and Development countries, Australia's average scores have decreased significantly since 2009 for reading; since 2006 for scientific literacy; and since 2003 for mathematical literacy.

3.1 Pathways through education and training

Education and training are crucial to a person's development and ability to lead a productive and fulfilling life. They promote self-confidence and independence and provide the skills and competencies needed to obtain employment and stay competitive throughout adulthood. Completion of schooling and higher levels of educational attainment (particularly tertiary level qualifications) open up broader employment opportunities and outcomes (such as higher relative earnings) in the future.

In Australia, schooling is compulsory until the completion of Year 10, after which young people must participate in full-time education, employment or training (or a combination of these activities) until the age of 17. After secondary school, young people can enter the workforce, complete further study, or combine both. There are several education and training options available, with many young people continuing their education pathway through higher or vocational education and training (including apprenticeships and traineeships) (see Chapter 3.3 'Apprenticeships and traineeships'; 3.4 'Tertiary education').

However, not all young people are participating in education, employment or training (those who are not are referred to as the 'NEET' group). Non-participation among young people has been linked to future unemployment, lower income and employment insecurity (Pech et al. 2009), placing these young people at risk of social and economic disadvantage and social exclusion.

Transitions

Key milestones

Achieving certain milestones is important if young people are to successfully move on to full-time employment or further study. Evidence has identified the following key transition ages:

- 15—engagement in school, with sufficient literacy and numeracy skills to complete Year 12 or an equivalent vocational qualification (like a Certificate III)
- 19—possessing an initial qualification (or be in the process of completing it)
- 24—being in the process of establishing a career path, having obtained a higher-level vocational qualification or a higher education qualification (for example, a Bachelor degree); young people without an initial qualification at age 19 should have re-engaged with education and training (Liu & Nguyen 2011; Victorian Government 2010).

School completion and transition to further study or work

Students who complete Year 12 tend to have more successful transitions from education to work (Ryan 2011) and are more likely to gain employment and/or continue onto tertiary education. These transitions are established early—for example, over 6 in 10 students establish academic success in early to middle childhood and a similar proportion maintain this through to school completion. Similar proportions are also fully engaged in education or work by their mid-20s (Lamb et al. 2015).

Completion rates have been rising over time, with the proportion of people aged 15–64 who had completed Year 12 (or equivalent) increasing from 65% in 2006 to 76% in 2016 (ABS 2016b) (see Chapter 3.2 'School retention and completion').

Many factors can influence the likelihood that a student will complete their schooling. For example, literacy levels at the age of 15 are a strong indicator for future achievements, including Year 12 completion, university attendance, and university completion. Parental aspirations are also important—secondary students whose parents wish them to attend university are far more likely to complete Year 12 (NCVER 2014).

Australia still has a high number of people who are not completing Year 12 by the time they are 19 (estimated at around 81,000 in 2014) (Lamb et al. 2015). Attending and completing school can be challenging for some young people. Year 12 (or equivalent) completion rates at age 19 are generally lower for people attending school in *Remote* and *Very remote* areas, who live in low socioeconomic areas, who are Indigenous (Lamb et al. 2015) or who have a disability (ABS 2016a).

Optimal pathways

There are many possible pathways through and beyond the education system. There is not one path of 'best fit'. However, certain factors will maximise one's chances of positive outcomes after secondary school.

Longitudinal research that considered the most successful 'paths' (defined as leading to goals to undertake further higher study and/or gain employment) found slightly different results for males and females. While the 'best' path for males differs across a range of desired outcomes, Year 12 completion is a common factor in each. For females, the 'best' pathway was clearly identified as completion of Year 12, followed by university study (Karmel & Liu 2011).

Employment outcomes

In 2016, people with higher levels of educational attainment were more likely to be employed: 80% of people with a Bachelor degree or above and 76% with a Certificate III or IV were employed, compared with 67% of people with Year 12 and 44% of people with Year 11 or below as their highest educational attainment (ABS 2016b). However, while educational attainment has been improving over time (see Chapter 3.2 'School retention and completion'; Chapter 3.4 'Tertiary education'), it is becoming more challenging for young people to find sustainable or full-time employment, even after graduating from higher education (Torii & O'Connell 2017).

The proportion of young people (aged 15–24) in full-time work is decreasing, and the percentage working part time is increasing. This trend is consistent with that for all people of working age (see Chapter 4.1 'The changing nature of work and worker wellbeing'). As at March 2017, 27% of people aged 15–24 worked full time, compared with 35% 10 years ago and 48% 30 years ago. The proportion working part time in 2017 was 31%—increasing from 28% a decade ago and 13% three decades ago (AIHW analysis of ABS 2017).

Understanding employment outcomes and opportunities for young people is complicated by the fact that young people are generally disproportionately affected by tough labour market conditions. Labour market outcomes have not improved for Australians aged 15–29 since 2008 (OECD 2016a)—as reflected in the youth unemployment rate. This rate has continued to rise since the Global Financial Crisis, but has been consistently higher than the overall unemployment rate over many years (13% in 2016 compared with an overall unemployment rate of 5.7%) (see Chapter 4.2 'Key employment trends').

University graduates

In 2016, 71% of university graduates were working full time within 4 months of finishing their undergraduate degree. While this was an increase from 69% for the previous year, it was a large drop from 85% in 2008. Since the Global Financial Crisis, graduates have taken longer to gain a position in the labour market (QILT 2016).

University graduates from more skill/practical based degrees are more likely to succeed in entering the labour market immediately after graduating. For example, Medicine and Pharmacy graduates were the most likely graduates to gain full-time employment (at more than 96% of graduates) in 2016. In contrast, for more generalist degrees in fields such as Creative arts, Communications, and Science and mathematics, less than 62% gained full-time employment immediately (within 4 months) after graduating (QILT 2016).

Apprentices and trainees

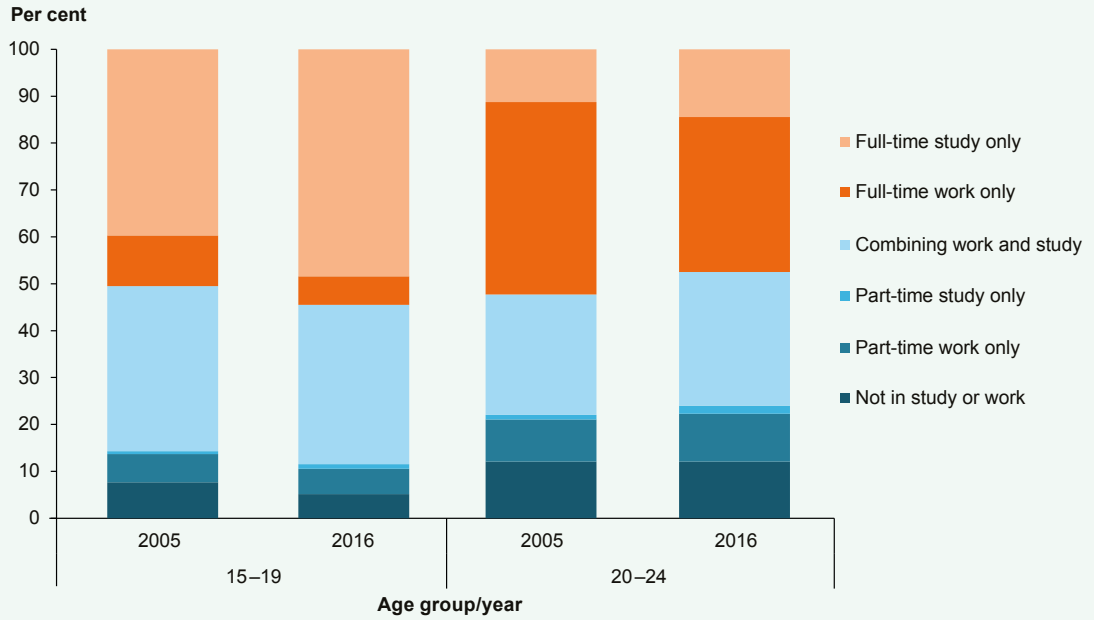
Most people (around 80–90%) who have completed an apprenticeship or traineeship are employed after training (Hargreaves et al. 2017). Older apprentices are more likely than their younger counterparts to be undertaking training at a higher level, and are more likely to complete their training.

There is a continuing growth in the proportion of apprentices undertaking apprenticeships at older ages. These are often workers with established skills, experience and prior qualifications. There is a need for more apprenticeship pathway options (and higher learning options, such as diploma and associate degrees) for this group (see Chapter 3.3 'Apprenticeships and traineeships').

Who is missing out?

Young people who are not in education, employment or training (often referred to as the 'NEET' group, or 'NEETs' for ease of reference) are seen to be completely disengaged from work and study. Low educational attainment and poor literacy and numeracy skills increase young people's risk of being a NEET, with around 40% of NEETs in Australia never having obtained an upper secondary qualification (OECD 2016a; 2016b). Females make up around 60% of the NEET group in Australia—this over-representation is often attributed to their domestic duties and child care obligations. NEET rates are also higher than average among Indigenous youth (making up 10% of the NEET youth, compared with around 3% of the population) and among migrants from non-English-speaking countries (18%) (OECD 2016c).

In 2016, most (91%) people aged 15–24 were engaged in education and/or employment (AIHW analysis of ABS 2016b; customised report). However, 8.8% of people aged 15–24 were not. This varied by age: 5.1% of people aged 15–19 (75,300 people) and 12% of people aged 20–24 (200,400 people) were not engaged in education and/or employment (Figure 3.1.1).



Sources: ABS 2005; AIHW analysis of ABS 2016b, customised report.

Figure 3.1.1: Participation in education and/or employment, people aged 15–24, by age group, 2005 and 2016

Between 2005 and 2016:

- the proportion of 15–19-year-olds not in employment, education or training decreased (from 7.7% to 5.1%, respectively)
- the proportion of 20–24-year-olds not in employment, education or training remained similar (at around 12%)

- the proportion of young people aged 15–19 and 20–24 engaged in full-time work (and not studying) decreased, while the proportion increased for young people engaged in full-time study only
- the proportion of 20–24-year-olds combining work and study increased slightly—from 26% to 29%.

Relative to the international scene in 2015:

- the proportion of Australians aged 15–19 who were not in education or employment was similar to the Organisation for Economic Co-operation and Development (OECD) average (6.0% compared with 6.3%, respectively), with Australia ranked 18th out of 32 OECD countries with available data
- among people aged 20–24, the Australian non-participation rate in 2015 (13%) was lower than the OECD average (17%), and ranked 11th out of 32 OECD countries (OECD 2017).

As already indicated, labour market conditions affect employment opportunities for young people. Several other factors may influence the proportion of the population who are NEETs, such as changed entitlements to Youth Allowance (see later in this article), or perceptions by young people that Year 12 and post-school qualifications are needed to be competitive in the job market (Gilfillan 2016).

Government financial support

The Australian Government offers several payments to support young people undertaking study, training or an apprenticeship. The two main payments are Youth Allowance (Student and Apprentice) and ABSTUDY (Non-living allowance), with around 155,800 and 20,800 recipients, respectively, as at December 2016 (DSS 2017).

The Council of Australian Governments made a commitment to help young people to achieve their educational potential and make the transition to employment through the National Partnership Agreement on Youth Attainment and Transitions (COAG 2009). This agreement outlined that young people who have not attained Year 12 or equivalent must undertake full-time education or training to be eligible for Youth Allowance.

The Australian Government can also assist eligible students with the cost of their tuition fees through subsidised university places, known as Commonwealth Supported Places (CSPs) and the Higher Education Loan Program (HELP). Information about CSPs and HELP loans are available on the Study Assist website at www.studyassist.gov.au.

What is missing from the picture?

While longitudinal data, such as from the Longitudinal Surveys of Australian Youth, can provide substantial insight into educational pathways, a large gap remains in the ability to identify and track individuals over time. Unique student identifiers, which could remove duplicate records and allow tracking of movements across state/territory and educational sectors, would provide a means to do this in future.

The annual Australian Bureau of Statistics Survey of Education and Work provides the most detailed data on youth participation in education and training; however, reliable estimates by Indigenous status and for smaller geographical areas are not available from this survey. Indigenous data are available, less often, from the National Aboriginal and Torres Strait Islander Health Survey and National Aboriginal and Torres Strait Islander Social Survey. Both Indigenous and small level geography data are available every 5 years from the Census.

Where do I go for more information?

More information on youth participation in education and training is available from the ABS Survey of Education and Work and from the National Centre for Vocational Education Research.

For the latest information on available payments and eligibility criteria, see the Department of Human Services website at www.humanservices.gov.au.

3.2 School retention and completion

Completing Year 12 or an equivalent vocational qualification is seen as a key milestone in the formal development of an individual's skills and knowledge and for improving their economic and social opportunities in life (see Chapter 3.1 'Pathways through education and training').

People with Year 12 qualifications are more likely to continue further study, particularly in higher education, and to enter the workforce. The Australian Government has committed to ensuring that all young people have the opportunity to complete Year 12 or its vocational equivalent. The states and territories are also committed to increasing rates of school completion.

School retention

Most young people stay at school until Year 12. In 2016, the apparent retention rate to year 12 (see Box 3.2.1) was 84%. There has been a gradual increase in the apparent retention rate over the last 6 years (up from 78% in 2010) (ABS 2017).

In 2016, the retention rate was higher for females (88%) than males (81%). This has been the case for many years (for example, rates were 83% compared with 73%, respectively, in 2010).

The apparent retention rate to Year 12 for Aboriginal and Torres Strait Islander students has increased steadily, from 47% in 2010 to 60% in 2016, but it is still lower than the non-Indigenous rate (79% in 2010 and 86% in 2016). However, the gap (between the Indigenous and non-Indigenous rate) has narrowed over the same period (from 32 percentage points to 26 percentage points) (ABS 2017).

Box 3.2.1: Measurement of retention rate

The apparent retention rate to Year 12 is an estimate of the percentage of students who stay enrolled full time in secondary education from the start of secondary school (Year 7 or 8 depending on the state or territory) to Year 12. The term 'apparent' is used because the measure is derived from total numbers of students in each of the relevant year levels, not by tracking the retention of individual students over time. A higher or increasing rate is desirable. This suggests that a larger proportion of students are continuing in school, which may result in improved educational outcomes.

Care needs to be taken, however, in interpreting this measure. It does not take account of factors such as student migration between states and territories, students repeating a year of education or returning to education after a period of absence, or the impact of full fee paying overseas students (SCRGSP 2017).

Completion of Year 12 or equivalent

Completion of Year 12 or its equivalent has risen in recent decades. This is likely to be due to several factors, including the commitment from government to raise the minimum level of education of young people (for example, national agreements for education and Indigenous reform; Box 3.2.2).

Box 3.2.2: Council of Australian Governments: selected education and Indigenous reform agreements

The Council of Australian Governments (COAG) (2016) agreed to the following benchmarks:

- lift the Year 12 or equivalent or Certificate II attainment rate to 90% by 2015 (from 2008)
- lift the Year 12 or equivalent or Certificate III attainment rate to 90% by 2020 (from 2008)
- halve the gap for Indigenous people aged 20–24 in Year 12 attainment or equivalent attainment rates by 2020.

The 2015 COAG benchmark outlined in Box 3.2.2, while close, was not met (completion rate of 88% for Year 12 or a Certificate II or above in 2015, for those aged 20–24).The 2020 target of Year 12 or equivalent Certificate III attainment is on track to be met, with an attainment rate of 87% in 2015 (COAG 2016).

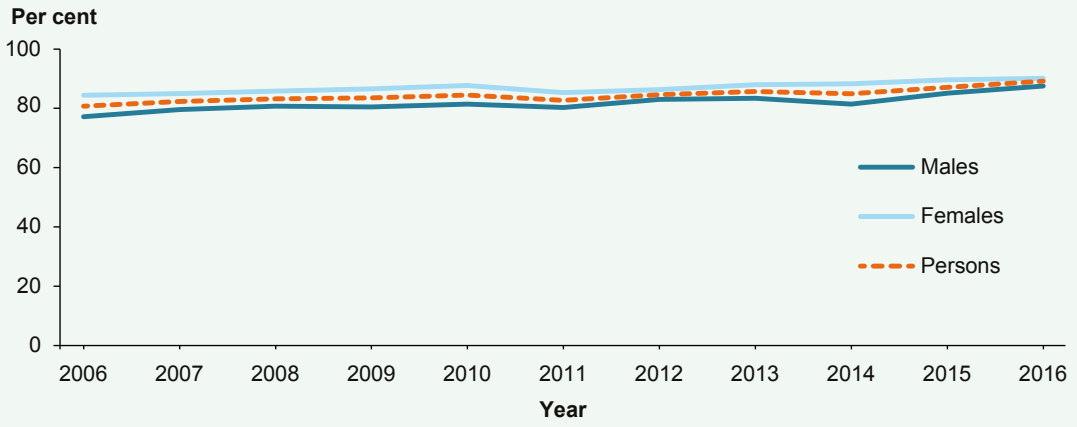
The target to halve the gap between Indigenous and non-Indigenous students in rates of Year 12 or equivalent attainment is also on track to be met by 2020 (COAG 2016). In 2014–15, 62% of Indigenous people aged 20–24 had completed Year 12 or equivalent or above, an increase from 45% in 2008 (SCRGSP 2016), and 'the gap' decreased to 25 percentage points (see Chapter 7.4 'Closing the gap in education').

According to the Australian Bureau of Statistics (ABS) Survey of Education and Work, in 2016:

- 3 in 4 (76%) people aged 15–64 had an educational attainment of Year 12 or equivalent or a non-school qualification at Certificate III level or above, an increase from 65% in 2006. There was no change to this proportion when also including people with a highest qualification of Certificate II (ABS 2016).

Among people aged 20–24 in 2016:

- almost 9 in 10 (89%) had attained Year 12 or equivalent or a non-school qualification at Certificate III level or above, and 90% for Certificate II or above. This is an increase from 81% and 82%, respectively in 2006 (see also Chapter 9.2 'Indicators of *Australia's welfare*')
- females (90%) were slightly more likely to have attained Year 12 or a Certificate III or above than males (88%). This has been the case for many years (Figure 3.2.1)
- attainment of Year 12 or a Certificate III or above generally decreased with remoteness. People aged 20–24 in *Major cities* were most likely to have completed Year 12 or Certificate II or above (92%), while people aged 20–24 in *Outer regional* (76%) and *Remote* and *Very remote* (77%) were least likely (ABS 2016).



Source: ABS 2016.

Figure 3.2.1: Completion of Year 12 or equivalent or a non-school qualification at Certificate III level and above, people aged 20–24, by sex, 2006 to 2016

What is missing from the picture?

Information on apparent retention rates was sourced from the ABS National School Statistics Collection, currently a large aggregate data collection. The retention rate is therefore an estimate (an 'apparent' rate), as individual students cannot be tracked from Year 7/8 through to Year 12. Reasons for this include student migration between states and territories, transfers between school sectors, and students progressing through school slower or faster than expected (for further details, see ABS 2016). To obtain an accurate measurement of student retention rates, and account for these variables, unique student identifiers would ideally be used to track individual students over time.

Where do I go for more information?

More information on youth education is available from the ABS Survey of Education and Work and Schools, Australia.

3.3 Apprenticeships and traineeships

Apprenticeships and traineeships are well-established parts of the vocational education and training system. They integrate on- and off-the-job training, combining training and employment to enable skill development and workforce participation. Australia's apprenticeship and traineeship system offers nationally recognised qualifications in more than 500 occupations. These include traditional trades as well as most sectors of business and industry. Apprentices are trained in a skilled trade (such as electrical, plumbing, cabinet making or automotive trades) or a non-trade (such as hospitality and child care). Trainees are trained in vocational areas, such as office administration, information technology and tourism.

Secondary students of working age may choose to do a school-based apprenticeship. This allows them to gain a formal qualification and earn a wage for their time in the workplace, while completing their school studies (see also Chapter 3.1 'Pathways through education and training').

Key demographics and trends

As at 30 September 2016, there were 278,500 apprentices and trainees in training—a decrease of 5.7% 12 months earlier (NCVER 2017a). In 2015, the majority (74%) of apprentices and trainees aged 15–24 were male, 4.9% were Indigenous, and 1.9% were people with disability (including impairment or long-term condition) (AIHW analysis of NCVER 2016).

Time series analysis by the National Centre for Vocational Education Research (NCVER) shows that for apprenticeships and traineeships in 2016 (as at June 30):

- commencements (in the previous 12 months) had been declining since they peaked in 2012, and were at their lowest since 1998 (168,800 in 2016)
- completions (in the previous 12 months) had been declining since they peaked in 2013, and were at their lowest since 2002 (107,900 in 2016) (NCVER 2017b).

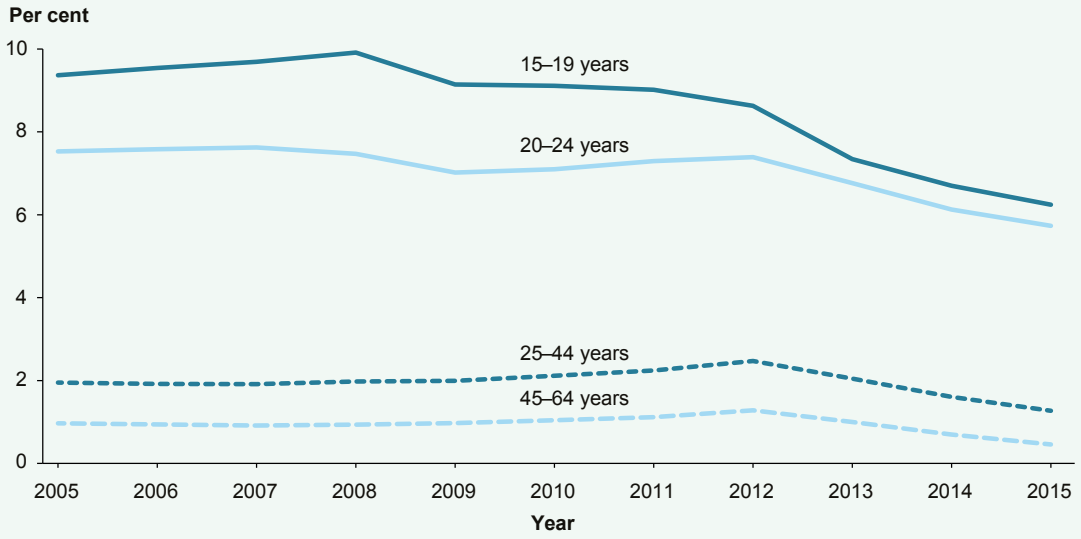
Most of the recent declines were in non-trade occupations. Declines from 2013 coincided with the removal of Australian Government incentive payments for the start and completion of apprenticeships and traineeships not on the National Skills Needs list (Atkinson & Stanwick 2016; Hargreaves & Bloomberg 2015).

Age

While most apprentices are young, the proportion of older apprentices has been increasing over the last few decades. In 2016, apprentices aged 25–64 accounted for 45% of non-trade apprentices (up from 22% in 1996) and 28% of trade apprentices (compared with 8% 20 years before) (Hargreaves et al. 2017).

Analysis by calendar year shows that, in 2015:

- there were around 187,000 apprentices and trainees aged 15–24 in Australia, or 6.0% of the population aged 15–24 (a decline from 258,000, and 8.7% of 15–24-year-olds in 2008) (Figure 3.3.1)
- 15–19-year-olds (6.2% of the population aged 15–19) were slightly more likely to be undertaking an apprenticeship or traineeship than 20–24-year-olds (5.7%); however, this gap has narrowed since 2005 (9.4% compared with 7.5%, respectively)
- 1.3% of the population aged 25–44 were apprentices and trainees, a 32% decrease from 1.9% in 2005
- 0.5% of people aged 45–64 were undertaking an apprenticeship or traineeship, a decrease from 1.0% in 2005
- a greater proportion of apprentices and trainees aged 15–19 were undertaking school based apprenticeships (23%) than in 2008 (17%) (AIHW analysis of NCVER 2016).



Notes

1. Apprentice and trainee data are annual averages of quarterly figures. Population data are the Australian Bureau of Statistics estimated resident population as at 30 June of the respective year.
2. A small number of apprentices and trainees are aged <15 and >64. These people are included with apprentices and trainees aged 15–19 and 45–64, respectively.
3. Data are collected by registered training organisations and state training authorities around Australia.

Source: AIHW analysis of NCVER 2016.

Figure 3.3.1 Apprentices and trainees as a proportion of the population, by age group, 2005 to 2015

Outcomes of apprenticeships

Completion rates for adult trade apprentices have steadily increased over time, while those for younger trade apprentices are on a slow but steady decline (Hargreaves et al. 2017).

Most people who complete an apprenticeship or traineeship are employed after training. In 2016, more than 90% of trade apprentices and almost 80% of non-trade apprentices were employed six months after finishing training, with rates slightly higher for people aged 15–24 than for people aged 25–64. For people who were not employed before they starting training, completing a trade apprenticeship resulted in employment for 84% of 15–24-year-olds and 66% of 25–64-year-olds. Around half of all people who were not employed before starting a non-trade apprenticeship were employed after completing their training (Hargreaves et al. 2017).

Younger apprentices (aged 15–24) were more likely to report job benefits due to their training than older (aged 25–64) apprentices—such as getting a job, or an increase in earnings or promotion at work. Most trade apprentices were employed in the occupation they trained for (Hargreaves et al. 2017).

What is missing from the picture?

Understanding of apprenticeship and traineeship participation and completion is limited. Key data gaps in this area include factors that influence both the start and completion of these qualifications, the destination and outcomes of apprentices and trainees after they exit the system, and the type and level of training being undertaken relative to known industry needs. Future research should respond to shifting consumer demand for online learning.

Where do I go for more information?

Comprehensive, quality data on apprentices and trainees are available from the National Centre for Vocational Education Research National Apprentices and Trainees Collection and the Australian Bureau of Statistics Survey of Education and Work.

3.4 Tertiary education

Higher levels of educational attainment are associated with higher employment rates and higher relative earnings, more social engagement and better health (OECD 2016).

Tertiary education in Australia can be broadly categorised as either 'higher education' or vocational education and training (VET). Higher education is generally delivered in a university setting, leading to a Bachelor, Master or Doctoral degree. VET focuses on delivering skills and knowledge for a specific industry, leading to Certificate and Diploma qualifications. It is delivered by Registered Training Organisations such as Technical and Further Education (TAFE) institutions. According to the Australian Bureau of Statistics (ABS) Survey of Education and Work, non-school qualifications considered above Year 12 attainment are those at the Certificate III level or above (includes Diploma, Advanced Diploma, Bachelor degree, Post-graduate Diploma, Master degree and Doctorate) (ABS 2016; AQFC 2013).

There were 172 registered higher education providers in Australia as at October 2015, 40 of which were Australian universities (DET 2015). There were 1.4 million students enrolled at Australian higher education institutions during 2015—the vast majority (92%) in universities. Around 74% of higher education students were domestic, 71% were enrolled on a full-time basis, and 55% were female. In 2015, 1.1% of students were from an Aboriginal or Torres Strait Islander background, an increase of 7.1% since 2014 (DET 2016).

In 2015, there were 4,277 VET training providers (including Australian providers operating overseas), with total enrolments of about 4.5 million students during the year. Two-thirds (67%) of all VET students were enrolled with private providers, with a further 21% enrolled in TAFE institutions (NCVER 2016).

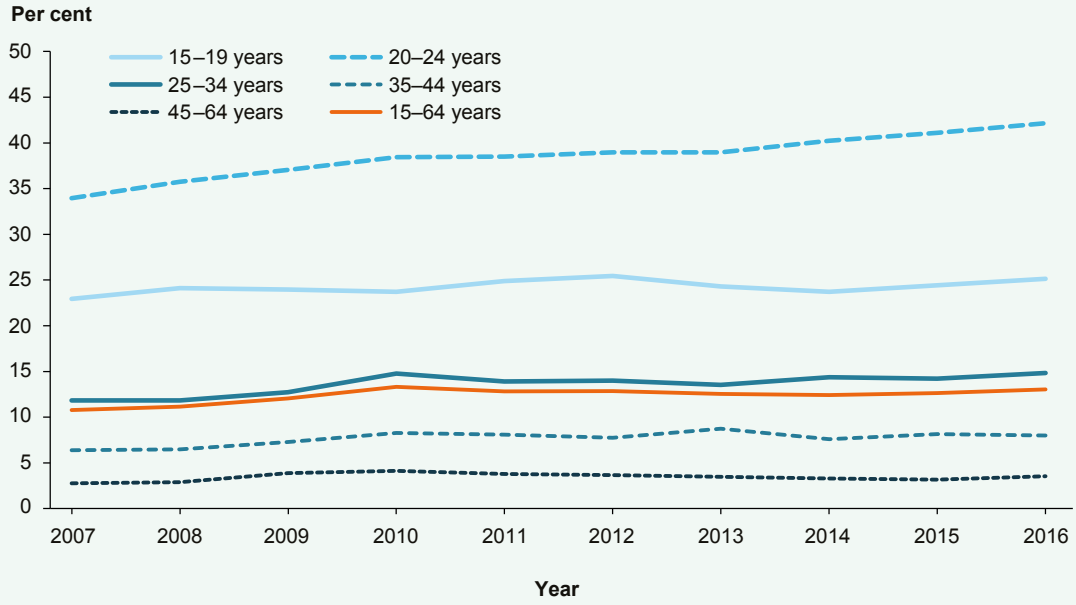
Enrolments in non-school qualifications

According to the ABS Survey of Education and Work, in May 2016, there were 2.2 million people aged 15–64 enrolled in formal study for a non-school qualification. Of these:

- 1.3 million (59%) were attending a higher education institution, such as a university, and 498,800 (22%) were attending a TAFE institution
- two in 5 (42%) were enrolled in a Bachelor degree, while 1 in 5 were enrolled in a Certificate III or IV (19%)
- similar proportions of males (42%) and females (41%) were enrolled in a Bachelor degree. Males (22%) were more likely than females (16%) to be studying for a Certificate III or IV, while females (17%) were more likely to be studying for an Advanced Diploma or Diploma than males (12%)
- the most common fields of study were Management and commerce (24% of people enrolled) and Society and culture (21%). Between 2008 and 2016, the proportion of enrolled students studying Engineering and related technologies fell from 12% to 8.8%, while the proportion studying Health increased from 11% to 14%

- the proportion of people studying for non-school qualifications was highest among people aged 20–24 (42%), followed by those for people aged 15–19 (25%), 25–34 (15%), 35–44 (8.1%) and 45–64 (3.5%) (ABS 2016).

Enrolments for non-school qualifications increased proportionally for all age groups from 2007–2016. The largest increases were seen among people aged 20–24 (from 34% to 42%) and 25–34 (12% to 15%) (Figure 3.4.1).



Sources: ABS 2016; AIHW analysis of ABS 2016, customised report.

Figure 3.4.1: Enrolment in study for a non-school qualification, people aged 15–64, by age group, 2007 to 2016

Attainment of non-school qualifications

As at May 2016, 59% of people (10.5 million) aged 15–74 had attained a non-school qualification. Of these:

- 44% (4.6 million people) had a Bachelor degree or higher qualification
- more than one-quarter (26%) had a qualification above a Bachelor degree level; this proportion has more than tripled since 1986 (when it was 7.2%)
- males (60%) were more likely than females (58%) to have attained a non-school qualification
- people aged 25–34 (73%) and 35–44 (72%) were most likely to hold non-school qualifications, followed by people aged 45–54 (66%), 55–64 (58%) and 65–74 (47%) (ABS 2016).

What is missing from the picture?

The annual ABS Survey of Education and Work provides the most detailed population based data on participation in education and training; however, reliable estimates by Indigenous status and for smaller geographical areas are not available from this survey. Indigenous data are available, less frequently, from the National Aboriginal and Torres Strait Islander Health Survey and the National Aboriginal and Torres Strait Islander Social Survey. Both Indigenous and small level geography data are available every 5 years from the Census. Limited data for Indigenous students are available from the Department of Education and Training's higher education statistics.

Where do I go for more information?

More information on youth education is available from ABS Survey of Education and Work and Schools, Australia.

3.5 How are we faring in education?

This article looks at Australia's progress in educational engagement and attainment. It presents key statistics on school attendance, literacy and numeracy, and considers some major international comparisons.

School attendance

Attendance rates are the number of days that students attend school as a percentage of all possible school attendance days.

Nationally in 2016:

- the attendance rate for primary school students in Years 1 to 6 was 94%
- attendance rates for students in the compulsory high school years (Years 7 to 10) were generally lower than for younger students, and declined for more senior years (from 93% in Year 7 to 90% in Year 10)
- rates of school attendance were slightly higher for non-government schools than government schools for Years 1 to 6 (94% and 93%, respectively, across all years) and for secondary school students (for example, 94% and 92% for Year 7, and 92% and 88%, respectively, for Year 10 non-government and government schools) (SCRGSP 2017).

Attendance rates have been steady since 2014 (SCRGSP 2017); however, there are some notable variations within the Aboriginal and Torres Strait Islander population (see Chapter 7.4 'Closing the gap in education' for detailed information on school attendance for Indigenous and non-Indigenous students).

Literacy and numeracy

Literacy and numeracy skills are essential for successful learning, healthy child and youth development, active participation in society and, ultimately, the economic productivity and performance of nations (DECD 2013). The National Assessment Program—Literacy and Numeracy (NAPLAN) tests are conducted annually for all students across Australia in Years 3, 5, 7 and 9. The data provide nationally comparable results on the performance of students in the assessment domains of reading, writing, language conventions (spelling, grammar and punctuation) and numeracy (ACARA 2016). Two main measures are used to report achievement: the percentage of students achieving at the agreed national minimum standard (NMS) and the mean score.

The most recent report (ACARA 2016) showed that, at the national level, results had largely plateaued for students since 2008. Exceptions are shown in Table 3.5.1 and represent the few 2016 national results for which differences in achievement at the NMS, or improvements in mean scores, were significantly different from those for 2008.

Table 3.5.1 NAPLAN national results by domain—significant change 2008 to 2016

NAPLAN domain	National results where a significant difference was recorded	Direction of change	2008	2016
Reading	Year 3 achievement at or above the NMS	↑	92.1%	95.1%
	Year 5 mean score	↑	484.4	501.5
Writing	Year 9 mean score	↓	565.9 (in 2011)	549.1
Spelling	Year 3 mean score	↑	399.5	419.8
Grammar and punctuation	Year 3 achievement at or above the NMS	↑	91.7%	95.5%
Numeracy	Year 5 mean score	↑	475.9	493.1

Notes

1. The NMS is the agreed minimum acceptable standard of knowledge and skills without which a student will have difficulty making sufficient progress at school. The mean score refers to the NAPLAN 'scale score'. Any given scale score represents the same level of achievement over time within a domain. For example, a score of 700 in reading in 1 year represents the same level of reading achievement in other testing years (ACARA 2016).
2. The year 9 writing score comparison was based on 2011 as this is the earliest year against which 2016 results can be compared.

Source: ACARA 2016.

Other points of interest are:

- There were improvements in some domains in each state and territory, particularly for Western Australia and Queensland. The Australian Capital Territory, New South Wales and Victoria have the highest mean achievement across the domains for Years 3, 5 and 7.
- There have been significant improvements for Indigenous students in some domains, but the gap between Indigenous and non-Indigenous achievement is still wide (see Chapter 7.4 'Closing the gap in education').
- Lower levels of achievement persist for disadvantaged groups, including students living in *Very remote* areas (see the example for Year 9 students in Figure 3.5.1), students whose parents have relatively low levels of education (see the example for Year 3 students in Figure 3.5.2), students whose parents work in unskilled occupations (ACARA 2016), and children involved in the statutory child protection system (see AIHW 2015).

How do we compare internationally?

The Programme for International Student Assessment (PISA) is a survey of the competencies of 15-year-olds in reading, scientific literacy and mathematical literacy. Results from the 2015 PISA show that Australia's recent performance has been mixed. Masters (2016) notes that the ability of Australian students to apply higher order skills and thinking—as indicated by results in the three literacy competency areas—has been declining since 2000.

In 2015:

- Australia's average scores had decreased significantly since 2009 for reading; since 2006 for scientific literacy; and since 2003 for mathematical literacy (see Figure 3.5.3)
- the scores for reading (503), scientific literacy (510) and mathematical literacy (494) were still higher than the average scores across the 35 participating Organisation for Economic Co-operation and Development (OECD) countries (out of the 72 participating countries and economies) in each domain (493 for both reading and scientific literacy and 490 for mathematical literacy)
- Australia's performance was significantly below that of 11 countries for reading, 9 countries for scientific literacy and 19 for mathematical literacy (see Figure 3.5.4)
- the national scores on all 3 domains were generally comparable to those of New Zealand and the United Kingdom, but were significantly lower than Canada's, and significantly higher than those for the United States
- Australia's scores were about 1 year of schooling lower for reading, 1.5 years of schooling lower for science and 2.3 years of schooling lower for mathematics than the scores of Singapore, the highest performing country on all three domains in 2015.

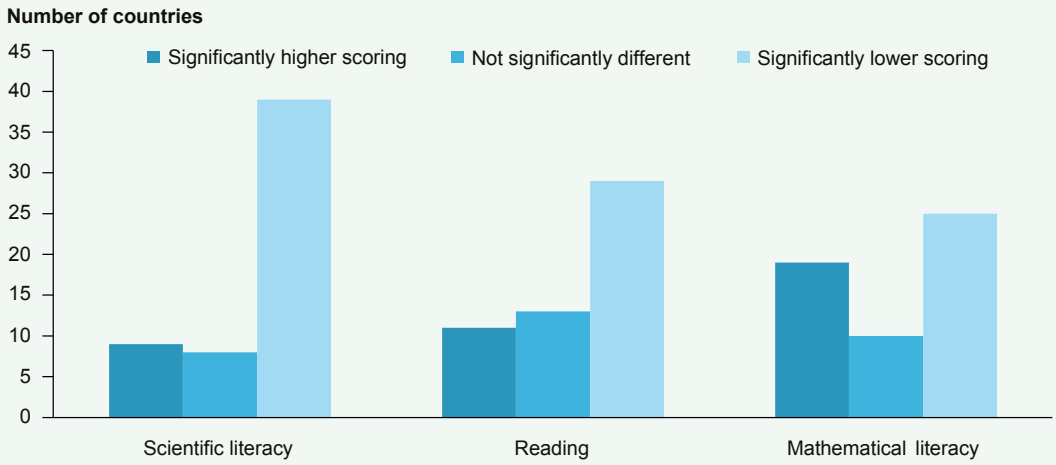
Source: Thomson et al. 2016.

Figure 3.5.3: Australia's average performance in PISA and differences over time, 2000 to 2015



Note: Australia is compared with only those countries that achieved an average score that was higher than the lowest performing OECD country.

Source: Thomson et al. 2016.

Figure 3.5.4: How Australia compared with other countries/economies in PISA, by number of countries, 2015

Box 3.5.1: Other international comparisons—TIMSS and PIRLS

The Trends in International Mathematics and Science Study (TIMSS) monitors trends in mathematics and science achievement every 4 years, at the Year 4 and Year 8 levels. TIMSS 2015 was the sixth assessment. TIMSS results consistently show East Asian countries and economies (mainly Singapore, Hong Kong, Chinese Taipei, Korea and Japan) as the highest performers.

Australia was outperformed by 12 countries (out of 39) in Year 8 mathematics and by 21 countries (out of 49) for Year 4 mathematics. Australia's performance in mathematics has not differed significantly since the last survey in 2011. In science, Australia was outperformed by 17 countries (out of 47) for Year 4, and by 14 countries (out of 39) for Year 8. Australia had higher average achievement for Year 4 science than in 2011 and the same level for Year 8.

The Progress in International Reading Literacy Study (PIRLS) has monitored trends in reading achievement at Year 4 level since 2001. It is conducted every 5 years, making 2016 the fourth assessment (results available in December 2017). In 2011, Australia, in its first year of participation, was outperformed by 21 countries (out of 45 participating countries) (Mullis et al 2012).

Source: IEA 2017.

In terms of tertiary education attainment, in 2015, Australia ranked eleventh out of 35 OECD countries for Bachelor degree or above qualifications for those aged 25–64 (32%). Switzerland was ranked first (42%), followed by Belgium (36%). Australia's proportion was slightly lower than that for the United States (34%) and the United Kingdom (33%) but was above that for New Zealand and Canada (both 30%) and the OECD average (28%) (OECD 2016).

What is missing from the picture?

International studies may not discern important factors influencing school achievement in different countries, such as the social, political and cultural environment. To understand a country's academic performance, it is necessary to also consider country-specific data and research, particularly for differing population groups and geographic regions. It is interesting, though, that both domestic and international data, as described here, highlight potential issues with Australia's educational performance. This has implications for its future direction.

Chapter 4

Our working lives

4.0 Introduction

For most of us, paid work plays a big role in our lives. Someone who starts full-time work in their 20s will likely spend at least 70,000 hours at work over the next 40 years.

Work does much more than help to pay our bills; it can be good for our overall health and wellbeing. Unemployment and joblessness increase not only the risk of economic hardship, but also the risk of deprivation and social exclusion.

This chapter examines various aspects of work—from the changing nature of work and the impact this has had on our wellbeing, to the increasing participation of seniors in the workforce. We also consider some recent trends in the labour market and jobless rates. Finally, we discuss the many Australians who work for free—our volunteers.

The Australian labour market has changed considerably over the last half century. The overall employment rate (proportion of the population who are employed) among people aged 15–64 has increased. As well, many more jobs are now held by women. The composition of jobs has also changed: in 1966, manufacturing accounted for about 25% of all jobs, and the services sector for 56%. Today, manufacturing accounts for about 7% of jobs, and service industries for almost 80%. Since 2008, there has been a marked decline in the proportion of lower skilled people who are employed. For instance, the proportion of people whose highest qualification was Year 10 and below who were employed fell by 8.5% between 2008 and 2016.

The notion of a standard-length work week—centred on the 8-hour day, 5-day week—is no longer the norm. As reported in the specially commissioned article in this chapter, the proportion of employed people working part-time has risen substantially; for men, this share has risen more than threefold over the last half century.

Should we be concerned about these changes? The commissioned article presents evidence that it is not the actual number of hours usually worked that matters for worker wellbeing, rather whether the number of hours align with worker preferences.

With increasing life expectancies and improvements in health care, most Australians will grow older and live longer, healthier and more actively engaging lives than any previous generation. For some older Australians, this includes staying longer in the workforce. Over the last 3 decades, the employment rate of Australians aged 65 and over has more than doubled; in fact, it was at an all-time high of 9.1% as at June 2016.

Every day, thousands of Australians work for free, giving their time, services or skills to help others. Volunteers provide a valuable service to the community—the value of their contribution to not-for-profit organisations has been estimated at $17 billion a year. In 2014, an estimated 5.8 million people aged 15 and over did some voluntary work. Australia's volunteer rate fell to 31% in 2014 after several years on the increase; however, we are still above the OECD average.

4.1 The changing nature of work and worker wellbeing

Mark Wooden, Melbourne Institute of Applied Economic and Social Research, University of Melbourne

The Australian labour market has changed markedly over the last half century. While the overall employment rate among the 'working-age population' (people aged 15–64, as defined by the Australian Bureau of Statistics, or ABS), has trended upward—from around 65% as at August 1966 (ABS 2007) to 72% as at August 2016 (ABS 2016c)—the more substantial changes have been in the composition of employment.

First, females account for a much greater proportion of the workforce today than in 1966: 47% of all jobs in 2016 were held by females (ABS 2016c), compared with just 30% in 1966 (ABS 2007).

Second, and associated with the growth in female labour force participation, many more jobs today are part time: 31% of all jobs in 2016 involved part-time hours (ABS 2016c), compared with 10% in 1966 (ABS 2007).

Third, there has been a marked change in the industrial composition of jobs. Manufacturing accounted for about 25% of all jobs in 1966, while what might be loosely described as the 'services sector' (all industries excluding agriculture, mining, manufacturing and construction) accounted for 56% (ABS 2007). In 2016, manufacturing accounted for only around 7% of jobs, while the services sector accounted for almost 80% (ABS 2016d).

Fourth, there has been a marked growth in the proportion of high-skilled jobs, often argued to be driven by a rapid recent growth in disruptive technologies and automation (Department of Employment 2016). This, in turn, has been associated with an increased demand for a more educated and qualified workforce. As a result, around 2 in 3 (66%) people in the labour force in 2016 had a non-school qualification, with 27% having a university (Bachelor degree or higher) qualification (ABS 2016a). In contrast, in the late 1970s, only 36% of the labour force had a post-school qualification, and 6.7% had a degree (see ABS 1979 for a classification of 'post-school qualifications') (ABS 1979).

But are workers necessarily better off? Greater gender equality at work (at least in terms of access to jobs), more jobs that provide opportunities to use skills, and a greater proportion of jobs in industries that are inherently safer and provide more pleasant working environments would all seem to be unequivocally beneficial developments (Safe Work Australia 2002; Skills Australia 2012; WGEA 2016).

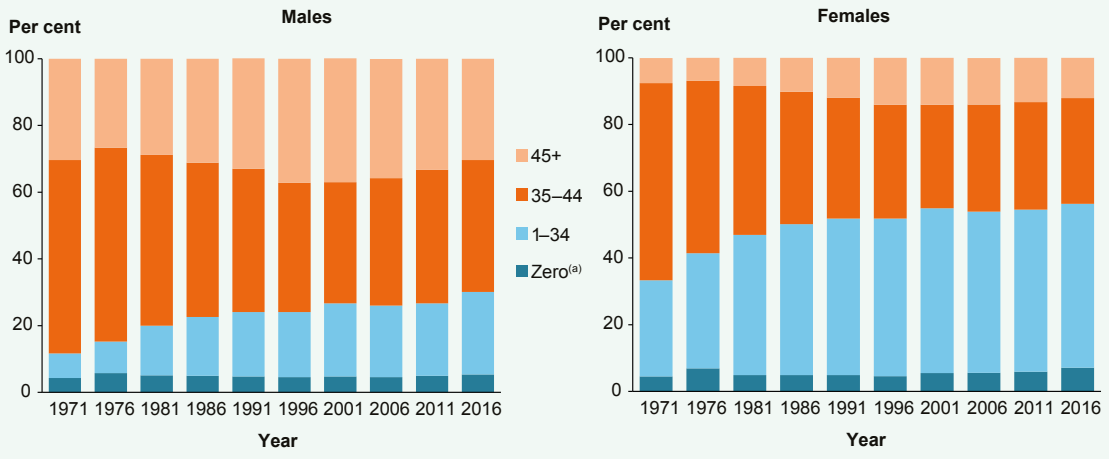
At the same time, though, many commentators have expressed concern that the quality of many jobs has declined. The media, for example, regularly reports stories that emphasise the rise in low-wage, part-time and insecure jobs (Adonis 2016; Cleary 2016; Smith 2014). There is also evidence, both in Australia and internationally, suggesting that many of the new jobs are low quality (for example, Green et al. 2010; Kalleberg 2011; McGovern et al. 2004). In particular, it is widely believed that jobs increasingly require workers to work longer hours and/or more unsocial hours or accept non-standard employment contracts involving either part-time hours or a lack of job security (and often both).

In this article, the question of job quality in Australia is examined. In particular, the article looks at data describing recent trends in working time and the incidence of non-standard employment, and at associations with measures of worker wellbeing.

Working time

Trends

The ABS Labour Force Survey (LFS) is the starting point for any analysis of working time trends in Australia. This survey has long included a question on the number of hours actually worked in all jobs held during the survey reference week. Figure 4.1.1 uses data for selected years from this survey to summarise the changing distribution of working hours since 1971. It shows that the notion of a standard-length work week—centred on the 8-hour day, 5-day week—has not been the norm for a long time. At the start of the period, in 1971, 58% of all employed people reported working between 35 and 44 hours a week, which is roughly equivalent to a standard work week once allowance is made for some modest level of paid overtime. By the end of the period (August 2016), this proportion was slightly less than 40% among males and less than 32% among females.



(a) Includes, for example, people on leave, on strike, and who did not work any hours during the reference week because of shift arrangements.

Sources: 1971–1986: ABS Labour force, Australia (ABS cat. no. 6202.0); 1991–2016: ABS Labour force, Australia, detailed—electronic delivery (ABS cat. no. 6291.0.55.001).

Figure 4.1.1: Composition of employment, by weekly hours actually worked and sex, 1971 to 2016

Figure 4.1.1 shows there has been a marked growth in the proportion of employed people working part-time hours. This is reflected in the rising share of people reporting working fewer than 35 hours during the survey reference week. Among males, this share has risen more than three-fold, from just 7.4% in 1971 to 25% in 2016. Growth has been less rapid among females, but the share is much higher: 49% of employed females in August 2016 worked fewer than 35 hours per week (29% in 1971). However, there has been very little growth in the share of females working fewer than 35 hours since the turn of the century—most of the growth occurred in the 1970s and 1980s.

When data on the incidence of part-time work are examined—as officially measured by the ABS, which defines a part-time worker somewhat differently to other sources (see Box 4.1.1)—there is still evidence that the part-time share among females has continued to rise; albeit at a slower rate in more recent years. As at August 2016, 46% of employed females worked part time compared with 45% 15 years earlier. Among males, however, recent growth has been much more striking. Part-time employment for males rose from 14% in August 2001 to almost 18% in August 2016, with most of this rise occurring since 2009.

Box 4.1.1: Measurement of part-time employment

Thirty-five hours per week is the cut-off point conventionally used to distinguish full time from part-time work in Australia. However, that definition typically requires information on the number of hours usually worked (not just on the number of hours actually worked, which is what is reported in Figure 4.1.1). Therefore, in the LFS, the ABS defines a part-time worker as someone who usually works fewer than 35 hours per week and did so during the survey reference week (ABS 2013).

Very differently, other surveys (for example, the Household, Income and Labour Dynamics in Australia (HILDA) Survey) collect data only on usual hours of work. Hence, the definition of part-time work is solely based on whether usual weekly hours of work are fewer than 35.

The proportion of workers reporting actually working fewer than 35 hours in a specific week will thus overstate the extent of part-time work as it will include some people who usually work full-time hours.

The share of workers in part-time employment in Australia is very high by international standards. While international comparisons are complicated by differences in definitions, data suggest that among Organisation for Economic Co-operation and Development (OECD) countries, only the Netherlands (38%) and Switzerland (27%) employ proportionally more part-time workers than Australia. In 2015, the OECD average proportion of workers in part time employment was 17% (defined by the OECD as people usually working fewer than 30 hours per week in their main job). The most comparable figure for Australia was around 24% (OECD 2016).

Australia is also relatively distinctive in having a workforce where the high incidence of part-time work is accompanied by a relatively high proportion of workers reporting working long hours each week. The OECD ranks Australia tenth out of 38 included member and partner countries for the proportion of its workers (13%) working 'very long hours' (50 hours or more per week as defined by the OECD) (OECD 2015).

As at August 2016, around 12% of females in paid employment reported that they worked long hours (defined here as 45 hours or more a week) during the survey reference week (Figure 4.1.1). This compares with 7.5% of females in 1971. Among employed males, the proportion working long hours is now back to where it was at the start of the period, after rising steadily for 2 decades between the mid-1970s and mid-1990s. Among females, the share of working long hours has been falling over the last 15 years or so.

In summary, the following points are noteworthy:

- The traditional 35- to 40-hour work week is less common today than 50 years ago.
- The main change in working-time patterns is growth in part-time employment.
- Much of the relative growth in part-time employment was concentrated in the 1970s and 1980s. Among males, however, growth in part-time employment has accelerated in recent years.
- During the 1980s and 1990s—and while the part-time employment share was rising—there was also a trend towards long work weeks. This trend stopped, and reversed in the 2000s.

Working-time mismatch

Concerns about the relatively high incidence of both part-time and long work hours are rooted in the notion that the best jobs are those where weekly hours most closely conform to industrial norms. However, there is now strong evidence that it is not the number of hours worked that matter most for worker wellbeing, but whether, and the extent to which, those hours (often driven by employer needs and demands) are aligned with worker preferences.

Survey data consistently show that most part-time workers, and especially females, have strong preferences for part-time work. For example, 2015 HILDA Survey data show that 87% of females in part-time work prefer part-time work (that is, working fewer than 35 hours per week). Among males in part-time jobs, the proportion who prefer part-time hours, while lower than that for females, still represents a sizeable majority (74%).

Studies of job satisfaction have mostly been unable to detect sizeable negative associations with part-time work (for example, Booth & van Ours 2008; D'Addio et al. 2007; Roeters & Craig 2014). Instead, some researchers have focused on the underemployed—part-time workers working fewer hours than desired—arguing that the insufficiency of work among some part-time workers is comparable to unemployment (see Anderson & Winefield 2011). Underemployment, like unemployment, is a source of stress that has the potential to compromise health and wellbeing.

The ABS LFS estimates the number of part-time workers who would prefer more hours. These workers, along with full-time workers who worked fewer than full-time hours during the survey reference week, are defined by the ABS as underemployed workers (see Box 4.1.2). Figure 4.1.2 shows that the (seasonally adjusted) rate of underemployment has trended upward since 1978 for both males and females. It rose steeply during the recession of the early 1990s, but then did not return to pre-recession levels. Since 2011, the rate has climbed steadily upward. In 2016, the underemployment rate was at a record high, accounting for 9.3% of all employed people (or 8.7% of the labour force). This is very different from the trend in the much more well-known unemployment rate, which was 5.6% in 2016, around half its peak of 11% in 1993.

Preferences for working hours

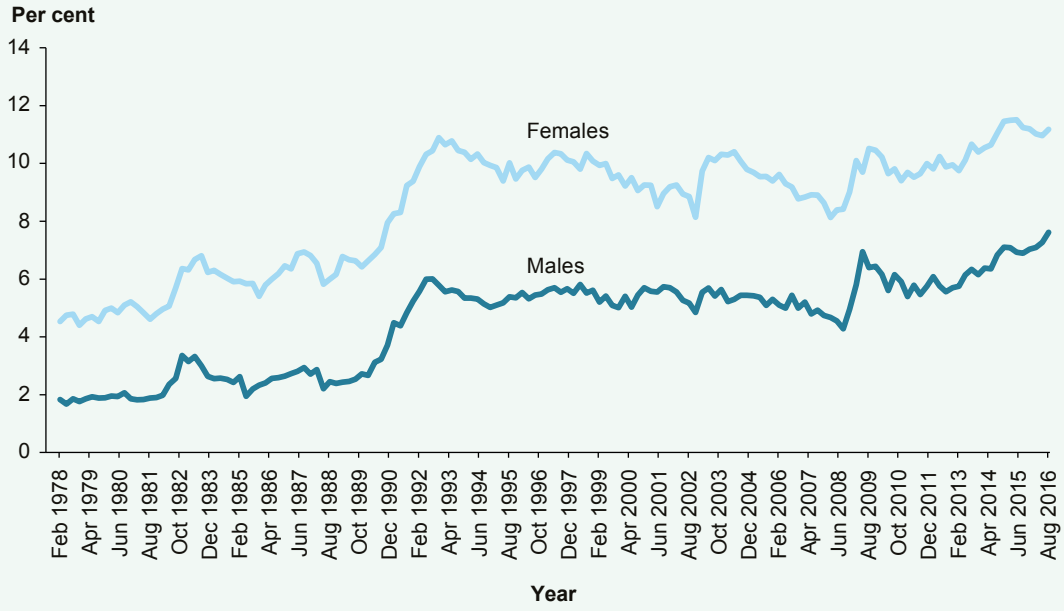
Box 4.1.2: How the ABS defines underemployment

The ABS classifies an employed person as underemployed if they are either:

(i) employed on a part-time basis and want to work more hours (and are available to start work with more hours, either in the survey reference week or in the 4 weeks after the survey), or

(ii) employed full time but worked fewer than 35 hours during the survey reference week for economic reasons.

Source: ABS 2013.



Note: Data are seasonally adjusted.

Source: ABS 2016b, Table 22.

Figure 4.1.2: Underemployment rate in Australia (as a proportion of employed people), by sex, February 1978 to August 2016

The data the ABS collects on working time preferences have limitations. For example, the monthly LFS collects data about preferences for more hours, but not preferences for fewer hours. The likelihood that, at any point in time, the preferences of all workers will coincide with the needs of their employer is very low. For example, the ABS Business Longitudinal Dataset shows the most common response to skill shortages is current employees working more hours at the request of their employer (Healy et al. 2012). Therefore, overemployment can be expected to be especially pronounced when firms face difficulties recruiting additional labour. As well, the LFS is asked on the basis that 'any responsible adult in the household' can respond to the questions. This means that one person in the household answers on behalf of all others, which can be problematic for questions eliciting information about preferences.

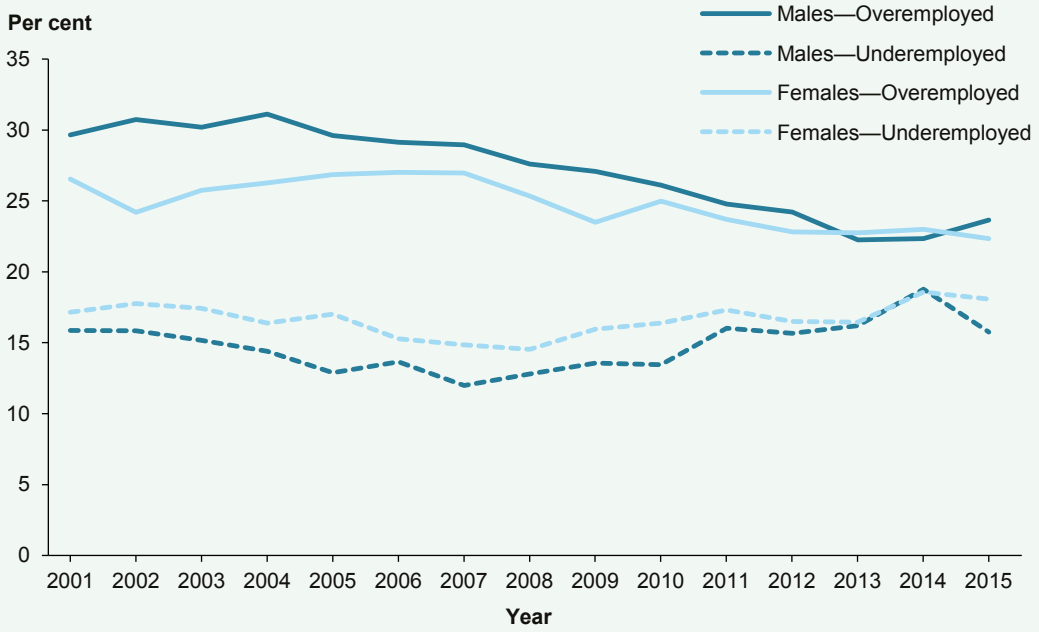
The HILDA Survey is an alternative source of data on working-time mismatch. The annual household panel survey began in 2001. Each year, employed respondents are asked to indicate:

- how many hours they usually work each week, including any paid or unpaid overtime
- whether they would prefer to work fewer, more, or about the same hours as currently (while taking into account how any change would affect income)
- if more or fewer preferred hours are nominated, how many.

Responses to this set of questions provides measures of the incidence of both underemployment and overemployment (that is, employed people who prefer to work fewer hours each week while taking into account any effect on their income), as well as the extent of those mismatches.

Underemployment and overemployment

Data from the HILDA Survey describing trends in the incidence of both underemployment and overemployment are presented in Figure 4.1.3. The figure also shows that there has been a general rise in the level of underemployment in recent years; these levels are much greater than suggested in Figure 4.1.2. This is due, in part, to full-time workers who prefer more hours being included among the underemployed in these data, and because workers have not had to be available to work the additional hours to be classified as underemployed. (The HILDA Survey started collecting data on 'availability to work additional hours' only in 2010.) Even if underemployment had been restricted to people who usually work part time but preferred more hours (and who were available to work those additional hours), the estimated rate of underemployment in 2015 would have been 11%. This is still 2 percentage points higher than the rate derived from the ABS data for this period.



Source: Wooden et al. 2016.

Figure 4.1.3: Underemployed and overemployed workers (as a proportion of employed people), by sex, 2001 to 2015

Figure 4.1.3 also shows that, historically, there have been many more overemployed workers (that is, people who would prefer to work fewer hours) than underemployed workers. At the same time, the incidence of overemployment has been in decline over the last 15 years. Today, the gap between the underemployment and overemployment shares is much smaller than it was at the start of the century.

The combined result of these different trends—rising underemployment but falling overemployment—is that the overall level of mismatch has fallen since 2001. In 2001, around 46% of males and 44% of females workers reported preferred hours that were different from usual hours. In 2015, the comparable proportions were 39% and 40%.

The data also show evidence of a clear time divide, with many part-time workers reporting that they work too little and many full-time workers reporting they work too much (Wooden et al. 2016). Also, the patterns in mismatch are highly gendered: females, who are much more likely to be working part time, are also much more likely to prefer part-time hours; while males, who are more likely to work long hours, are also more likely to prefer long hours.

The numbers presented in both figures 4.1.2 and 4.1.3 are based on a count of heads. As such, they are not necessarily a good guide to the overall level of mismatch. That requires extra information on the extent of mismatch (that is, the size of the difference between preferred and usual hours of work). As noted earlier, this information is collected in the HILDA Survey, with the data indicating that, for most workers reporting mismatch, the extent of mismatch is considerable. For example, in the most recent survey wave (2015), the mean level of mismatch was 13.4 hours per week among males and 12.1 hours per week among females, with mean hours (the difference between hours worked and desired hours) of overemployment slightly higher (by about 1 hour) than mean hours of underemployment. These levels have changed very little over time.

Working time and worker wellbeing

So, does working time—more specifically, working hours that are not in line with worker preferences—affect worker wellbeing? Associations between three indicators of worker wellbeing and usual weekly hours worked, cross-classified by working-time mismatch, were analysed using the HILDA survey (Table 4.1.1).

The three indicators of wellbeing used were:

1. *job satisfaction:* records responses, on a 0 to 10 scale, to the question: 'All things considered, how satisfied are you with your job?'
2. *life satisfaction:* records responses, again on a 0 to 10 scale, to the question: 'All things considered, how satisfied are you with your life?'
3. *mental health:* measured with the Mental Health Inventory, a measure that involves 5 items assessing the frequency of symptoms of anxiety and mood disturbance over a 4 week period. Scores on each item are summed and then transformed to a range from 0 to 100.

Table 4.1.1: Indicators of worker wellbeing (mean scores), by usual weekly hours worked and working-time mismatch, 2001 to 2015 (pooled)

Hours usually worked per week	Well-matched	Underemployed	Overemployed
		Job satisfaction (0–10)	
≤34	8.1	7.3	7.3
35–40	7.8	7.4	7.1
41–49	7.9	7.7	7.1
50+	8.0	7.5	7.2
Total	**7.9**	**7.3**	**7.2**
		Life satisfaction (0–10)	
≤34	8.1	7.7	7.8
35–40	7.9	7.7	7.7
41–49	8.0	7.8	7.7
50+	8.0	7.5	7.6
Total	**8.0**	**7.7**	**7.7**
		Mental health (0–100)	
≤34	76.0	71.7	73.7
35–40	76.3	73.2	73.8
41–49	77.4	75.1	74.7
50+	78.4	73.0	74.7
Total	**76.6**	**72.2**	**74.3**

Note: Observations are drawn from the first 15 waves of the HILDA Survey and pooled, with each observation weighted by the relevant cross section weight.

Source: Wooden et al. 2016.

The data presented in Table 4.1.1 suggest four main conclusions.

- First, worker wellbeing does not vary much with the length of the usual work week. Consider, for example, job satisfaction levels among the group of workers who report that their usual work hours are consistent with preferences (the well-matched). The mean job satisfaction score within this group was 7.9, varying from 7.8 for people working a standard 35–40 work week to 8.1 for part-time workers and 8.0 for people working long work weeks (50 hours or more).
- Second, regardless of the number of hours worked, both underemployed and overemployed workers report lower levels of satisfaction and mental health than well matched workers. In the case of job satisfaction, these differences are quite large, with mean scores of 7.2 and 7.3 for the overemployed and underemployed, respectively, compared with 7.9 for workers who are well matched.

- Third, these differences are most marked with respect to job satisfaction. The differences are smaller when examining the other two wellbeing measures, but nevertheless remain statistically significant (at a 95% confidence level). These smaller differentials for life satisfaction and mental health are to be expected, and reflect the fact that broader measures of wellbeing will depend much more on factors outside work.
- Fourth, these lower levels of wellbeing do not differ much between the underemployed and the overemployed.

In summary, it is not the number of hours worked that matters for worker wellbeing, but whether those hours accord with worker preferences. Further, other more extensive and statistically sophisticated analyses of these data have found that the conclusions reported here are robust when controlling for individual characteristics (for example, Otterbach et al. 2016; Wooden et al. 2009).

Note that very little has been said here about the forces influencing either worker or employer preferences for working hours. This lies largely beyond the scope of this article. It should not be assumed, though, that the factors driving underemployment will be the same as those driving overemployment. Indeed, there may well be very different, if not opposing, forces at work (Reynolds & Aletraris 2006).

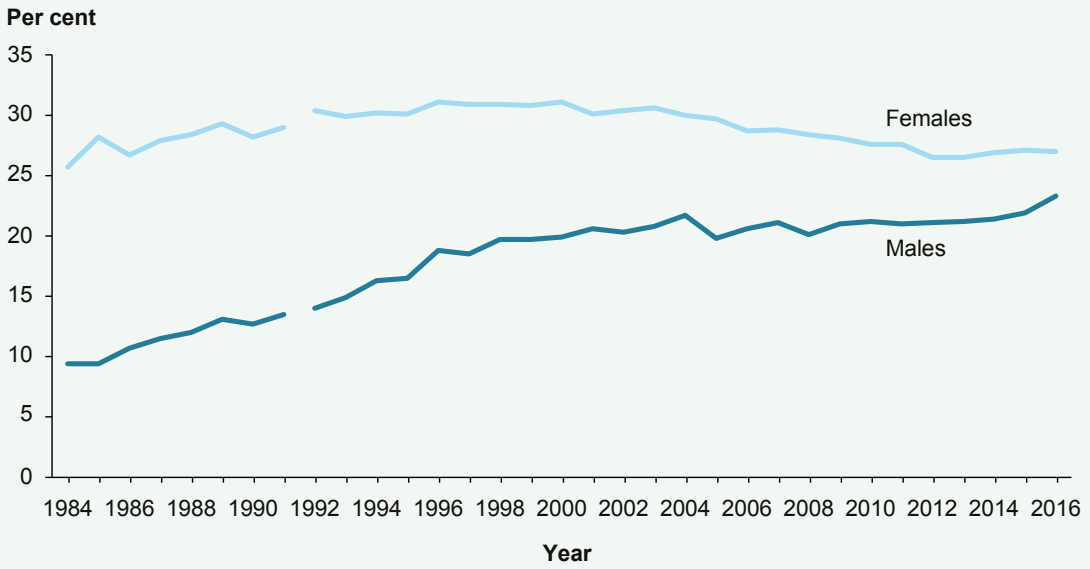
Job security and precarious employment

Another often expressed view is that jobs in Australia today are more insecure than at any other time in Australia's recent (post-World War II) history, and that growth in more precarious non-standard forms of employment (such as casual work, fixed-term contracts, labour hire, and as self-employed contractors) is the major reason for this rise in insecurity (for example, see ACTU 2011). This has important consequences for worker wellbeing, with job insecurity being a source of stress and hence a negative influence on health outcomes (Benach et al. 2014). The potential adverse consequences do not just end with health consequences, however. The greater financial insecurity associated with more insecure forms of work can, for example, also affect the ability of workers to obtain loans or obtain accommodation in the rental market (Independent Inquiry into Insecure Work 2012).

Incidence of, and trends in, non-standard employment

Available data confirm that the incidence of non-standard forms of employment (especially casual employment) is very high in Australia. Still, there is relatively little evidence of significant growth in the share of total employment accounted for by these non-standard jobs over the last 2 decades.

For example, data collected by the ABS on the proportion of employees without either paid annual leave entitlements or paid sick leave entitlements (typically synonymous with casual employment) suggest that most of the growth in the casual employment share occurred before the late 1990s (see Figure 4.1.4 for the trend in this share between 1984 and 2016). The proportion of female employees without paid leave entitlements peaked in 1996, at about 31%, but declined to 27% by 2016. Among male employees, there has been no obvious trend decline, with the proportion reporting no paid leave entitlements fluctuating around 20–21% for most of the period since 2000. However, in 2016, there was a noticeable jump in casual employment levels among male workers (to 23%).



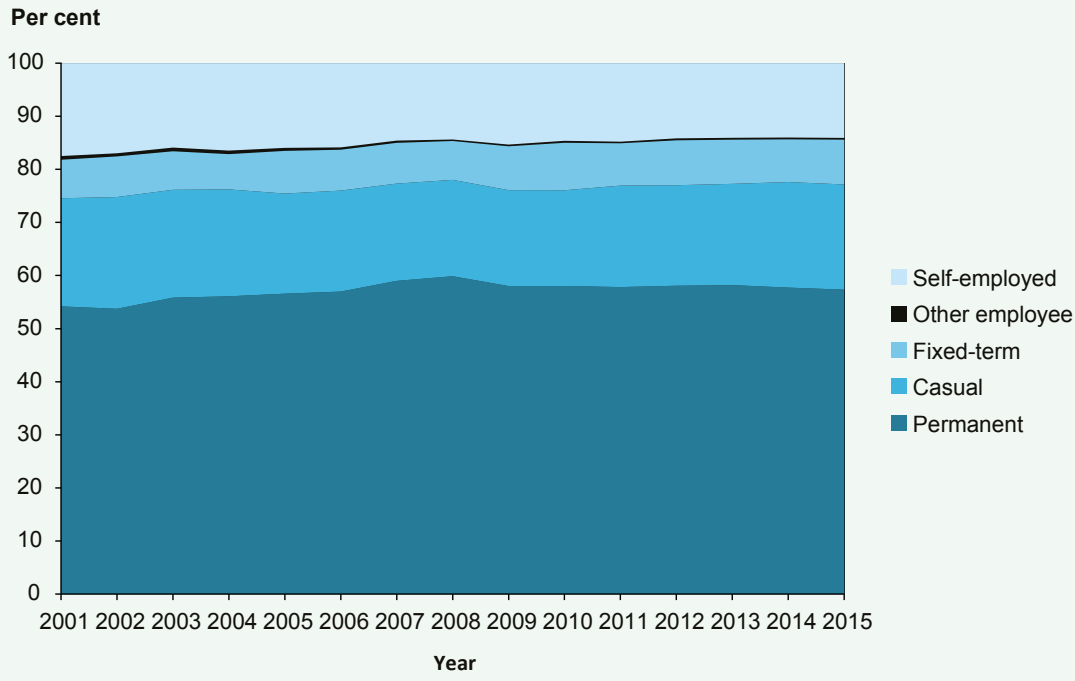
Note: All figures are for the month of August. Figures for 1984 to 1991 include employee managers of incorporated enterprises, and are therefore not directly comparable with figures for other years.

Sources: 1984–1988: Dawkins & Norris 1990; 1988–1992: ABS Employment Benefits, Australia (ABS cat. nos 6334.0 and 6310.0); 1993, 1994 and 1997: ABS Weekly Earnings of Employees (Distribution), Australia (ABS cat. no 6310.0); 1995: ABS 1995; 1996: ABS 1996; 1998–2013: ABS Employee Earnings, Benefits and Trade Union Membership, Australia (ABS cat. no 6310.0); 2014–2016: ABS Labour Force, Australia, Detailed, Quarterly (ABS cat. no 6291.0.55.003).

Figure 4.1.4: Employees without paid leave entitlements (proportion of all employees) by sex, 1984 to 2016

Similarly, there is little evidence that other forms of non-standard employment have been growing relative to more traditional forms of employment—that is, permanent wage and salary earner jobs—in recent years. For example, data collected in the HILDA Survey allow the sorting of employees into one of three main groups based on their employment contract in their main job: fixed-term contract, casual, or permanent/ongoing. Adding the self employed gives the total employed population.

Figure 4.1.5 shows how the composition of the employed workforce by contract type/ employment status has changed over the last 15 years. In 2015, permanent employees accounted for 57% of all employed people—3.1 percentage points higher than in 2001. Virtually all this growth has been offset by a decline in the self-employment share, which has been steadily declining throughout this period; ABS data suggest the decline in the self employment share began in the early 1990s (see Atalay et al. 2014). In contrast, the casual employment share has been fairly stable since 2001, at around 20% of the employed workforce, while the share of workers on fixed-term contracts has increased by only 1.2 percentage points (from 7.2% to 8.4%).



Source: Wooden et al. 2016.

Note: 'Other' employees includes people who could not be categorised elsewhere; this incorporates some apprentices, persons working on probation and some employees working on a commission basis.

Figure 4.1.5: Composition of employment, 2001 to 2015

Almost 1 in 3 employees in Australia have non-standard forms of employment, with casual and fixed-term contract employees combined accounting for 28% of the employed workforce. However, this level is nothing new, with most (if not all) of the growth in the share of non-standard jobs occurring before the turn of the century.

Non-standard employment, job insecurity and worker wellbeing

HILDA Survey data show that non-standard forms of employment (that is, casual employment and fixed-term contract employment) are associated with relatively higher levels of job insecurity. This can be seen in Table 4.1.2, where employment status (and whether working full-time or part-time hours) is cross-classified by a measure of job insecurity—the expected probability of job loss during the next 12 months. The mean probability of job loss among full-time casual employees is almost 20% among males, and more than 15% among females. The comparable proportions among full-time permanent employees are about half this (10% and 8%, respectively). Rates of perceived job loss are also relatively high among fixed-term contract workers. Among females, fixed-term contract jobs are associated with the highest probabilities of job loss. However, there is little evidence of part-time jobs being more insecure than full-time jobs—the mean perceived probability of job loss was noticeably lower among part-time casual employees than among their full-time equivalents.

Table 4.1.2: Probability of job loss, employed people, by employment type and full-time/part-time status and sex, 2001 to 2015 (pooled)

	Mean probability of job loss (%)		Probability of job loss ≥50%	
Employment status	**Males**	**Females**	**Males**	**Females**
Full-time permanent	9.9	7.8	8.9	7.4
Part-time permanent	10.5	7.1	10.1	7.0
Full-time casual	19.8	15.5	24.0	19.2
Part-time casual	13.1	11.9	13.0	12.8
Full-time fixed term	16.0	17.8	16.3	19.8
Part-time fixed term	19.5	17.8	20.8	22.4

Note: The probability of job loss is derived from answers to the question: 'What do you think is the per cent chance that you will lose your job during the next 12 months? (that is, get retrenched or fired or not have your contract renewed.)'. Observations are drawn from the first 15 waves of the HILDA Survey and pooled, with each observation weighted by the relevant cross-section weight.

Source: Wooden et al. 2016.

Except for satisfaction with job security, differences in wellbeing across the different employment types are mostly very small (Table 4.1.3), with no differences for overall life satisfaction. Job satisfaction levels, on the other hand, are slightly lower among males in casual jobs than males in permanent jobs (but this difference is quite small, at 7.4 and 7.6, respectively). More sophisticated statistical analysis of the HILDA Survey data (covering the first 10 survey waves) that controls for other personal characteristics suggests that the difference is greater—perhaps twice as large (Buddelmeyer et al. 2015). This analysis, however, was unable to detect any significant differences in job satisfaction between males in fixed-term contract jobs and males who were permanent employees, nor was there any evidence that the job satisfaction of female workers varies with contract type.

Table 4.1.3: Indicators of worker wellbeing (mean scores), employed people, by employment type and sex, 2001 to 2015 (pooled)

Employment type and sex	Satisfaction with job security (0–10)	Overall job satisfaction (0–10)	Life satisfaction (0–10)	Mental health (0–100)
Males				
Permanent employee	8.1	7.6	7.9	76.7
Casual employee	7.3	7.4	7.9	74.7
Fixed-term contract employee	7.5	7.6	7.9	76.6
Self-employed	7.4	7.7	7.8	77.3
Females				
Permanent employee	8.3	7.7	7.9	74.7
Casual employee	7.6	7.6	7.9	72.2
Fixed-term contract employee	7.0	7.6	7.8	73.3
Self-employed	7.7	8.0	8.0	75.9
All people				
Permanent employee	8.2	7.6	7.9	75.8
Casual employee	7.5	7.5	7.9	73.2
Fixed-term contract employee	7.3	7.6	7.9	75.0
Self-employed	7.5	7.8	7.9	76.8

Note: Observations are drawn from the first 15 waves of the HILDA Survey and pooled, with each observation weighted by the relevant cross section weight.

Source: Wooden et al. 2016.

Both male and female casual employees report lower mental health levels than permanent employees, but the difference is again small. Further, it is not obvious in which direction the causation runs—it may be that mental health issues make it difficult for workers to both obtain and retain permanent work. Other research (also involving the HILDA Survey data) controls for reverse causation and is unable to find any evidence that casual or fixed-term contract employment is harmful for mental health (Richardson et al. 2012).

Recent research undertaken in Europe (Jahn 2015; Origo & Pagani 2009) suggests that it is not employment type that is so critical for worker wellbeing, but perceived job insecurity, which, in turn, may be only imperfectly correlated with employment type. Very few so called permanent jobs are in fact permanent. While rates of job loss are considerably lower for permanent employees than for other types of worker, when permanent employees do lose their job, the cost to those individuals, both economically and psychologically, may be considerable.

Table 4.1.4 shows mean scores on the four wellbeing indicators by employment type, cross classified by a simple measure of job insecurity.

Table 4.1.4: Indicators of worker wellbeing (mean scores), employed people, by employment type and job security, 2001 to 2015 (pooled)

Employment type and job security (% distribution)	Satisfaction with job security (0–10)	Overall job satisfaction (0–10)	Life satisfaction (0–10)	Mental health (0–100)
Permanent—secure (41.1%)	8.8	7.9	8.0	77.1
Permanent—moderately insecure (21.3%)	7.7	7.4	7.7	74.4
Permanent—insecure (5.6%)	5.3	6.7	7.5	71.1
Casual—secure (12.2%)	8.3	7.9	8.1	74.5
Casual—moderately insecure (7.1%)	7.3	7.4	7.8	72.7
Casual—insecure (3.4%)	4.9	6.7	7.4	70.0
Fixed-term contract—secure (4.7%)	8.4	7.9	8.0	76.5
Fixed-term contract—moderately insecure (2.9%)	7.1	7.5	7.7	74.8
Fixed-term contract—insecure (1.8%)	4.5	7.0	7.6	71.2

Note: A secure job is defined as one where the respondents report zero probability of job loss in the next 12 months; a moderately insecure job is one where this probability is non-zero but less than 50%; and an insecure job is one where this probability is 50% or more. Observations are drawn from the first 15 waves of the HILDA Survey and pooled, with each observation weighted by the relevant cross-section weight.

Source: Wooden et al. 2016.

The data reported in Table 4.1.4 clearly show that it is not employment type that matters so much for worker wellbeing but how insecure workers feel in their jobs. Most casual employees in Australia report zero chance of losing their job in the year ahead (54%) and, on average, these workers do not report lower levels of job or life satisfaction than permanent employees. Mental health wellbeing levels are slightly lower among casual employees, but, again, the differences are small. This could reflect a causal process where mental health problems are an obstacle to securing permanent jobs (rather than the result of casual employment).

In contrast, there are marked differences between workers when differentiated based on their reports of expected probability of job loss. Workers in secure jobs (regardless of their contractual arrangement) report not only much higher satisfaction with job security, but also being much better off on each of the three other wellbeing indicators.

So, does this mean non-standard employment is not the problem for worker wellbeing that it is often thought to be? Yes and no. Very clearly, it is job insecurity that is most critical for worker wellbeing. Yet it remains the case that the likelihood of being in an insecure job is much greater when the contract for that job is casual or for a fixed-term.

What is missing from the picture?

When examining working time, the focus has been on the number of hours worked, but equally important may be when those hours are worked (for example, the time of day or week). Data to inform this question may be available from the Australian Time Use Survey (ATUS), but information is dated—the ATUS was last conducted in 2006.

Where do I go for more information?

For a broader review of recent trends in the Australian labour market, see Wilkins and Wooden (2014).

More information about the HILDA Survey, including how to obtain the unit record data file, is available at http://melbourneinstitute.unimelb.edu.au/hilda.

For more detailed analyses of the relationship between working-time mismatch and measures of worker wellbeing that use HILDA Survey data, see Wooden et al. (2009) and Otterbach et al. (2016).

For a more detailed analysis of the relationship between non-standard employment and job satisfaction that uses HILDA Survey data, see Buddelmeyer et al. (2015).

Acknowledgment

This article uses confidentialised unit record file data from the HILDA Survey (and more specifically from Beta Release 15). The HILDA Survey Project was initiated and is funded by the Department of Social Services, and is managed by the Melbourne Institute of Applied Economic and Social Research. The findings and views reported in this paper, however, are those of the author and should not be attributed to either the Department of Social Security or the Melbourne Institute.

The author gratefully acknowledges the research assistance of Markus Hahn.

4.2 Key employment trends

Employment, and the economic resources gained from it, underpins a society's ability to support itself. Having a job helps a person to satisfy their own needs and wants. It also helps them to support their family and their community more broadly. Without employment, some people depend on welfare services and supports, among other society responses. This article provides information on employment trends and on some of the main Australian Government programs that deliver income support and employment services to unemployed people. Box 4.2.1 sets out the main concepts and definitions used when discussing the employment of the population.

Box 4.2.1: Employment concepts and definitions

The 'working age population' in this article is all people aged 15–64.

The 'youth population' in this article is all people aged 15–24.

The 'employment to population ratio' is a measure of the total level of employment. It is the proportion of the total working age population who are employed (that is, the number of working age people employed divided by the total working age population). Data for this measure are based on monthly trend estimates.

The 'unemployment rate' is the number of unemployed people expressed as a percentage of the labour force. The unemployment rate used is an average of monthly rates over a calendar year. To be defined as unemployed, a person must be:

- aged 15 or older
- not currently working and has actively looked for work at any time in the 4 weeks leading up to the end of the survey reference week
- available for work in the survey reference week or waiting to start work in a new job within 4 weeks from the end of the reference week.

Formal definitions of these terms and information on how the data are collected can be found in supporting documentation for the Australian Bureau of Statistics (ABS) Labour Force Survey (ABS 2017).

Long-term employment trends

Over the last 40 years, Australia has generally seen rising levels of employment. This is despite three labour market downturns: in the early 1980s, the early 1990s, and after the Global Financial Crisis (GFC) of 2007–08.

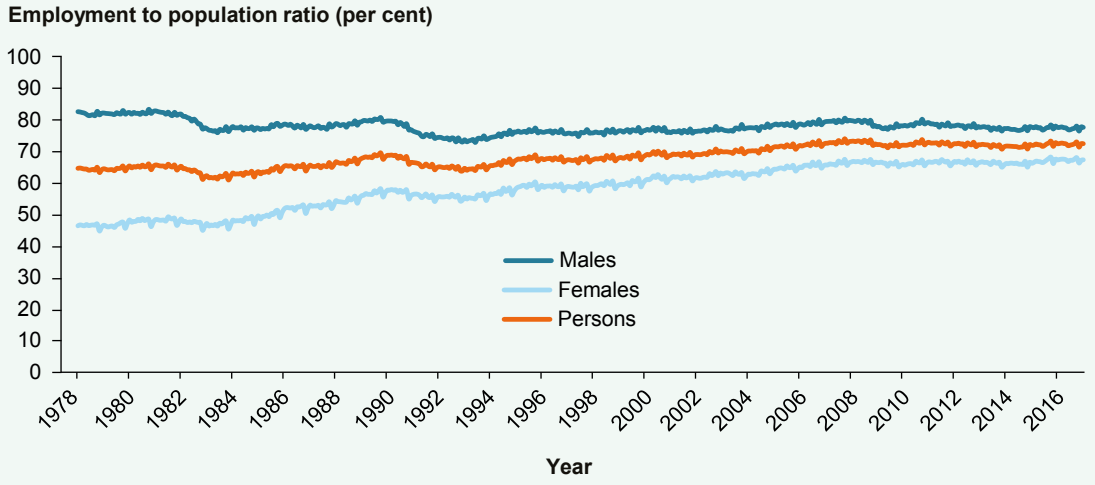
The downturns in the 1980s and 1990s saw a substantial fall in the working age employment to population ratio (see Box 4.2.1) over a few years, after which it grew to surpass pre-event levels. For example, from mid-1981 to mid-1983, the ratio fell from 65% to 62%, but was more than 65% by the end of 1987. The downturn relating to the GFC saw the ratio fall by less than 2 percentage points (73.3% to 71.7%) and last for only 1 year (mid-2008 to mid 2009). Since then, it has been relatively stable, moving between a low of 71.5% and a high of 72.9% (Figure 4.2.1).

Trends for males

Male employment mirrored the overall employment trends up to 2008. Since then, there has been a marked decline in the working age employment to population ratio. It fell from a high of 80% in early 2008 to a low of 77% in mid-2009. Despite bouncing back in 2010–11, the rate has trended downward since the GFC, reaching a 13-year low of 77% throughout most of 2014. It was 77% in March 2017.

Trends for females

The story is more positive for females. Over the course of the last 40 years, the female working age employment to population ratio has been rising. From around 46–47% during the late 1970s, the rate continued to grow until the late 2000s. From the end of 1985, at least half of all working age females were employed; by early 2008, this figure had risen to two-thirds of all working age females. Since 2008, growth in female employment has slowed, although the GFC did not result in a substantial downturn in female employment. Since the start of 2017, the female working age employment to population ratio was 67.3%, which is close to its highest ever level of 67.4% (in early 2016).



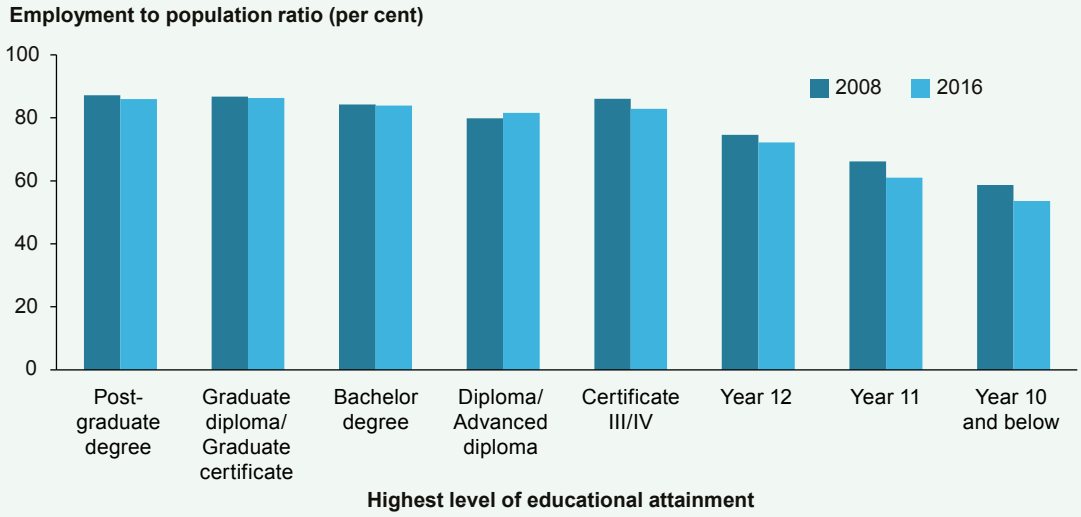
Source: AIHW analysis of ABS 2017.

Figure 4.2.1: Employment to population ratio by sex, March 1978 to March 2017

Education and employment

Since 2008, despite relative stability in employment, there has been a marked decline in the proportion of lower skilled people who are employed. For instance, the proportion of people whose highest qualification was Year 10 and below (including Certificate I/II) who were employed fell from 59% to 54% between 2008 and 2016. By comparison, the proportion of people whose highest qualification was a Bachelor degree who were employed fell only slightly from 84.2% in 2008 to 83.9% in 2016 (Figure 4.2.2).

In general, more than 4 of every 5 people who have a Diploma or higher educational qualification are employed. This compares with just over half (54%) of all people with 'Year 10 and below' (including Certificate I/II) being employed in 2016.



Source: AIHW analysis of ABS 2017.

Figure 4.2.2: Employment to population ratio by highest level of education, 2008 and 2016

Youth unemployment

Over the long term, the unemployment rate has showed some variation (Figure 4.2.3). The youth unemployment rate followed a similar pattern to the total unemployment rate, albeit with consistently higher rates.

The two key peaks in youth unemployment align with the recessions of the early 1980s and 1990s—18% (1983) and 19% (1992), respectively. After the second peak, the youth unemployment rate fell to its lowest level of 8.8% in 2008. Unlike the pre-GFC labour market downturns, the youth unemployment rate has continued to rise, as opposed to fall sharply (as was expected), and was 13% in 2016.

The gap between the youth unemployment rate and the total unemployment rate has tended to be more pronounced when total unemployment rates are higher, with the reverse being true when the unemployment rate is lower. This suggests that the unemployment rates in the youth population group are more sensitive to economic changes than they are for the population as a whole.

Figure 4.2.3: Average annual unemployment rates, 1979 to 2016

Support while looking for work

The Australian Government helps people while they look for work through several payments and services. Financial assistance is available through the following programs:

- Newstart Allowance: provides financial help to people aged 22 or older who are looking for suitable paid work. The benefit covers unemployed people as well as some underemployed people. In 2015–16, the Department of Human Services finalised about 696,000 Newstart Allowance claims, an increase from 671,000 claims in 2014–15 (DHS 2016).
- Youth Allowance (other): available to people looking for work, or undertaking approved activities, who are aged 16–21; full-time students aged 18–24; and apprentices aged 16–24. The benefit has similar rules to those for the Newstart Allowance but notably includes parental income tests, unless independence exemptions are met. In 2015–16, the Department of Human Services finalised about 417,000 Youth Allowance (other) claims, a drop from 424,000 claims in 2014–15 (DHS 2016).
- Job Commitment Bonus: targets job seekers aged 18–30 who have been long-term unemployed (unemployed for 12 months or more). Two payments are made if a job seeker is eligible. The first, of $2,500, is made after 12 months of continuous work and the second, of $4,000, is made for completing a further 12 months of work. In 2015–16, the Department of Human Services processed about 4,300 claims for the first payment (DHS 2016).

The jobactive program is the main Australian Government funded program that supports job seekers in finding employment, linking them with employers. On 1 July 2015, jobactive replaced the Job Services Australia program. The jobactive program supports both job seekers and employers (by delivering employment services). In 2015–16, nearly 350,000 job placements were made through the program (Department of Employment 2016). In 2015–16, 43% of job seekers who had participated in jobactive for 6 months moved off income support, or had substantially reduced their reliance on it (Department of Employment 2016).

People with disability, illness or injury can access Disability Employment Services to find and keep a job. In 2015–16, 31% of participants for this service were employed within 3 months of accessing it (DSS 2016). Australian Disability Enterprises also provides a wide range of supported employment opportunities for people with disability. In 2015–16, just under 19,900 employees were assisted by this agency (DSS 2016).

On 1 July 2015, the Community Development Programme began to support jobseekers in remote Australia. It supports around 35,000 people, 83% of whom identify as being Aboriginal and Torres Strait Islander (PM&C 2017).

What is missing from the picture?

As jobactive has been in existence only since 1 July 2015, there are insufficient data to measure performance over a long-term period for this program.

Where do I go for more information?

More information on labour force data is available from the ABS Labour Force Survey.

More information on support for unemployed people in Australia is available at the Department of Human Services and Department of Employment websites.

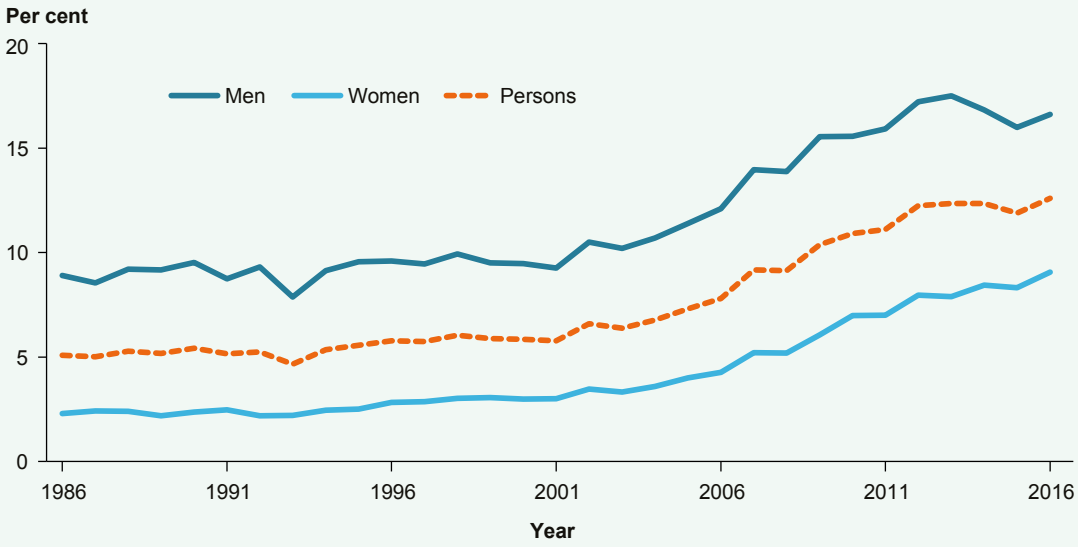
4.3 Seniors in the workforce

Australia's older generation (people aged 65 and over) is continuing to grow. With increasing life expectancies and improvements in health care, more of us will grow older and live longer, healthier and actively engaging lives. This has implications at both the national and individual level, including (but not limited to) those to do with the economic workforce and retirement income planning.

Recent policy changes to meet these challenges include increasing the eligibility age for the Age Pension as well as introducing incentives (such as the Work Bonus and Restart) to encourage seniors back into the workplace, and employers to hire mature-aged workers.

Increasing participation and part-time work

Over the last 3 decades, the employment rate (employment to population ratio) has generally increased among people aged 65 and over, from 5.1% in 1986 to 13% in 2016 (ABS 2016a; (Figure 4.3.1). Over the same period, the unemployment rate for this age group remained relatively stable at around 1.4%.

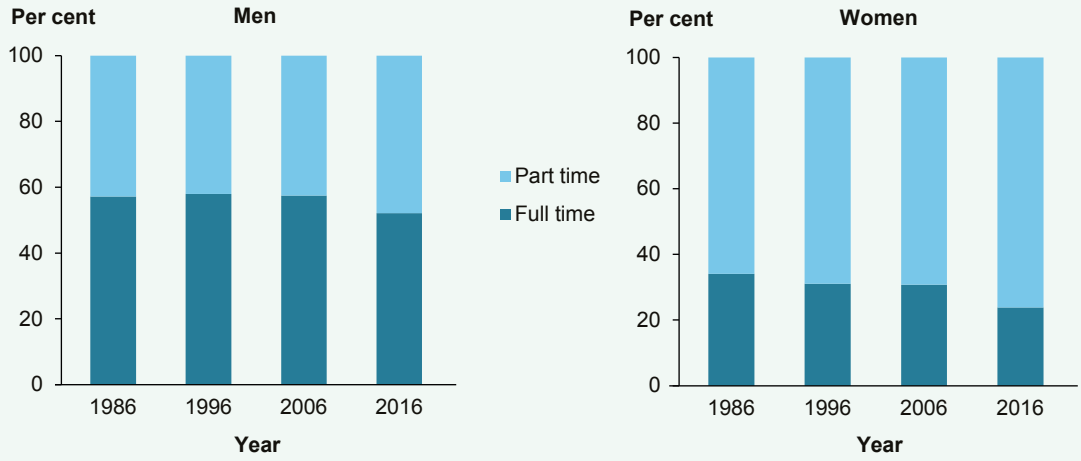


Source: AIHW analysis of ABS 2016a.

Figure 4.3.1: Employment rate, people aged 65 and over, by sex, June 1986 to June 2016

In recent decades, there has been a downward trend in full-time work and an upward trend in part-time work for older Australians. In 1986, a slightly higher proportion of employed older people worked full time (51% compared with 49% working part time) (ABS 2016a). However, the balance between full-time and part-time work shifted in 1997. Since then, there has been a higher proportion in part-time work, steadily increasing to a peak of 59% in 2016.

Employed older women were more likely to work part time than men (Figure 4.3.2). Over the last 3 decades, the majority of employed older women worked part time, with the proportion doing so increasing from 66% in 1986 to 76% in 2016. The proportion of employed older men who worked part time has also increased—though not as much—rising from 43% in 1986 to 48% in 2016.



Source: AIHW analysis of ABS 2016a.

Figure 4.3.2: Proportion of employed persons aged 65 and over working full time and part time, by sex, 1986, 1996, 2006 and 2016, as at June

International comparisons

Labour force data for Australia, relative to that for other countries, suggest that older Australians are faring relatively well against the Organisation for Economic Co-operation and Development (OECD) average (Table 4.3.1). The latest OECD data show that the unemployment rate for Australians aged 65 and over in 2015 was below the OECD average. However, the participation (people working and actively looking for work) and employment rates for people aged 65 and over were just short of the OECD average and well below the rates for New Zealand, Japan and the United States.

Table 4.3.1: Labour force participation, employment rate and unemployment rate, people aged 65 and over, selected OECD countries and OECD average[(a)], 2015

	OECD	Australia	Canada	Japan	New Zealand	United Kingdom	United States
Participation rate (%)	13.8	12.2	13.4	22.1	22.1	10.3	18.9
Employment rate (%)	14.1	12.0	12.8	21.7	21.7	10.1	18.2
Unemployment rate (%)	2.6	1.5	4.5	2.0	1.6	1.9	3.8

(a) International comparisons should be treated with caution as countries have different population profiles. For example, the share of the population in the upper age ranges (80 and over) might vary.

Source: OECD 2017.

Reasons for not working

The most recent data on persons not in the labour force show that, in 2016, there were around 101,100 discouraged job seekers—people available to start work within the next 4 weeks but not actively seeking work (ABS 2016b). Of these people, close to one-third (30% or 30,400) were aged 65 and over. The most commonly reported reason for not actively looking for work among older discouraged job seekers was that they believed they would be considered too old by employers.

In 2014–15, close to 4 in 5 people (79%) aged 65 and over had retired (ABS 2016c). Among men and women, the retirement rate was similar (78% and 80%, respectively). For people who had retired at age 65 and over, reaching retirement age was the most commonly reported reason for leaving their last job (62%). The retirement rate of seniors in 2014–15 was lower than what is was a decade ago (83% in 2004–05).

What is missing from the picture?

Information on Indigenous labour force participation and retirement is limited and is not presented in this article. While the Australian Bureau of Statistics (ABS) publishes labour force data for Indigenous Australians in the National Aboriginal and Torres Strait Islander Social Survey and the Aboriginal and Torres Strait Islander Health Survey, there is no annual measure currently available. Similarly, there are limitations to presenting data on retirement as the ABS Retirement and Retirement Intentions Survey, used in this article, does not include information on the Indigenous status of respondents.

Where to go for more information?

For more information on labour force participation and retirement, see the ABS reports Labour Force and Retirement and Retirement Intentions.

To find out more on the Work bonus and Restart incentives, visit the following sites: Department of Human Services and Department of Employment, respectively.

A paper assessing the changing role of part-time work in Australia was released in 2008 and is available for free download via the Productivity Commission's website. See: www.pc.gov.au/research/supporting/part-time-employment.

The report *Too old to work, too young to retire* overviews seniors in the workforce, providing insight to their experiences, vulnerabilities and future aspirations. For further information on research around age discrimination in the workplace, and the laws in place to prevent this, see the *Willing to Work* report by the Australian Human Rights Commission.

4.4 Working for free—volunteers in Australia

Australians have a long history of volunteering across many aspects of community life. Volunteers provide an irreplaceable service to the community. Volunteering benefits both the economy and the health and wellbeing of volunteers. In 2012–13, the estimated value of voluntary work in not-for-profit organisations was equivalent to $17 billion (ABS 2015a). Organisations report that volunteers bring new insights, enhance the image of the organisation, increase the efficiencies and volume of operations, and improve effectiveness; volunteering also broadens the networks and professional skills of the volunteers themselves (PwC 2016). Many report that volunteering makes them happier, and provides them with a sense of personal satisfaction, which has flow-on health benefits.

Fewer people are volunteering

The Australian Bureau of Statistics (ABS) General Social Survey (GSS) defines a volunteer as 'someone who is over the age of 15 and, in the previous 12 months, willingly gave unpaid help, in the form of time, service or skills, through an organisation or group' (ABS 2015a). Informal volunteering, such as the care provided by informal carers, is not included under this definition (for information on informal carers, see Chapter 8.3 'Informal carers').

Data from the GSS show that, in 2014:

- an estimated 5.8 million people aged 15 and over (or 31% of the population) participated in voluntary work
- an estimated 748 million hours of voluntary work were provided (or an average of 128 hours per volunteer)
- sport and physical recreation (31%) was the most common type of organisation for which people volunteered
- fundraising or sales (23%) was the most common type of voluntary work undertaken
- the proportion of the population who volunteered was lower than in previous years, and the change between 2010 and 2014 was statistically significant (Figure 4.4.1; ABS 2015b).

Australia's volunteer rate fell for the first time in 2014 after several years on the increase. Yet, it is still above the Organisation for Economic Co-operation and Development (OECD) average. In 2012, the volunteer rate for working-age people (aged 15–64) in Australia was 40%, compared with the OECD average of 34% (OECD 2016). Nevertheless, the decline in the rate of volunteering is concerning as it has links to the economy and health, is thought to be an indicator of wellbeing (for example, by building social connections) and is often highlighted by the World Health Organization as contributing to an age-friendly world (WHO 2015).

Source: ABS 2015b.

Figure 4.4.1: Proportion of people aged 15 and over who undertook unpaid voluntary work in the last 12 months, by sex, 2006, 2010 and 2014

Who volunteers?

In 2014, volunteering was highest among:

- people born in Australia (34%), compared with people born overseas (26%)
- females—who made up 54% of all volunteers
- young people aged 15–17 (42%), followed by people aged 35–44 (39%) and 65–74 (35%)
- people living in *Outer regional* and *Remote* areas (39%), compared with people living in *Major cities* (30%)
- people working part time (38%), followed by people who were unemployed (31%) and people working full time (30%)
- people with a Bachelor degree or above (41%), compared with people without a non-school qualification (25%)
- people living in households in the highest gross household income quintile (39%), compared with people living in the lowest (23%).

(ABS 2015b)

Helping—the main reason to volunteer

According to the GSS, in 2014, helping others and helping the community was the most commonly reported reason for volunteering (64%), followed by personal satisfaction (57%), to do something worthwhile (54%), and personal or family involvement (45%) (ABS 2015a). Around one-third of volunteers reported the reason for being a volunteer was for the social contact (37%), and to use their skills or experience (31%).

What is missing from the picture?

Aboriginal and Torres Strait Islander communities and people from a non-English speaking background undertake large amounts of informal volunteering. As most definitions of volunteering explicitly exclude less structured and informal volunteering, these groups of people are often under-represented in national rates of volunteering. For a deeper understanding of volunteering among these groups, see the report *Giving and volunteering in culturally and linguistically diverse and Indigenous communities*.

Rates of volunteering appear to be in decline. Data on why this is occurring—such as societal factors (including changes in work patterns and living arrangements)—and on the impacts on society (for example, on trust and social cohesion) are not readily available. The associated implications for organisations that rely on volunteers are also unknown. Understanding the demand for, or potential undersupply of, volunteers is hindered by the unavailability of reliable data.

Where do I go for more information?

Information about volunteers in this snapshot is sourced from the ABS General Social Survey.

An entire chapter was dedicated to volunteering in the 2015 edition of the OECD's biennial publication *How's Life?*, which summarises a range of data measuring wellbeing.

See also Chapter 9.2 'Indicators of *Australia's welfare*'.

Chapter 5

Ageing and aged care

5.0 Introduction

Australia's population profile is changing: we are living longer than ever before. As a result, older Australians now make up a greater proportion of the total population. In 2017, an estimated 3.8 million Australians (15% of the population) are aged 65 and over compared with 2.2 million (13%) in 2007.

This chapter looks at two of the key issues facing older Australians: aged care and dementia.

Many older people are choosing to stay in their home for longer. The clear majority can live independently in households, with or without support. In 2015, only 5.2% of older people lived in cared accommodation, such as nursing homes and aged care hostels.

One in 4 older people aged 65 and over lives alone. Living alone is generally seen as a risk factor for social isolation—a condition that can affect health and wellbeing. Yet, there seems to be minimal differences in social participation between older people who live alone and older people who live with others.

Almost 40% of older people aged 65 and over need help with at least one activity, such as mobility, communication, health care or property maintenance. As might be expected, the older people are, the more likely they are to need help. This assistance may be given informally by family members, friends and neighbours, or formally by a service or organisation. Spouses and partners provide the most informal help for older Australians.

Dementia is a substantial challenge to Australia, particularly as the population continues to age. While it is not caused by age, dementia does primarily affect older people. It is difficult to determine the exact number of people with dementia as there are no national data on how many people are diagnosed. However, estimates suggest that in 2017, around 365,000 Australians had dementia, 99% of whom were aged 60 and over. This number of people affected by dementia is projected to rise considerably, to 900,000 people by 2050.

According to the Australian Bureau of Statistics Survey of Disability, Ageing and Carers (SDAC), around half of people with dementia lived in cared accommodation (such as residential aged care facilities and hospitals, as well as group homes). The other half lived in households (such as private dwellings and self-care units within retirement villages).

Almost all people with dementia have a disability. The majority (95%) of people living in cared accommodation always needed help with at least one core activity (mobility, self-care or communication) compared with 56% of people living in households.

5.1 Ageing and aged care

Australia's older generation are generally classified as people aged 65 and over; that is, people born before 1952. They are commonly called the 'baby boomer generation' or 'baby boomers'. The expectations of baby boomers about the type of aged care they want, and their right to choose, are changing, with many preferring to remain in their home for longer (Productivity Commission 2011).

In 2017, there were an estimated 3.8 million older Australians (equivalent to 15% of the population), an increase from 2.2 million people (13% of the population) 10 years earlier (ABS 2013, 2014). Very old Australians (aged 85 and over) accounted for 2.0% of the population in 2017, with this proportion projected to increase to 4.4% by 2057 (ABS 2013). The increasing number of older people and the changing characteristics of the ageing population are associated with a range of issues. These include the implications for high-level aged care; a need for policies and services that respond to the needs of this population and support healthy, positive ageing; and the potential for social isolation and elder abuse.

1 in 4 older people live alone

In 2015, the vast majority (95%) of older people lived in households, with the remainder (5.2%) living in cared accommodation, such as residential aged care facilities (ABS 2016). More than one-quarter (27%) of older people living in households lived alone and this proportion is projected to remain about the same through to 2036 (ABS 2015). Women were more likely to live alone than men (35% compared with 18%).

Living alone is generally considered to be a risk factor for social isolation (see Box 5.1.1). However, data from the 2015 Australian Bureau of Statistics (ABS) Survey of Disability, Ageing and Carers showed minimal differences overall in social participation between older people who lived alone and people who lived with others. One important sign of social and community participation is contact with family and friends. In 2015:

- 88% of older people who lived alone were visited at home by friends or family in the last 3 months, a slightly lower proportion than for people who lived with others (92%)
- older men who lived alone were less likely to have been visited by family or friends (83%) in the last 3 months than were older men who lived with others (91%); there was little difference between women who lived alone and women who lived with others (91% and 92%, respectively)
- the proportion of older people who went out to visit friends and family in the last 3 months differed little between older people who lived alone (84%) and older people who lived with others (86%).

Box 5.1.1: Social isolation

Social isolation is seen as the objective state of having minimal contact with others; it differs from loneliness, which is a subjective state of negative feelings associated with having a lower level of contact than desired (Wenger et al. 1996). Some recent definitions embed the construct of loneliness within social isolation (Hawthorne 2006), but others argue they are conceptually distinct. Regardless, research has found that social isolation is associated with increased mortality (Steptoe et al. 2013), as well as with poorer health behaviours (smoking and physical inactivity) and biological effects (high blood pressure and inflammation) (Shanker et al. 2011).

Older people are at an increased risk of social isolation due to a number of environmental factors, primarily the loss of physical or mental capacity or the loss of friends and family members (WHO 2016). It is estimated that around 1 in 5 (19%) older Australians are socially isolated, with the highest rates occurring in the largest urban regions and in sparsely populated states and territories (Beer et al. 2016).

Informal providers—the main form of support

Almost 40% of older people aged 65 and over needed assistance with at least one activity in 2015 (ABS 2016). The need for assistance increased with age, from 22% of people aged 65–69 to 89% of people aged 90 and over. Activities with the highest reported need for assistance included:

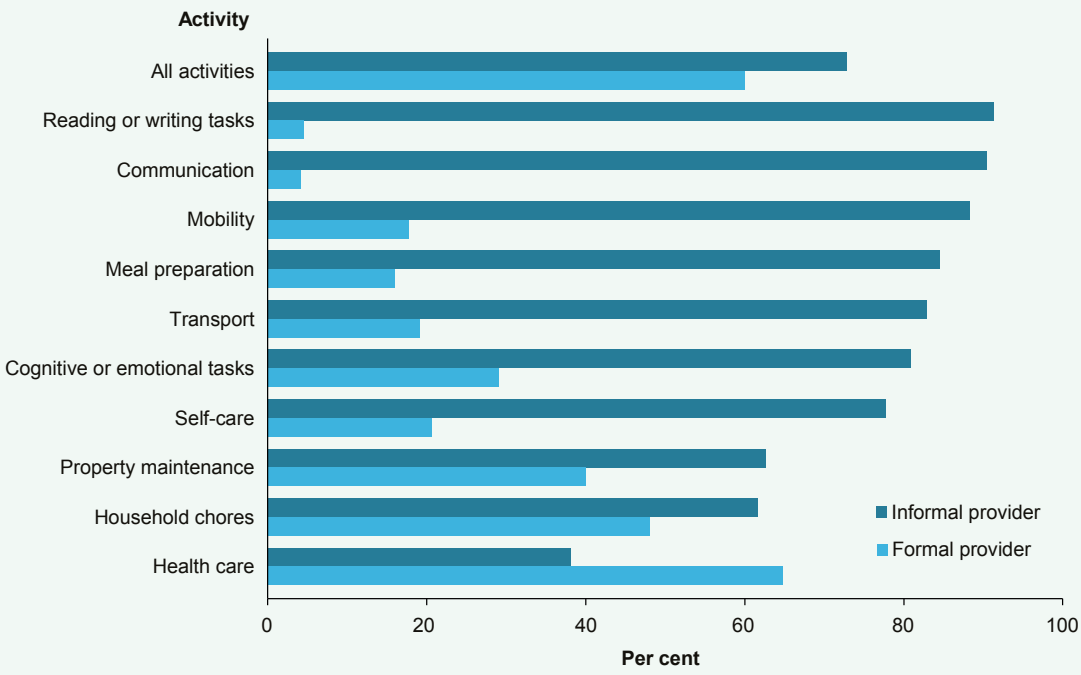
- personal activities (27%)—such as self-care, mobility, communication, cognitive or emotional tasks, and health care
- property maintenance (20%).

The most common types of personal activities for which older people needed assistance were:

- health care (23%)
- mobility (16%)
- self-care (12%).

Both formal and informal providers assist people who live in households. Informal providers are family, friends, neighbours or others who provide help but are not attached to an organisation. Formal providers provide regular paid help and work for an organisation. More than one type of provider may assist older people. Overall, in 2015, 73% of older people who needed assistance were helped by an informal provider, and 60% by a formal provider (ABS 2016). There were some notable differences between the type of activity for which assistance was needed and the provider type (Figure 5.1.1):

- informal providers predominately helped with communication and with reading or writing tasks (more than 90% for each activity)
- health care was the only activity where the majority of care was delivered by formal providers (65%)
- household chores had the most even split between support by informal and formal providers (62% and 48%, respectively).



Source: ABS 2016.

Figure 5.1.1: Australians aged 65 and over living in households who needed assistance, by activity type and provider type, 2015

Spouses and partners provided informal assistance to more than one-third (35%) of all older Australians needing assistance and close to half (48%) of older Australians who received support from an informal provider (ABS 2016). Children were the second most common informal providers for people who needed assistance (21% were daughters and 18% sons).

How many people receive aged care services?

Aged care is currently provided to older people through three main programs:

- the Commonwealth Home Support Programme (CHSP)—provides entry-level support services (such as transport, assistance with food preparation and meals, and personal care) to help older people remain independent and in their homes and communities for longer
- the Home Care Packages Program—offers packages of services at four levels of care to enable people to live at home for as long as possible, with care needs (including clinical services) increasing incrementally for each level of care
- residential aged care—provides a range of care options and accommodation on a permanent or respite basis for older people who are unable to continue living independently in their own homes.

As well as the mainstream programs, flexible care programs provide care for special groups or circumstances in mixed settings. Transition Care is the largest of these, providing support for older people to return home after a hospitalisation.

The use of aged care services is often seen as a progression—from low-level or temporary care to high-level, permanent care; however, this is not necessarily the case. Some people may never use aged care services; if they do, their progression through the care system is not necessarily linear and they may enter at any level.

Aged care is increasingly being provided through community-based programs to support people to remain living at home for longer. In 2015–16, many more people used one of the community-based aged care programs than residential aged care (Table 5.1.1). Some people used more than one program during the year; for example, more than half (52%) of the people who used respite residential aged care during 2015–16 later entered permanent care (DoH 2016).

Table 5.1.1: Number of people accessing aged care programs, by program type, 2015–16

Aged care program	Persons
Commonwealth Home Support Program	640,000
Home and Community Care[(a)]	285,400
Home Care Packages Program	88,900
Residential aged care	
Permanent	235,000
Respite	56,900
Transition Care	24,700

(a) The CHSP was launched in July 2015, incorporating Home and Community Care Program (HACC) and a number of smaller programs. In 2015–16, Western Australia and Victoria had not yet transitioned to CHSP and, in these states, support services to assist people to continue living independently at home were provided under HACC.

Source: DoH 2016.

Elder abuse

Older people who rely on others to help them with their needs may be susceptible to elder abuse. The World Health Organization (WHO) defines elder abuse as 'a single or repeated act, or lack of appropriate action, occurring within any relationship where there is an expectation of trust, which causes harm or distress to an older person' (WHO 2016). Elder abuse can have physical outcomes—death, psychological effects and an increased risk of hospitalisation or residential aged care admission.

The rates of elder abuse in high to middle income countries, as estimated by the WHO, range from 2.0% to 14%, with the most common form of abuse being financial (1.0% to 9.2%) (WHO 2015). Other forms of abuse include neglect, and physical, sexual and psychological abuse. Victims are more likely to be women, have a physical or mental disability, and be care dependent and socially isolated. Rates of abuse may be higher for older people living in institutions than in the community (WHO 2016).

Currently, little data are available on elder abuse in Australia (see 'What is missing from the picture?'). The ageing of the Australian population suggests that the potential for elder abuse may increase in coming years. This makes the need for reliable and nationally standardised data increasingly important in order to measure and monitor progress in this area.

What is missing from the picture?

Individually, many data collections gather information on older Australians and how they use particular services, such as those offered through the aged care or health systems. However, the interactions between these systems are poorly captured—identifying individual people's movements between aged care and hospital, for example, requires data linkage. Such linkage has previously been carried out as part of the AIHW's Pathways in Aged Care (PIAC) work, and could be repeated. For general information on data linkage, see Chapter 1.7 'Understanding health and welfare data'.

Data on the use of aged care by Aboriginal and Torres Strait Islander people may be an underestimation of the true number using aged care programs as Indigenous status may not be accurately collected or people may choose not to identify as Indigenous. For information on the use of aged care services by Indigenous Australians, see Chapter 7.6 'Use of disability and aged care services by Indigenous Australians'.

Data on elder abuse in Australia—including its prevalence, the type of abuse, who carried out the abuse, and in what context or setting abuse may be more likely to occur—are currently not comprehensively collected or reported. Some data are collected in surveys (for example, the ABS Personal Safety Survey) and there is limited mandatory reporting of some forms of elder abuse in residential aged care (in relation to suspected, alleged or witnessed assaults). But there are no data collected for other aged care services (such as community-based aged care programs), and the extent of elder abuse that occurs at home is largely unknown.

An inquiry for the Australian Law Reform Commission (ALRC) on elder abuse was announced in early 2016, with the report *Elder Abuse—A National Legal Response* tabled in June 2017. The report includes 43 recommendations for law reform, with the aim to safeguard older people from abuse. As part of these, the ALRC recommends building the evidence base for elder abuse through a national prevalence study, including the development of standardised measures of elder abuse for consistent data collection (ALRC 2017).

Where do I go for more information?

More information on how ageing affects a person's life and experiences is available in the most recent (2015) ABS Survey of Disability, Ageing and Carers.

For a more detailed analysis of the aged care sector and characteristics of people in aged care, visit the GEN website gen-agedcaredata.gov.au. Previous publications using PIAC, which links data from a number of aged care programs, are also available on this website.

More information on aged care services is available on the My Aged Care website.

The Australian Institute of Family Studies published the research report, *Elder abuse: Understanding issues, frameworks and responses*, which provides insight into elder abuse in the Australian context.

5.2 Dementia and people's need for help from others

Dementia is not a specific disease. Rather, it is a group of conditions characterised by the gradual impairment of brain function. It commonly affects people's ability to think, remember and reason—and their personality—and impairs other core brain functions, such as language and movement. The condition is degenerative and irreversible. Dementia is the second most common underlying cause of death and it contributes to Australia's burden of disease through years of life lost from death and disability. In 2014, it was the leading underlying cause of death for 12,000 people, with an estimated 33 people dying from dementia each day. People may also die with dementia; it was recorded as an associated cause of death for a further 35,600 deaths in 2014. In 2011, it accounted for 3.4% of the overall burden of disease, and was the leading cause of total burden for females aged 85 and over.

Dementia is a substantial challenge to Australia's care systems, particularly as the population continues to age. While it is not caused by age—and should not be considered as an inevitable consequence of ageing—dementia does primarily affect older people. The AIHW report *Dementia in Australia* indicates that only 1.3% of the estimated 365,000 people with dementia in Australia in 2017 were aged under 60. The number of people affected by dementia is estimated to rise considerably, to 900,000 people by 2050.

People's health generally declines as dementia progresses; they increasingly need help from others, including informal carers and aged care services. Often, as the impacts of dementia worsen, the increasing burden on informal carers such as family members influences care decisions, such as whether to move to residential aged care or stay at home. It is expected that greater numbers of older people in Australia will choose to stay at home for longer (see Chapter 5.1 'Ageing and aged care'). Hence, it will be increasingly important to ensure that informal carers are adequately supported and that people receive an appropriate level of formal care at home. It is similarly important to ensure that people within residential aged care receive care that is appropriate to their needs.

This article focuses on how dementia affects people's functional ability and their need for assistance and how these factors differ, not only between people with dementia in cared accommodation (commonly permanent residential aged care) and people who still live at home, but also between people with and without dementia in permanent residential aged care.

People with dementia

The Australian Bureau of Statistics Survey of Disability, Ageing and Carers (SDAC) estimated that there were more than 194,000 people with dementia in Australia in 2015 (ABS 2016b). This estimate is lower than that produced by the AIHW for the report *Dementia in Australia*. While the SDAC criteria were broadened in 2015 to better identify people with dementia (ABS 2016a), the survey primarily collects information from the perspective of disability and impairment and it may underestimate the prevalence of dementia in the population; for more information, see 'What is missing from the picture?'.

Based on AIHW analyses of the 2015 SDAC, just over half (51%) of people with dementia lived in households (such as private dwellings and self-care units within retirement villages), with the remaining 49% living in cared accommodation (such as residential aged care facilities, hospitals and other institutions that provide care, as well as group homes) (ABS 2016b).

In 2015, people living with dementia in cared accommodation were more likely to be:

- older (62% were aged 85 and over, compared with 28% of people with dementia living in households—the average age of a person with dementia in cared accommodation was 85.3, compared with 77.9 for households)
- women (70%, compared with 53% for men)
- widowed (59%, compared with 29%. This varied further by sex—70% of women living in cared accommodation were widowed, compared with 32% of men) (ABS 2016b).

Overall, people with dementia in cared accommodation were more likely to indicate restrictions in line with common dementia symptoms than people living in households. These included memory problems or confusion (86%, compared with 68% in households), social or behavioural issues (67%, compared with 18%) and partial or complete loss of speech (52%, compared with 9.3%) (ABS 2016b).

Almost all people with dementia identified by the survey had a disability (99% of people with dementia living in cared accommodation, and 94% of people with dementia living in households). As might be expected, the likelihood of needing assistance with core activities was greater for people with dementia living in cared accommodation: 95% of these people always needed assistance with at least one core activity (mobility, self-care or communication) and 16% with all three, compared with 56% and 7.8%, respectively, for people with dementia living in households (ABS 2016b).

Dementia in permanent residential aged care

After people enter permanent residential aged care, their care needs are assessed using the Aged Care Funding Instrument (ACFI). This tool is not a comprehensive assessment, but it does provide some information on people's care needs as they relate to service provision in residential aged care. People are assessed on 12 items that measure care needs on three broad domains—activities of daily living, behaviour, and complex health care.

Almost 92,000 people with dementia were living in permanent residential aged care as at 30 June 2016 (representing 52% of the total). People with dementia were more likely to be rated as requiring a 'high' level of assistance on all three domains (42%, compared with 23% of people without dementia). For many specific items, the differences were even greater (Table 5.2.1).

Table 5.2.1: Proportion of people in permanent residential aged care with/without dementia who were assessed as being most dependent, by ACFI domain[(a)] and individual item[(b)], as at 30 June 2016

	ACFI domain/item	With dementia (%)	Without dementia (%)
	Activities of daily living	**63**	**48**
	Nutrition	26	9
	Mobility	61	56
	Personal hygiene	90	76
	Toileting	77	63
	Continence	86	70
	Behaviour	**80**	**43**
	Cognitive skills	46	9
	Wandering	16	5
	Verbal behaviours	65	50
	Physical behaviours	53	32
	Symptoms of depression[(c)]	14	18
	Complex health care	**61**	**61**
	Taking medications	45	44
	Health-care procedures and activities	33	35

(a) Proportion of people who received the highest rating (H, or high) on a domain based on the ratings on the underlying individual items.

(b) Proportion of people who received the highest rating (D, or most dependent) on an individual item relating to day-to-day care needs (defined by need for assistance, frequency, or degree of impairment/inference in function, as relevant to item).

(c) Fewer than 1 in 6 people were assessed as showing symptoms of depression that caused major interference with their ability to function and participate in activities. However, ACFI data also showed that 2 in 5 (42%) people with dementia had been diagnosed with depression, and slightly more than half (51%) of people without dementia.

Source: AIHW analysis of ACFI data.

Further information on health conditions that affect people's care needs in permanent residential aged care is also available through information collected via the ACFI.

What is missing from the picture?

It can be difficult to determine the exact number of people with dementia. There are no national data or population-based surveys with diagnostic criteria on dementia to identify how many people are diagnosed with dementia—and diagnoses cannot be relied on to accurately capture the number of people with dementia, as the condition may go unrecognised (particularly in its early stages).

Some data on people with dementia are available from administrative data sources, such as those relating to deaths, hospitalisations, aged care assessments and pharmaceutical prescriptions. Each of these sources provide some information on particular groups of people with dementia. However, people with dementia may not be reliably identified as they come into contact with various services; for example, data on how people with dementia use aged care outside of permanent residential aged care are not readily available, although this can be analysed in more detail using the Pathways in Aged Care (PIAC) linkage map. Data linkage could be used to improve our understanding of how different services are used by people with dementia, as well as to improve estimates of the number of people living with dementia in Australia.

Where do I go for more information?

More information about people with dementia is available at www.aihw.gov.au/dementia/, and the report *Dementia in Australia* is available for free download. Recent publications drawing on PIAC linkage work include information on how some people with dementia used aged care—to find out more about PIAC and other aged care data, see GEN.

Chapter 6

Housing and homelessness

6.0 Introduction

'Having a roof over one's head' is generally seen to be essential to the wellbeing of individuals and families. Access to housing is very important. It is just as important that this housing is safe, affordable and suitable for people's specific needs.

Each night in Australia, more than 105,000 Australians are homeless. They may be spending the night in supported accommodation for the homeless, sleeping in temporary accommodation, 'couch surfing', sleeping on the street, or living in severely crowded dwellings.

Homelessness can profoundly affect a person's mental and physical health, their education and employment opportunities, and their ability to participate fully in social and community life.

This chapter profiles homelessness and social housing in Australia, and examines the changing shape of housing and home ownership.

In 2015–16, homelessness agencies were supporting nearly 280,000 people—or 1 in 85 Australians. These agencies assist not only people who are homeless, but also people who are at risk of becoming homeless (this includes providing generic services to people facing housing crises). Six in 10 clients were female, 1 in 6 were children, and nearly one-third were under the age of 18.

Over the past 3 decades, home ownership rates have fallen in Australia, with younger people being particularly affected. Despite mortgage interest rates being substantially lower (on average) over the last 20 or so years, and the government incentives for first home buyers, the overall home ownership rate has fallen.

Between 1994–95 and 2013–14, the proportion of Australians who owned their home (with or without a mortgage) fell from 71% to 67%. The 2016 Census found similar trends. The pattern of home ownership also changed over this time. The proportion of Australians owning their home outright fell from 42% to 31%, while the proportion financing their purchase with a mortgage rose from 30% to 36%. People aged 25–34 had the steepest decline in home ownership rates over the period.

The gap between household income and house prices in Australia has widened over the past 3 decades, creating a barrier to home ownership for many. As a result, more people are renting. The proportion of Australians in private rental is higher than ever before, with 26% of the population renting in 2013–14 compared with 18% in 1994–95. Half of the estimated 1.3 million lower income rental households were in rental stress in 2013–14, as were 62% of lower income households renting in the private market.

Social housing programs that provide rental housing at below market rates are available for eligible Australians. The programs focus on low-income households in greatest need. These households include Aboriginal and Torres Strait Islander Australians, younger and older Australians, people with disability, people experiencing domestic and family violence, and the homeless. There were 394,000 households living in social housing at 30 June 2016. A further 195,000 were on the waiting list at June 2016.

6.1 Social housing

Social housing is eligible rental housing that is provided by government or non-government (including not-for-profit) organisations, at below market rates. The aim is to alleviate housing pressures. Having access to appropriate and secure housing that is affordable can limit the risk of low-to-moderate income Australians being socially excluded by factors such as homelessness, overcrowding and poor physical and mental health.

Social housing programs

In Australia, there is a range of social housing programs that fall under a regulated funding model (Box 6.1.1).

Box 6.1.1: Main social housing programs and funding, 2015–16

Public rental housing—This is the largest social housing program (Figure 6.1.1). It comprises publicly owned dwellings administered by state and territory governments. Rents are subsidised for eligible low-income tenants so that they generally pay no more than 30% of their gross income on rent.

State owned and managed Indigenous housing (SOMIH)—These dwellings, managed by state and territory governments, are aimed at low-to-moderate income households with at least one member who identifies as being an Aboriginal or Torres Strait Islander Australian (see also Chapter 7.1 'Community factors and Indigenous wellbeing').

Mainstream community housing—This is the second largest social housing program (Figure 6.1.1). Mainstream community housing is generally delivered by not-for-profit organisations to low-to-moderate income or special needs households. Community housing models vary across states and territories. Generally, state or territory governments provide community housing organisations with some assistance, be it direct funding or land and property.

Indigenous community housing—This housing is owned or managed by an Indigenous community housing organisation. These organisations may either directly manage the dwellings they own or sublease tenancy management services to the relevant state/territory housing authority or another organisation. This housing is made available to households with at least one Indigenous tenant (see also Chapter 7.1 'Community factors and Indigenous wellbeing').

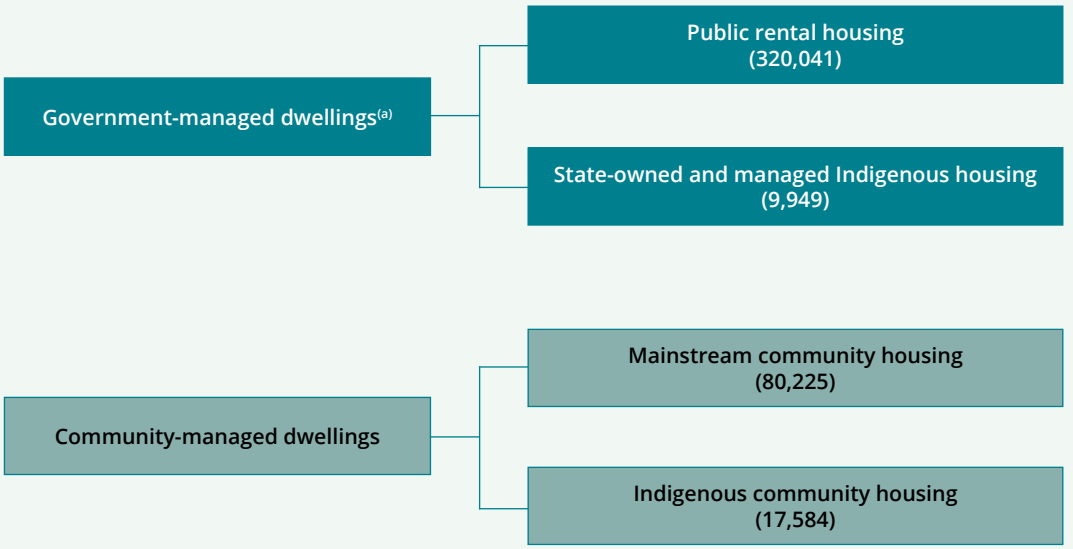
Commonwealth funding for social and affordable housing programs is provided via the National Affordable Housing Specific Purpose Payment and via National Partnerships between the Australian and state and territory governments.

Over the past decade, policy changes have seen a gradual shift in the social housing sector, from government-managed housing programs toward community-managed housing.

In the 9 years from 2007–08 to 2015–16, the total number of social housing dwellings has risen by 5.6% (or 22,800 dwellings) to 432,800:

- The largest rise has been in community-managed housing programs; specifically, for mainstream community housing, where dwelling numbers have more than doubled, from 36,000 to more than 80,000.
- In contrast, dwelling numbers have dropped in government-managed programs; specifically, for public rental housing, where dwellings dropped by nearly 18,000 to 320,000 dwellings.
- Although their numbers have dropped, public housing dwellings continue to make up the majority of social housing (75%) (Figure 6.1.1).

Although the total number of social housing dwellings has risen, this growth rate is not keeping pace with household growth. Therefore, the share of social housing is declining. Over the 9-year period, social share has gradually fallen from 5.1% to 4.7% (see also Chapter 6.3 'The changing shape of housing in Australia').



(a) Excluding government-managed NT remote public housing (5,046 dwellings).

Figure 6.1.1: Main social housing programs in Australia, by total number of dwellings, 30 June 2016

Social housing tenants

As at 30 June 2016, 394,000 households were living in social housing (public rental housing, SOMIH and mainstream community housing)—a 4.0% increase from 379,000 households in 2008. An estimated 845,000 tenants made up these households across Australia. Indigenous households made up 9.4%, or 29,293, of public rental housing households and 7.9%, or 5,377, of mainstream community households while SOMIH and Indigenous community housing programs were focused on Indigenous households.

Social housing tenant characteristics such as the age of the main tenant, main income source and living arrangements can vary across social housing programs (Table 6.1.1).

Table 6.1.1: Ongoing[a] social housing tenants, by selected housing program and selected characteristics, 30 June 2016

	Number of households (% change from 2008)	Sex[b] (%)		Age[b]	Living arrangement	Income
		Male	Female			
Public rental housing	312,000 (–6%)	37	63	54% older Australians (aged 55+)	54% living alone	29% disability support pension
SOMIH	9,700 (–22%)	24	76	64% aged 35–64	36% sole parent with dependent children	32% on other government payments[c]
Mainstream community housing	72,400 (+103%)	41	59	67% aged >45	59% living alone	n.a.

n.a. not available.

(a) 'Ongoing' means that the household's tenancy is not concluded.

(b) Excludes cases where sex or age were 'not stated' (less than 3% in each program).

(c) 'Other government payments' are government payments provided other than set government allowances, pensions or cash incomes.

Social housing has focused on low-income households in greatest need who can also have special needs. This includes Indigenous Australians, young and older Australians, people with disability, people experiencing domestic and family violence, and the homeless. Based on the proportion of newly assisted households in greatest need, these vulnerable households accounted for more than half of all newly housed tenants in the public rental housing, SOMIH and mainstream community housing programs in 2015–16.

The proportion of new public rental housing allocations provided to greatest need households increased from 36% in 2003–04 to 74% of newly allocated households in 2015–16. Over the same period, however, the total number of new public rental housing allocations reduced from 31,000 households to 20,500, in part due to a reduction in public rental housing dwelling stock (Figure 6.1.2).

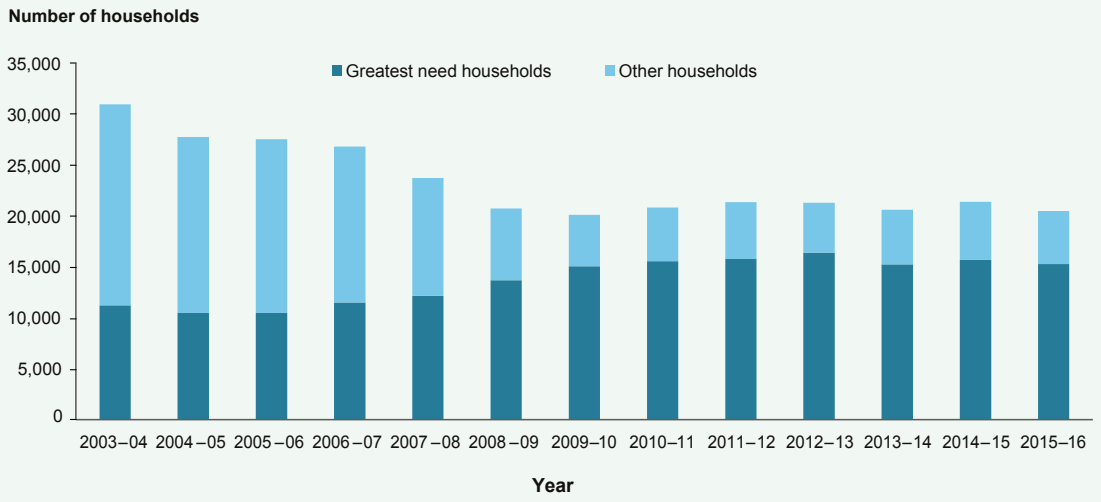


Figure 6.1.2: Number of newly assisted households in public rental housing in greatest need and other households, 2003–04 to 2015–16

Social housing wait lists and prioritisation

Demand for social housing is strong. As at 30 June 2016, there were around 195,000 households on social housing waiting lists. Both the waiting lists themselves, and the wait times for many households, are very long. As at 30 June 2016, 47% of households waiting for public housing had been doing so for more than 2 years. This excludes households considered to be in greatest need, who remain a priority for provision of housing assistance (see also Chapter 9.2 'Indicators of *Australia's welfare*').

Tenant satisfaction

Over time, social housing has been a stable form of tenure for vulnerable tenants. For the allocation of affordable housing to be considered successful, the dwelling must meet the needs of the household. In 2015–16, 2 in 5 (42%) public rental households and 1 in 3 (34%) SOMIH households had been in the same tenancy for over a decade. This low tenant turnover, together with ongoing demand for social housing, poses a challenge when bridging the gap between supply and demand.

The National Social Housing Survey presents a profile of social housing tenants and their satisfaction with services provided by their housing provider (see Box 6.1.2). In 2016, tenants living in mainstream community housing had higher levels of satisfaction (80%) than tenants in other social housing programs (73% for public rental housing and 68% for SOMIH).

Box 6.1.2: Social housing tenant satisfaction

Personal experiences of social housing vary among tenants. To record the influence of individual experiences on social housing satisfaction, the National Social Housing Survey documents tenant comments. These comments reflect both the benefits and the difficulties faced by tenants. Here are two:

> *I thank you for giving me a place when my world fell from under me.*
>
> *I have had several inspections over the years. I have holes in my floor which has* [sic] *been inspected at least 5 times by a housing inspector. No side and back fence. Window can't be open or closed due to termites. Fireplace still full of bricks and falling into lounge room for 6 years now, very dirty, holes in the wall.*
>
> 2014 National Social Housing Survey

What is missing from the picture?

To further support low-income Australians into stable housing, governments across Australia fund services to support people who are homeless or at risk of homelessness, known as Specialist Homelessness Services. Support from these service providers includes assisting social housing tenants to maintain their social housing tenure. More on these services is available through reports linked below and in Chapter 6.2 'Homelessness'.

Where do I go for more information?

For more information about housing assistance in Australia, see reports available online at www.aihw.gov.au/housing-assistance-publications/. The report *Housing assistance in Australia 2017*, the National Social Housing Survey: a summary of national results 2016, Specialist homelessness services 2015–16, and other recent publications are available for free download.

6.2 Homelessness

Homelessness can profoundly affect a person's health (mental and physical), their education and employment opportunities and their ability to participate fully in social and community life.

On Census night in 2011, more than 105,000 men, women and children in Australia were estimated to be homeless (see Glossary for a definition of 'homeless'). This figure included people who were in supported accommodation for the homeless, in temporary accommodation, in severely crowded dwellings (those requiring 4 or more extra bedrooms to accommodate them adequately) and people who were 'sleeping rough'. More than half of these people were male (56%). The majority were aged under 35 (60%, compared with 46% in the general population), 1 in 5 (20%) were in supported accommodation and about 1 in 15 (6.4%) were 'sleeping rough' (ABS 2012).

The rate of homelessness in 2011 was 48.9 people for every 10,000 population. This is an increase of 8.2%, from 45.2 people per 10,000 population in 2006. The estimated number of homeless Australians is expected to rise in the 2016 Census, as the enumeration strategy and methodology used will better capture this population.

Governments across Australia fund a range of services called specialist homelessness services (SHS) to support people who are homeless or at imminent risk of homelessness (Box 6.2.1).

Box 6.2.1: Specialist homelessness services

A number of factors can not only lead to homelessness, but become barriers to ending it. These include domestic violence, diagnosed mental health issues, drug and/or alcohol issues, and release from custodial settings (for example, an adult correctional facility, youth detention or correctional centres, and immigration centres). SHS are geared to meeting the particular needs of these clients.

This article provides an overview of the characteristics of people who access SHS, with more detailed analysis presented for people experiencing mental ill health and leaving custody, as captured by the Specialist Homelessness Services Collection.

Specialist homelessness services—These services are delivered by non-government organisations. They include agencies that specialise in delivering services for specific groups (such as young people, Indigenous people or people experiencing family and domestic violence). They also include agencies that provide more generic services to people facing housing crises. Currently, people experiencing family and domestic violence are the single biggest client group within the Collection (38% of all clients) (for more information, see Chapter 2.7 'Family, domestic and sexual violence').

Specialist Homelessness Services Collection—This national data collection, conducted by the AIHW, contains data collected by homelessness agencies funded under the National Affordable Housing Specific Purpose Payment and the National Partnership Agreement on Homelessness. These data include information on clients receiving the services, the assistance they requested and outcomes achieved. National data from 5 collection years are now available.

More than 800,000 Australians were supported by homelessness agencies between 2011–12 and 2015–16. In 2015–16 alone, 279,196 clients were supported, representing 1 in 85 Australians (1.2% of the total population).

Characteristics of clients

Age and sex

Of clients who sought assistance from homelessness services in 2015–16:

- 6 in 10 were female (59%, or almost 166,000)

- 1 in 6 were children under the age of 10 (16%, or nearly 46,000 clients); there were similar numbers of boys and girls

- nearly 3 in 10 clients were aged under 18 (28%, or nearly 79,000); about half were female (40,000)

- clients aged 25–34 made up the largest age group (19%); 7 in 10 (68%) were female

- about 12,000 older women (55 and over) sought services, a 52% increase since 2011–12

- most commonly, clients were living in single-parent families (34%) when they sought support.

Clients with a current mental health issue

The Australian Government's national approach to reducing homelessness identifies untreated mental health as one of the main pathways into homelessness, and has given priority to this vulnerable group (COAG 2009).

Specialist homelessness agencies support many people with mental health issues, providing a range of health, housing and general services. Clients with a current mental health issue (see Glossary for a definition of clients with a current mental health issue) make up the fastest growing client group in the SHS population. Increased rates of identification, greater community awareness and reduced stigma about mental health have all potentially driven the increase in self-identification and reporting of mental illness among SHS clients. On average, this client group has grown at a rate of 13% per year since 2011–12 (Table 6.2.1). The increase has been faster for females, growing at an average rate of 14% per year since 2011–12. The equivalent growth rate for males over this period was 11%.

The rate of service use by clients with a mental health issue has increased 50% in 5 years, from 20 people per 10,000 population in 2011–12 to 30 people in 2015–16.

Similar to the general SHS population, the majority of clients with a current mental health issue were female (58%) in 2015–16.

Table 6.2.1: SHS clients with a current mental health issue, 2011–12 to 2015–16

	2011–12	2012–13	2013–14	2014–15	2015–16
Number of clients	44,835	48,599	56,281	63,062	72,364
% of all clients	19.0	19.9	22.2	24.7	25.9
Rate (per 10,000 population)	20.1	21.4	24.3	26.9	30.4

Note: Rates are crude rates based on the Australian estimated resident population as at 30 June of the reference year.

Clients leaving custodial arrangements

People who leave custodial settings are seen to be at increased risk of homelessness and they are also less likely to exit homelessness (Johnson et al. 2015). Being able to secure stable housing may reduce the likelihood of their reoffending (Australian Government 2008).

The number of clients who had recently left custodial settings grew, on average, by 11% each year between 2011–12 and 2015–16 (Table 6.2.2). The growth rate is higher for females (15%) than males (10%). In part, at least, this rise is a response to programs that connect people leaving custody with SHS services. The vast majority of clients are leaving adult prisons (84% in 2015–16); another 15% left youth centres.

The rate of service use has also increased for people who have recently left custodial settings, from 2.3 people per 10,000 population in 2011–12 to 3.3 people in 2015–16. However, despite increasing rates of service use, fewer clients in this group are receiving accommodation than before (45% in 2011–12 and 38% in 2015–16). As well, people who are given accommodation stay fewer nights. (The median nights of accommodation per client has fallen from 31 in 2011–12 to 26 in 2015–16.)

The majority of clients who had recently left custodial settings in 2015–16 were male (77%), with most males aged between 25 and 44 (58%).

Table 6.2.2: SHS clients leaving custodial arrangements, 2011–12 to 2015–16

	2011–12	2012–13	2013–14	2014–15	2015–16
Number of clients	5,132	6,399	6,756	6,866	7,804
% of all clients	2.2	2.6	2.7	2.7	2.8
Indigenous (%)	24	23	23	25	27
Rate (per 10,000 population)	2.3	2.8	2.9	2.9	3.3

Notes

1. Rates are crude rates based on the Australian estimated resident population as at 30 June of the reference year.
2. Indigenous proportions include only clients where Indigenous status is known, and consent given. About 10% of clients each year were excluded on these basis.

What is missing from the picture?

To help governments and homelessness service providers to better focus their delivery of services, more information is needed on pathways in and out of homelessness as well as on the longer term outcomes of service users. More information is also needed on individuals who use services across sectors. The AIHW is actively contributing to this knowledge and understanding of clients who use multiple services—such as drug and alcohol treatment services, as well as child protection services and youth justice—by carrying out data linkage projects.

Where do I go for more information?

For more information about SHS in Australia, see reports available online at: www.aihw.gov.au/homelessness-publications/. The report *Specialist homelessness services 2015–16* and other recent publications are available for free download.

6.3 The changing shape of housing in Australia

Housing, even in its simplest form, meets two basic human needs: shelter and security. Its influence on the welfare of households is substantial, affecting, for example, health and wellbeing, education, employment and social and community participation. So fundamental is housing that the right to it is recognised by a number of international agreements, including the Universal Declaration of Human Rights (article 25.1). Economically, buying a home is often the largest financial investment a household will make, and it provides a means of saving for millions of Australians. It is also a key source of voluntary retirement savings and financial security for a majority of age pension recipients. As well, housing is a vehicle for asset/wealth accumulation for a growing number of households and, relatively more recently, a growing number of investors.

The 'great Australian dream' of owning one's own home is slipping away for some groups of Australians. While aggregate home ownership rates (that is, households with or without a mortgage) have declined modestly in Australia over the past 20 years—from 71% in 1994–95 to 67% in 2013–14—there have been more dramatic falls for younger age groups and lower income groups, suggesting barriers for those groups wishing to buy (ABS 2015a).

The decline in home ownership has not been uniform. Underpinning the national decline is a widening disparity in ownership rates and trends across Australia. Data from the annual Australian household-based panel survey show that since 2001 the largest fall in home ownership rates has been in Victoria (7.8 percentage point decline to 66%) followed by New South Wales (4.3 percentage points) and South Australia (2.5 percentage points), with little net change in Queensland and Western Australia (Melbourne Institute of Applied Economic and Social Research 2016). Globally, the aggregate home ownership rate in Australia ranks twenty-ninth among the 35 countries in the Organisation for Economic Co-operation and Development (OECD).

Since 1945, Australians have enjoyed high rates of home ownership and relatively low housing costs. In the past few decades, however, housing trends in Australia have changed:

- High home ownership rates have been threatened as house price increases have outpaced rises in household incomes.
- Australia has experienced declining housing affordability (both rental and purchase affordability). Affordability issues are particularly affecting younger generations and lower income groups. With these groups having limited opportunities to become home owners, this trend threatens to widen economic inequalities between owners and renters and destabilise wealth transfer between generations.
- Levels of exit from ownership are higher for someone entering home ownership in 2001–10 than for someone who entered it before 2001 (Wood et al. 2013). It is estimated that 1 in 5 (22%) Australians exited home ownership in the decade to 2010, with one-third of these people never re-entering it.

- The focus in providing direct housing and housing assistance has shifted—from lower income working families to the most vulnerable in society, such as people living with disability or experiencing domestic and family violence. The proportion of newly assisted households in greatest need more than doubled in the 12 years to 2015–16 (to 74% in public housing and 56% in state owned and managed Indigenous housing).

These trends have created policy challenges for governments of all levels. Exits from home ownership, as well as delayed and reduced rates of entry across the life course, threaten the high levels of home ownership on which Australian retirement incomes policy is based. This has the potential to place increasing demand on housing assistance, particularly on the Commonwealth Rent Assistance (CRA) scheme (Wood et al. 2013).

Further, Australia's retirement policy is largely based on low housing costs in older age. With fewer Australians tending to own their house outright at retirement, this increases pressure on the welfare system, as a greater proportion of superannuation money will be spent on housing costs. Where increasing numbers of people entering retirement are potentially reliant on social housing or private rental (as a result of their inability to own their own home), costs to government could be reasonably expected to escalate.

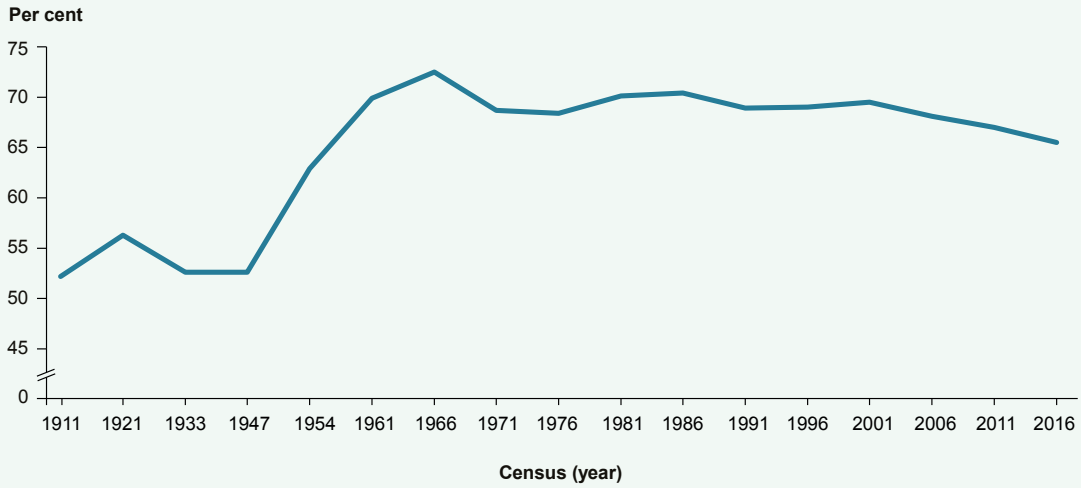
Home ownership and changing trends in housing tenure

Home ownership rates in Australia rose substantially after World War II (Figure 6.3.1). In part, this can be attributed to government policies that promoted home ownership, improving housing affordability and increasing supply, together with rapidly growing household incomes and the lifting of constraints on housing finance.

While aggregate home ownership rates have remained stable in Australia since the mid-1960s, the rates of home ownership for different age cohorts have varied markedly. This variation has been driven by substantial changes in the factors influencing the housing market over the past 20 or so years. For example, until the early 1990s, growth in the housing stock increased at a faster rate than the population. However, in 2011, the shortage of housing, relative to the underlying demand for it, was estimated at 228,000 dwellings (NHSC 2012).

Over this 20 or so year period, steady population growth, combined with other demographic changes—the growth of single-person and single-parent households (for example, as a result of more family breakdowns, and a decline in marriage rates), declining average family size, and an ageing population—placed upward pressure on dwelling stock.

Despite mortgage interest rates being substantially lower, on average, over the last 20 or so years and the government incentives to first home buyers, the overall home ownership rate has declined by 6 percentage points to 66% (Census 2016), its lowest figure since the 1954 Census (Figure 6.3.1).



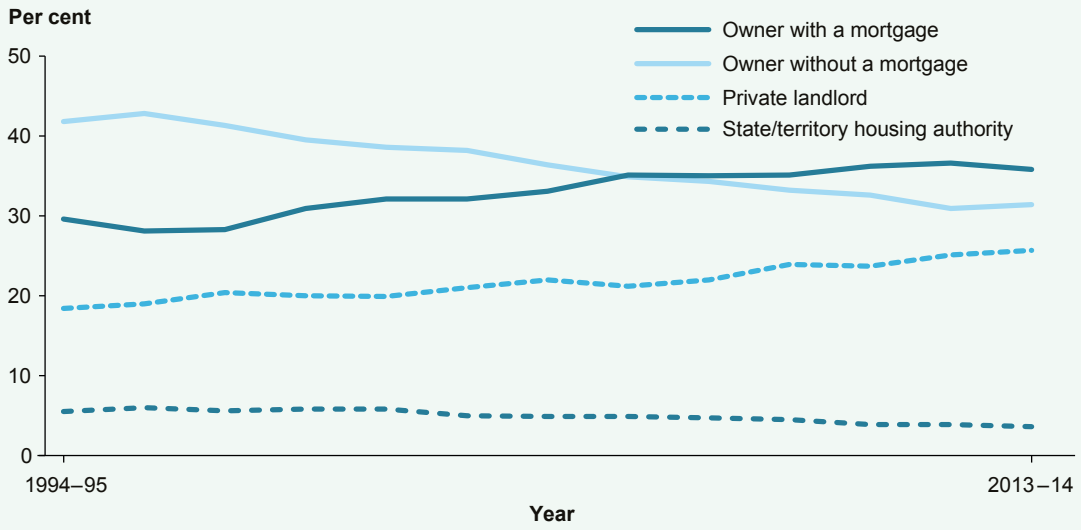
Notes

1. Percentages are of occupied private dwellings, excluding those for which tenure is not stated.
2. Censuses were conducted irregularly until 1961.

Source: ABS Censuses, as charted by Eslake 2013.

Figure 6.3.1: Australian home ownership rates at Censuses, 1911 to 2016

Over the past 20 years, there has also been a major shift in home ownership trends across Australia (Figure 6.3.2). Nationally, the proportion of home owners without a mortgage has continued to fall, while the proportion of renters has increased.



Note: Excludes 'Renter–other landlord type' and 'Other tenure type', which were steady at around 1.5% and 2.5%, respectively.

Source: ABS 2015a.

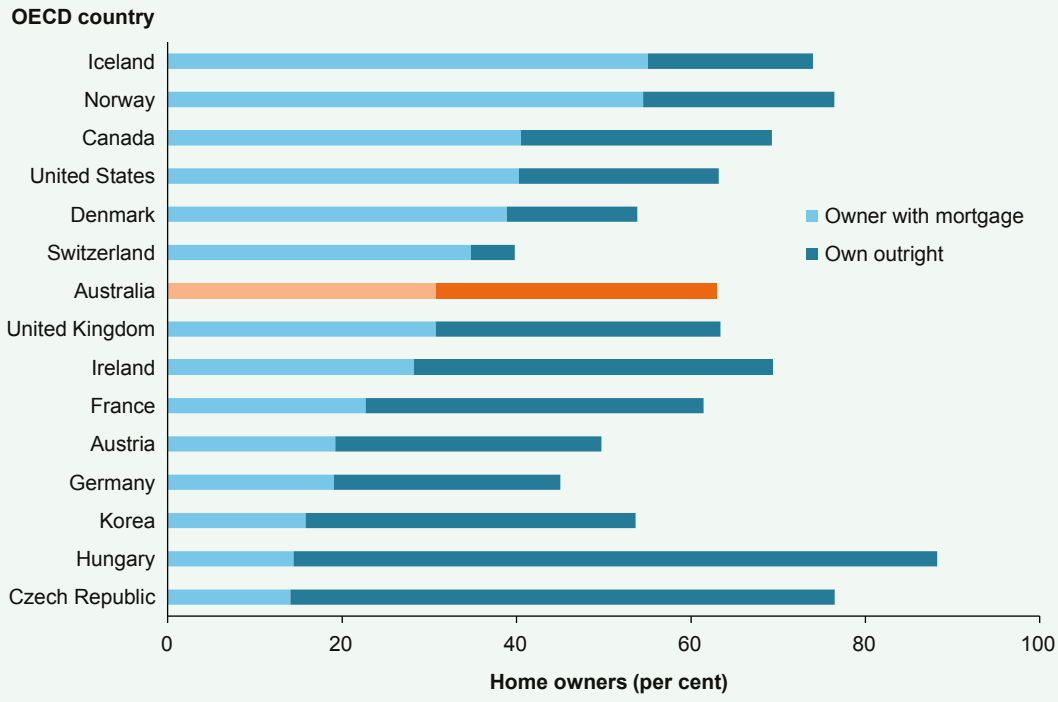
Figure 6.3.2: Changes in housing tenure in Australia, 1994–95 to 2013–14

Between 1994–95 and 2013–14, the proportion of Australians who owned their home outright fell from 42% to 31%. Over the same period, more home owners financed their purchase with a mortgage (increasing from 30% to 36%).

Australians are renting in greater proportions than 2 decades ago. The private market has seen the greatest increase in renter numbers, up 7 percentage points to 26% over 20 years. In contrast, state/territory housing authorities are contributing fewer rental properties in the market, down 1.9 percentage points to 3.6%.

Global trends in home ownership rates

Home ownership is still the most common tenure type in Australia, as it is in many other OECD countries (Figure 6.3.3). However, home ownership rates have tended to increase in many OECD countries over recent decades, unlike the Australian experience (Andrews & Sánchez 2011). Contributing to this trend overseas, at least in part, are changes in the characteristics of households (including population ageing, household structure, and income and education) and policy influences, such as mortgage market innovations (including the relaxation of deposit constraints, increasing home ownership rates among lower income households, and tax reliefs on mortgage debt financing) (Andrews & Sánchez 2011).



Notes

1. Year of collection and method of collection varies across countries and may affect comparisons. Data for Australia are sourced from the Household, Income and Labour Dynamics Survey 2014.
2. Percentage of renter (private and subsidised) and 'Other, unknown' not shown.

Source: OECD 2017b.

Figure 6.3.3: Home ownership distribution in selected OECD countries, 2014 or most recent year

While Australia ranks in the lowest quarter of OECD countries in terms of aggregate home ownership rates (twenty-ninth), it ranks in the top third for home owners with a mortgage (selected OECD countries are shown in Figure 6.3.3). It is similar to Ireland, Spain, Portugal, United Kingdom, Finland and Belgium at around 30%.

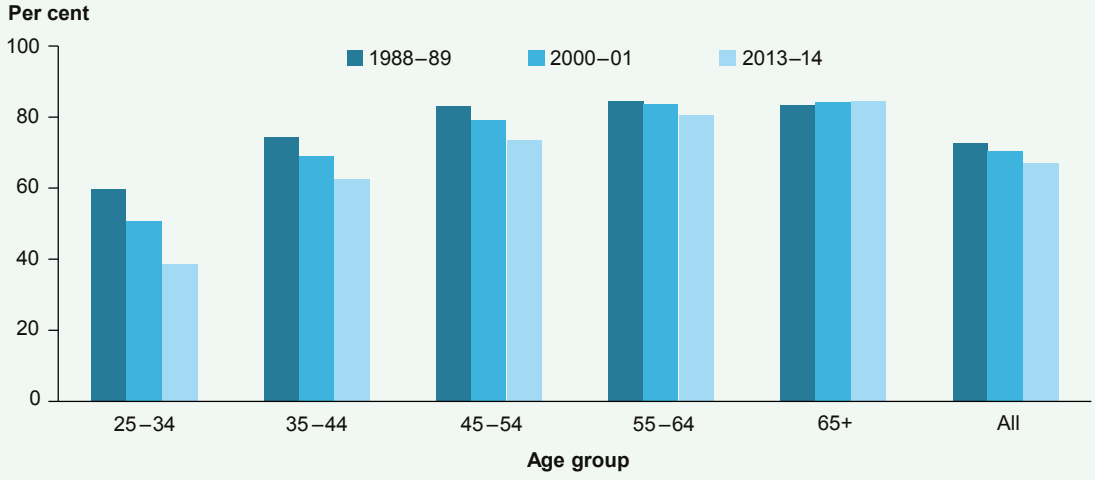
From an international perspective, national housing outcomes and policy challenges are contemporary issues. To help countries measure access to affordable housing and strengthen the knowledge base for policy evaluation, an online OECD Affordable Housing Database has been developed, with support from the European Union.

Home ownership across the generations, and changing housing careers

Housing careers can be thought of as the sequence of housing circumstances an individual or household occupies over their life (Beer et al. 2006). Research shows that Australia is experiencing generational change when it comes to home ownership, with younger households being principally affected by factors such as economic constraints, lifestyle choices and work–home preferences (Burke et al. 2014; Yates 2011).

The steepest decline in home ownership rates across the 25 years to 2013–14 has been for people aged 25–34 (Figure 6.3.4) (see Supplementary table S6.3.1). This is typically the age at which first transitions into home ownership are made. But, fewer and fewer people in this age group are entering home ownership, with a 21 percentage point decline to just 39% in 2013–14 (compared with 60% in 1988–89). Home ownership rates for people aged 35–44 also fell, but not so much (12 percentage points). People aged over 65 (the age of retirement) were the only age group to increase their rate of home ownership and, even then, the increase was marginal.

Census data from 2016 became available just prior to the release of this publication and confirm this trend of diminishing home ownership rates among younger Australians. From 2006 to 2016 Census data reveal the greatest declines in home ownership have been in the 25–34 and 35–44 year age groups (from 51% down to 45% and from 68% to 62%, respectively).

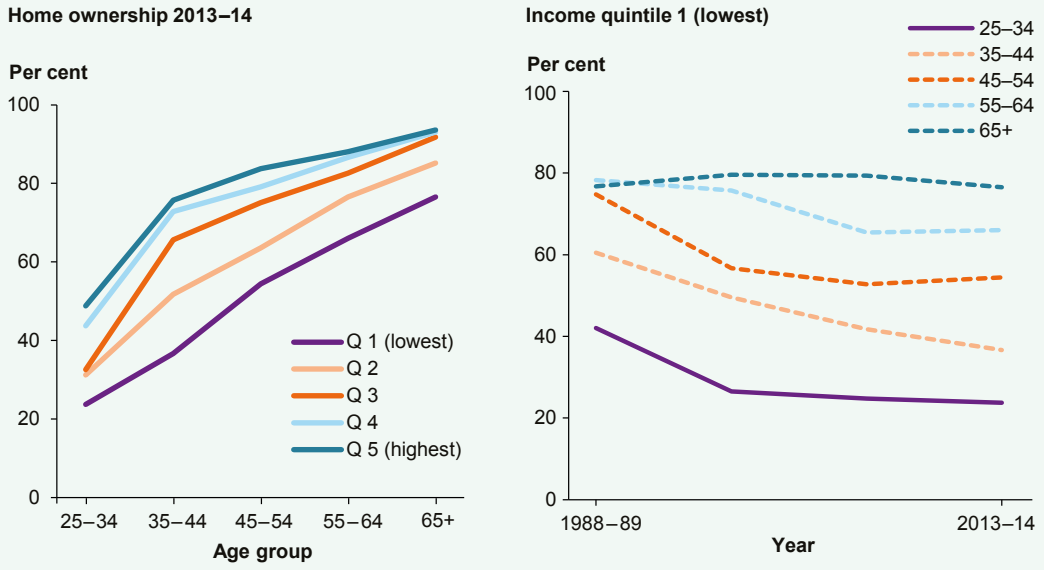


Sources: ABS 4130.0 Housing occupancy and costs 1988–89, 2000–01 and 2013–14.

Figure 6.3.4: Home ownership rates, by age group, 1988–89, 2000–01 and 2013–14

Consistent with a decline in ownership rates among younger Australians is evidence of first home buyers being older than they were a decade ago (ABS 2015a). In 2000–01, 61% of first home buyers were aged between 25–34; by 2013–14, this proportion had dropped to less than half (49.6%). At least in part, the financial impacts of higher education costs and compulsory superannuation contributions on younger generations have been implicated in their deferral into home ownership, as they save for a deposit in a market of increasing house prices (Burke et al. 2014; Yates 2011). In the absence of real income growth, the effect of increased house prices on the time taken to save for a deposit is significant, particularly in Sydney and Melbourne. Estimates reveal that since 2006, the average number of years required to save for a deposit in Sydney increased from 5 to 8 years and in Melbourne, 4 to 6 years (Australian Government 2017).

While lifestyle preferences and choices affect purchasing decisions across all age groups, constraints that strongly impede access of younger households are largely financial. These constraints include the price of dwellings themselves, deposit requirements, and access to mortgages. For each age group, home ownership rates increase notably with household income. Over the past 25 years, however, home ownership rates have declined more steeply for younger Australians earning the least (Figure 6.3.5).



Note: Equivalised disposable household income is household incomes that are adjusted to enable analysis of the relative wellbeing of households of different size and composition, using an equivalence scale.

Sources: ABS 4130.0 Housing occupancy and costs 1988–89, 2000–01, 2009–10 and 2013–14.

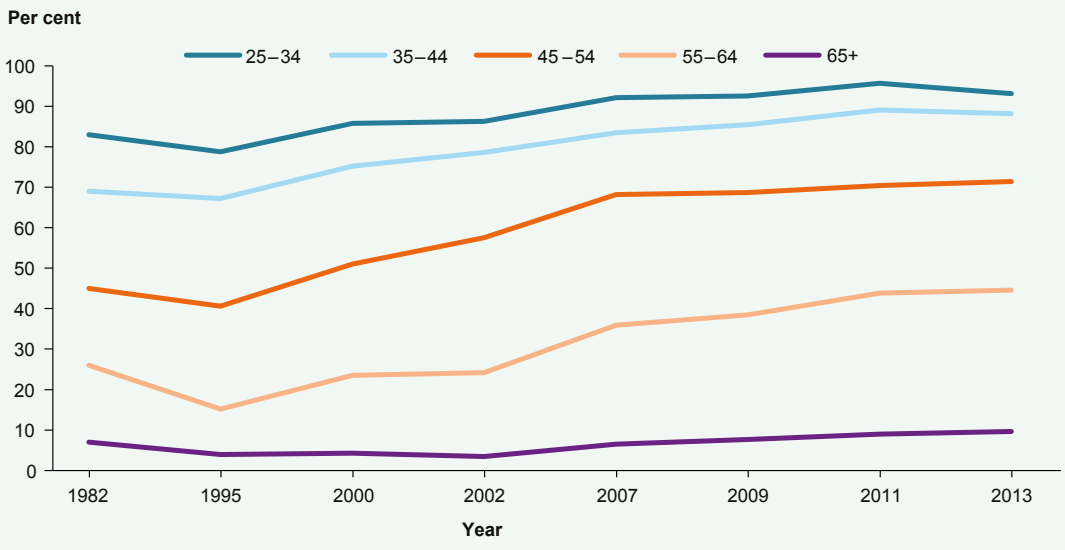
Figure 6.3.5: Home ownership rates, by age group and equivalised disposable income quintile 2013–14; and for equivalised disposable income quintile 1 (lowest), by age group, 1988-89, 2000–01, 2009–10 and 2013–14

Generational changes in mortgage indebtedness

Australian households have adapted to increased affordability pressures by not becoming home owners or, if they are home owners, taking on more debt. This latter option has been enabled both by the willingness of households to take on more debt and lenders changing their practices to offer larger mortgages (Tomlinson & Burke 2012). The current climate of low interest rates has also been an influential factor in household indebtedness.

More than 70% of Australian households had some level of debt during 2013–14, with housing debt a major component of this (ABS 2015b). For those households with a mortgage, more than 4 in 10 (44%) were servicing a total debt that was three or more times their annualised disposable income. This is a 10.5 percentage point increase since 2003–04. This greater level of debt taken on by more Australian home owners with a mortgage makes many of these households vulnerable to economic hardship. Further, repayment affordability may well become an issue for these households should interest rates rise in the future.

Among home owners, the proportion of households with a mortgage has grown across all age groups during the past 3 decades (Figure 6.3.6). This rise in mortgage indebtedness coincided with the house price boom in the late 1990s. The proportion of older mortgagors is climbing most steeply, particularly for people approaching retirement (aged 45–54 and 55–64). In 1982, less than half (45%) of people born during the Depression, from 1928 to 1937 (austerity babies), were financing a mortgage when aged 45–54. By comparison, in 2013, 71% of people born between 1957 and 1966 (mainly baby boomers), were financing a mortgage when aged 45–54. This trend is of particular concern as these households approach retirement without their home and asset base being paid off. For people looking to retire in the next 10 years, 45% of 55–64-year-olds in 2013 were still servicing a mortgage, compared with just 26% in 1982.



Sources: ABS 4130.0 Housing occupancy and costs 1982–83, 1995–96, 2000–01, 2002–03, 2007–08, 2009–10, 2011–12 and 2013–14. Graph based on that published in Ong et al. 2013.

Figure 6.3.6: Proportion of home owners with a mortgage, by age group, selected years

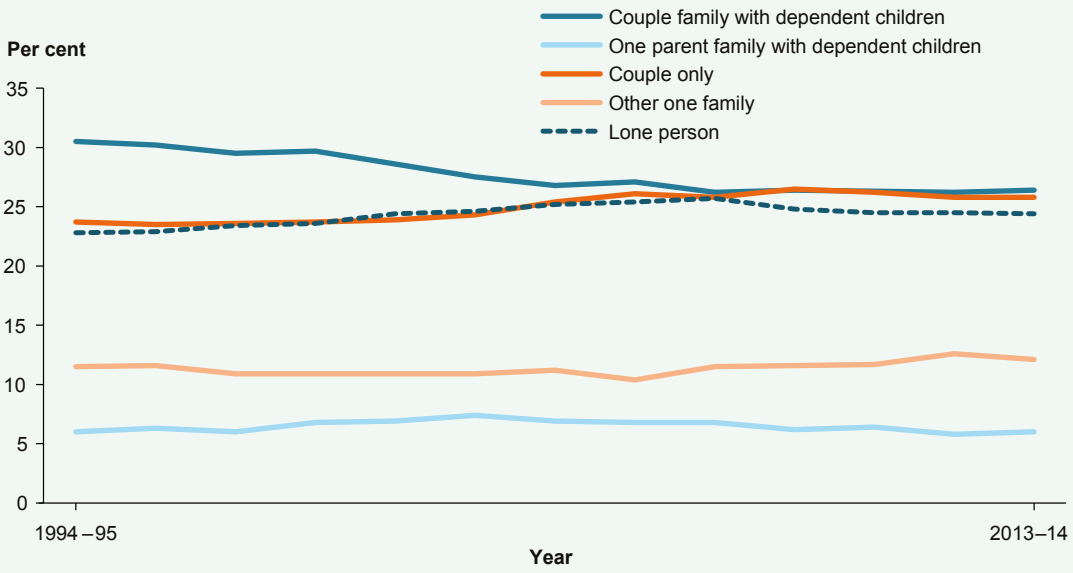
The recent housing boom of the late 1990s has seen house prices rapidly escalate, with corresponding deteriorations in purchase affordability, particularly for people trying to enter the housing market, and those rental households on low incomes. Decreasing levels of housing purchase affordability in Australia have forced many households to adapt by borrowing more, deferring the purchase of a home, moving into more affordable housing (such as apartments and townhouses) and moving to more affordable locations. Despite this, low-income and single-income working age households are increasingly being left out of the home purchase market (Wood et al. 2013).

Australian population—demographic changes and challenges

There is evidence of a decline in household formation since 2006. Between 1994–95 and 2013–14, the Australian population grew by around 31%, with accelerated growth between 2006 and 2013 on the back of increases in overseas migration. Over the same period, the number of households in Australia increased from 6.5 to 8.8 million, a rise of 34% (ABS 2015b). The number of people in these households, on average, has declined steadily for many years; by 2006 it had fallen to its lowest point, 2.5 people per dwelling (ABS 2015b). After this time, households formed at a slower rate than population growth, implying that people were not forming households at the same rate as before. Rising house prices in the face of unaccompanied growth in incomes, a lack of available dwellings (that is, insufficient or mismatched supply) and a lack of affordable dwellings have been proposed as possible reasons for a decline in household formation (AHURI 2016; ABS 2011; Reserve Bank of Australia 2015).

The composition of families is also changing, presenting its own housing challenges (Figure 6.3.7). Family households remain the most common household type, but there have been changes in their composition. Couple families with dependent children have declined from 31% in 1994–95 to 26% in 2013–14, while the proportion of couple-only families (25.8%, up from 23.7%), and multiple-family households (2.3%, up from 1.3%) have all increased.

With family structure changing, so too, are families' housing choices and preferences. The challenge is for housing options to be responsive, flexible and affordable to meet this change. For example, as the numbers of lone-person and couple-only households grow, these households may increasingly seek smaller dwellings. Increases in non-nuclear family households are likely to expose a growing number less likely to have the financial resources, or the need, to buy a large single family home. Other challenges include having sufficient options for older households who may prefer to age in their own home or in alternative appropriate accommodation.



Sources: ABS 4130.0 Housing occupancy and costs, selected years between 1994–95 and 2013–14.

Figure 6.3.7: Family composition of households, 1994–95 to 2013–14

Future projections forecast 4.3 million more households in Australia by 2036, increasing from 8.4 million in 2011 to between 12.6 and 12.7 million in 2036 (ABS 2015c), an increase of between 49% and 51%. There were about 7.8 million Australian households living in private dwellings in 2011, estimated to increase by 49% to 11.6 million by 2031. Family households are projected to have the largest increase over the projection period, remaining the most common household type in Australia.

Housing affordability: trends and distribution

Given current population projections, demand for housing will continue to grow. This increased demand will put pressure on dwelling prices, with a particularly adverse effect for low-income households.

A number of factors influence house prices, and therefore housing affordability (Box 6.3.1).

Box 6.3.1: Determinants of housing affordability in Australia

Demand for housing is influenced by factors such as:

- population growth
- changes in household composition
- economic circumstances, such as household income and the number of income earners in the household
- interest rates and access to affordable finance
- tax settings
- attractiveness to investors (profitability and percentage returns) compared with the asset classes
- rental prices and availability
- consumer preferences, such as the size, location, tenure and quality of housing; the balance between housing costs and the costs of transport; and demand for second/holiday homes.

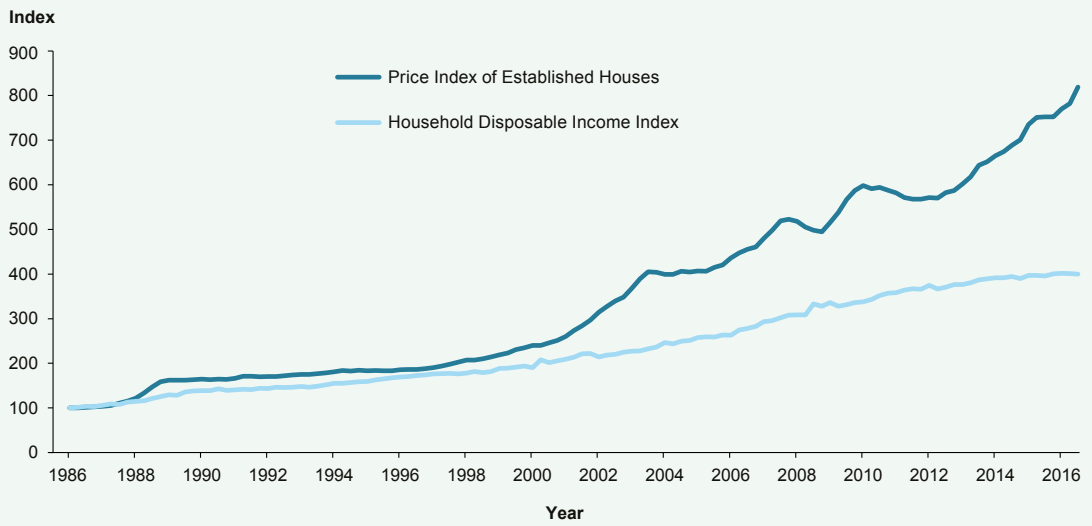
The supply of housing is influenced by a range of factors, such as:

- land availability, such as zoning and restrictions on land tenure that do not readily permit land to be developed, sold, or individually owned
- land release and development processes, including fees and regulation
- the costs of construction and providing essential infrastructure, such as water, power, and sewerage
- the availability of skilled labour in the construction industry
- the level of services (such as public transport) and employment required to attract households into locations
- government taxes and subsidies
- interest rates and access to affordable sources of development finance.

Sources: Adapted from PM&C 2014; Kirchner 2014; NHSC 2009; The Senate Select Committee on Housing Affordability in Australia 2008; URC 2008.

The gap between household income and dwelling prices in Australia has widened over the past 3 decades, creating a barrier to home ownership for many (Burke et al. 2014) (Figure 6.3.8). This gap has been fuelled by rapid house price growth, after the financial system was deregulated, with the total value of Australian housing estimated to be $6.5 trillion (CoreLogic RP Data 2016a).

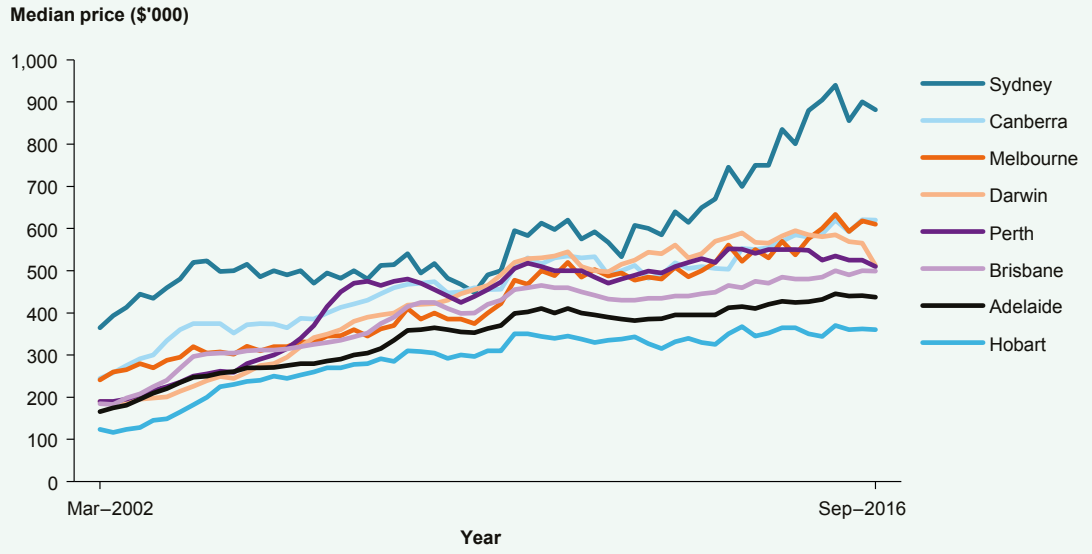
House prices in Australia have increased substantially in recent decades. The OECD noted in its biennial survey that they have reached unprecedented highs in Australia, increasing by 250% in real terms since the 1990s (OECD 2017a). The impact of higher house prices has been partially offset by lower mortgage interest rates, increased credit availability and changes in financial agency practices. These favourable lending conditions and low interest rates have encouraged buyers into the market, despite the growth in house prices themselves.



Sources: ABS cat. no. 5206.0 various years; ABS cat. no. 6416.0 various years. Graph based on that published in Burke et al. 2014.

Figure 6.3.8: Established house prices compared with household disposable income, Australia, 1986 to 2016

As Figure 6.3.9 shows, house price growth has not been uniform across Australian cities. Sydney prices have seen the steepest rises, particularly in the past 5 years, and are the most expensive. By contrast, Hobart has the lowest median house price, currently less than half that of Sydney.

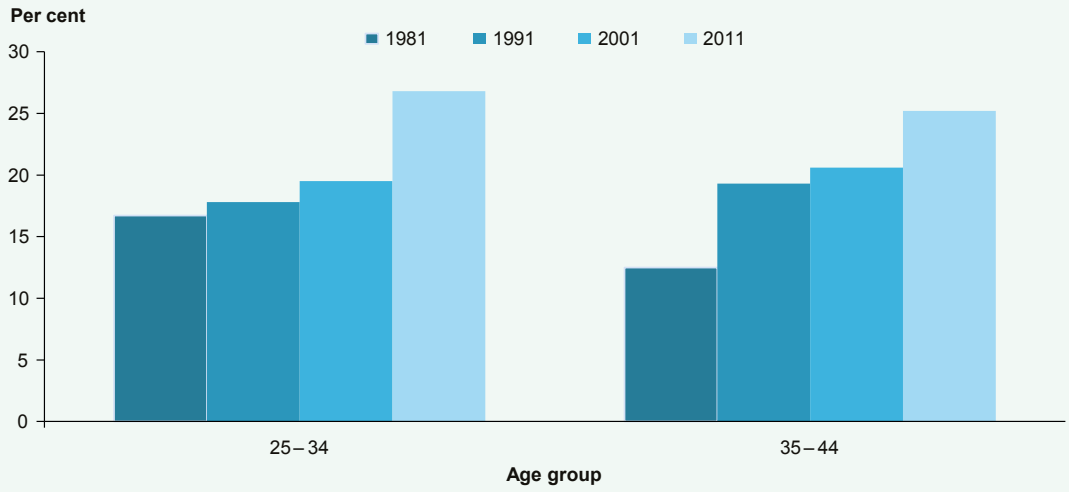


Note: Capital cities have been ordered from highest to lowest median price as at September 2016.

Source: ABS 2016a.

Figure 6.3.9: Median price of established houses, by capital city, March 2002 to September 2016

With house prices outpacing income growth, repayment affordability is affected. The cost of mortgages rose substantially in the 30 years to 2011 (Figure 6.3.10). This rise has been particularly felt by younger home buyers. The proportion of median household income spent on mortgage repayments increased by more than 50% for people aged 25–34 between 1981 and 2011. This proportion more than doubled over the same period for people aged 35–44, with this age group paying around 25% or more of their median household income on mortgage repayments (Burke et al. 2014).



Note: Data are for all purchasers in these age groups.

Source: Burke et al. 2014, based on ABS Census unit record files, various years.

Figure 6.3.10: Median mortgage as a percentage of median household income, by home owners with a mortgage and age group, 1981, 1991, 2001 and 2011

What is affordable, to whom and where?

Generally, measurements of housing affordability focus on quantifying housing stress as a proxy for all housing affordability driven outcomes (Gabriel et al. 2005; Rowley & Ong 2012). Measurements of housing stress primarily focus on the financial aspects of housing affordability, ignoring the wider non-financial impact of housing quality, location, economic participation and social and neighbourhood issues. A key issue with common housing stress measures (for example, house price to income ratio and the 30:40 rule—that is, housing costs below 30% of household income for the bottom 40% of the household income distribution) is that they include buyers and renters, but ignore people trying to enter the housing market.

The concept of affordability means different things to different people and households, and it depends on the housing situation. Affordability for home owners relates to purchase and repayment expenses; for renters, it relates to rental expenses. For the highest income households, affordability is a matter of exercising choice, rather than being restricted in accessing the market. For people with more modest means (with lower income and/or accumulated wealth assets), affordability is, and remains, a major issue and affects their ability to access the housing market.

The level of affordability experienced by buyers is influenced by many factors, including interest rates, asset wealth, dwelling prices, household composition, and the level of household income (Box 6.3.1).

From June 1993 to June 2016, the standard variable interest rate for housing loans fluctuated but trended downward, decreasing from 9.50% to 5.35%. This has helped people with a mortgage, but not renters. House prices have outpaced income growth over the past decade, contributing substantially to the decline in purchase affordability, particularly for lower income renters, and single-income households.

Affordability for rental households

For households renting, affordability is also declining (Hulse et al 2014). Stronger demand for housing generally leads to a tighter rental market, which has a disproportionate impact on lower income private renters.

The proportion of Australians in private rental is higher than ever before, with more than one quarter (26%) of the population renting in 2013–14, compared with just 18% in 1994–95 (ABS 2015a). Over the same period, renters have had a 62% (or $144) increase in average weekly housing costs. This is substantially higher than for owners with a mortgage (42%) or public housing renters (45%) over this time (ABS 2015b).

The number of lower income households renting has also grown; there were an estimated 1.3 million households in 2013–14. The proportion of these lower income rental households in rental stress (spending more than 30% of their gross income on housing costs) (see Chapter 9.2 'Indicators of *Australia's welfare*') has also increased. Half (50%) of the estimated 1.3 million lower income rental households were in rental stress in 2013–14, up from 40% in 2007–08 (ABS 2015a). For lower income households renting in the private market (about 912,500), 62% were in rental stress in 2013–14. The growing population of lower income households who are private renters represents a growing divide in home ownership and wealth inequity in Australia.

Affordability for households entering the market

Research indicates that it is future households that will face major affordability constraints (Eslake 2013; Rowley & Ong 2012). The barriers to purchasing a home are increasingly an issue for younger Australians and lower income households as they try to become home owners.

To highlight the difficulty in entering the housing market, the AIHW analysed a cross section of the community, to examine their opportunity to buy a home in the 2013–14 market. The population included private renter households who did not own a property—an estimated 2.3 million private rental households. An affordable dwelling price was estimated (affordable price point) using median gross household income data applied in a mortgage calculation for particular household or income groups in each Australian capital city (see 'Methods and conventions' section of this report for supplementary technical information related to the purchase affordability indicator; S6.3.1). Income data vary considerably across capital cities and therefore create quite different affordable price points; hence, outcomes are relative for each city. The proportion of dwellings sold in each capital city at or below these price points was calculated, providing an insight into the prospects for people wanting to get into the housing market. This analysis excluded Australians who were housed through social housing programs or who received government subsidised rent, as these households have different financial situations (and incomes) and are less likely to be in a position to buy a house.

Only about 1 in 6 (15%) of all dwellings sold in Australia in 2013–14 could have been bought by private rental households in Australia earning the median household income (CoreLogic RP Data 2016b).

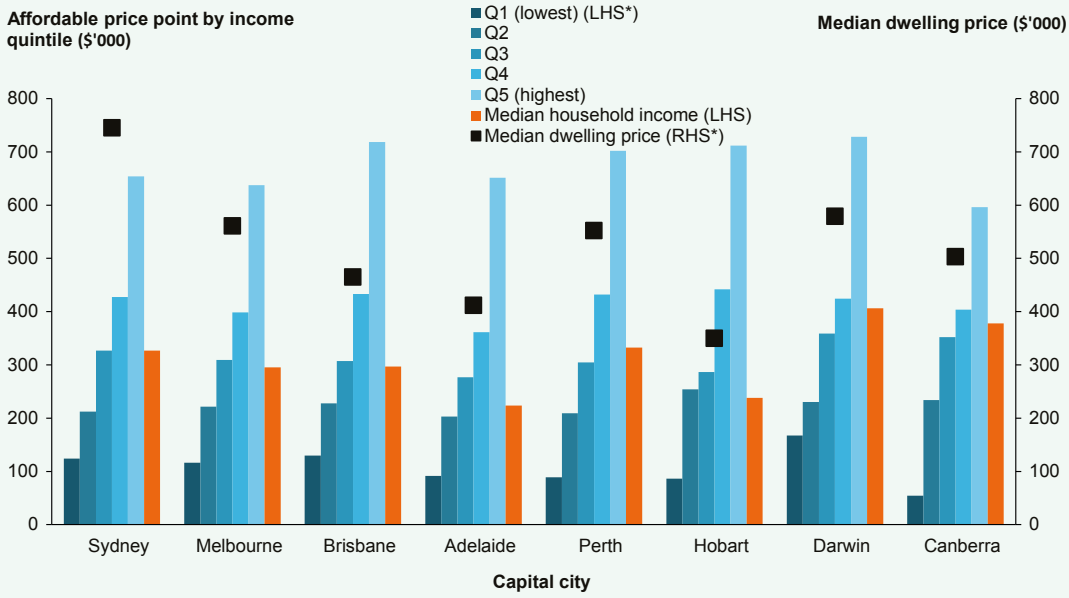
Of the 544,875 dwellings sold in Australia in 2013–14, 71% were in capital cities, with the remaining 29% across the rest of the states/territories. This reflects the distribution of the Australian population.

AIHW analyses of affordable purchase price data show the influence of broad location, income and household composition on the potential of rental populations to buy a dwelling in capital cities in Australia in 2013–14. The analyses reveal a notable degree of 'unaffordability' for these households.

Household income and affordability

Across all capital cities, both the median house and unit price exceeded the calculated maximum affordable dwelling price for the median income rental household.

The gap between the affordable price point for the median rental household income and median dwelling price was most pronounced for households in Sydney, with a median house price of $745,000. This figure is higher than even the affordable price point for the highest income quintile (Figure 6.3.11).



Note: Equivalised disposable household income is household incomes that are adjusted to enable analysis of the relative wellbeing of households of different size and composition, using an equivalence scale.

* LHS = left hand side; RHS = right hand side.

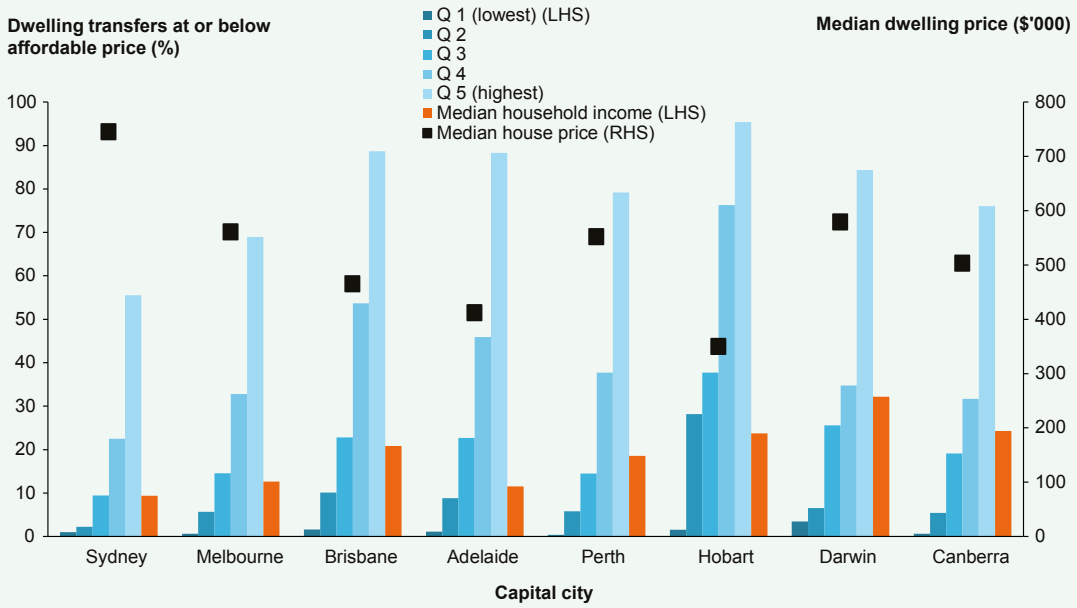
Figure 6.3.11: Median price of established houses and maximum affordable price points, by equivalised disposable income quintile and capital city, 2013–14

Overall, the proportion of dwellings sold that were affordable to the median income rental household across the capital cities ranged from 9.4% in Sydney to around 32% in Darwin (Figure 6.3.12). These locational differences are driven by differences in household incomes and the distribution of the prices of dwellings sold during 2013–14.



Note: Equivalised disposable household income is household incomes that are adjusted to enable analysis of the relative wellbeing of households of different size and composition, using an equivalence scale.

* LHS = left hand side; RHS = right hand side.

Sources: AIHW analysis of ABS 2016b; CoreLogic RP Data 2016b.

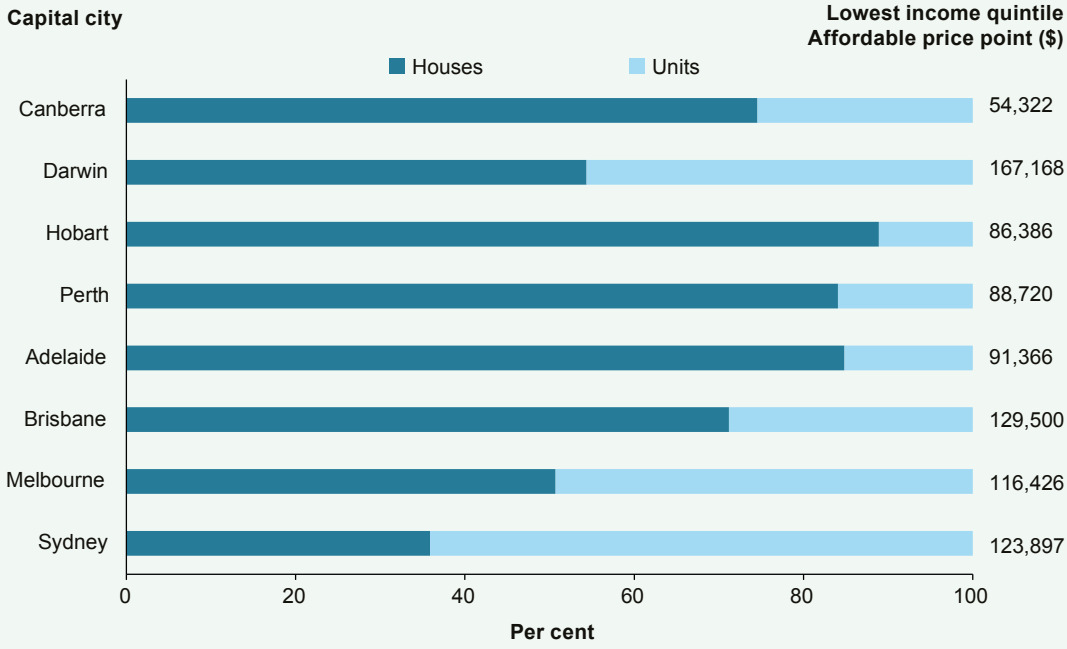
Figure 6.3.12: Median price of established Australian houses and proportion of dwellings transferred at or below the maximum affordable price point, by equivalised disposable income quintile and capital city, 2013–14

For rental households in the lowest equivalised disposable household income quintile (the lowest income earners), there were considerably fewer opportunities to enter the property market. For example, from less than 1% of dwellings sold in Perth to 3.5% in Darwin were affordable for these households (Figure 6.3.12).

By comparison, households in the highest equivalised disposable household income quintile, (the highest income earners) could afford to buy up to 95% of dwellings sold in Hobart and more than 75% of dwellings in all other capital cities, except for Sydney and Melbourne. Only 56% of dwellings sold in Sydney were affordable to the highest income earners and 69% in Melbourne.

There were not only fewer opportunities for financially constrained households to buy an affordable property, but also limited choice in the type of dwelling, depending on location (Figure 6.3.13). Sydney was the only capital city where there were more units than houses transferred below the affordable price point for people in the lowest two income quintiles (quintile 1, 64%; quintile 2, 52%). In Darwin, Melbourne and Brisbane, where the affordable

price point was also high, renters in the lowest income quintile would have had fewer opportunities to buy a house than renters in capital cities with lower affordable price points (Hobart, Adelaide, Perth and Canberra). These analyses imply that, for renters in the lowest income quintile living in capital cities with the highest affordable price points, choice of dwelling type would be constrained.



Note: Equivalised disposable household income is household incomes that are adjusted to enable analysis of the relative wellbeing of households of different size and composition, using an equivalence scale.

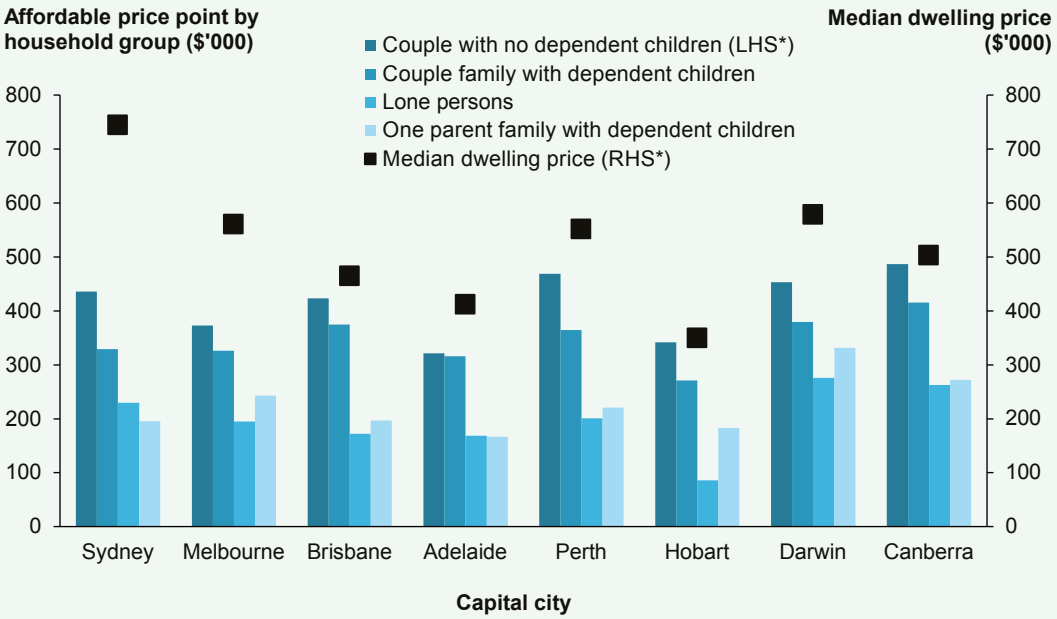
Household composition and affordability

Purchase affordability is influenced not only by household income, but also by the composition of the household itself. Households with a single income and/or dependants have reduced borrowing capacity, while the adequacy of the dwelling is influenced by family size. While calculated affordable price points varied across household types and capital cities, one thing remained constant: the median house price across all capital cities was above the maximum affordable dwelling price point across all household types.

For certain household types, the gap between median income and affordable price point was greater than others (Figure 6.3.14). Across most capital cities, this gap was largest for lone-person households, followed closely by single-parent households with dependent children.



* LHS = left hand side; RHS = right hand side.

Sources: AIHW analysis of ABS 2016b; CoreLogic RP Data 2016b.

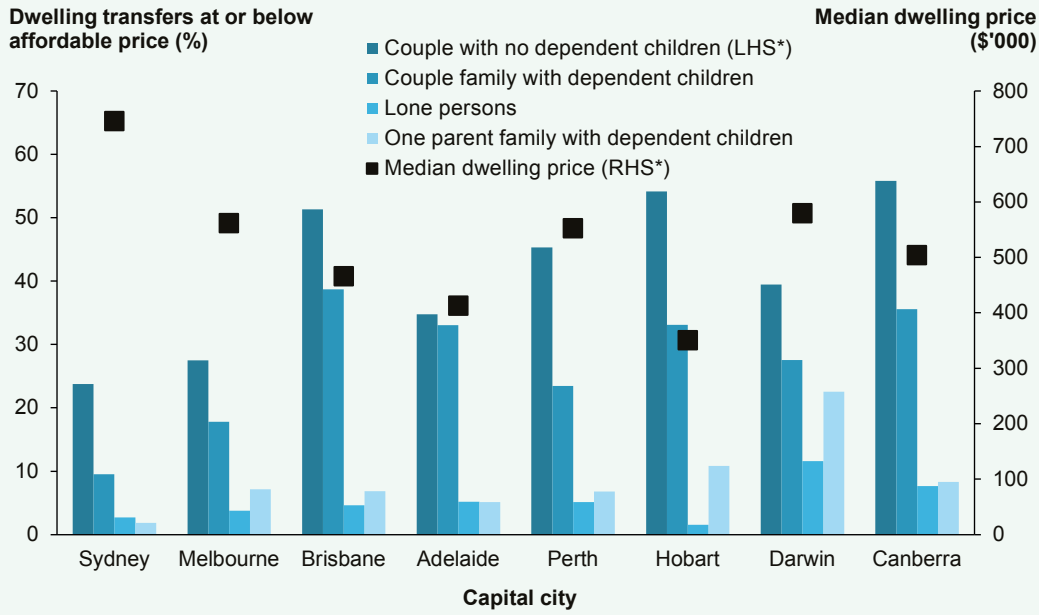
Figure 6.3.14: Median price of established Australian houses and affordable price points, by family composition of household and capital city, 2013–14

The vast majority of affordable dwellings transferred across all Australian capital cities in 2013–14 were not affordable for single-income households; that is, one-parent families with dependent children and lone-person households (Figure 6.3.15).

Sydney was the least affordable capital city. For single-income households, just 1.8% (or 2,144) of dwellings sold in 2013–14 were deemed affordable, and for lone-person households just 2.7% (or 3,180). A similar trend was observed for single-income and lone-person households in the four other capitals, ranging from a 10% in Adelaide to 12% in Perth and Brisbane.

Couples with no dependent children had the greatest opportunity to buy a house across all capital cities. For example, a couple with no dependent children earning the median income could have bought about half of all dwellings sold in Canberra, Hobart, Perth and Brisbane. However, in Sydney, even these households could only have bought around 24% of properties.

These data show that, for most rental households across most income quintiles, median house prices were well above what these households could comfortably afford. Despite this price issue, the Australian housing market continues to grow, with more and bigger houses being bought. Higher income earners accessing bigger and better homes, and investors entering the housing market, have been responsible for some of the economic pressures contributing to rising real house prices.



* LHS = left hand side; RHS = right hand side.

Housing assistance

Direct housing assistance

Increasing affordability issues have the potential to increase the number of households in housing stress and hence the demand for direct housing assistance. A range of incentives and programs are available to directly assist low-to-moderate income households and households who are particularly disadvantaged or vulnerable. These include measures to help households pay for housing, to increase the supply of affordable housing and to assist with rental subsidies and the provision of social housing.

Social housing programs are available for lower income Australians who need housing and meet eligibility criteria. Latest figures estimate that Australia has nearly 433,000 social housing dwellings (public rental housing, mainstream community housing, state owned and managed Indigenous housing, Indigenous community housing). This stock, however, is shrinking; it is not keeping up with household growth (4.7% in 2016, down from 5.1% in 2007–08) (AIHW analysis of National Housing Data Repository), effectively reducing the number of social housing dwellings available. The composition of the 'Australian population' accessing social housing assistance has changed over time, with the most disadvantaged groups (for example, the homeless, people with disability, and Indigenous populations) accounting for a growing proportion of people who receive housing assistance (see also Chapter 6.1 'Social housing').

A growing proportion of Australians are renting in the private market, including many lower income households. As social housing dwellings as a proportion of all dwellings decrease, lower income households find themselves having to rent in the private market. Where lower income households remain in the private rental market, they may be helped financially through the CRA scheme. The growth of the CRA over the past 10 years, both in terms of the number of recipients and government expenditure, indicates a growing reliance on this funding in a rental market with increasing rental costs and a growing population of lower income renters. The number of CRA recipients increased by 43% to 1,346,000 income units in 2015–16, while real government expenditure increased to nearly $4.4 billion, up from $2.6 billion over the same period.

An adequate supply of affordable, sustainable rental housing is a key requirement to meet the increasing demand on social housing. The Australian Government has responded to this need by establishing an Affordable Housing Working Group, following a request from state and territory Treasurers at the Council on Federal Financial Relations meeting in October 2015. The Working Group's final report was considered by Treasurers in December 2016. Following this, the Australian Government established an Affordable Housing Implementation Taskforce that is investigating innovative ways to harness private sector investment in the social housing sector including through the National Housing Finance and Investment Corporation (NHFIC). NHFIC will operate an affordable housing bond aggregator to encourage greater private and institutional investment and provide cheaper and longer-term finance to registered providers of affordable housing.

Indirect housing assistance and affordability

Indirect housing assistance provided through so called tax expenditures (for example, capital gains tax and negative gearing) is a major contribution towards housing assistance in Australia.

The value of housing tax expenditures reported for 2015–16 was about $60 billion (Table 6.3.1), an increase of almost 40% since 2005–06. This increase reflects the increase in housing wealth accumulated over this period.

In 2015–16, indirect assistance to owner–occupiers via the capital gains tax exemption on the family home was estimated at almost $55 billion (Table 6.3.1) in the 2015 Tax Expenditures Statement (Treasury 2016b).

The 50% discount on capital gains was estimated to provide up to a further $6 billion to investors in residential property in 2015–16.

These estimates represent an upper bound of the benefits to housing investors, since the data apply to all investments that generate capital gains. The Grattan Institute provided an estimate of about $5 billion in 2011–12 from the capital gains tax discount for investors in residential property, to which it adds about a further $2 billion, considering the negative gearing opportunities provided by the asymmetric treatment of income and expense (Kelly et al. 2013). As at 2011, total quantified tax expenditures were estimated to account for almost 9% of gross domestic product, with housing tax expenditures accounting for around one third of the total (Treasury 2011).

Table 6.3.1: Large housing tax expenditures and capital gains tax 2005–06 to 2015–16 (estimated)

Year	CGT main residence exemption ($b)	CGT discount for individuals and trusts ($b)
2005–06	40	5
2006–07	40	6
2007–08	41	10
2008–09	29	9
2009–10	40	4
2010–11	37	4
2011–12	32	5
2012–13	36	4
2013–14	46	4
2014–15	55	6
2015–16 (estimated)	55	6

* CGT = Capital Gains Tax.

Note: All estimates are based on a revenue foregone approach.

Sources: Treasury 2016b and earlier years.

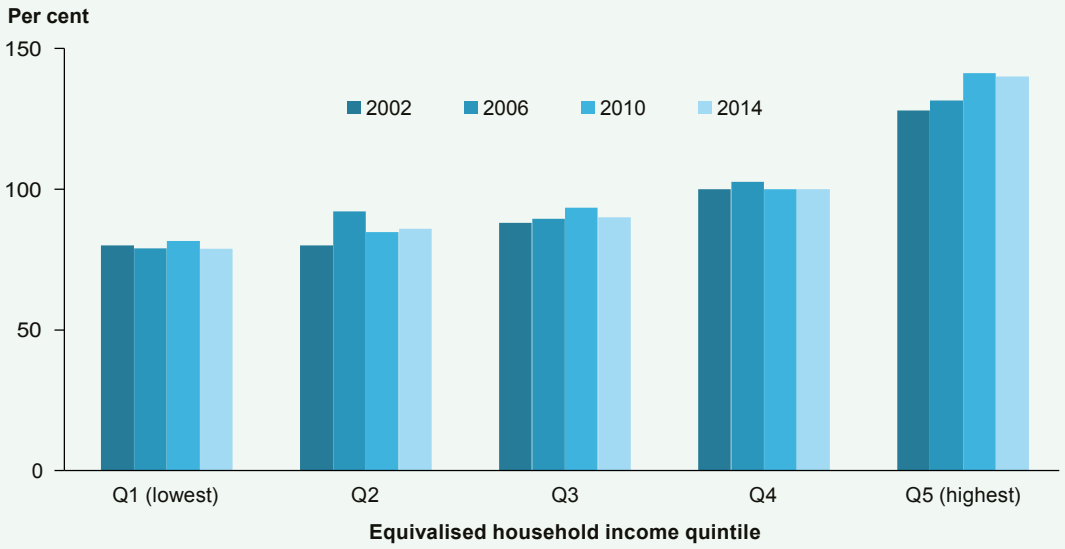
Regardless of what impact measurement issues have on revenue or what tax benchmark is used to identify them, tax expenditures have a substantial impact on the equity and efficiency outcomes of Australia's housing system.

Housing wealth, both in the form of owner-occupied (Figure 6.3.16) and other residential property wealth, has increased more rapidly for households in the highest income quintile over the past decade than it has for households in all lower quintiles. Households in the top income quintile, therefore, have benefited more from the tax concessions accorded to owner-occupied housing and to investment housing than have all other households.

Tax concessions that exempt some or all the income earned from housing—whether this is earned by owner–occupiers or by investors—make investment and speculation in residential property more attractive than it otherwise would be (Treasury 2010).

Investors compete directly with potential home buyers; established owners are encouraged to improve their housing living standards. Both responses add to demand pressures in the housing market. In light of the relatively sluggish supply responses across Australia, they contribute to upward pressures on dwelling prices and to the increasing difficulties faced by would-be home buyers.

Subsidies for home ownership are often justified because of the associated economic and social benefits. Of these, contributions to wealth accumulation and to protection against poverty in older age are central. As increasing proportions of younger, and particularly lower income households, are excluded from home ownership, these arguments become less compelling. As argued almost a decade ago, tax expenditures support home owners, not home ownership (The Senate Select Committee on Housing Affordability in Australia 2008).



Note: Equivalised disposable household income is household incomes that are adjusted to enable analysis of the relative wellbeing of households of different size and composition, using an equivalence scale.

Source: Reserve Bank of Australia statistics, Analysis of Australian Housing and Urban Research Institute data.

Figure 6.3.16: Ratio of quintile median dwelling wealth of primary residence to median dwelling wealth of all households, by equivalised disposable income quintiles, 2002, 2006, 2010 and 2014

Direct housing assistance, such as that provided through CRA, is often justified on equity grounds. This assistance is relatively tightly aimed at lower income households at risk of facing financial stress as a result of high housing costs in the private rental market. Indirect housing assistance, however, is not so focused, with the greatest assistance going to high-income and high-wealth households. This inequitable distribution of assistance has been well documented over the past 25 years.

What is missing from the picture?

With generational changes occurring with home ownership, there is limited information in the following areas:

- the housing aspirations of different population groups—whether by choice or necessity, what trade-offs are individuals and households willing to make when it comes to housing? Population groups of particular interest include, for example, youth, aged people, the homeless, people with disability and Indigenous people. Trade-offs might include increased mortgage repayments during periods of low interest rates, increased indebtedness, tenure options, location, and quality across the life course
- measurements of affordability—these are currently limited to measuring the cost burden on households and do not include, for example, the wider non-financial impact of housing quality or location
- housing stress—this measure examines only the position of households currently in home ownership; it does not quantify, for example, the would-be households who are unable to form.

The supply of housing and drivers of supply are outside the scope of this article.

Where do I go for more information?

Chapter 7

Indigenous Australians

7.0 Introduction

Aboriginal and Torres Strait Islander people are the Indigenous peoples of Australia. They are not one group, but comprise hundreds of groups that each have their own distinct set of languages, histories and cultural traditions.

There were an estimated 761,300 Indigenous Australians, or 3% of the total Australian population, in June 2017. Indigenous communities pass on knowledge, tradition, ceremony and culture from one generation to the next through language, performance, protection of significant sites, storytelling and the teachings of Elders. In 2014–15, 62% of Indigenous Australians aged 15 and over identified with a clan, tribal or language group, and 74% recognised an area as homelands or traditional Country.

As a group, Indigenous Australians experience widespread socioeconomic disadvantage and health inequality. This chapter examines factors affecting their wellbeing, including community safety; closing the gap in Indigenous education; income and employment; and use of disability and aged care services.

Educational achievements of Indigenous children and youth have been improving but substantial gaps remain. The Australian Early Development Census (AEDC) is an assessment of 'school readiness' carried out in a child's first year of full-time schooling, usually at the age of 5. The AEDC results show that the gaps in child development between Indigenous and non-Indigenous children have, on average, developed even at this early age. In all three AEDC collections since 2009, Indigenous children were more than twice as likely as non-Indigenous children to be assessed as developmentally vulnerable. However, there has been encouraging progress: the proportion of Indigenous children assessed as vulnerable on 1 or more of the 5 assessed domains dropped from 47% in 2009 to 42% in 2015—a larger fall than for non-Indigenous children over this period.

Of the three education-related Closing the Gap targets for which trend data are available, only one is on track—the target to halve the gap in Year 12 attainment by 2020.

The gap between Indigenous and non-Indigenous Australians continues into working age. Indigenous Australians aged 15–64 are less likely to be in the labour force than non-Indigenous Australians, on average earn less, and are more likely to receive a government pension or allowance as their main source of income. However, the proportion of Indigenous adults with incomes in the bottom 20% of equivalised gross weekly household incomes has decreased over the past decade.

7.1 Community factors and Indigenous wellbeing

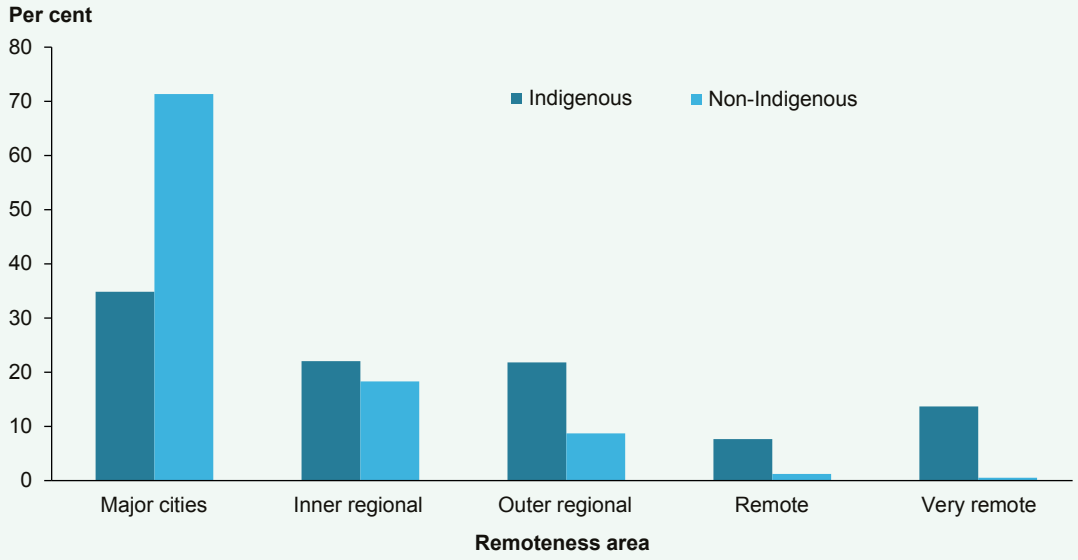
Aboriginal and Torres Strait Islander people are the Indigenous peoples of Australia. They live in all parts of the nation, from major cities to remote tropical and desert areas. Indigenous Australians are not one group, but comprise hundreds of groups that have their own distinct set of languages, histories and cultural traditions.

Indigenous Australians can be of Aboriginal origin, Torres Strait Islander origin, or both. The Australian Government defines Indigenous Australians as people who are of Aboriginal or Torres Strait Islander descent, who identify as being of Aboriginal or Torres Strait Islander origin and who are accepted as such in the communities in which they live, or have lived. In most data collections, a person's Indigenous status is based on the first two parts of this definition.

Indigenous population

As at 30 June 2017, there were an estimated 761,300 Indigenous Australians, who made up 3.1% of the total Australian population (ABS 2014). Indigenous population estimates based on the 2016 Census were not available at the time of writing (see Box A in this report's preliminary pages).The Indigenous population is much younger than the non-Indigenous population, and Indigenous Australians are more likely than non-Indigenous Australians to live outside of the *Major cities* areas.

- In the 2011 Census, 90% of Indigenous Australians identified as being of Aboriginal origin only, 6% as Torres Strait Islander origin only, and 4% as both Aboriginal and Torres Strait Islander origin.
- In June 2011, the median age of the Indigenous population was 21.8 (compared with 37.6 for the non-Indigenous population). Only 3.4% of the Indigenous population was aged 65 or over compared with 14% of the non-Indigenous population (ABS 2013a).
- The majority (79%) of Indigenous Australians live in non-remote areas, with more than one third (35%) living in *Major cities*. 7.7% live in *Remote* areas, with a further 14% in *Very remote* areas (see Glossary for information about the remoteness classification used in this report). By comparison, 1.7% of the non-Indigenous population live in *Remote* or *Very remote* areas of Australia (Figure 7.1.1).
- More than half of all Indigenous Australians live in New South Wales (31%) or Queensland (28%), with a further 13% in Western Australia and 10% in the Northern Territory.
- The Northern Territory has the highest proportion of Indigenous Australians in its population at 30%; in the other jurisdictions, Indigenous people make up 1–4% of the population (ABS 2013a).



Source: ABS 2013a.

Figure 7.1.1: Population distribution, by Indigenous status and remoteness area, as at 30 June 2011

The 2011 Census identified around 209,000 households where at least one Indigenous person was a usual resident (referred to in this section as an Indigenous household).

- Three-quarters (75%) of these were one-family households, 6% consisted of two or more families, 14% were one-person households and 5% were group households.
- Indigenous households were less likely than other households to be single-person households (14% compared with 25%), more likely to consist of 2 or more families (6% compared with 2%) and more likely to contain 5 or more people (23% compared with 10%) (ABS 2012a).

In 2011, there were 181,700 families living in Indigenous households.

- Families in Indigenous households were more likely than families in other households to include children aged under 15 (59% compared with 38%), and more likely to be one parent families with children aged under 15 (28% compared with 7.7%).
- The proportion of families with dependent students was similar in Indigenous and other households (14% and 15%, respectively) (AIHW analysis of ABS 2011 Census (TableBuilder)).

Why focus on Indigenous Australians?

Indigenous Australians experience widespread socioeconomic disadvantage and health inequality. They are more likely than non-Indigenous Australians to be exposed to poverty, unemployment, violence, substance abuse and imprisonment. Indigenous children tend to have poorer educational outcomes than non-Indigenous children (see Chapter 7.4 'Closing the gap in education'), and are more likely to have contact with the child protection and youth justice systems. Given current mortality rates, an Indigenous baby born in 2010–2012 has an expected life span 10 years shorter than that of a non-Indigenous baby (ABS 2013b).

The reasons for these disparities are complex, and include dispossession, marginalisation, and racism, as well as the ongoing and cumulative effect of past policies of forced removal and cultural assimilation (HREOC 1997; SCRGSP 2016a).

The 2008 National Indigenous Reform Agreement (the Agreement) (COAG 2008) commits all Australian governments to actions aimed at closing the gap in Indigenous disadvantage. The Agreement notes that efforts will be directed across seven key platforms: early childhood, schooling, health, economic participation, healthy homes, safe communities, and governance and leadership. It also acknowledges the importance of culture and of eliminating discrimination. The wide range of actions across multiple sectors recognises the complex web of factors involved in creating and perpetuating Indigenous disadvantage, and that the approach to closing the gap must be coordinated and multifaceted. It must involve not just governments but also the corporate sector, non-government organisations and the Indigenous community.

In October 2015, the Australian Government released the Implementation Plan for the National Aboriginal and Torres Strait Islander Health Plan 2013–2023. The Implementation Plan outlines 106 actions to be taken by the Australian Government, the Aboriginal community controlled health sector, and other key stakeholders to give effect to the vision, principles, priorities and strategies of the National Aboriginal and Torres Strait Islander Health Plan 2013–2023. The Implementation Plan sets a number of goals to be achieved by 2023 for a set of 20 indicators for Indigenous health care processes and outcomes at the national level. These goals complement the existing Council of Australian Governments (COAG) Closing the Gap targets and focus on prevention and early intervention across the life course. For more information on the Implementation Plan, its vision and the context for its goals, see *National Aboriginal and Torres Strait Islander Health Plan 2013–2023* (DOH 2015) and the associated technical companion document (AIHW 2015).

This chapter focuses on two of the key factors that support the wellbeing of Indigenous Australians: a well-functioning community and a safe, secure home with working facilities. Information about some of the factors that reduce Indigenous wellbeing (such as exposure to discrimination and violence) and on educational outcomes, employment and income for Indigenous Australians can be found in other parts of Chapter 7.

Indigenous community functioning

Indigenous communities pass on knowledge, tradition, ceremony and culture from one generation to the next through language, performance, protection of significant sites, storytelling and the teachings of Elders. Family and kinship are integral to establishing relationships, positions and obligations within and outside the community (Bourke & Edwards 2004). Having a cohesive and well-functioning community, which provides opportunities for education, employment and recreation, as well as the infrastructure of adequate housing, transport and other services—and where people are empowered to make choices—can help to deal with the social and economic issues that result in social isolation, poor mental wellbeing, and anti-social behaviour (such as violence, crime and drug use) (ABS 2004; Hirschfield & Bowers 1997; Victorian Government 2015).

Functioning in this context is about the things people achieve or experience, consistent with their account of wellbeing. It varies from basic needs (such as being adequately nourished and being free from avoidable disease) to very complex activities or personal states (such as being able to take part in the life of the community and having self-respect). The conversion of capabilities into functioning is influenced by the values and personal features of individuals, families and communities, and by the social and cultural environment in which they live. Different cultures give greater or lesser priority to different types of functioning (Sen 1999, as cited in AHMAC 2015).

In 2008 and 2010, workshops were undertaken to inform the development of community functioning measures for the Aboriginal and Torres Strait Islander Health Performance Framework. These workshops drew together Indigenous people from across Australia, who described the various elements of family and community life essential for high levels of functioning. Six themes central to Indigenous Australian community functioning were identified: Connectedness to Country, land, and history, culture and identity; Resilience; Leadership; Having a role, structure and routine; Feeling safe; and Vitality (AHMAC 2015).

The next few sections present information about some aspects of community functioning that relate to each of these themes. The majority of the data are drawn from the Australian Bureau of Statistics (ABS) National Aboriginal and Torres Strait Islander Social Survey (NATSISS), conducted most recently in 2014–15, with previous surveys conducted in 2008 and 2002. The available data suggest that, in terms of these key themes supporting wellbeing through community functioning, circumstances for Indigenous Australians have either been maintained or have improved since 2008. Comparison data for non-Indigenous Australians is from the ABS 2014 General Social Survey (GSS).

Connectedness to country, land and history, culture and identity

This theme comprises being connected to country, land, family and spirit; strong and positive social networks with Indigenous people; a strong sense of identity and being part of a collective; and sharing, giving and receiving, trust and love, and looking out for others (AHMAC 2015).

In 2014–15:

- 62% of Indigenous Australians aged 15 and over identified with a clan, tribal or language group, and 74% recognised an area as homelands or traditional country
- 18% of Indigenous people aged 15 and over spoke an Australian Indigenous language, with a further 20% speaking some words. Around one-third (34%) of Indigenous people aged 4–14 spoke at least some words of an Indigenous language
- an Indigenous language was the main language spoken at home for 11% of Indigenous Australians aged 15 and over, and for 7.5% of Indigenous children aged 4–14. Speaking an Australian Indigenous language as the main language spoken at home was considerably more common in remote than non-remote areas (41% compared with 2.0% for people aged 15 and over)
- almost two-thirds (63%) of Indigenous Australians aged 15 and over and three-quarters (75%) of Indigenous children aged 4–14 had been involved in Indigenous cultural events, ceremonies or organisations in the previous 12 months (ABS 2016)

- more than 4 in 5 (83%) Indigenous Australians aged 15 and over had weekly face-to-face contact with family or friends living outside their household, a higher proportion than among non-Indigenous Australians (77%) (ABS 2015a; 2016)
- half (50%) of Indigenous Australians aged 15 and over provided support (such as money, food, clothing or transport) to relatives living outside their household (ABS 2016).

These results are all similar to those from the 2008 survey. Comparable data from the 2002 survey indicate that the proportion speaking an Indigenous language (including as a main language spoken at home) was similar in 2014–15 and 2002, while the proportion identifying with a clan or language group was higher in 2014–15 (62% compared with 54% in 2002). However, the proportion of Indigenous Australians who had attended an Indigenous cultural event in the last 12 months was somewhat lower in 2014–15 than in 2002 (63% compared with 68%) (AIHW 2017a).

Resilience

This theme comprises coping with the internal and external world; power to control options and choices; ability to proceed in public without shame; optimising what you have; challenging injustice and racism, standing up when required; coping well with difference, flexibility, and accommodating; ability to walk in two worlds; engagement in decision making; and external social contacts (AHMAC 2015).

In 2014–15 among Indigenous Australians aged 15 and over:

- 62% had not experienced unfair treatment in the previous 12 months
- 86% had not avoided situations in the previous 12 months due to past unfair treatment
- almost all (97%) had participated in sporting, social or community activities in the previous 12 months
- 49% felt able to have a say in their community on important issues at least some of the time. This is similar to the result among non-Indigenous Australians (53%)
- of people who were employed and had cultural responsibilities, their work allowed them to meet these responsibilities in 71% of cases
- most (92%) could get support from outside their household in times of crisis. This is similar to the result among non-Indigenous people (95%) and an increase since 2008 (89%)
- 80% of people who had seen a general practitioner in the previous 12 months felt that their doctor listened carefully to them, and 85% felt that their doctor showed respect
- 81% felt that their doctor could be trusted (ABS 2016)
- more than half (58%) felt that local police could be trusted, an increase from 52% in 2008 (AIHW 2017a).

Leadership

This theme comprises strong Elders in family and community, both men and women; role models, both men and women; strong direction, and vision; and a 'rock', someone who has time to listen and advise (AHMAC 2015).

In 2014–15:

- half (51%) of Indigenous children aged 4–14 in remote areas and almost one-quarter (23%) of Indigenous children in non-remote areas spent at least 1 day with a leader or Elder each week
- most (82%) Indigenous Australians aged 15 and over had someone outside the household in whom they could confide
- half (50%) of Indigenous Australians aged 15 and over living in remote areas felt that their community had strong leadership, and more than half (52%) felt that the leaders in their community had time to listen and give advice (ABS 2016).

Having a role, structure and routine

This theme comprises having a role for self: participation, contributing through paid and unpaid roles; capabilities and skills derived through social structures and experience through non-formal education; knowing boundaries and acceptable behaviours; sense of place—knowing your place in family and society; being valued and acknowledged; and disciplined (AHMAC 2015).

In 2014–15:

- 61% of Indigenous Australians aged 15–64 were in the labour force, with most of these people (79%) being employed. By comparison, 77% of non-Indigenous Australians aged 15–64 were in the labour force in 2014, with 94% of these people being employed (AIHW analysis of ABS 2014–15 NATSISS (TableBuilder) and AIHW analysis of ABS 2014 GSS (TableBuilder))
- 72% of Indigenous Australians aged 15 and over lived in a household where household members had not run out of money for basic living expenses in the previous 12 months, a similar proportion to that in 2008 (AIHW 2017a).

More information about income and employment among Indigenous Australians can be found in Chapter 7.5 'Income and employment for Indigenous Australians'.

Data from the 2011 Census show that:

- families living in Indigenous households were more likely than those in other households to have had some or all residents move house in the previous year (29% compared with 19%) (AIHW analysis of ABS 2011 Census (TableBuilder)).

Feeling safe

This theme comprises lack of physical and lateral violence (see Glossary); safe places; emotional security; cultural competency; and relationships that can sustain disagreement (AHMAC 2015).

In 2014–15 among Indigenous Australians aged 15 and over:

- most (84%) felt safe at home alone after dark, an increase from 80% in 2008
- over half (54%) felt safe walking alone in their local area after dark, similar to the result from 2008 (53%)
- most (87%) had not been a victim of physical violence in the previous 12 months, a similar proportion to that in 2008 (85%) (AIHW 2017a).

More detailed information about safety issues, contact with the criminal justice system and the exposure of Indigenous Australians to violence can be found in Chapter 7.3 'Community safety among Indigenous Australians'.

Vitality

This theme covers community infrastructure, access to services, education, health, income and employment (AHMAC 2015).

In 2014–15:

- 47% of Indigenous Australians aged 15 and over had a non-school qualification—that is, educational attainments other than those of a pre-primary, primary and secondary education. These qualifications may be attained after completing school, or concurrently with obtaining school qualifications. This proportion was significantly higher than that in 2008 (32%)
- 22% of Indigenous Australians aged 15 and over were enrolled in formal study—a significant increase from 19% in 2008
- 39% of Indigenous Australians aged 15 and over were daily smokers, a drop from 45% in 2008 and 49% in 2002, but still almost 3 times the rate among non-Indigenous Australians (ABS 2016)
- the majority (74%) of Indigenous Australians aged 15 and over who had tried to access services in the previous 12 months (such as health care, utilities, employment services and financial institutions) had no problems accessing these services. This was the same as for non-Indigenous Australians (74%) (AIHW analysis of ABS 2014–15 NATSISS (TableBuilder) and AIHW analysis of ABS 2014 GSS (TableBuilder))
- 81% of Indigenous Australians were living in houses of an acceptable standard (AIHW 2017a)
- 40% of Indigenous Australians aged 15 and over rated their general health as very good or excellent, a fall from 44% in 2008 (ABS 2016).

Housing and homelessness

A stable and adequately maintained and serviced home is fundamental for health. As well, it provides a safe and secure environment, and underpins a well-functioning community. Not having affordable, secure and appropriate housing can have negative consequences. These include homelessness, poor health, and lower rates of employment and education participation—all of which can lead to social exclusion and disadvantage.

This section focuses on housing stability (including tenure and housing assistance), housing quality (including facilities and structural soundness) and potential overcrowding. It also looks at homelessness and the use of relevant support services by Indigenous Australians.

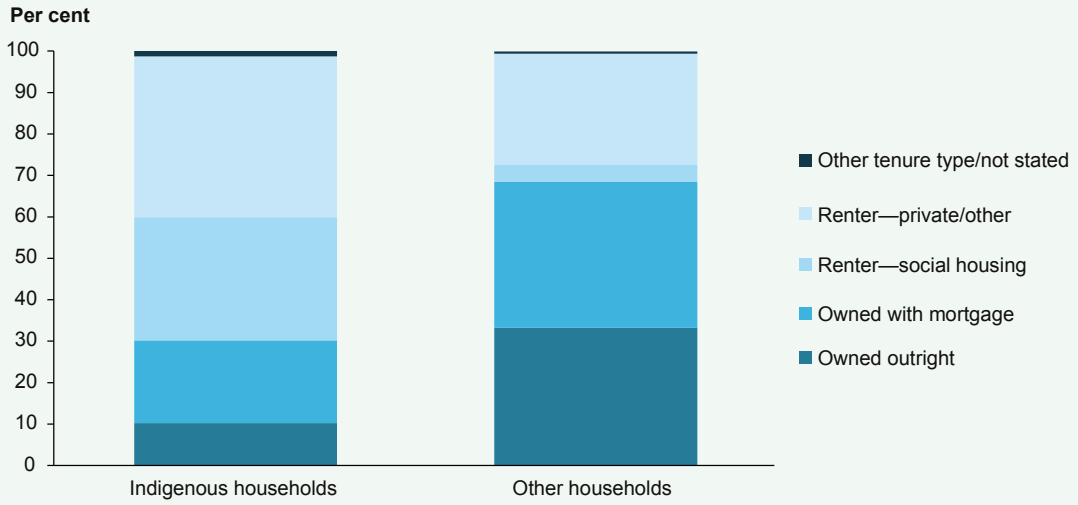
Housing tenure

Housing tenure describes whether a dwelling is owned or rented, or occupied under some other arrangement (see also Box 7.1.1). Survey data from the NATSISS show that, in 2014–15, of the estimated 283,900 Indigenous households:

- 3 in 10 (30%) were home owners—10% owned their home outright (about 29,000 households) and 20% had a mortgage (56,900 households)
- nearly 7 in 10 (69%) were renters—30% lived in social housing (about 84,400 households), while the remainder (39%) were private renters or rented from another type of landlord (110,300 households)
- 1.3% occupied their dwelling under some other arrangement, or did not provide information on household tenure (Figure 7.1.2).

The rate of home ownership among Indigenous households (30%) was less than half that for other households (68%) (Figure 7.1.2).

The proportion of Indigenous households who owned their home with or without a mortgage in 2014–15 (30%) was similar to the proportions in 2012–13 and 2008 (both 32%) (SCRGSP 2016a).



Notes

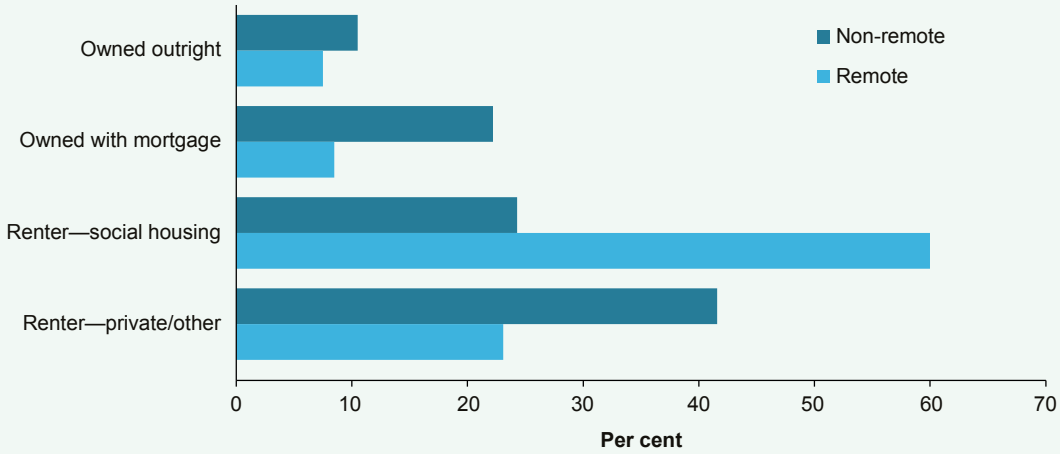
1. Data for 'Other households' are from the 2014 General Social Survey.
2. See Box 7.1.1 for definitions of the tenure types shown.

Source: AIHW analysis of the 2014 General Social Survey (TableBuilder); AIHW analysis of the 2014–15 National Aboriginal and Torres Strait Islander Social Survey (TableBuilder).

Figure 7.1.2: Housing tenure of households, by Indigenous status, 2014–15

There were also differences in tenure type by remoteness area (Figure 7.1.3). In 2014–15:

- Indigenous households in non-remote areas were twice as likely to own their home (with or without a mortgage) as Indigenous households in remote areas —33% compared with 16%
- Indigenous households in remote areas were more than twice as likely to live in social housing as Indigenous households in non-remote areas—60% compared with 24%.



Note: See Box 7.1.1 for definitions of the tenure types shown.

Source: AIHW analysis of the 2014–15 National Aboriginal and Torres Strait Islander Social Survey (TableBuilder)

Figure 7.1.3: Housing tenure of Indigenous households, by remoteness area, 2014–15

Box 7.1.1: About the housing tenure data in this article

Tenure type describes whether a dwelling is owned, rented, or occupied under some other arrangement. For the analyses shown in this chapter, distinctions are made between:

- two types of home owners—people with and without a mortgage. The category 'owned with a mortgage' consists of participants in rent/buy and shared equity schemes and those living in a household in which payments were being made on mortgages or secured loans towards the purchase of the dwelling.
- two types of renters:
  - people renting from social housing providers
  - private/other renters (includes people renting from real estate agents, unrelated persons, relatives, owner–managers of caravan parks, employers and other landlords, and people for whom landlord type was not stated)
- households with some other tenure type (including dwellings being occupied under a life tenure scheme) and households for which information on tenure type was not stated.

Households occupying their dwelling 'rent free'—that is, where the household exchanges no money for lodging and is not an owner of the dwelling—are classified as renters.

Information about housing tenure can be presented about 'households' (see Glossary) or about 'people living in households'. This article presents information about households. Indigenous households are defined as households in which at least one resident (of any age) identified as being of Aboriginal and/or Torres Strait Islander origin.

Housing assistance

Housing assistance aims to relieve the pressures of housing costs, and provide safe and secure housing for many low-income households, particularly households that are disadvantaged or vulnerable (see also Chapter 6.1 'Social housing').

Due to the multiple disadvantages that many Indigenous Australians face in the housing market, they are a priority group for (or focus of) many housing assistance services. This section provides information on the programs that assist the largest number of Indigenous households, namely Commonwealth Rent Assistance (CRA) and social housing (see Box 7.1.2). Note that the data in this section are administrative by-product data, rather than survey data as in the previous section on 'Housing tenure'. Due to differences in the collections, the estimates of the number of households living in social housing differ between the two sources.

Assistance from CRA

CRA is a non-taxable income supplement payable to eligible people who rent in the private or community housing rental markets (see Box 7.1.2). Recipients of CRA are 'income units'—that is, a person or a group of persons within a household, whose command over income is shared (see Glossary).

Data on the recipients of CRA show that:

- as at 26 June 2016, 67,387 income units receiving CRA reported having an Indigenous member (this represents 5% of all CRA recipients of around 1.3 million income units)
- the proportion of Indigenous income units in total CRA income units has increased from 3.6% in 2009 to 5.0% in 2016
- over the period 2009 to 2014, the proportion of Indigenous income units in rental stress, even after receiving CRA, ranged within a narrow band of 29% to 31%; this proportion was slightly higher in 2015 and 2016 (both 33%) (AIHW analysis of AIHW 2014a; SCRGSP 2014, 2015, 2016b, 2017).

While CRA data relate to income units rather than to households, data from the ABS 2013–14 Survey of Income and Housing suggest that, in practice, the clear majority of income units are households. Specifically, data from that survey indicate that, among CRA recipients, there are about 9.3 households for every 10 income units (see the 'Methods and conventions' section of this report for supplementary technical information related to housing assistance data; S7.1.1). Using this information, it can be estimated that 62,900 Indigenous households were receiving CRA in June 2016—equating to one-quarter (25%) of all Indigenous households (see 'Methods and conventions'; S7.1.2). By comparison, an estimated 13% of other households (or about 1.2 million) were receiving CRA. Although an estimated 75% of Indigenous households do not receive CRA, some would receive other forms of housing assistance.

Box 7.1.2: Major housing assistance programs

Social housing: This is rental housing provided by not for-profit, non-government or government organisations to eligible households, with rents set below market rates (based on a percentage of a tenant's income).

There are four main social housing programs in Australia. Of these, two are 'mainstream' programs available to all Australians—public housing and community housing (see Chapter 6.1 'Social housing'). The other two are specifically aimed at Indigenous Australians—state owned and managed Indigenous housing, and Indigenous community housing. As well, from 2008–09, some remote dwellings in the Northern Territory were transferred from Indigenous community housing programs to public housing. These are referred to as 'NT remote public housing'.

Commonwealth Rent Assistance: This is a non-taxable income supplement funded by the Australian Government. It is payable to people who rent in the private housing market and receive an income support payment, or more than the base rate of Family Tax Benefit Part A, and who pay rent above a minimum threshold. CRA is paid at 75 cents for every dollar above a minimum rental threshold until a maximum rate is reached. The minimum threshold and maximum rates vary according to the composition of an income unit's household, including the number of children. CRA may also be payable to people living in mainstream community housing or Indigenous community housing and, in some jurisdictions, to people living in state owned and managed Indigenous housing.

Recipients of CRA are 'income units' not households (see Glossary). Indigenous income units are those in which at least one member has self-identified as being Indigenous.

Social housing assistance

As at 30 June 2016:

- 44,228 Indigenous households lived in social housing managed through either the public housing program, mainstream community housing program or state owned and managed Indigenous housing programs
- almost 18% of Indigenous households were living in social housing managed by one of these three programs, compared with 3.9% of other households
- of these three programs, public housing was the largest provider of social housing to Indigenous households, with 13% of Indigenous households living in this housing
- Indigenous households were 4 times as likely as other households to live in public housing (12% compared with 3.1%, respectively) and 3 times as likely to live in mainstream community housing (2.2% compared with 0.7%) (Table 7.1.1).

Table 7.1.1: Households living in social housing, by Indigenous status, 30 June 2016

	Indigenous households		Other households	
Type of social housing	**Number**	**Rate[a]**	**Number**	**Rate[a]**
Public housing	29,293	11.8	282,926	3.1
Mainstream community housing[b]	5,377	2.2	62,821	0.7
State owned and managed Indigenous housing	9,558	3.8	102	0.0
Total	**44,228**	**17.8**	**345,849**	**3.8**

(a) Per 100 households. See 'Methods and conventions'; S7.1.2 for information on the denominator used.

(b) Total household counts for Mainstream community housing data may not match other published totals due to gaps in detailed information about tenants. Queensland provided partial unit record tenant data for the first time in 2015–16 (unit record data was not available for 3,840 households). Unit record data are not provided for the Northern Territory.

Sources: AIHW analysis of ABS 2015b; AIHW 2017b; AIHW National Housing Assistance Data Repository.

In addition to the dwellings managed by these three social housing programs, Indigenous households also access social housing via the Indigenous community housing program and the Northern Territory remote public housing program. Together, these two programs managed 22,630 dwellings in 2015–16, however information about whether these dwellings are tenanted and the Indigenous status of tenants living in these dwellings is incomplete or not available. For more information on social housing, see Chapter 6.1 'Social housing'.

Housing quality

The 2014–15 NATSISS collected information on basic types of household facilities that are considered important for a healthy living environment, as well as whether the household dwelling had any major structural problems. These data show that in 2014–15:

- 29% of Indigenous Australians (28% of people aged 15 and over and 32% of people aged under 15) were living in a dwelling with major structural problems. Most commonly, these problems were major cracks in the walls or floors, followed by major plumbing problems
- 15% of Indigenous Australians (15% of people aged 15 and over and 14% of people aged under 15) were living in a household in which at least 1 basic facility considered important for a healthy living environment (namely, facilities for preparing food, for washing clothes, for washing people, or sewerage facilities) were not available or did not work
- nearly 1 in 5 (19%) Indigenous people were living in a house that did not meet an acceptable standard; that is, at least one basic household facility was unavailable or there were more than 2 major structural problems (Table 7.1.2).

Indigenous Australians in remote areas were more likely than Indigenous Australians in non-remote areas to be living in a dwelling with major structural problems (37% compared with 27%), that lacked basic household facilities (27% compared with 11%) and that did not meet acceptable standards (31% compared with 16%) (Table 7.1.2).

The proportion of Indigenous adults living in dwellings with major structural problems or in which 1 or more basic facilities were not available was similar in 2014–15 and 2008. Comparable data for non-Indigenous Australians are not available.

Table 7.1.2: Proportion of Indigenous Australians living in dwellings with structural problems or with household facilities that are not available or do not work, by remote and non-remote areas, 2014–15

	Non-remote	Remote	Australia
Major structural problems			
Number of types of structural problem			
1–2	*20.5	*27.7	22.0
3 or more	6.6	8.9	7.1
At least 1 major structural problem	**27.1*	**36.8*	*29.1*
Most common structural problems			
Major cracks in walls / floors	10.8	13.2	11.3
Major plumbing problems	*6.2	*12.1	7.4
Walls or windows that are not straight	*5.8	*10.7	6.9
Major electrical problems	*5.0	*9.9	6.1
Wood rot / termite damage	5.8	6.3	5.9
Household facilities			
Has household facilities that are not available or do not work[(a)]	*11.3	*26.7	14.5
Facilities that do not work			
Facilities for preparing food	*6.8	*18.3	9.1
Facilities for washing clothes or bedding	*5.7	*15.2	7.7
Facilities for washing people	2.1	5.1	2.8
Sewerage facilities	*2.2	*4.2	2.6
Overall housing standard[(b)]			
Not acceptable	*16.1	*31.1	19.3
Total[(c)]	**100.0**	**100.0**	**100.0**
***Total* (number)**	**542,800**	**143,800**	**686,900**

* Statistically significant difference between the proportions for remote and non-remote areas (p<0.05).

(a) Includes facilities such as cooking facilities, a fridge, toilet and bath or shower.

(b) A house was deemed to be of an acceptable standard where it had fewer than 3 structural problems and had working facilities for washing people, for washing clothes or bedding, for preparing food, and working sewerage facilities. A house was deemed to be not of an acceptable standard where any of the these facilities were unavailable or there were more than 2 structural problems.

(c) Total includes 'not stated' responses. Sum of components does not equal the total as households may have reported more than one type of structural problem or lack of access to more than one type of household facility.

Source: AIHW analysis of 2014–15 National Aboriginal and Torres Strait Islander Social Survey (TableBuilder).

Overcrowding

In basic terms, overcrowding occurs when a dwelling is too small for the size and composition of the household living in it. Overcrowding can put stress on household infrastructure, such as food preparation areas, sewerage systems and laundry facilities. It can also adversely affect health, education and family relationships (AIHW 2014b; SCRGSP 2016a).

Various approaches are used to define and measure the extent of overcrowding. This chapter uses the definition currently used by the ABS, which is based on the Canadian National Occupancy Standard (CNOS) (see Glossary). Using this definition, a dwelling is overcrowded if it requires at least one additional bedroom to accommodate the people who usually live there, given their ages, sex, and relationships to each other.

Note that the concept of overcrowding is subjective; Indigenous people—indeed, any Australians—may be defined as living in overcrowded conditions based on a particular standard such as the CNOS, but may themselves not feel that their household is overcrowded (Keys Young 1998; Memmott et al. 2012).

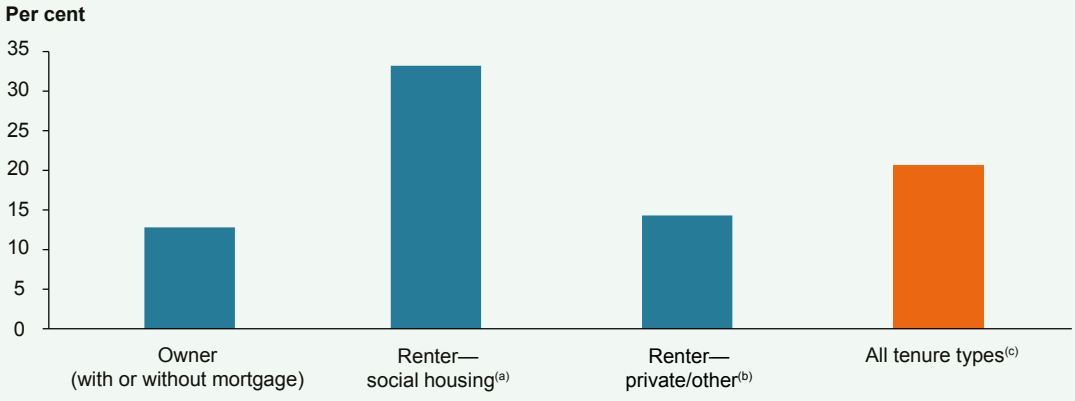
According to data from the 2014–15 NATSISS, 10% of Indigenous households were living in overcrowded dwellings (29,000 households). This was 3 times the rate of overcrowding among other households (3.0% in 2013–14, corresponding to about 258,300 households, based on the ABS Survey of Income and Housing) (ABS 2016).

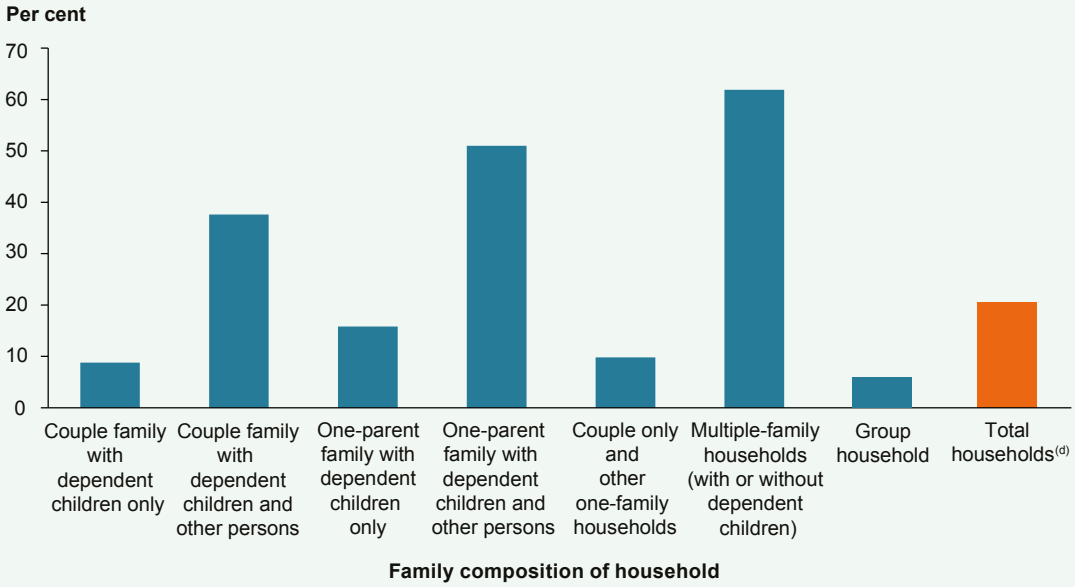
As well as information about Indigenous households, data are also available on the number of Indigenous people living in overcrowded dwellings. Those data show that, in 2014–15:

- 1 in 5 (21%, or 141,400 people) Indigenous Australians were living in overcrowded dwellings
- younger Indigenous Australians were more likely than Indigenous Australians in older age groups to live in overcrowded conditions—about one-quarter of people aged under 15 and aged 15–24 were living in overcrowded conditions (24% and 25%, respectively), compared with 17% of people aged 24–34, 35–44 and 45–54, and 10% of people aged 55 and over
- Indigenous Australians living in remote areas were more than twice as likely to be living in overcrowded conditions as Indigenous Australians in non-remote areas—41% compared with 15%
- across states and territories, the rate of overcrowding was highest in the Northern Territory, where just over half (53%) of Indigenous Australians were living in overcrowded conditions. The rate of overcrowding in the Northern Territory was about double that for the jurisdiction with the next highest rate—Western Australia (25%)
- within the Northern Territory, the rate of overcrowding was highest in *Very remote* areas, where two-thirds (67%) of Indigenous Australians were living in overcrowded conditions (compared with 36% in *Remote* areas, and 31% in non-remote areas)
- the rate of overcrowding varied according to housing tenure, with the highest rate among Indigenous Australians living in social housing (33%), and the lowest among Indigenous Australians living in a home owned outright or with a mortgage (13%)
- the rate of overcrowding also varied according to the family composition of the household (Figure 7.1.4).

Available data suggest a decline in overcrowding over time:

- NATSISS data indicate that the proportion of Indigenous people living in overcrowded conditions decreased from 27% in 2004–05 to 21% in 2014–15 (see Chapter 9.2 'Indicators of *Australia's welfare*'). (SCRGSP 2016a).
- Census data indicate that the proportion of Indigenous households that were living in overcrowded conditions fell from 16% in 2001 to 11% in 2016.





(a) Consists of households renting their dwelling (or occupying it rent free) from a state or territory housing authority, housing co-operative or church group, Indigenous Housing Organisation, community housing or Council.

(b) Consists of households renting their dwelling (or occupying it rent free) from real estate agents, unrelated persons, relatives, owner/managers of caravan parks, employers and other landlords, and those for whom landlord type was not known.

(c) Includes households with other tenure types and households for which tenure type was not stated.

(d) Includes lone-person households.

Source: AIHW analysis of 2014–15 NATSISS (TableBuilder).

Figure 7.1.4: Indigenous people living in overcrowded households, by tenure type, and by family composition of household, 2014–15

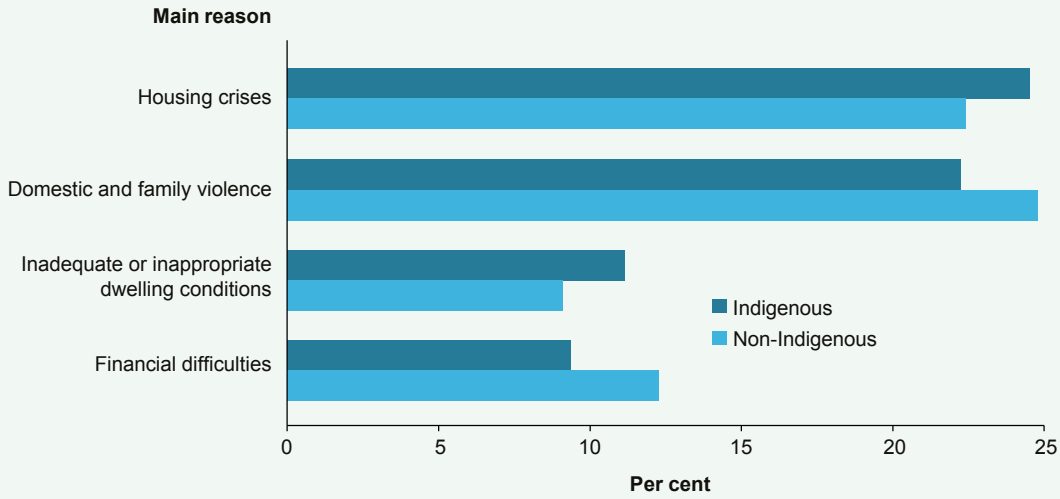
Homelessness

The 2014–15 NATSISS asked Indigenous Australians about experiences of homelessness. Note, however, that the NATSISS did not specifically ask about the experience of living in severely crowded dwellings (households that require 4 or more bedrooms according to the CNOS), which is considered homelessness under the ABS statistical definition (see Glossary). According to NATSISS data:

- 29% of Indigenous Australians aged 15 and over (an estimated 129,000 people) had been homeless at some time in their life. More than 1 in 4 (27%) of these people had been homeless in the previous 2 years. The results were similar for males and females (ABS 2016). By comparison, data from the 2014 GSS suggest that 13% of non-Indigenous Australians aged 15 and over had ever experienced homelessness.

Governments across Australia fund a range of services to support people who are homeless or at risk of becoming homeless. These specialist homelessness services (SHS) are delivered by non-government organisations. These include those that specialise in delivering services to specific groups (such as young people or people experiencing domestic and family violence), as well as those that provide more generic services to people facing housing crises.

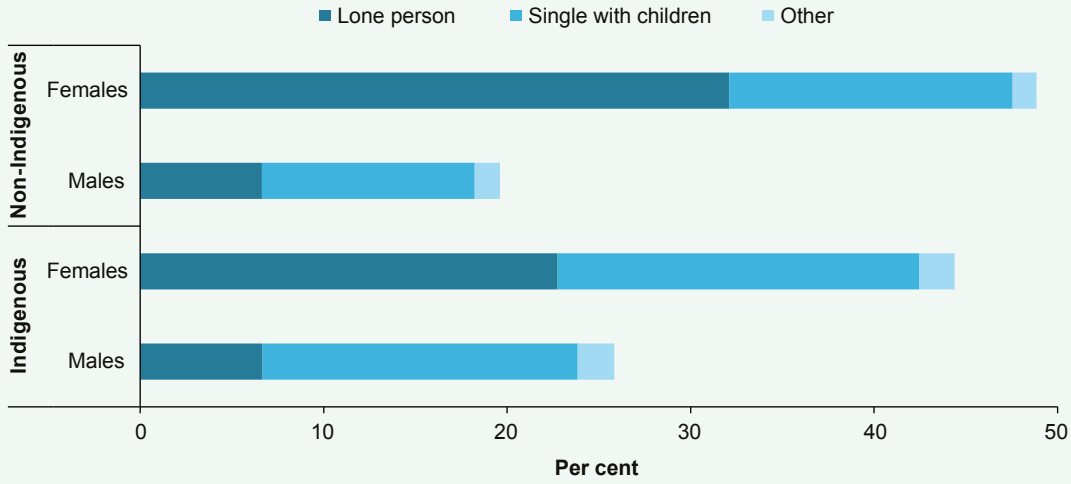
- In 2015–16, an estimated 61,700 Indigenous people accessed SHS.
- Indigenous people made up 24% of people accessing SHS in 2015–16. The rate of use of these services among Indigenous Australians was more than 9 times that for non-Indigenous Australians.
- A total of 61% of Indigenous SHS clients in 2015–16 were female, compared with 58% of non-Indigenous clients.
- Indigenous SHS clients tend to be younger than non-Indigenous clients; in 2015–16, more than half (54%) were aged under 25 compared with two-fifths (41%) of non-Indigenous clients.
- In 2015–16, more than 1 in 5 Indigenous SHS clients (22%) cited domestic and family violence as their main reason for seeking assistance, slightly less than the proportion among non-Indigenous clients (25%) (Figure 7.1.5).
- More than 1 in 3 (37%) Indigenous SHS clients in 2015–16 reported domestic and family violence as a reason for seeking assistance or were assessed by the SHS agency as having a need for domestic and family violence assistance, a similar proportion to that among non-Indigenous clients (37%). Lone females and single clients accompanied by children were more likely than other clients to require domestic and family violence assistance (Figure 7.1.6).
- The proportion of Indigenous clients ending an SHS support period in stable housing (either public or private) increased from 57% in 2012–13 to 64% in 2015–16 (AIHW 2017b).



Note: The four most common reasons given by Indigenous clients for seeking assistance are shown. These were also the four most common reasons for non-Indigenous clients, but in a different order.

Source: AIHW 2017b.

Figure 7.1.5: SHS clients, main reason for seeking assistance, by Indigenous status, 2015–16



Source: AIHW SHS Collection Data Cubes.

Figure 7.1.6: SHS clients citing domestic and family violence as a reason for seeking assistance or being assessed by the SHS agency as requiring such assistance, by Indigenous status, sex, and family type, 2015–16

What is missing from the picture?

Much of what we know about Indigenous Australians and the gap between Indigenous and non-Indigenous outcomes relies on statistics that are calculated using data from the Census, surveys and administrative data from service providers. These data collections rely on people identifying themselves and/or their family members as Indigenous, and this information being accurately recorded and supplied to relevant agencies. The AIHW and the ABS strive to collect and present accurate data, as well as to ensure that service providers are aware of the importance of collecting accurate Indigenous status information. However, they acknowledge that, for various reasons, not all Indigenous people are identified in the different data sets, which can lead to an under-count. For example, it is estimated that around two-thirds of Indigenous Australians have formally identified as such to Medicare either on enrolment or using the Voluntary Indigenous Identifier form. Under-identification of Indigenous people in key data collections makes it difficult to report accurately on the circumstances and experiences of Indigenous Australians, and to assess whether their needs are being met.

The Indigenous estimated resident population (ERP) is derived from the Census counts after adjusting for the under-count and for those records where Indigenous status is unknown. In 2011, the Indigenous under-count was estimated to be 17% (114,000 persons) and about 1 million Census records (4.9%) had an unknown Indigenous status (ABS 2012b). The 2011 Indigenous ERP was 669,881 people—an increase of 152,838 people, or 30% from the 2006 ERP. The increase was due to several factors, including natural population growth, improved Census estimates and changes in Indigenous identification.

Caution is needed when comparing data from two Censuses. For example, Census data show that, in 2006, 4.6% of Indigenous Australians needed help with daily activities due to a disability or health condition, compared with 5.7% in 2011. This could suggest that the proportion of Indigenous people who needed help has increased since 2006. However, the change could be due to more people with a disability being identified as Indigenous in 2011 or due to the population having aged since 2006. While it is likely that all scenarios have contributed, it is often difficult to separate these effects.

Complete information on the use of housing assistance among Indigenous Australians is not currently available. There is a lack of reliable information on the number of households living in social housing and also receiving CRA; hence, it is not possible to derive the number of Indigenous (or other) households receiving assistance from at least one major housing assistance program.

There is a high level of missing information about Indigenous status in some housing assistance data (for example, Indigenous status was missing for 25% of households in public housing in 2015). The coverage of some administrative data collections is also incomplete (for example, data on mainstream community housing in the Northern Territory are not available by Indigenous status).

Available information about the housing aspirations of Indigenous people is limited. Research suggests that most Indigenous Australians aspire to home ownership, with the main motivations being intergenerational asset building for future generations, and housing security (Memmott et al. 2009). Further information about the housing aspirations of Indigenous Australians would be useful in determining the appropriateness of current housing policies.

If successful programs are to be put in place to deal with the myriad of factors underlying and perpetuating Indigenous disadvantage, more information about the effectiveness of existing or newly implemented programs is needed. There has been relatively little robust evaluation of the performance and effectiveness of Indigenous programs and policies (Department of Finance and Deregulation 2009; Productivity Commission 2015). Rigorous evaluation of policies, programs and interventions can provide the evidence for 'what works' and ensure that future efforts are directed at strategies that produce positive outcomes for Indigenous Australians.

Where do I go for more information?

Data on issues covered in this Chapter are available from *The health and welfare of Aboriginal and Torres Strait Islander peoples: 2015*, and the *Aboriginal and Torres Strait Islander Health Performance Framework*.

The AIHW website includes further information on housing assistance programs. The reports *Housing circumstances of Indigenous households: tenure and overcrowding*, *Housing assistance for Indigenous Australians* and other recent publications are available for free download.

Information from the 2014–15 NATSISS is available from the ABS website.

7.2 Factors affecting the social and emotional wellbeing of Indigenous Australians

Social and emotional wellbeing is strongly linked to the welfare of the individual and community. Stressful life events, recent or past trauma, and experiences of discrimination, bullying or harassment can adversely affect a person's social and emotional wellbeing and contribute to higher levels of psychological distress and poor mental health (Ferdinand et al. 2012; Kelaher et al. 2014; Net Industries 2017). These experiences may reduce people's willingness to contact services, negatively affecting their health and welfare outcomes (Kelaher et al. 2014).

Poor social and emotional wellbeing is also linked to employment: it can be a barrier to finding or keeping a job, stressful events at work can affect mental health, and the loss of a job or inability to find work can cause or increase psychological distress (Harnois & Gabriel 2000; Krueger et al. 2011; Olesen et al. 2013). Problems with finding or keeping employment have broader impacts on income, living conditions and opportunities for the affected individual as well as their family and community (Belle & Bullock 2010).

Social and emotional wellbeing for Aboriginal and Torres Strait Islander Australians is a broad construct that includes mental health as well as factors such as connection to country, culture, spirituality, ancestry, family and community (Gee et al. 2014). Factors linked to poor social and emotional wellbeing among Indigenous Australians include discrimination, grief, past and ongoing child removals and unresolved trauma, social exclusion, economic and social disadvantage, incarceration, experiences of violence, substance use and poor physical health (Zubrick et al. 2014).

Mental and substance use disorders are the largest contributor to the burden of disease in Indigenous people, accounting for 19% of the total burden in 2011 (AIHW 2016). Suicide and self-inflicted injuries accounted for a further 4.5% of the burden. Dealing with the causes of poor social and emotional wellbeing, self-harm and suicide are therefore critical to improving both the health and welfare of Indigenous Australians.

The effects of stressful events on wellbeing are influenced by differences in resilience—that is, how people cope with stress and the resources they have available to make adjustments (Net Industries 2017). These resources may be physical (for example, health status), personal (such as values, self-control, and religious beliefs) or social (such as networks and supports). Resilience is strongly related to an individual's environment, and the ability of their family, community and culture to provide these resources in culturally meaningful ways (First Nations Information Governance Centre 2014; Ungar 2008).

For Indigenous Australians, factors such as family and community connectedness, supportiveness, sharing and leadership have been found to be important in building resilience and strength, and in enhancing social and emotional wellbeing (McLennan 2015; Parker & Milroy 2014). This finding reinforces the importance of a well-functioning community as a key factor in improving the social and emotional wellbeing of Indigenous Australians. More information about community functioning is provided in Chapter 7.1 'Community factors and Indigenous wellbeing'.

This chapter looks at some of the key factors affecting and reflecting the social and emotional wellbeing of Indigenous Australians, including psychological distress and life stressors, experiences of discrimination, substance use, and self-harm and suicide.

Psychological distress and stressors

According to the Australian Bureau of Statistics (ABS) 2014–15 National Aboriginal and Torres Strait Islander Social Survey (NATSISS):

- more than two-thirds (68%) of Indigenous Australians aged 15 and over had experienced at least one personal stressor in the previous 12 months. The most commonly experienced stressors were the death of a family member or close friend (28%), not being able to get a job (19%), serious illness (12%) and work-related stressors (11%)
- more than one-quarter (28%) of Indigenous Australians aged 15 and over and almost one-third (32%) of Indigenous children aged 0–14 lived in a household where household members had run out of money for basic living expenses at least once in the previous 12 months
- one-third (33%) of Indigenous Australians aged 15 or over had experienced high or very high levels of psychological distress in the previous 4 weeks
- Indigenous adults were 2.6 times as likely as non-Indigenous adults to have high or very high levels of psychological distress (ABS 2016).

Experiences of discrimination

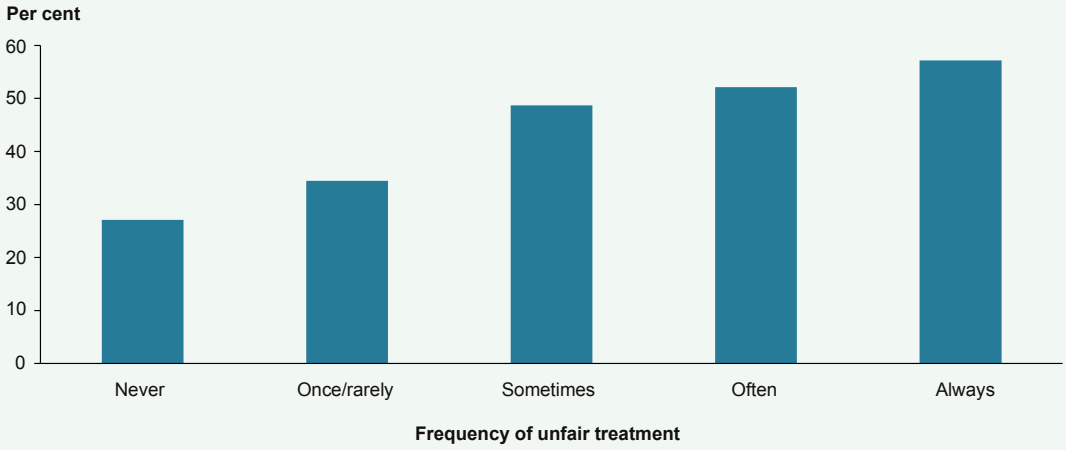
Racism and discrimination affect wellbeing in several ways, both directly and indirectly. They cause psychological distress and increase the risk of mental health issues, such as depression (Ferdinand et al. 2012; Priest et al. 2011). They are also associated with risky behaviours, such as substance use (Paradies 2008). Anticipation of being subject to racism may cause anxiety. Fear of discrimination may lead to avoidance of certain people, places or situations, which can have negative consequences—for example, not seeking health care when it is needed, poor school attendance, or social isolation. This avoidance can have profound effects on socioeconomic outcomes and health status.

A survey of Aboriginal people in Victoria found that the risk of high levels of psychological distress increased as the volume of racism experienced increased (Ferdinand et al. 2012). According to Reconciliation Australia, 46% of Indigenous respondents to its 2016 Reconciliation Barometer survey reported experiencing racial prejudice in the previous 6 months, compared with 18% of general community respondents (Reconciliation Australia 2017).

According to the 2014–15 NATSISS, of Indigenous Australians aged 15 and over:

- one-third (33%, or about 148,400 people) felt that they had been treated unfairly in the previous 12 months because they were Indigenous. The most commonly reported form of unfair treatment was hearing racial comments or jokes (23%), followed by being called names, teased or sworn at (14%), and not being trusted (9.3%)
- 4.8% (21,100 people) reported that discrimination had been a stressor in their lives in the previous 12 months
- 14% (62,300 people) had avoided situations in the previous 12 months due to past unfair treatment (ABS 2016).

Among Indigenous people aged 15 and over who felt they had been treated unfairly in the previous 12 months because they were Indigenous (148,400 people), 44% had high or very high levels of psychological distress. This was 1.6 times the rate of high/very high psychological distress among Indigenous people who had not been treated unfairly in the previous 12 months (27%). The proportion of Indigenous Australians with high or very high levels of psychological distress increased with the frequency of unfair treatment experienced in the previous 12 months—from 34% of people who felt unfairly treated once or rarely to 57% of people who always felt unfairly treated (Figure 7.2.1).



Source: AIHW analysis of 2014–15 NATSISS (TableBuilder).

Figure 7.2.1: Proportion of Indigenous Australians aged 15 and over with high or very high levels of psychological distress, by frequency of unfair treatment in the previous 12 months, 2014–15

Use of alcohol and other drugs

Alcohol and other drugs are the cause of, or contribute to, a wide range of social problems among Indigenous Australians. These include violence, social disorder, family breakdown, child neglect, loss of income or diversion of income to purchase alcohol and other substances, and high levels of imprisonment (Wilkes et al. 2014). See also Chapter 7.3 'Community safety among Indigenous Australians' for information on contact with the criminal justice system and experiences of violence among Indigenous Australians.

Alcohol

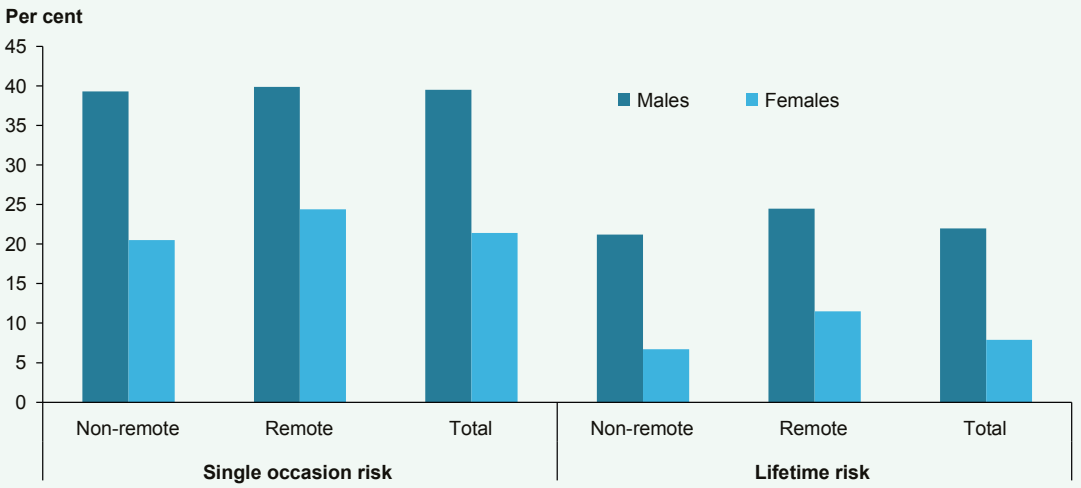
Most Australian adults drink alcohol, and do so at levels that cause few adverse effects. However, a substantial proportion of people drink at levels that increase the risk of alcohol-related harm to themselves and others. As well as the risks to an individual's physical health, harmful use of alcohol is associated with anti-social behaviour, violence, anxiety, depression, self-harm, road traffic accidents, and other unintentional injuries (NHMRC 2009).

According to the 2014–15 NATSISS, among Indigenous Australians aged 15 and over:

- 38% were abstainers (that is, they never consumed alcohol, or had consumed alcohol on 1 day or less in the previous 12 months)
- 15% drank at levels that exceeded the Australian guidelines for lifetime risk of long-term harm (more than 2 standard drinks per day, on average), a decrease from 19% in 2008
- 30% had consumed alcohol at a level that exceeded the Australian guidelines for single occasion risk of harm at least once (more than 4 standard drinks on a single occasion), a decrease from 38% in 2008
- drinking at risky levels was significantly more common among males than females (Figure 7.2.2).

Data from the 2011–12 Australian Health Survey and the 2012–13 Australian Aboriginal and Torres Strait Islander Health Survey show that, after adjusting for age:

- Indigenous Australians aged 15 and over were 1.2 times as likely as non-Indigenous Australians of this age to abstain from alcohol
- the proportions of Indigenous and non-Indigenous people aged 15 and over drinking at levels that put them at risk of lifetime harm were similar
- Indigenous Australians aged 15 and over were 1.1 times as likely as non-Indigenous Australians of this age to drink at levels putting them at risk of short-term harm (ABS 2013).



Source: AIHW analysis of ABS 2016.

Figure 7.2.2: Proportion of Indigenous Australians drinking at risky levels, by sex and remoteness area, 2014–15

Other drug use

According to the 2014–15 NATSISS, 30% of Indigenous Australians aged 15 and over had used other drugs (drugs other than alcohol and tobacco) in the previous 12 months, an increase from 22% in 2008. The most commonly used substance was marijuana (19%), followed by analgesics or sedatives used for non-medical purposes (13%). About 1 in 20 (4.8%) Indigenous Australians aged 15 and over had used amphetamines in the previous 12 months. Amphetamines can be used in several forms (for example, powder, tablet or ice); survey data for the total Australian population suggest that the preferred form is ice (or crystal methamphetamine), with half (50%) of recent amphetamine users aged 14 and over in 2013 reporting that they mainly use ice (AIHW 2014).

Data from the 2013 National Drug Strategy Household Survey suggest that Indigenous Australians are more likely than non-Indigenous Australians to report using substances, particularly marijuana and pharmaceuticals used for non-medical purposes (AIHW 2014).

Self-harm and suicide

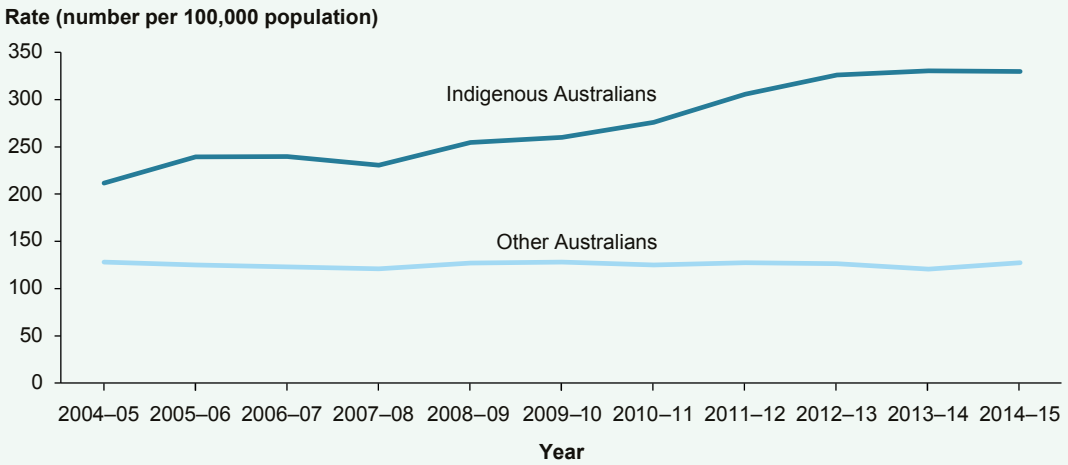
Suicide and self-harm cause great distress and grief in both Indigenous and non-Indigenous communities. Indigenous Australians experience higher rates of self-harm and death from suicide than non-Indigenous Australians. Underlying this is a complex set of factors, including the effects of past trauma; psychological distress; geographic and social isolation and marginalisation; socioeconomic disadvantage; substance abuse; and experiences of violence, abuse and neglect.

In 2014–15, there were more than 2,200 hospitalisations of Indigenous Australians for non-fatal self-harm (that is, a hospitalisation for self-inflicted injury where the patient was discharged alive)—an age-standardised rate of 315 per 100,000 population. This was 2.6 times the rate for non-Indigenous Australians.

- Among both Indigenous and non-Indigenous Australians, females were more likely than males to be hospitalised for non-fatal self-harm.
- The age-standardised rate of hospitalisations of Indigenous Australians for non-fatal self-harm increased by almost 60% between 2004–05 and 2014–15. By comparison, the rate for other Australians remained stable during this period (SCRGSP 2016) (Figure 7.2.3).

Between 2011 and 2015, there were 690 deaths due to suicide among Indigenous Australians in New South Wales, Queensland, Western Australia, South Australia and the Northern Territory combined—an age-standardised rate of 23 per 100,000 population. This was 2.1 times the rate for non-Indigenous Australians in those jurisdictions.

- Among both Indigenous and non-Indigenous Australians, males were around 3 times as likely as females to die from suicide.
- The suicide death rate was greatest among Indigenous Australians aged 25–34, at 41 per 100,000 population (SCRGSP 2016).
- Between 2006 and 2015, the suicide death rate increased among both Indigenous (from 19 to 26 per 100,000 population) and non-Indigenous Australians (from 10 to 13 per 100,000 population) (Figure 7.2.4).

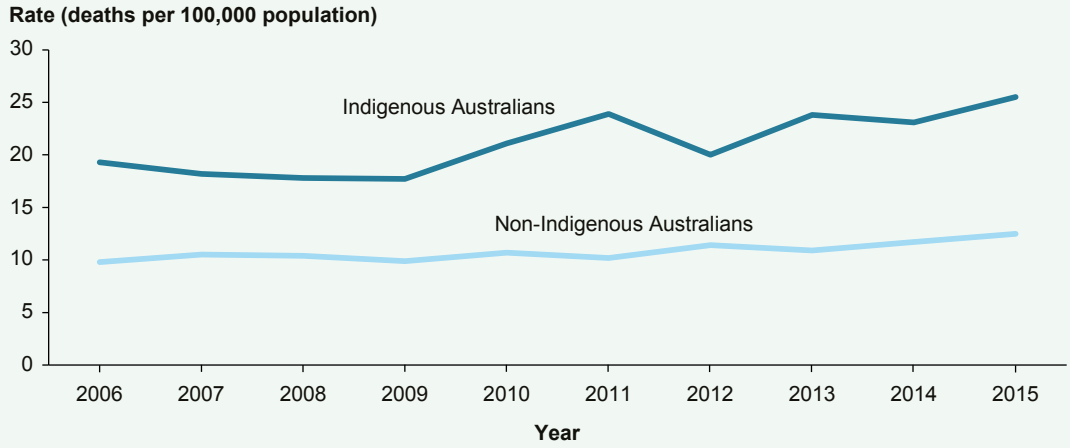


Notes

1. 'Non-fatal' refers to records where the patient was discharged alive. 'Intentional self-harm' refers to a principal diagnosis of injury and poisoning (ICD-10-AM codes S00–T98) and a first reported external cause reported for ICD-10AM codes X60–X84, based on the International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification.
2. Rates have been directly age-standardised to the 2001 Australian standard population and are expressed per 100,000 population.

Source: SCRGSP 2016.

Figure 7.2.3: Rate of non-fatal hospitalisations for intentional self-harm, by Indigenous status, 2004–05 to 2014–15



Notes

1. Rates have been directly age-standardised to the 2001 Australian standard population and are expressed per 100,000 population.
2. Suicide includes ICD-10 codes X60–X84 and Y87.0. Causes of death data from 2006 onward are subject to a revisions process. The status of data in this figure is: 2006–2012 (final), 2013 (revised), 2014–2015 (preliminary).

Source: AIHW 2017.

Figure 7.2.4: Suicide rates, by Indigenous status, 2006 to 2015

Being part of a resilient, well-functioning community that includes strong family and community support networks, that minimises exposure to harm, and that provides opportunities for engagement can help to prevent suicide among Indigenous Australians (DoHA 2013). Access to culturally appropriate and coordinated support services, and the involvement of Elders in establishing suicide prevention activities at the community level, is also critical (Dudgeon et al. 2016). Research among First Nations people in Canada has also found that community empowerment, self-determination, and renewal and maintenance of culture protect against suicide (Chandler & Lalonde 2008).

7.3 Community safety among Indigenous Australians

Many factors can influence community safety and wellbeing for Aboriginal and Torres Strait Islander people. Among the positive influences are being connected to country, land, family and spirit; having strong and positive social networks; and having strong leadership in both the family and the community (see Chapter 7.1 'Community factors and Indigenous wellbeing' for more information about these and other positive influences on community functioning).

This article focuses on contact with child protection services, contact with the criminal justice system, and community experiences of safety and violence. Indigenous Australians are over-represented in Australia's child protection, youth and adult justice systems. They also experience violence (particularly family and domestic violence) at rates well above those of non-Indigenous Australians. Factors contributing to this include past experience of violence and abuse (including in childhood), long-term social disadvantage, use of alcohol and drugs, and the ongoing impact of past dispossession and forced removal policies that have caused psychological trauma and contributed to the breakdown of traditional parenting, culture and kinship practices (SCRGSP 2016).

Contact with child protection services

The child protection system across Australia assists vulnerable children who have been, or are at risk of being, abused, neglected or otherwise harmed, or whose parents are unable to provide them with adequate care or protection. Children may receive a mix of child protection services. These include 'investigations', 'care and protection orders', and 'out-of-home care'. Investigations can lead to 'substantiations' if there is sufficient reason to believe that a child has been, or is at risk of being, abused, neglected or harmed. Definitions of key terms are available in the Glossary (see also Chapter 2.4 'Child protection' and Chapter 2.5 'A stable and secure home for children in out-of-home care').

Factors that may be associated with child abuse and neglect include poverty, substance abuse by parents, marginalisation, social isolation, parental exposure to violence and crime, low levels of parental educational achievement, and inadequate housing (AIHW 2014; Scott 2014). All these factors are more common among Indigenous Australians than non-Indigenous Australians. Protecting Indigenous children requires a multifaceted approach that takes account of these factors, and strengthens and empowers Indigenous families and communities (SNAICC 2015).

- In 2015–16, more than 46,600 Indigenous children aged 0–17 received child protection services and about 12,900 (43.6 per 1,000 population) were the subject of a child protection substantiation—a rate around 7 times that for non-Indigenous children (Figure 7.3.1).
- The most common reasons for substantiations for Indigenous children were emotional abuse and neglect (accounting for 39% and 36% of cases, respectively). By comparison, 47% of substantiations for non-Indigenous children were due to emotional abuse, and 20% due to neglect.
- More than one-third of children (35%) on care and protection orders as at 30 June 2016 were Indigenous despite making up only 5.5% of the Australian population aged 0–17.
- As at 30 June 2016, there were more than 16,800 Indigenous children in out-of-home care, a rate almost 10 times that for non-Indigenous children (Figure 7.3.1).

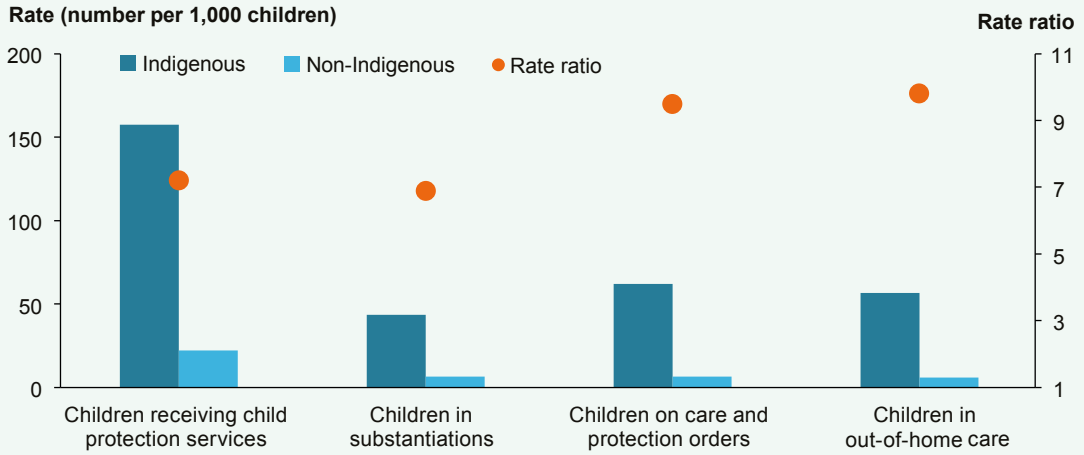

Figure 7.3.1: Children in the child protection system, by Indigenous status, 2015–16

Contact with police and the criminal justice system

In 2014–15, around 1 in 7 (15%) Indigenous people aged 15 and over reported that they had been arrested in the previous 5 years (20% of males and 9.2% of females) and over 1 in 3 (35%) had been formally charged by police at least once in their lifetime (48% of males and 23% of females) (ABS 2016a). Comparable data for the non-Indigenous population are not available.

Youth justice

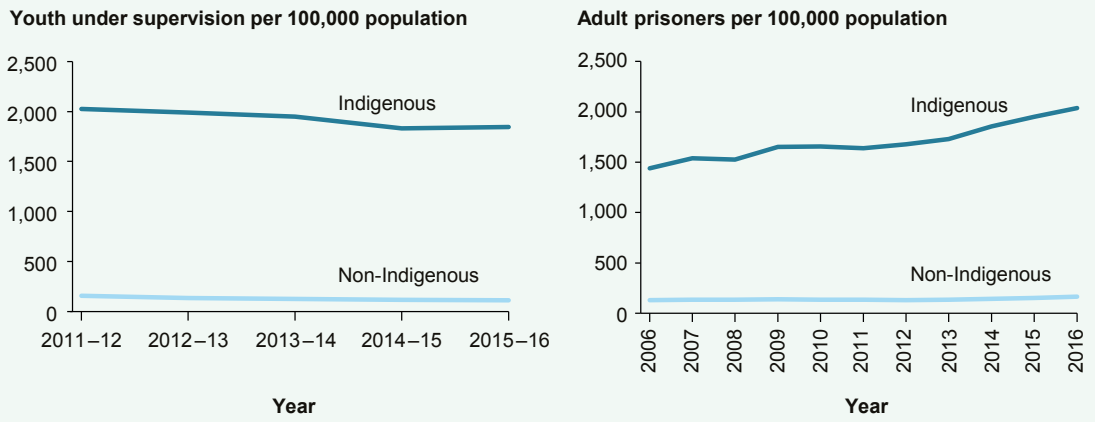
Supervision of young people on legal orders is a major aspect of Australia's youth justice system (see Chapter 2.6 'Youth justice supervision'). On an average day in 2015–16, the majority (84%) of young people under supervision were supervised in the community, with the remainder in secure detention facilities.

- Although only 5.5% of young Australians aged 10–17 are Indigenous, on an average day in 2015–16, nearly half (48%) of people of this age under supervision were Indigenous. Among people aged 10–17 supervised in detention, more than half (59%) were Indigenous.
- For both Indigenous and non-Indigenous Australians, about 4 in 5 people aged 10–17 under supervision on an average day in 2015–16 were male (80% for Indigenous, 83% for non-Indigenous). These proportions were higher among people in detention (89% for Indigenous, 91% for non-Indigenous).
- Between 2011–12 and 2015–16, the rate of Indigenous people aged 10–17 under supervision on an average day fell from 2,026 to 1,845 per 100,000 population (Figure 7.3.2).

Adult imprisonment

Indigenous Australians are greatly over-represented in adult prisons. They are generally younger than non-Indigenous prisoners and more likely to have been imprisoned before.

- As at 30 June 2016, around 10,600 prisoners identified as Indigenous. This accounted for more than one-quarter (27%) of the total Australian prison population. The Indigenous age-standardised imprisonment rate was 13 times that for non-Indigenous Australians (2,039, compared with 163 per 100,000 population) (ABS 2016b).
- Around 1 in 4 (24%) Indigenous prisoners were aged 24 or under, compared with 1 in 7 (14%) non-Indigenous prisoners.
- The majority of Indigenous and non-Indigenous prisoners were men (90% and 93%, respectively).
- Three-quarters (76%) of Indigenous prisoners had been imprisoned before, compared with half of non-Indigenous prisoners (49%).
- Between 30 June 2006 and 30 June 2016, the age-standardised Indigenous imprisonment rate increased by 42% compared with a 24% increase for non-Indigenous Australians (Figure 7.3.2).



Notes

1. Data for youth relate to young people aged 10–17 in detention or community supervision on an average day in the relevant year.
2. Data for adults are age-standardised rates for prisoners aged 18 and over (17 and over in Queensland) as at midnight on 30 June in the relevant year.

Sources: ABS 2016b; AIHW 2016.

Figure 7.3.2: Youth under supervision per 100,000 population, 2011–12 to 2015–16 and adult prisoners per 100,000 population, 2006 to 2016, by Indigenous status

Community experiences of safety and violence

Family violence in Indigenous communities is both a cause and an effect of social disadvantage, intergenerational trauma, poor parenting and substance misuse (see also Chapter 7.2 'Factors affecting the social and emotional wellbeing of Indigenous Australians' for information on the use of alcohol and other drugs by Indigenous Australians). It is likely to be linked to the effects of colonisation and dispossession, and past policies of removal, disempowerment and assimilation (Memmott et al. 2001).

In 2014–15 among Indigenous Australians aged 15 and over:

- 16% felt unsafe walking alone in their local area after dark and 8.1% felt unsafe at home alone after dark. Among both Indigenous and non-Indigenous Australians, females were more likely than males to feel unsafe when alone after dark (Figure 7.3.3)
- in the previous 12 months, 13% had experienced physical violence and 16% had been threatened with physical violence (ABS 2016a)
- more than two-thirds (68%) of people who had experienced physical violence reported that alcohol or other substances contributed to the most recent incident
- almost two-thirds (63%) of women and more than one-third (35%) of men who had experienced physical violence reported that the perpetrator of the most recent incident was a family member (AIHW analysis of ABS 2014–15 National Aboriginal and Torres Strait Islander Social Survey)

- the majority (69%) were aware of there being problems in their neighbourhood or community. The most commonly reported problems were theft (44%), dangerous or noisy driving (41%), alcohol (38%) and illegal drugs (37%) (ABS 2016a)
  - by comparison, 67% of non-Indigenous people aged 15 and over were aware of there being problems in their local area. The problems they most commonly reported were noisy driving (38%), dangerous driving (36%), offensive language/behaviour, rowdy behaviour and noisy neighbours (all 17%) (AIHW analysis of ABS 2014 General Social Survey)
- Indigenous Australians in remote areas were more likely to report neighbourhood or community problems than Indigenous Australians in non-remote areas (82% compared with 65%), and were more than twice as likely to report problems with alcohol, family violence, assault, rape, neighbourhood conflict and gambling (ABS 2016a).

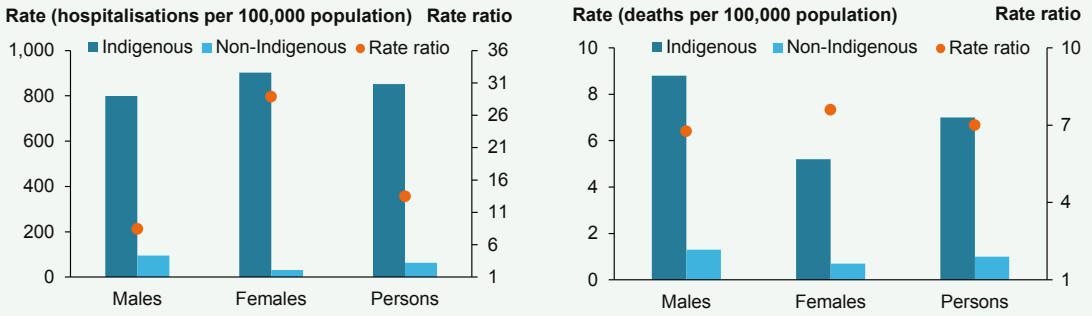
Figure 7.3.3: Feelings of safety when alone after dark, people aged 15 and over, by sex and Indigenous status, 2014–15

Hospitalisations and deaths due to assault

In 2014–15, the Indigenous age-standardised hospitalisation rate for non-fatal assault (that is, hospitalisations for injuries inflicted by another person where the patient was discharged alive) was more than 13 times the rate for non-Indigenous Australians (852 compared with 63 per 100,000 population) (Figure 7.3.4). The ratio was even higher for females (29 times as high) and for people living in *Remote* and *Very remote* areas (19 times as high).

Indigenous Australians are also more likely than non-Indigenous Australians to die from assault. Over the 5-year period 2010–2014 in New South Wales, Queensland, Western Australia, South Australia and the Northern Territory combined:

- there were 192 deaths due to assault among Indigenous Australians. The Indigenous age-standardised rate of deaths from assault was 7 times as high as the rate for non-Indigenous Australians (7.0 compared with 1.0 per 100,000 population) (Figure 7.3.4)
- Indigenous and non-Indigenous males were around twice as likely as their female counterparts to die from assault (age-standardised rate ratios of 1.7 for Indigenous and 1.9 for non-Indigenous) (SCRGSP 2016).



Note: Hospitalisation rates are for Australia. Death rates are for New South Wales, Queensland, Western Australia, South Australia and the Northern Territory combined.

Figure 7.3.4: Age-standardised hospitalisation (2014–15) and death (2010–2014 pooled) rates for assault, by Indigenous status and sex

What is missing from the picture?

The prevalence of violence in Australia is difficult to determine as not all incidents are reported to police or other authorities. Incomplete identification of Indigenous Australians in relevant data collections also reduces the accuracy of estimates of violence among Indigenous Australians. Determining the prevalence of domestic or family violence is further complicated by the fact that even when incidents are reported, the victim may not disclose that the incident was perpetrated by a family member (ABS 2013). For the hospital separations data on non-fatal assault cited in this article, the relationship of the perpetrator to the victim was recorded in only 51% of cases.

The AIHW is developing reporting capability in the form of a national Family, Domestic and Sexual Violence data clearinghouse. The clearinghouse will coordinate national reporting, and provide a platform for improving data quality and for identifying data gaps and priority data developments. The AIHW may also conduct data linkage and facilitate the access of researchers to data. More information is provided in Chapter 2.7 'Family, domestic and sexual violence'. The collection of more detailed data regarding experiences of violence among Indigenous Australians would provide valuable information to support policy and service responses to this issue.

Where do I go for more information?

More information about community safety for Indigenous Australians is available from the reports *The health and welfare of Aboriginal and Torres Strait Islander peoples* and the *Aboriginal and Torres Strait Islander Health Performance Framework*.

More data on child protection and youth justice can be found on the AIHW website.

Detailed information on prisoners, offenders and victims of reported crime are available from ABS Crime and Justice statistics.

7.4 Closing the gap in education

Good health and wellbeing throughout life depend to a considerable extent on sound education. For Aboriginal and Torres Strait Islander Australians, in particular, education can provide opportunities to avoid the several disadvantages they face (ABS 2011; Biddle 2006; Biddle & Cameron 2012).

The Council of Australian Governments (COAG) is committed to a number of Closing the Gap targets for education (Box 7.4.1); this article reviews the progress made against these. It also analyses, for Indigenous people, several other aspects of school and tertiary educational attainment and transitions from school to work, as well as education related employment outcomes. In addition, it assesses the patterns of early childhood development and school readiness for Indigenous (and non-Indigenous) children from the most recent 2015 Australian Early Development Census (AEDC).

Box 7.4.1: COAG Closing the Gap targets related to education

- Ensure that 95% of all Indigenous 4-year-olds are enrolled in early childhood education by 2025.
- Close the gap between Indigenous and non-Indigenous school attendance within five years (by 2018).
- Halve the gap for Indigenous children in reading, writing and numeracy achievements within a decade (by 2018).
- Halve the gap for Indigenous Australians aged 20–24 in Year 12 (or equivalent) attainment rates (by 2020).

Source: PM&C 2017.

Of the education related targets, the 2020 target on Year 12 attainment is on track to be met, but not the 2018 target on reading and numeracy; and progress will need to accelerate for the 2018 school attendance target to be met (PM&C 2017). It is too early to properly assess progress on the new 2025 target on early childhood education. The previous 2013 early childhood education target expired unmet (PM&C 2017).

Early childhood development (school readiness)

Indigenous disadvantage has an early onset. Many Indigenous children fall behind, even on the earliest measures of childhood development. This is usually related to Indigenous households generally being in lower socioeconomic areas, with children inheriting the disadvantage of the families into which they are born (Daly and Smith 2005; Guthridge et al. 2016). Indigenous children also face several other unique developmental constraints not generally shared by the wider population. Common among these are multiple early life stressors—from deaths and adult imprisonment occurring more often in their families, from having severe illnesses and accidents, from experiencing discrimination (Shepherd and Zubrick 2012) and from the intergenerational effects of forced separation (Silburn et al. 2006).

A key marker of early childhood development in Australia is available through the AEDC assessments (Box 7.4.2). The AEDC assessments have been validated as a valuable measure of school readiness and have strong potential to predict later-stage school learning outcomes for the individual child (Brinkman et al. 2013).

Box 7.4.2: Australian Early Development Census

- The AEDC is a census type data collection. It has been conducted every 3 years since 2009 for all children in their first year of full-time schooling, usually when aged 5.
- School teachers assess these children on five domains of early childhood development:
  - physical health and wellbeing
  - social competence
  - emotional maturity
  - language and cognitive skills
  - communication skills and general knowledge.
- The assessments are based on teacher observations; the children do not participate in tests.
- For each of the five AEDC domains, children are given a score between 0 and 10. The distribution of scores achieved is quite skewed, with most children receiving high domain scores (towards 10). Such a distribution, with greater sensitivity at the lower end of the scale, is reasonable for a measure focused on levels of vulnerability in child development.
- The numerical scores of the AEDC assessments are used to classify all assessed children into three categories: 'developmentally vulnerable', 'developmentally at risk' and 'developmentally on track'.
- In the first data collection (2009), a series of cut-off scores were set for each of the five domains to convert numerical scores into these three categories. Children falling below the 10th percentile were categorised as 'developmentally vulnerable'. Children ranked between the 10th and 25th percentile were categorised as 'developmentally at risk', and all other children were categorised as 'developmentally on track'.
- The cut-off scores set in 2009 for these classifications remain the same across the three collection cycles.
- Two additional summary assessments of vulnerability are made of whether a child is assessed as developmentally vulnerable on any one or more of the five domain(s), and on two or more domains.
- The AEDC recently introduced a new measure of early childhood development, the Multiple Strength Indicator, that focuses on the more advanced skills and competencies of the assessed children (Gregory and Brinkman 2016a). Results on this Indicator are not presented in this chapter.
- The AEDC data collection instrument has been validated to measure developmental vulnerability for Indigenous children in the Australian context (Silburn et al. 2009).

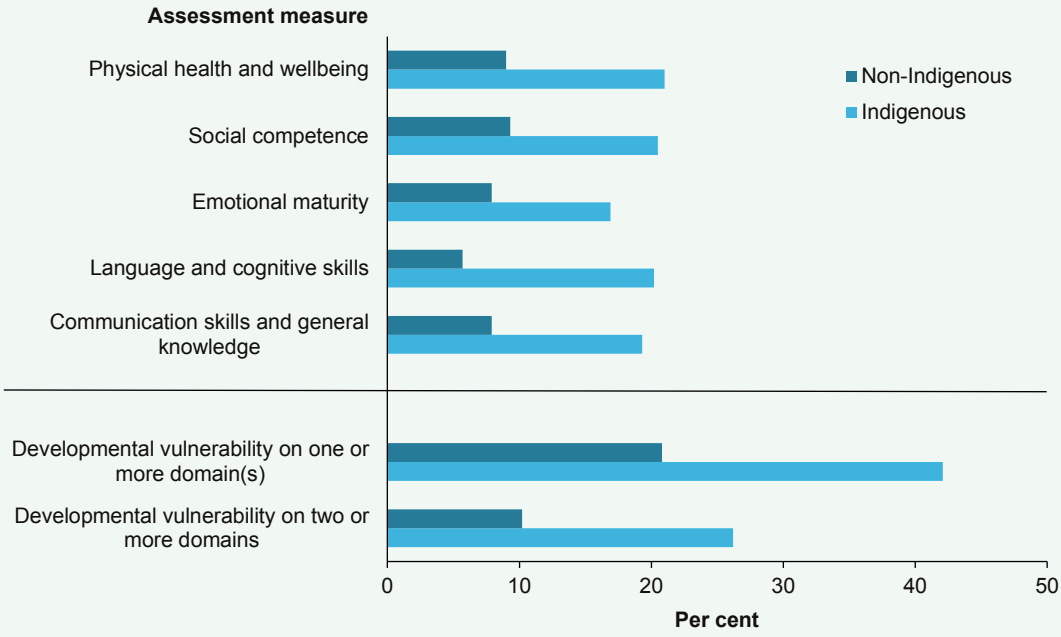
Source: DET 2016b.

The three collections of the AEDC (2009, 2012 and 2015) show that gaps in child development between Indigenous and non-Indigenous children have, on average, formed even at this early age. In all three collections, Indigenous children were more than twice as likely as non-Indigenous children to be assessed as developmentally vulnerable. This was the case for the result on each of the five specific test domains and for both the vulnerability summary indicators used in AEDC data reporting (vulnerable on one or more of the five domain(s), and vulnerable on two or more of the five domains).

2015 AEDC results

The latest AEDC collection (2015) assessed around 302,000 children (of whom about 17,300, or 5.7%, were Indigenous). The results showed that, nationally, around 42% of all Indigenous children were categorised as developmentally vulnerable on one or more of the five AEDC domain(s), compared with 21% of all non-Indigenous children (Figure 7.4.1). As well, 26% of Indigenous children were assessed as vulnerable on two or more of the five domains, compared with the non-Indigenous rate of 10% (DET 2016b).

Figure 7.4.1 also shows the proportion of children assessed as vulnerable on each of the five AEDC domains. The Indigenous rates were at least 2 times higher than the non-Indigenous rates for all domains, with the smallest gap (still 2.1 times as vulnerable) in the emotional maturity domain. The largest gap (3.5 times as vulnerable) was in the language and cognitive skills domain.

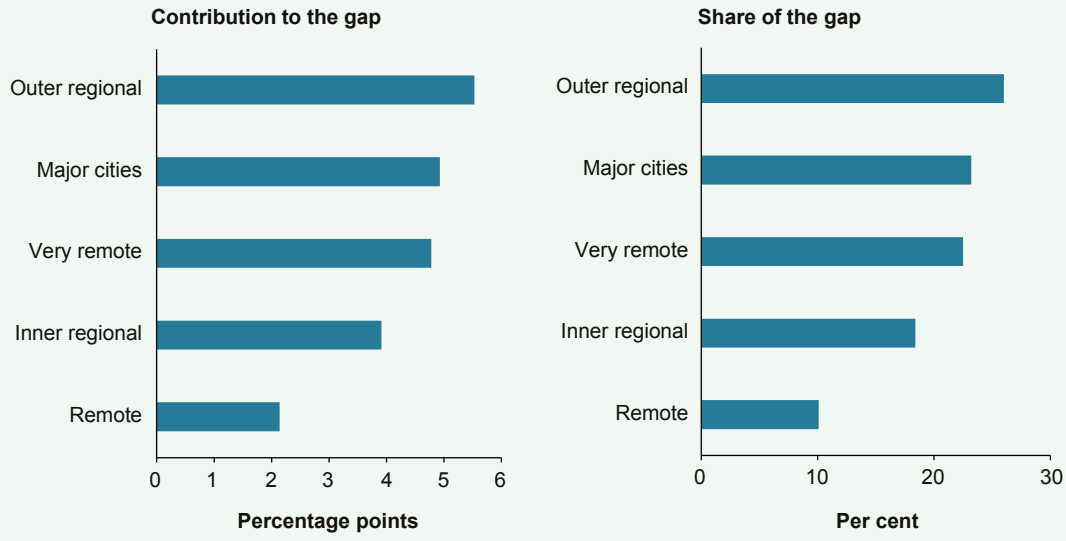


Source: DET 2016b.

Figure 7.4.1: Proportion of developmentally vulnerable children in each of the five domains and on vulnerability summary measures, by Indigenous status, 2015

A contributing factor to the higher vulnerability rate of Indigenous children at the national level is that Indigenous children who live in *Remote* and *Very remote* areas have much higher levels of vulnerability, and more Indigenous children live in these areas, as a share of all Indigenous children, than is the case for non-Indigenous children. In 2015, about two-thirds (66%) of Indigenous children living in *Very remote* areas were assessed as vulnerable on one or more domain(s), as were 52% of Indigenous children in *Remote* areas (AIHW analysis of 2015 AEDC data, unpublished).

The *Very remote* and *Remote* areas jointly contribute to around one-third of the national gap between Indigenous and non-Indigenous children in the proportion vulnerable on one or more domain(s); the *Very remote* areas alone contribute to 22% of the national gap (Figure 7.4.2). The majority of Indigenous children, however, live in *Major cities* and *Inner* and *Outer regional* areas, so these regions contribute to the major share (two-thirds) of the national gap. The highest single-region contribution to the national gap is *Outer regional* areas (26%), followed by *Major cities* (23%) and *Inner regional* areas (18%) (AIHW analysis of 2015 AEDC data, unpublished).



Note: The national gap on this measure is 21.3 percentage points (and the sum of the left horizontal bars equals 21.3).

Source: AIHW analysis of AEDC data, unpublished.

Figure 7.4.2: Contribution to the national gap in vulnerability on one or more domain(s) between Indigenous and non-Indigenous children, by remoteness area, 2015

At the national level, encouraging progress has been made to reduce the gap in early childhood development outcomes between Indigenous and non-Indigenous children. The proportion of Indigenous children assessed as vulnerable on one or more domain(s) decreased from 47% in 2009 to 43% in 2012, and to 42% in 2015. This was a larger decrease than for non-Indigenous children over this period for whom this proportion decreased from 22% in 2009 to 21% in 2015 (DET 2016a).

The AEDC results for Indigenous children also vary by sex. A consistently lower proportion of Indigenous girls were assessed as vulnerable on each of the five domains, and on the two vulnerability summary measures. This pattern was also seen for non-Indigenous children. For instance, in the 2015 AEDC assessments, 34% of Indigenous girls were assessed as vulnerable on one or more of the five domain(s), compared with 50% of Indigenous boys. The biggest relative difference by sex was on the emotional maturity domain: only 10% of Indigenous girls were assessed as vulnerable compared with 24% for Indigenous boys, making boys almost 2.5 times more likely to be assessed as vulnerable on this domain (AIHW analysis of 2015 AEDC data, unpublished).

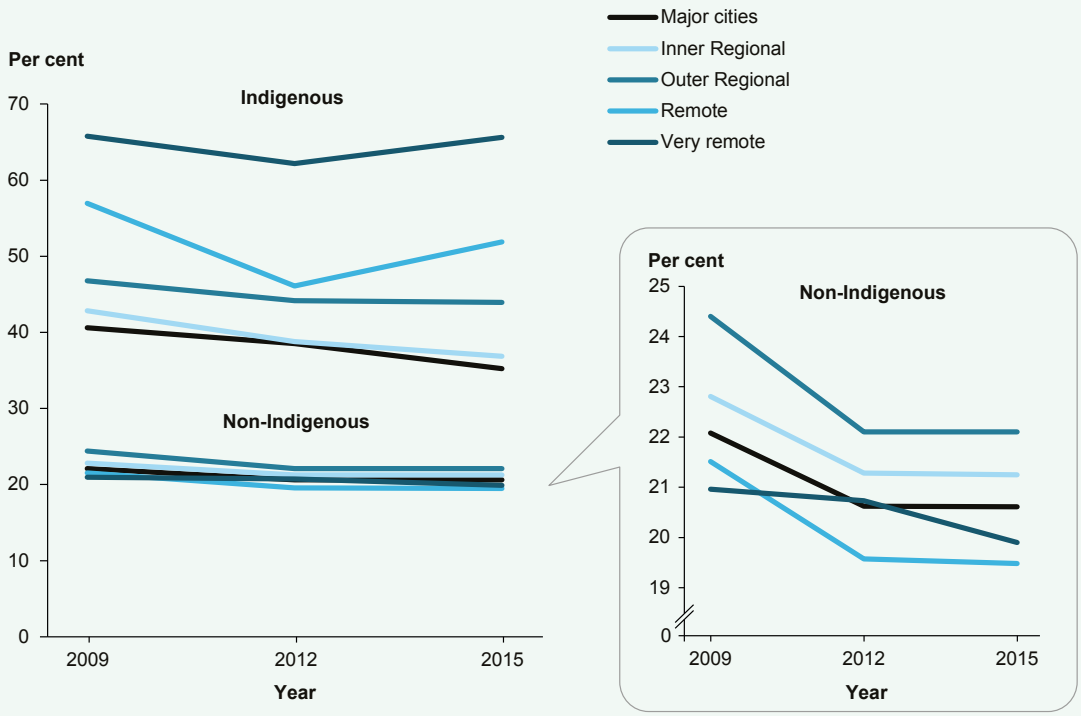
Trends in AEDC results by remoteness areas

The results presented in this sub-section are based on unpublished AIHW analyses of the unit record AEDC data. Over time, changes have been uneven across remoteness areas in the proportion of Indigenous children assessed as vulnerable on one or more domain(s) (Figure 7.4.3). Between 2009 and 2015, this vulnerability rate decreased most in *Inner regional* areas (from 43% to 37%) and in *Major cities* (from 41% to 35%); both changes were significant, based on the critical difference method recommended in Gregory and Brinkman (2016b). However, when comparing changes between the two most recent AEDC collections (2012 and 2015), the vulnerability rate for Indigenous children increased significantly in *Remote* and *Very remote* areas and decreased significantly in *Major cities* and *Inner regional* areas. There was no change for Indigenous children living in *Outer regional* areas.

In *Very remote* areas, the proportion of Indigenous children assessed as vulnerable on one or more domain(s) increased by 3.5 percentage points (from 62% in 2012 to 66% in 2015); the 2015 vulnerability rate was almost the same as in the first collection of 2009, offsetting almost all the decrease observed between 2009 and 2012 (Figure 7.4.3).

Around 18% of all Indigenous children in the 2015 AEDC collection lived in *Remote* or *Very remote* areas (DET 2016b). The uneven pattern in developmental vulnerability across remoteness areas over time means that Indigenous children in *Remote* and *Very remote* areas are falling further behind (increasing gaps) in their early development. This comparison applies not just with non-Indigenous children in these areas, but also with Indigenous children living in *Major cities* and *Inner and Outer* regional areas.

The high rate of developmental vulnerability of Indigenous children in *Remote* and *Very remote* areas is not due mainly to the effect of geographical location. A similar pattern is not observed for non-Indigenous children. A smaller population of non-Indigenous children live in these areas, but their development vulnerability is not higher than in other areas. Indeed, in the 2015 AEDC collection, non-Indigenous children living in *Remote* and *Very remote* areas had the lowest and second lowest rate of vulnerability on one or more domain(s) among all non-Indigenous children (Figure 7.4.3 inset).



Source: AIHW analysis of AEDC data, unpublished.

Figure 7.4.3: Proportion of children vulnerable on one or more domain(s), by Indigenous status and remoteness area, 2009, 2012 and 2015

Progress in the Closing the Gap targets in education (and student achievements in PISA)

Early childhood education

In December 2015, the COAG agreed to a new target on access to quality early childhood education for 4-year-old Indigenous children. The previous target expired unmet in 2013. The new target is to ensure that 95% of all Indigenous 4-year-olds are enrolled in early childhood education by 2025. The new target extends beyond the original focus on Indigenous children living in remote communities; it aims to increase the participation of all Indigenous children in high-quality early childhood programs nationally (PM&C 2017).

This target has two measures of progress:

(a) the proportion of children enrolled in a preschool program in the year before full-time schooling

(b) the proportion of children attending a preschool program in the year before full-time schooling.

Baseline data for this target for 2015 have been recently released, using a revised method to calculate the numerators and the denominators of both measures (SCRGSP 2016a). The revised baseline data are derived from the National Early Childhood Education and Care Collection, which is managed by the Australian Bureau of Statistics. The revised method used in the new baseline takes account of the variation in school starting ages by jurisdiction, and how this interacts with population estimates. Also, the attendance rates reported for measure (b) are calculated as a percentage among children enrolled in a preschool program, rather than as a percentage of the relevant population of children, as was reported previously (SCRGSP 2016a).

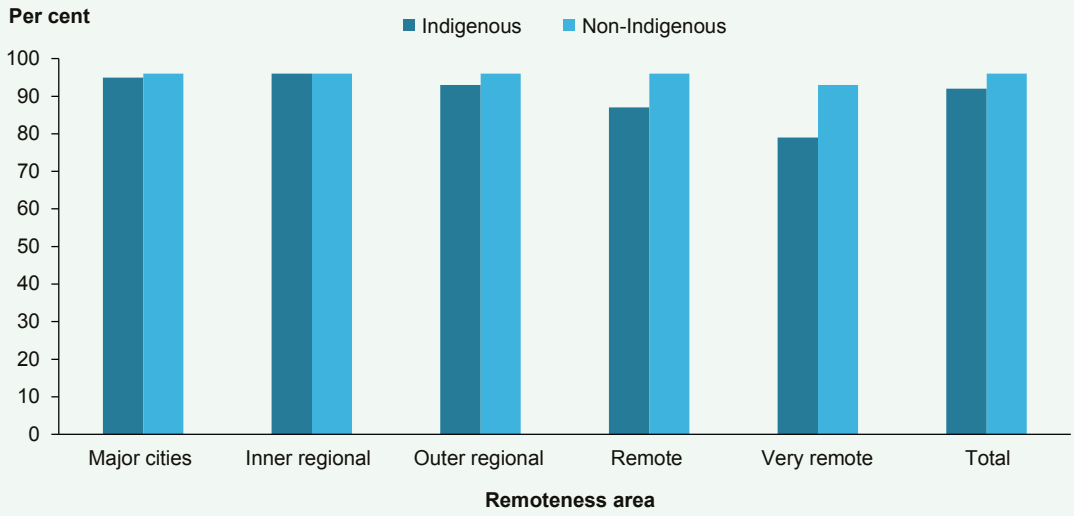
The new baseline data for 2015 are therefore not comparable with previously reported data. Progress against this target should be assessed only in relation to the revised 2015 baseline and using future data releases consistent with the new methodology.

The revised baseline data for 2015 show a total of 14,200 Indigenous children enrolled in a preschool program in the year before full-time schooling. Expressed as a ratio of the potential population of children (taking account of the different rules on school starting ages in each state and territory), this represents a rate of 87% of all Indigenous children enrolled in a preschool program in the year before full-time schooling. The comparable non-Indigenous rate was 98% (SCRGSP 2016a).

The 2015 preschool enrolment rate for Indigenous children in the year before full-time schooling varied considerably across jurisdictions. To highlight some continuing misalignment of the numerator and denominator counts—even within the revised baseline methodology—the enrolment rate for Indigenous children exceeds 100%, as presently computed, in three jurisdictions (Western Australia, South Australian and the Australian Capital Territory). The lowest rate was 77% in New South Wales, followed by 84% in the Northern Territory, 85% in Queensland and 94% in Victoria (SCRGSP 2016a).

For preschool attendance, the revised 2015 baseline data show a total of 12,900 Indigenous children attending at least 1 hour of preschool (in the reference week of the National Early Childhood Education and Care Collection). As a proportion of Indigenous children enrolled in preschool, the national Indigenous preschool attendance rate in 2015 was 92%. The equivalent attendance rate for non-Indigenous children was 96%. There is significant variation across jurisdictions in the estimated preschool attendance rates for Indigenous children (expressed as a proportion of children enrolled) in the year before full-time schooling. Five jurisdictions recorded rates of 95% or higher (New South Wales, Queensland, South Australian, Tasmania and the Australian Capital Territory), with a low of 73% in the Northern Territory, followed by 88% in Western Australia and 92% in Victoria (SCRGSP 2016a).

There was also significant variation across remoteness areas in preschool attendance rates in the year before full-time schooling for Indigenous children (Figure 7.4.4). In 2015, *Major cities* and *Inner regional* areas recorded attendance rates of 95% or higher, and *Very remote* areas had the lowest rate, of 79%. For comparison, preschool attendance rates for non-Indigenous children varied little by remoteness areas, ranging from 93% attendance in *Very remote* areas to 96% attendance in all other areas.



Source: SCRGSP 2016a.

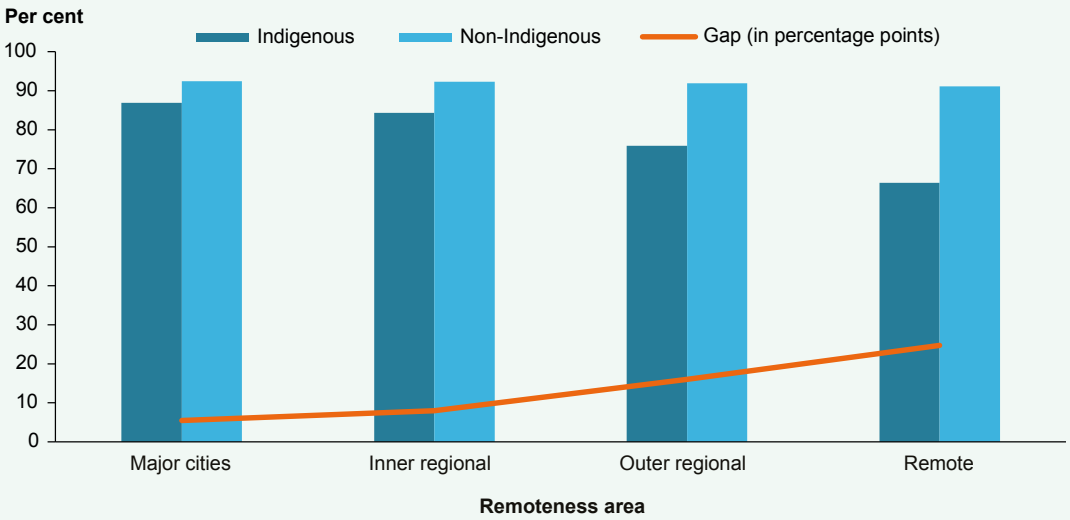
Figure 7.4.4: Proportion of enrolled children attending a preschool program in the year before full-time schooling, by Indigenous status and remoteness area, 2015

School attendance (Year 1 to Year 10)

In May 2014, COAG agreed to a new target to close the gap in school attendance rates between Indigenous and non-Indigenous students by the end of 2018. The baseline data for this new target were developed for 2014. The baseline and progress measures for this target calculate the school attendance rate for Indigenous and non-Indigenous students in each grade from Year 1 to Year 10 (using Semester 1 data), as well as a combined attendance rate for Year 1 to Year 10.

In 2016, the attendance rate for Indigenous students was 83% (about the same rate as in 2014), and for non-Indigenous students, 93%. The gap in attendance rates of 10 percentage points in 2016 was the same as in 2014. Progress will need to accelerate for this target to be met (PM&C 2017).

The overall school attendance rate in 2016 for Indigenous students was highest in *Inner regional* areas (87%) and *Major cities* (86%), declining steadily with increasing remoteness (to 66% in *Very remote* areas) (Figure 7.4.5). Attendance rates for non-Indigenous students varied little across remoteness areas (ranging from 93% in *Major cities* to 91% in *Very remote* areas). The largest gap in attendance rates between non-Indigenous and Indigenous students was in *Very remote* areas (25 percentage points), and the smallest gap was in *Inner regional* areas (5.5 percentage points).



Note: The gap denotes the difference between the non-Indigenous and Indigenous rates, as represented by the heights of the corresponding columns in the figure.

Source: SCRGSP 2016a.

Figure 7.4.5: Student attendance rate in Years 1–10 (combined), by Indigenous status and remoteness area, 2016

The attendance rate for Indigenous students also varies greatly between primary and secondary schools. For instance, in 2016, the average attendance rate for Indigenous students in primary school (Years 1–6) was 86%, and 79% in secondary school (Years 7–10). The lowest attendance rate among all Indigenous students in Years 1–10 was 75%, in Year 10 (SCRGSP 2016a).

The school attendance target has two supplementary measures associated with it:

- proportion of students who attend school 90% or more of the time, by Indigenous status
- number and proportion of schools achieving 90% or more average school attendance, by Indigenous status.

Table 7.4.1 shows data for these additional measures.

Table 7.4.1: Students attending school 90% or more of the time and schools achieving 90% or greater average attendance, by Indigenous status, 2016

	Proportion of students attending school 90% or more of the time (%)	Proportion of schools achieving 90% or greater average attendance (%)
Indigenous students	49	48
Non-Indigenous students	79	86

Note: Government schools in New South Wales are excluded from the additional measure for proportion of students attending school 90% or more of the time due to lack of data.

Sources: PM&C 2017; SCRGSP 2016a.

Literacy and numeracy

The COAG target is to halve the gap in school achievements in reading, writing and numeracy between Indigenous and non-Indigenous students by 2018. The gap is assessed by measuring the difference between the proportion of Indigenous and non-Indigenous students who are at or above the National Minimum Standard (NMS) in the National Assessment Program—Literacy and Numeracy (NAPLAN) test results (see Box 7.4.3 and Box 7.4.4 for further details).

Progress on this measure since the 2008 baseline year has been mixed. Consistent trends are not usually found, due to the variability in the NAPLAN results from year to year for Indigenous students.

Box 7.4.3: About National Assessment Program—Literacy and Numeracy

- The NAPLAN tests are conducted every year for all students across Australia in Years 3, 5, 7 and 9. Each year, over 1 million students nationally sit the NAPLAN tests.
- Assessments are made on three main domains (reading, writing, and numeracy), and two other language-related sub-domains (spelling, and grammar/punctuation).
- The Australian Curriculum, Assessment and Reporting Authority (ACARA) prepares national reports on each year's NAPLAN results. Student achievements are reported in two ways—a scaled score, and in performance bands.
- The scaled scores are constructed so that a given score represents the same level of achievement over time on a domain. This means these scores are consistent across the test for Years 3, 5, 7 and 9. Increases in the scaled score for the same student tested over a period of years (that is, in Years 3, 5, 7 and 9) show comparable improvements in the ability of that student.
- The conversion of scaled scores into performance bands provides an extra indicator of whether a particular child's achievement level on a specific test is at or above a pre-agreed NMS set for each test and year level.
- Every year, a small proportion of students are exempted from the NAPLAN tests.
- Children can also be withdrawn from the NAPLAN testing program at the request of their parent/carer, or be absent on the day of the test.
- Exempt students are included in the count of students participating in the NAPLAN testing program and are assessed to not have met the NMS; but they are excluded from the calculation of the mean scores.
- Withdrawn and absent children are not included in the counts of participating students nor in the calculations of the proportion of students who have met the NMS.
- A higher proportion of Indigenous students are regularly exempted, withdrawn or absent from the NAPLAN tests than non-Indigenous children. The combined proportion of Indigenous students exempted, withdrawn or absent is also generally higher in higher grades (SCRGSP 2016a). This can affect comparability of results for the same group of students over time.

Box 7.4.4: NAPLAN results and methods used to measure progress against the COAG target

- Progress against the Closing the Gap targets in reading, writing and numeracy is assessed using data on increases since the 2008 baseline in the proportion of Indigenous students who are at or above the NMS (not in reference to the mean scaled scores of Indigenous and non-Indigenous students).
- The target to halve the gap by 2018 has been converted into an agreed trajectory between 2008 (the baseline year) and 2018 (the target year) on the proportion of Indigenous students meeting the NMS (COAG 2012).
- The trajectories are a guide to measure progress from baseline performance to achievement of the target. They are, however, only indicative, with the national trajectories developed from those that each state and territory has adopted to measure its own progress.
- Achieving the annual trajectory progress points are neither requirements nor guarantees that the final target point will be reached. Still, it is customary to use the agreed annual trajectory points as a basis for assessing whether the latest calendar year's NAPLAN results are on track to meet the target by 2018.
- The annual trajectory points for assessing progress were developed for the three main NAPLAN test domains (reading, writing and numeracy). The original trajectories for the writing test (COAG 2012), however, are not currently valid, due to changes in the genre of the writing test.
- The NAPLAN writing tests have two alternate genres—narrative writing and persuasive writing. From 2008 to 2010, the test genre was narrative and from 2011 to 2015 it was persuasive. In 2016, the writing test switched back to narrative, and new analytical methods were developed to place scores for the narrative task and the persuasive task on the same scale. Results for both genres of the writing test are therefore comparable over time, but only from 2011 onwards.
- There are no agreed Closing the Gap trajectories for writing using the new combined scale from 2011 onwards. Therefore, assessment of progress against the COAG Closing the Gap target on literacy and numeracy is confined to the NAPLAN reading and numeracy domains, in Years 3, 5, 7 and 9 (a total of 8 test-year and test-domain combinations).
- As well as the COAG endorsed measures of progress against this target, other measures of progress reported on the achievements of Indigenous students are changes over time in their mean NAPLAN test scores, and gains in mean score made by the same cohort of students as they are tested in higher school grades.

Source: ACARA 2016.

Progress against the annual trajectory

The usual way to assess progress against this literacy and numeracy target is to compare the latest calendar year NAPLAN results with the national trajectory points for that year. Among the 8 test-year and test-domain combinations with an agreed trajectory point for 2016 (see Box 7.4.4), the 2016 results on the proportion of Indigenous students meeting the NMS showed that only numeracy in Year 9 was on track to meet the 2018 target.

Figure 7.4.6 tracks the annual performance of Indigenous and non-Indigenous students in the NAPLAN reading and numeracy tests between 2008 and 2016; the agreed trajectory points consistent with meeting the target in 2018 are also shown. In 2016, apart from Year 9 numeracy, the achievement levels by Indigenous students are below the agreed trajectory points for 2016. Achievements below the 2016 trajectory levels signal that progress achieved by 2016 is not on track to meet the 2018 target levels for Indigenous students. (The Year 3 reading achievement in 2016 is very close to the agreed trajectory point, with the deficit being only 1.8 percentage points).

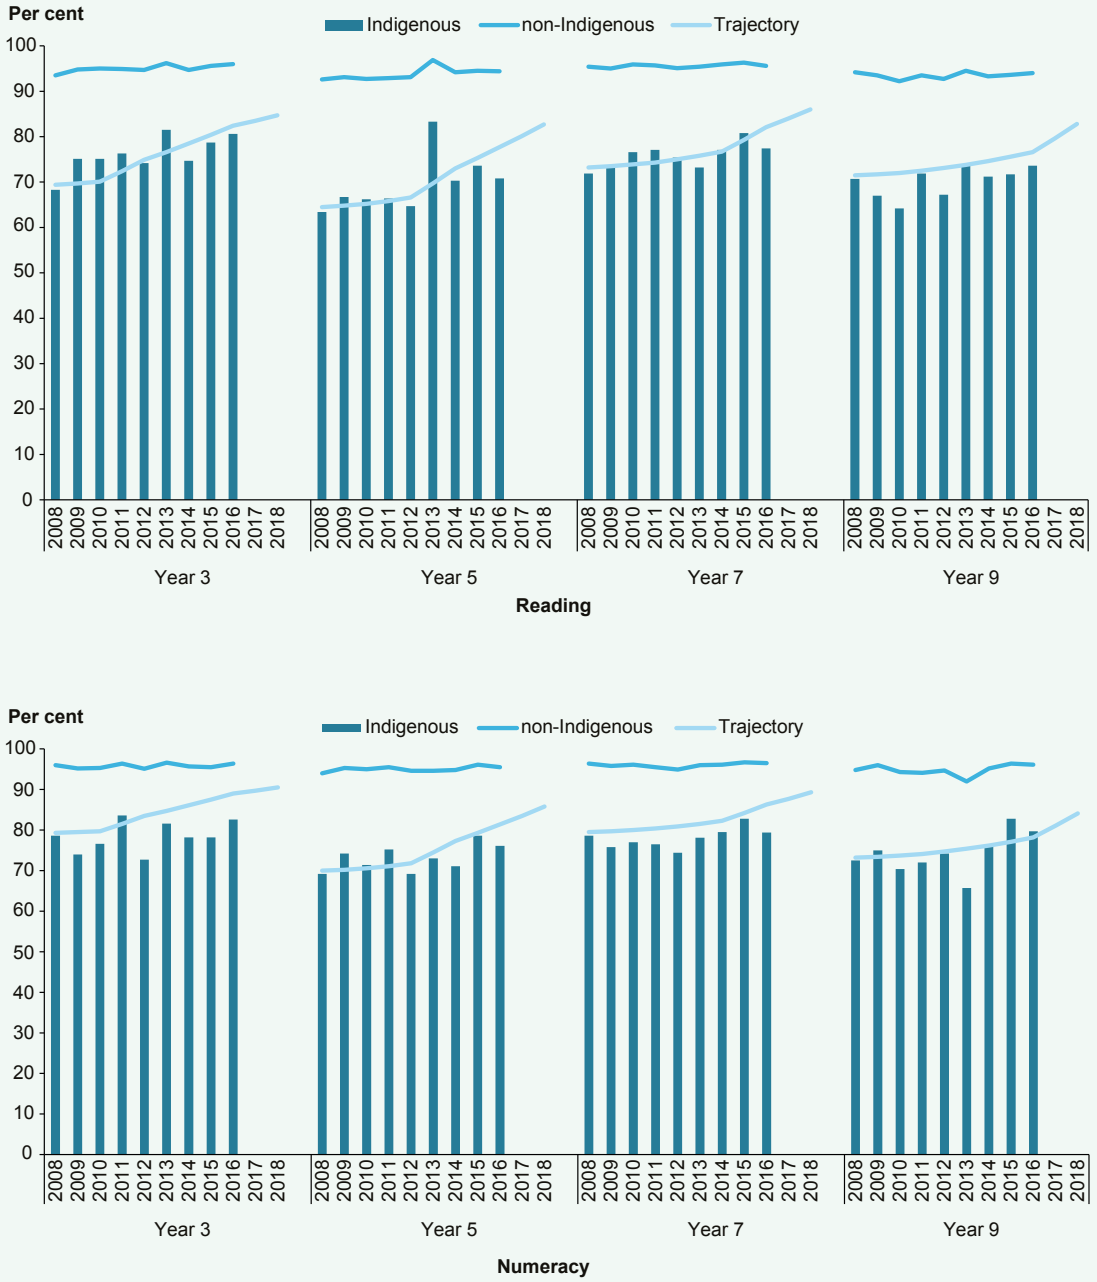
Figure 7.4.6 also shows the large variability in the proportion of Indigenous students who meet the NMS across different calendar years in NAPLAN tests. The NAPLAN tests are designed to be equivalent in difficulty across calendar years so that the scaled scores measure the same level of achievement across different cohorts of children tested. Yet, for Indigenous students, there is unexpected variability in the results on the proportion meeting the NMS across different years, such as the one-off large increase in 2013 Year 5 reading results.

These large and unexplained fluctuations in the Indigenous NMS results across years suggest that, in assessing progress against this target, a narrow focus looking only at the latest calendar year results may not be appropriate. Using the 2015 NAPLAN results for Indigenous children, instead of the latest 2016 results, the assessment of progress against the target is quite different.

The 2015 results for the proportion of Indigenous students meeting the NMS (also in Figure 7.4.6) show that for half of the measures (4 of the 8), progress was on track to meet the 2018 target in Years 5, 7 and 9 numeracy and in Year 7 reading. By the same token, if results in a future year improved, showing an increase in the number of measures on track, the general variability of NMS results for Indigenous students means that they would also need to be treated with some caution.

Indigenous NAPLAN results and gaps by remoteness areas

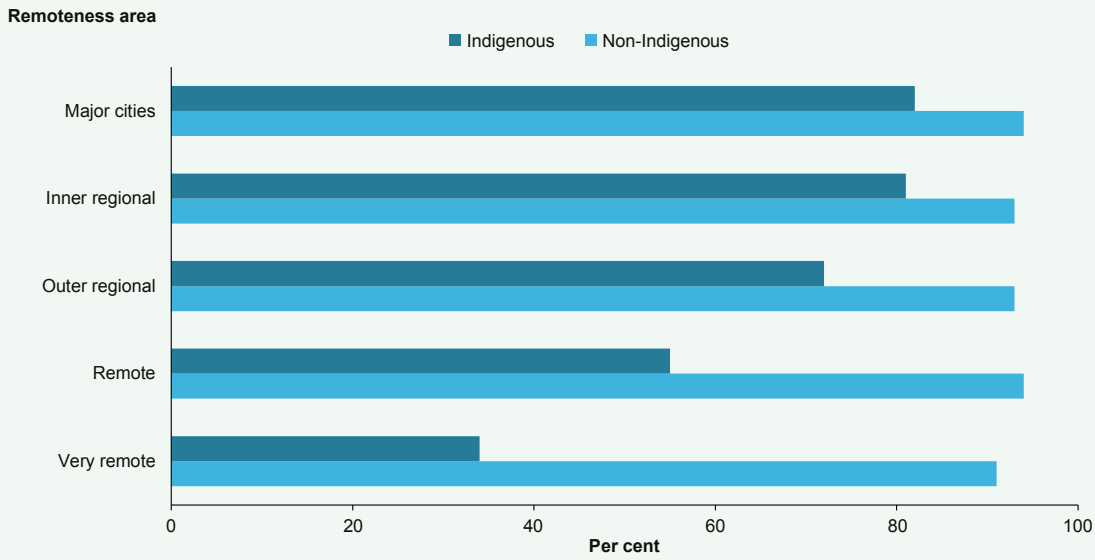
The proportion of Indigenous students who achieve the NMS declines substantially with increasing remoteness, while there is little variation by remoteness for non-Indigenous students. There are large gaps not only between Indigenous and non-Indigenous students but also within Indigenous students by region of residence. For instance, in Year 9 reading in 2016, the gap in the proportion achieving the NMS between Indigenous and non-Indigenous students in *Very remote* areas was 57 percentage points. There was also an almost equally large gap of 48 percentage points in Year 9 reading results between Indigenous students in *Very remote* areas and *Major cities* (Figure 7.4.7).



Note: The annual trajectory points shown are for Indigenous student results. They represent achievements consistent with halving the gap between 2008 and 2018, and were developed through the National Indigenous Reform Agreement process. These trajectory points are given in Schedule G of COAG (2012).

Sources: AIHW analyses of NAPLAN data in ACARA 2016 and previous NAPLAN national reports; COAG 2012.

Figure 7.4.6: NAPLAN performance in reading and numeracy, by Indigenous status and year level, and trajectories for Indigenous achievements (percentage meeting the NMS), 2008 to 2016



Source: AIHW analysis of NAPLAN data in ACARA 2016.

Figure 7.4.7: Proportion of students meeting the NMS in Year 9 Reading, by Indigenous status and remoteness area, 2016

The substantially poorer NAPLAN performance of Indigenous students living in *Remote* and *Very remote* and areas is a major concern as it contributes significantly to the national gap, even though the overwhelming majority of Indigenous students live in non-remote areas. Using data from an earlier 2014 NAPLAN testing round for Year 5 reading, the Productivity Commission (2016) estimated that *Very Remote* areas accounted for one-third of the national gap in the NMS percentage for Year 5 reading. This one-third share in the national gap is substantially disproportionate to the share of Indigenous students in *Very remote* areas (only 12% in 2014) because of the considerably larger gaps in NAPLAN achievements that occur there.

Indigenous students in metropolitan and provincial areas, accounting for a large majority of the Indigenous student population, still contributed more than half (55%) to the national gap in 2014 Year 5 reading. But the contributions of the *Remote* and *Very remote* areas were also significant (adding up to 45%). The Productivity Commission (2016) concluded that, to be effective and equitable, approaches to closing the gap on literacy and numeracy need to improve the educational outcomes of Indigenous students in all regions—metropolitan, provincial, remote and very remote areas (as well as across all states and territories).

Improvements in Indigenous results since the baseline of 2008

Improvements in achieving the NMS

As well as checking if annual trajectory points are met, progress against the reading, writing and numeracy targets is assessed through improved NAPLAN performance of Indigenous students—that is, by comparing the proportion of Indigenous students achieving the NMS in the 2008 baseline year with the latest year of results (point to point comparisons).

Between 2008 and 2016, there were statistically significant increases in the proportion of Indigenous children who achieved the NMS in:

- 4 of 8 measures of the reading and numeracy test domains (reading in Years 3 and 5 and numeracy in Years 5 and 9)
- 4 of 8 measures in the spelling and grammar/punctuation tests in Years 3, 5 and 7 (both tests in Year 3, and grammar/punctuation in Years 5 and 7)
- 1 of 4 measures of the writing results (Year 3, comparing results of 2011 with 2016).

Improvements in mean NAPLAN scores

The NAPLAN annual reports also report the mean scores achieved by Indigenous students in the NAPLAN tests over time. This measure is not formally agreed to by COAG to assess progress against this target.

Using 2008 data as the baseline, almost half (7 of the 16 measures, excluding writing) showed statistically significant increases in the mean NAPLAN test scores achieved by Indigenous students in 2016. These were in Years 3 and 5 in reading; Year 5 in numeracy; Year 3 in spelling; and in Years 3, 5 and 7 in grammar/punctuation. For the writing test, the mean score was not statistically higher in 2016 than the revised baseline of 2011 for any year level.

Gaps in school achievements—perspective from the Programme for International Student Assessment

Australia has participated in the Programme for International Student Assessment (PISA) since its inception. PISA is administered to 15-year-old students (who are usually in Years 9, 10 or 11) (see Box 7.4.5 for further details on the PISA). PISA results are a valuable indicator of the school achievements of Indigenous students, even though the PISA is not a formal measure related to the COAG target on literacy and numeracy.

Like for NAPLAN, PISA results consistently show significant gaps in the average achievements of Indigenous and non-Indigenous students. Several of these gaps have been reduced over time, however, more noticeably in the latest results for 2015, because of declines in the PISA performance of non-Indigenous students. However, the gap in performance of Indigenous students remains substantial. Indigenous students tend to be under-represented at the higher proficiency levels and over-represented at the lower proficiency levels in all domains in PISA tests.

PISA 2015 results

Australia's results from the PISA 2015 show that Indigenous students continue to achieve significantly lower scores than non-Indigenous students in all three major test domains.

In 2015, the mean score achieved by Indigenous students in reading literacy was 435 points, compared with a mean score of 506 points by non-Indigenous students. (This resulted in a gap of 71 points.) This level of difference in the mean scores indicates that Indigenous students, on average, were behind by around 2.3 years of schooling in reading literacy, compared with non-Indigenous students (Thomson et al. 2016).

In 2015, the mean score attained by Indigenous students in mathematical literacy was 427 points, compared with a mean score of 497 points for non-Indigenous students. (This represents a gap of 70 points.) The mean scores in scientific literacy for Indigenous and non-Indigenous students were 437 and 513 points, respectively (that is, a gap of 76 points).

The gap of 70 points in the mean score in mathematical literacy indicates Indigenous students, on average, were behind by around 2.3 years of schooling; correspondingly, the gap of 76 points in scientific literacy indicates they were, on average, behind by around 2.5 years of schooling (Thomson et al. 2016).

Comparisons of PISA results over time

Time trends for the Australian PISA test results on the mean scores of Indigenous and non-Indigenous students on the three core domains show that the gaps in these mean scores have narrowed slightly mainly due to significant declines in the mean performance of non-Indigenous students (Figure 7.4.8).

The starting point for the comparisons in Figure 7.4.8 is the PISA test cycle in which a particular test domain was the major domain for the first time. The recommendation that the most reliable way to establish a trend for PISA results is to compare major domain results (Thomson et al. 2016) could not be followed here as it would severely reduce the number of data points for comparison. Instead, the latest 2015 results (in which scientific literacy was the major domain) are compared with the first instance in which a particular domain was the major domain (2000 for reading, 2003 for mathematical literacy, and 2006 for scientific literacy.) The first full assessment of each domain as the major domain sets the scale of assessment and provides a valid starting point for future comparisons (Thomson et al. 2016).

All three core domains show that for non-Indigenous students the mean scores in 2015 are lower than the first point of comparison with a major domain assessment. For Indigenous students, there was a significant decline in performance in mathematical literacy but no change in results for reading or scientific literacy. In all instances, the relative decline in mean scores for non-Indigenous students has been greater which has led to a small reduction in the gap between Indigenous and non-Indigenous mean scores. In general, though, this is not a desirable way to reduce the school achievement gaps.

Box 7.4.5: About the Programme for International Student Assessment

- PISA is a standardised test of the knowledge and skills administered to 15-year-olds by the Organisation for Economic Co-operation and Development in over 70 countries. It tests young people's ability to apply their knowledge and skills to real-life problems and situations, rather than how well a specific curriculum is learned.
- This means that PISA results can be consistently compared, both across countries and across time (OECD 2015).
- International results from the PISA are used regularly by many participating countries to evaluate the effectiveness of their school education systems.
- The PISA has been administered triennially since 2000. Australia has participated in all cycles of the PISA, and six sets of results for Australian students are now available.
- In 2015, over half a million students (representing 28 million 15-year-olds in 72 countries and economies) took the 2-hour PISA test. Students were assessed against three core domains (scientific, mathematical and reading literacy) as well as in collaborative problem solving. Australian students also took part in an optional assessment of financial literacy.
- Since the first cycle, the PISA has focused on the three core domains, but one domain is selected as the major domain in each test cycle. A substantial part of the total test time is devoted to the major domain.
- The distinction between major and minor domains matters. The recommended most reliable way to establish a trend for results in an assessment domain is to compare results between cycles when that assessment domain was the major domain.
- PISA testing in Australia has consistently ensured that enough Indigenous students are sampled to allow for reliable reporting of results by Indigenous status.
- In Australia, PISA results are reported as mean scores achieved in each of the three domains at the national and jurisdictional level. Results are also reported for each domain by selected demographic groups at the national level.
- In some test cycles, the sample of Australian students who sit for the PISA are also invited to become part of the Longitudinal Surveys of Australian Youth (LSAY), and to be interviewed regularly until age 25. The LSAY is a valuable longitudinal data resource covering the critical periods of school completion and transitions to employment or further education and training (NCVER n.d.).
- PISA test scores are important markers of students' cognitive ability around the end of compulsory schooling. Analyses of LSAY data in the Australian context show that PISA test scores are reliable predictors of later educational and employment outcomes (for example see Mahuteau et al. 2016; Nguyen 2010).

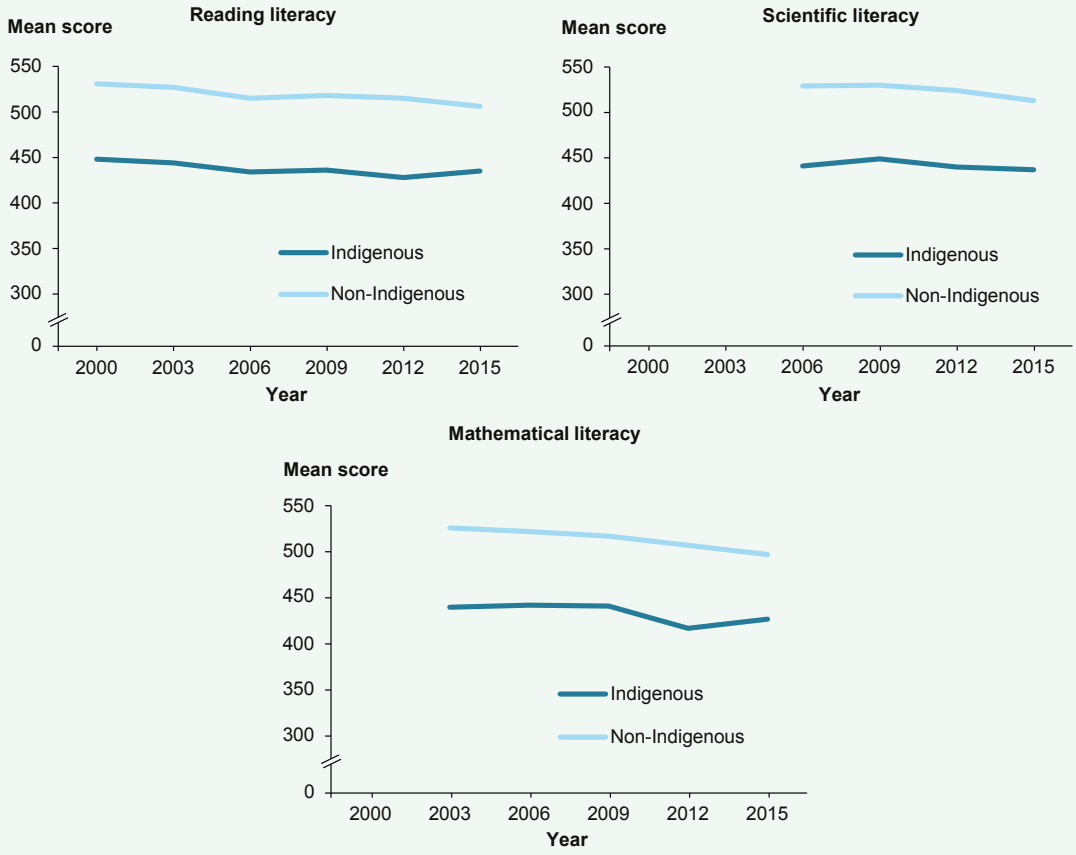
Source: Thomson et al. 2016.

A welcome feature in the trends in Figure 7.4.8 is that the Indigenous mean scores increased in 2015 compared with 2012 in two domains—by 7 points in reading literacy, and by 10 points in mathematical literacy. Both increases are statistically significant.

In reading literacy between 2000 and 2015, there was a 13-point decline in the mean score of Indigenous students (not statistically significant). A larger decline of 25 points in the scores of non-Indigenous students over this period was statistically significant. This results in a reduction in the gap in reading literacy between Indigenous and non-Indigenous students of 12 points (from 83 points in 2000 to 71 points in 2015). (Statistical significance of changes in the gap cannot be readily assessed.)

In mathematical literacy between 2003 and 2015, there also was a 13-point decline in the mean score of Indigenous students (from 440 points in 2003 to 427 points in 2015). This decline is statistically significant. Despite this decline, the gap in mathematical literacy was reduced by 16 points (from 86 points in 2003 to 70 points in 2015), again due to a larger (and statistically significant) decline in the performance of non-Indigenous students.

In scientific literacy since 2006, the mean score of Indigenous students has not changed significantly. It ranges from 441 in 2006 to 437 in 2015. There has, however, been a significant reduction of 16 points in the mean score for non-Indigenous students. The gap in the mean score in scientific literacy between Indigenous students and non-Indigenous students has decreased by 12 points (from 88 points in 2006 to 76 points in 2015).



Note: The starting point for the time series in each domain is the PISA test cycle in which that domain was the major domain for the first time.

Source: Thomson et al. 2016.

PISA results and subsequent education outcomes

Analyses of the longitudinal link between the PISA sample of students and LSAY follow-up till age 25 in some of the Australian PISA test cycles show that PISA test scores are a good predictor of later employment and educational outcomes. Analyses of the 2003 PISA/LSAY cohort found that higher PISA scores in reading and mathematical literacy were linked with higher Year 12 completion and post-school university enrolment for both Indigenous and non-Indigenous students (Nguyen 2010).

A later more detailed analysis (Mahuteau et al. 2016) focusing on the educational outcomes of Indigenous students who participated in the PISA cohorts in 2006 and 2009 showed that:

- there was only a very modest improvement in the PISA results of Indigenous students at age 15 between the 2006 and the 2009 cohorts, once other background characteristics of the students in the two cohorts were controlled for
- a large part of the gap (50% to 63%) in the mean PISA scores of Indigenous and non-Indigenous students in these cohorts could be attributed to differences in their socioeconomic area and other background variables, and to differences in the schools that Indigenous students attend. However, a sizeable part of the gap still remains unexplained by these socioeconomic and school-related factors
- there was no significant difference between the subsequent educational outcomes of Indigenous and non-Indigenous students after taking account of their academic achievement at age 15, as reflected in the PISA scores. For example, the Year 12 completion rate and subsequent university enrolment rates were similar for Indigenous and non-Indigenous students who had similar PISA test scores.

A key implication of this last finding is that remedial efforts to advance Indigenous educational outcomes need to begin much earlier than age 15. At this age, gaps in academic achievement have already been set, and are shown to largely determine future outcomes. This reinforces the well-understood evidence from the international child development literature that early investment in the lives of disadvantaged children will help to reduce inequality in outcomes, in both the short and long term (Cunha and Heckman 2007).

However, it is noteworthy that given the same levels of ability developed by age 15 (as represented by the PISA scores), Indigenous students appear not to be further disadvantaged in subsequent educational outcomes. Indigenous students have the same rate of completing high school and acquiring further educational qualifications as non-Indigenous students with similar levels of PISA test achievements at age 15.

If sustained advances can be made in early childhood development vulnerability and school learning outcomes for future cohorts of Indigenous children, it would be very likely that they can attain the same rates of subsequent educational outcomes as non-Indigenous children—for both Year 12 completion and participation in tertiary education. The international literature on PISA assessments has found that 15-year-old PISA students who had attended at least 1 year of pre-primary school scored better on the PISA tests, particularly for mathematical literacy in 2015, than students who did not go to preschool (Sparks 2017).

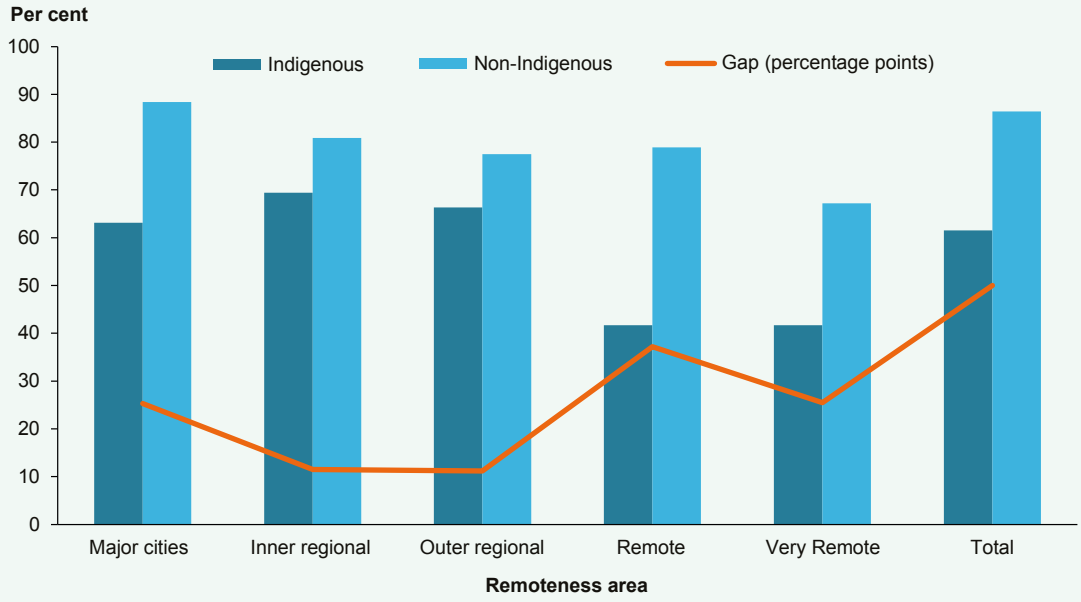
Year 12 attainment

Progress on the Year 12 attainment target can be measured from either Census or survey data. While the Census is the preferred official data source, the most recent Indigenous data for this target are from the 2014–2015 National Aboriginal and Torres Strait Islander Social Survey. Those data show this target is on track to be met (PM&C 2017).

In 2008 (survey baseline data), the Year 12 attainment gap between Indigenous and non-Indigenous 20–24-year-olds was 40 percentage points (attainment rates of 45% and 85%, respectively). The COAG target is to halve that gap by 2020.

The proportion of Indigenous 20–24-year-olds who have attained a Year 12 or equivalent level of education has increased significantly, from 45% in 2008 to 62% in 2014–2015; in 2014–15, the gap between Indigenous and non-Indigenous 20–24-year-olds decreased to 25 percentage points (with 62% and 86% attainment rates, respectively) (PM&C 2017). This shows that in relation to the survey-based estimates of this target measure, about two-thirds of the final reduction of the gap needed by 2020 has already been achieved by 2014-15.

In 2014–15, Year 12 attainment among Indigenous 20–24-year-olds was substantially higher in non-remote areas than in remote areas. It ranged from the highest rate of 69% in *Inner regional* areas to 42% in both *Remote* and *Very remote* areas (Figure 7.4.9).



Note: The gap denotes the difference between the non-Indigenous and Indigenous rates, as represented by the heights of the corresponding columns in the figure.

Source: AIHW analyses of ABS 2014, 2016.

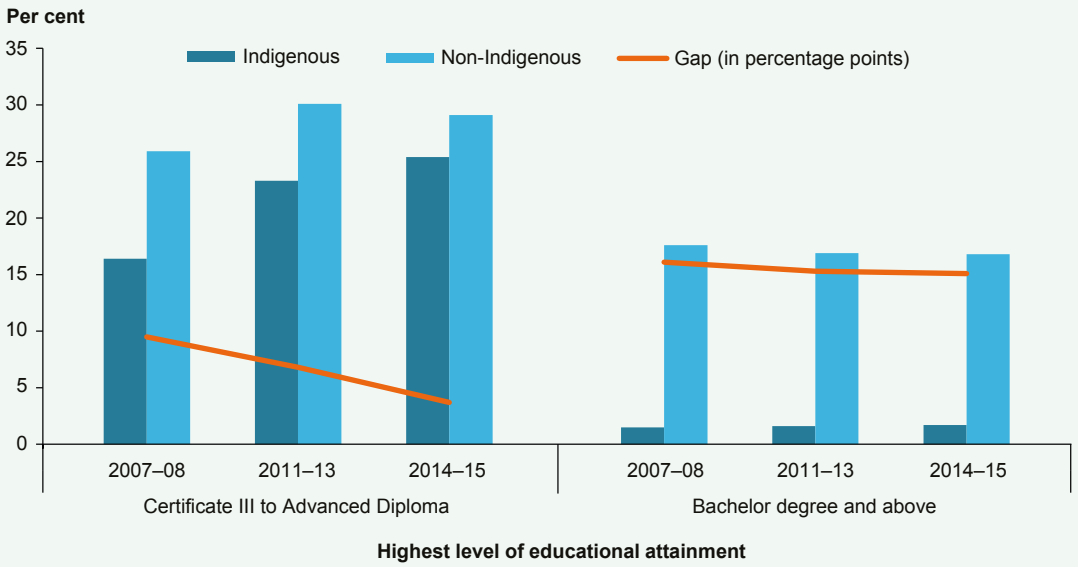
Figure 7.4.9: Proportion of population aged 20–24 with at least Year 12 or equivalent educational attainment, by Indigenous status and remoteness area, 2014–15

Post-school education and training

Post-school qualifications

Post-school qualifications are those obtained through successful completion of vocational education and training and/or higher education at universities. They include postgraduate/bachelor/diploma/certificate degrees from universities, and certificates in vocational education. Post-school qualifications are often classified as Certificate level III or higher in vocational education programs. That convention is adopted for the data reported in this section. Some individuals may complete post-school qualifications without having completed Year 12 in school; and some may take vocational educational courses while still enrolled in school. All of the latter category are excluded from the analyses in this section, irrespective of the Certificate level enrolled in, because they are still in school.

In 2014–15, slightly more than one-quarter (27%) of Indigenous 20–24-year-olds had obtained a post-school qualification (Certificate level III or higher)—double the rate (13%) in 2002 (SCRGSP 2016b). (These proportions exclude individuals still studying at any level). In 2014–15, the majority of Indigenous 20–24-year-olds with a post-school qualification had completed a Certificate III to an advanced diploma (25% of all 20–24-year-olds), and 1.7% had a Bachelor degree or higher. In 2014–15, Indigenous 20–24-year-olds had almost caught up with their non-Indigenous counterparts in attainment rates for a Certificate III to an advanced diploma, but a large gap remained in attaining a Bachelor degree or higher (Figure 7.4.10).



Note: The gap denotes the difference between the non-Indigenous and Indigenous rates, as represented by the heights of the corresponding columns in the figure.

Source: SCRGSP 2016b.

Figure 7.4.10: Post-school qualifications at Certificate III level to Advanced Diploma, and Bachelor degree and above for people aged 20–24, by Indigenous status, 2007–08, 2011–13 and 2014–15

Among all Indigenous persons aged 20–64, in 2014–15, 39% had obtained a post-school qualification—an increase from 18% in 2002 (SCRGSP 2016b). However, over time, there has not been a narrowing of the gap between the Indigenous and non-Indigenous population because post-school qualifications have also increased at about the same pace for the non-Indigenous population of 20–64-year-olds.

The rate of post-school attainment for Indigenous adults aged 20–64 decreases with remoteness area of residence. In *Major cities*, half of Indigenous 20–64-year-olds have attained a Certificate III level or above (including Bachelor and above). This rate decreases progressively with remoteness (50% in *Major cities*, 43% in *Inner regional* areas, 36% in *Outer regional* areas, 28% in *Remote* areas and 19% in *Very remote* areas).

Higher education enrolments

The number of Indigenous students enrolled in higher education has increased steadily over time. Between 2006 and 2015, enrolments increased by more than 80% (from 8,800 to 16,100) (DET 2016c). However, Indigenous students are still under-represented in tertiary enrolments, accounting for only 1.1% of all higher education domestic enrolments in 2015 (DET 2016a).

Participation in vocational education and training

In Australia, a wide range of agencies provide vocational education and training (VET) services. Their funding models vary from being fully publicly funded to fully privately funded. Data collected on Australia's VET services are reported on an annual basis for the total level of VET activity, and quarterly for only government-funded activity. Indigenous trainees feature prominently in both types of data collections.

Total VET activity

In 2015, around 4.5 million students were enrolled in vocational training, with 4,277 Australian providers. Of these students, about 165,500 (3.6%) were reported as Indigenous, 3.7 million (81%) as non-Indigenous and 698,900 (15%) did not report their Indigenous status (NCVER 2016a).

In 2015, there were 170,100 VET program enrolments for Indigenous students. Among these, 89% were in Australian Qualifications Framework (AQF) programs and the rest (11%) in non-AQF programs. These Indigenous students were enrolled in 1.3 million specific VET subjects.

Government-funded VET activity

In the first 9 months to 30 September 2016, there were 1.1 million students enrolled in the government-funded VET system, of whom 69,900 (6.5%) were Indigenous (NCVER 2016b). Indigenous students have a higher share in total enrolment for government-funded VET places than in total VET activity; this share has increased from 5.4% in 2011 (SCRGSP 2017).

The number of Indigenous students undertaking government-funded training in the first 9 months of 2016 increased by 14% over that for the corresponding period in 2015. This was a larger increase than the 4% increase in government-funded VET enrolments for non-Indigenous students over the same period.

Expressed as a proportion of the relevant Indigenous total population, Indigenous participation in government-funded VET has decreased slightly, from 12% in 2011 to 10% in 2015. Among Indigenous 18–24-year-olds, in 2015, almost one-quarter (24%) participated in a government-funded VET program, compared with 16% of non-Indigenous people in the same age group. The Indigenous participation rate in government-funded VET among 18–24-year-olds has, however, decreased slightly from 27% in 2011 (SCRGSP 2017).

Load pass rate of Indigenous students

The VET load pass rate has improved for Indigenous students, from 65% in 2004 to 77% in 2015. The VET load pass rate for Indigenous students has increased 3.5 percentage points since 2011 and 10.7 percentage points since 2006. Accordingly, the gap between Indigenous and non-Indigenous students in the VET load pass rate has reduced by half to 6.5 percentage points in 2015 compared to 13 percentage points in 2006 (SCRGSP 2016b). (The VET load pass rate is the ratio of hours studied by students who passed their subject(s) to the total hours committed to by all students who passed, failed or withdrew).

Transition from school to work

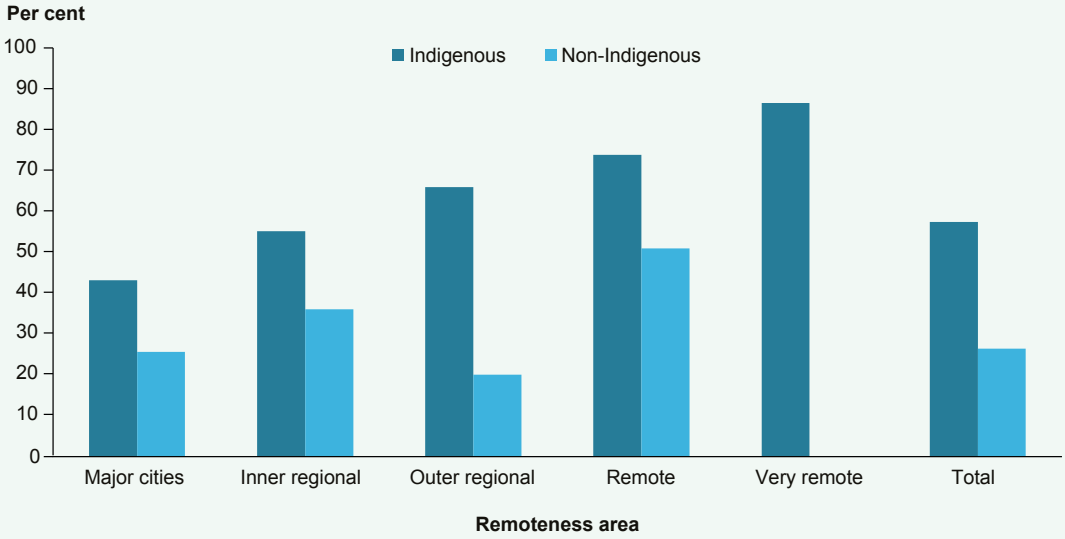
The transition from school to work or further education and training is an important milestone for young people. A commonly used measure of the lack of success in this transition is expressed as the proportion of 17–24 year olds who, after leaving school, are not 'fully engaged' in employment or further education and/or training (that is, the total time spent either separately, or in combination, in employment and further education/training is less than what constitutes a normal 'full-time' basis of involvement; note this is different to 'NEET'; see Chapter 3.1 'Pathways through education and training').

Indigenous young people aged 17–24 are more likely not to be fully engaged than non-Indigenous Australians of the same age. In 2002, more than two-thirds (68%) of young Indigenous Australians were not fully engaged. This proportion declined to 57% in 2014–15. In contrast, the proportion of young non-Indigenous Australians not fully engaged in employment, education and/or training increased slightly over the same period (from near-stable rates of around 25% between 2002 and 2012–13 to 26% in 2014–15) (SCRGSP 2016b). This led to a narrowing of the gap between Indigenous and non-Indigenous 17–24-year-olds between 2002 and 2014–2015 (from 43 to 31 percentage points).

The proportion of young Indigenous people not fully engaged in employment, education and/or training increases with remoteness of residence. In 2014–15, this rate ranged from 43% in *Major cities* to 87% in *Very remote* areas. However, the greatest gap in this rate between Indigenous and non-Indigenous 17–24-year-olds was in *Outer regional* areas (46 percentage points). The gaps in other regions were less than half the gap in the *Outer regional* areas (Figure 7.4.11).

Education and employment outcomes

The educational outcomes for many Indigenous youth and working age adults have generally improved over time. This is likely to continue, but there is still a long way to go before the remaining gap between the Indigenous and non-Indigenous populations for educational outcomes is closed. The gaps in educational qualifications are salient because they often are the sources of later gaps in employment and other socioeconomic indicators and health status (ABS 2011; Karmel et al. 2014).



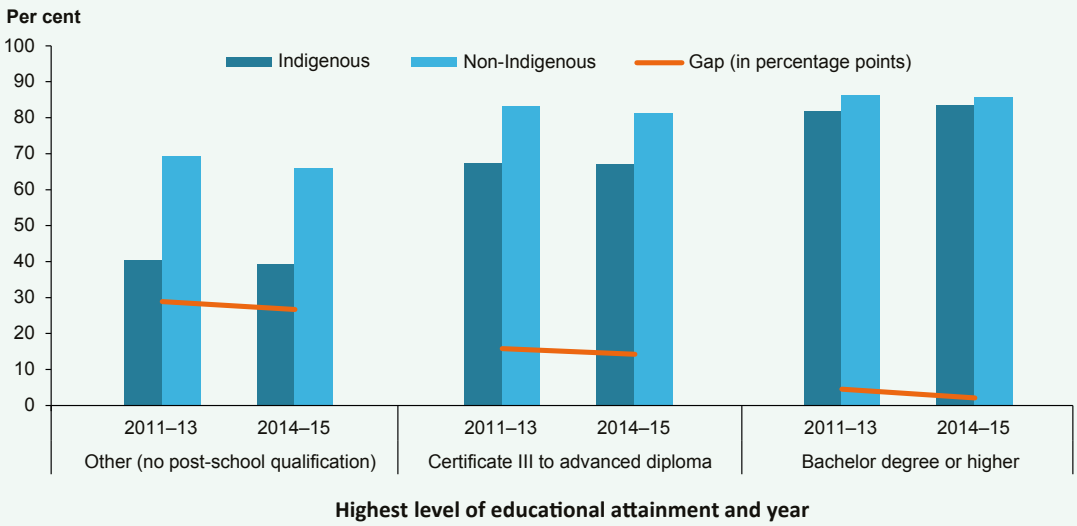
Note: The proportion of non-Indigenous 17–24-year-olds who were not fully engaged in employment, education and/or training in *Very remote* areas was not available for 2014–15. Hence, the gap between the non-Indigenous and Indigenous rates are not separately indicated for any of the remoteness areas.

Source: SCRGSP 2016b.

Figure 7.4.11: Young people aged 17–24 not fully engaged in employment, education and/or training, by Indigenous status and remoteness area, 2014–15

The key role of education as a 'leveler' of some of the other related gaps is clearly shown by the links between the highest level of post-school qualifications and the gaps in employment status. Not many Indigenous people aged 18–64 have a Bachelor degree or higher level of qualification. However, once they achieve that level of qualification, they consistently report high levels of employment (expressed as an employment ratio) of more than 80%. There also are only minimal gaps when compared with the employment to population ratio for non-Indigenous people aged 18–64 who have a Bachelor degree or higher level of qualification.

In 2014–15, the employment to population ratio for Indigenous people aged 18–64 varied greatly by the level of post-school qualifications (Figure 7.4.12). Among people with only a Certificate I or II (or lower), only 39% were employed. The employment ratio increased substantially to 69% for people with a Certificate III to an advanced diploma. The employment ratio increased further to 84% for people with a Bachelor degree or higher. The gap in the employment to population ratio between Indigenous and non-Indigenous persons aged 18–64 with only a Certificate I or II (or lower) was 27 percentage points in 2014–15. This gap was lower by almost half (14 percentage points) for people with a Certificate III to an advanced diploma. The employment ratio gap almost disappears (only 2 percentage points) for people with a Bachelor degree or higher level of qualification.



Notes

1. 'Bachelor degree or higher' comprises Bachelor degree, Graduate Diploma/Graduate Certificate and Postgraduate Certificate; 'Certificate III to advanced diploma' includes Certificate III/IV, Certificate III/IV not further defined and Advanced Diploma/Diploma; and 'Other (no post-school qualification')' comprises Certificate I and II, Certificate I and II not further defined, Certificate not further defined and people who do not have a post-school qualification (includes secondary school educational attainment and no post-school qualification).
2. The gap denotes the difference between the equivalent non-Indigenous and Indigenous rates, as represented by the heights of the corresponding columns in the figure.

Source: SCRGSP 2016b.

Figure 7.4.12: Employment to population ratio, people aged 18–64, by level of highest educational attainment and Indigenous status, 2011–13 and 2014–15

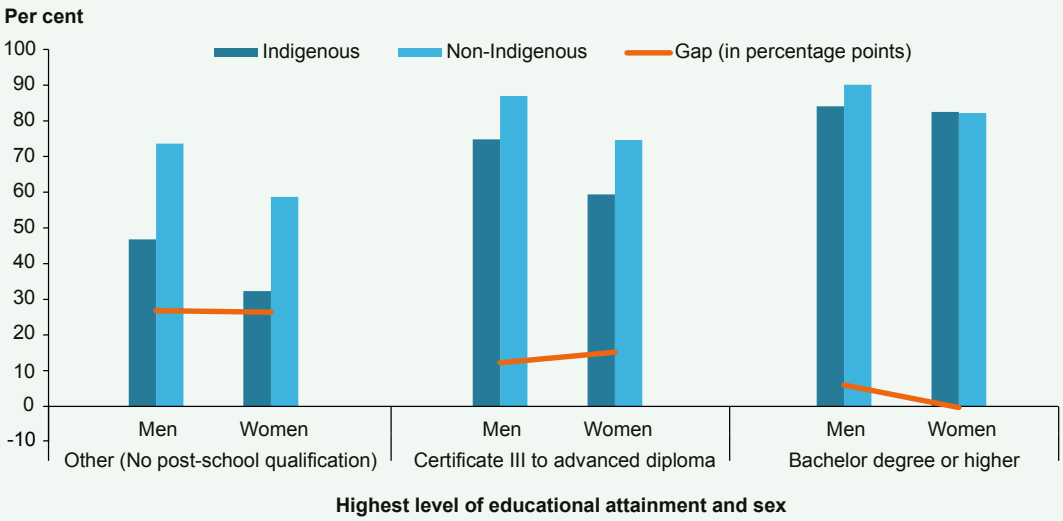
As shown in Figure 7.4.13, the boosts for employment of attaining a Certificate III or above is clear, for both Indigenous men and women.

The employment to population ratio for Indigenous men increased from 47% for men without a post-school qualification to 75% for men with a Certificate III to advanced diploma. This ratio increased further to 84% for Indigenous men with a Bachelor degree or higher.

For Indigenous women, the increases in the employment to population ratio were similar: from 32% for women without a post-school qualification to 59% for women with a Certificate III to advanced diploma, and 83% for women with a Bachelor degree or higher.

The gaps between the proportions of Indigenous and non-Indigenous adults employed are high for both men and women with education levels below Certificate III (shown as 'Other' in Figure 7.4.13). For people with a Bachelor degree or higher, Indigenous employment rates are consistently high (above 80%) for both men and women, and the gaps with non-Indigenous employment are much smaller. A gap does not exist for Indigenous women with a Bachelor degree or higher (both employment rates are between 82% and 83%).

A qualification at the level of Certificate level III is thus seen as the critical threshold level of education that greatly improves the employment prospects of Indigenous workers and reduces the employment gaps between them and equivalently qualified non-Indigenous working age adults. This is a consistent pattern seen in other time periods (Karmel et al. 2014; SCRGSP 2016b).



Notes

1. 'Bachelor degree or higher' comprises Bachelor degree, Graduate Diploma/Graduate Certificate and Postgraduate Certificate; 'Certificate III to advanced diploma' includes Certificate III/IV, Certificate III/IV not further defined and Advanced Diploma/Diploma; and 'Other (no post-school qualification') comprises Certificate I and II, Certificate I and II not further defined, Certificate not further defined and people who do not have a post-school qualification (includes secondary school educational attainment and no post-school qualification).
2. The gap denotes the difference between the non-Indigenous and Indigenous rates, as represented by the heights of the corresponding columns in the figure.

Figure 7.4.13: Employment to population ratio, people aged 18–64, by level of highest educational attainment, Indigenous status and sex 2014–15

What is missing from the picture?

The Closing the Gap agenda and its early learning and education measures have helped to substantially improve our understanding of the early onset of gaps in child development and learning outcomes for many Indigenous children. Family background, school characteristics and remote locations play important contributing roles.

Much less is known, however, about the origins and trends in the development of non-cognitive skills of Indigenous children. The child development literature stresses that cognitive and non-cognitive skills work together to produce successful adult outcomes, and that one helps to develop the other. Further analyses are needed on how Indigenous (and non-Indigenous) children from disadvantaged backgrounds can be helped to acquire non-cognitive skills—such as perseverance, motivation and self-esteem—that are vital in producing successful adult outcomes, including in education. This requires developing further, as well as making greater use of, any existing data on children linked over different services and outcome measures.

Where do I go for more information?

Early learning and care and achievements in school literacy and numeracy are part of the regular reporting by the AIHW on Children's Headline Indicators. These are disaggregated by Indigenous status, remoteness area and socioeconomic area (see AIHW Children's Headline Indicators for more information).

More information about the AEDC results is provided in the national reports prepared for each collection 2015 AEDC National Report, and community level report cards and maps are available online at 2015 AEDC Community Profiles.

Detailed annual national reports on the NAPLAN tests are produced by ACARA; see NAPLAN—National reports by year. As well, trends in NAPLAN results over time by Indigenous status and remoteness area (among others) are available at ACARA NAPLAN time series data.

A fuller discussion of the gaps in educational outcomes and other broader measures related to education are reported regularly in the Overcoming Indigenous Disadvantage Reports prepared by the Steering Committee for the Review of Government Service Provision. The latest report was released in November 2016; see *Overcoming Indigenous Disadvantage: Key Indicators 2016*.

7.5 Income and employment for Indigenous Australians

One way in which Aboriginal and Torres Strait Islander Australians face socioeconomic disadvantage is through disparity of income. Low income is associated with a wide range of disadvantages, including poor health, shortened life expectancy, poor education, substance abuse, reduced social participation, crime and violence (AHMAC 2015). Income is also closely linked to employment status.

Besides providing income, being employed has important benefits for the health, social and emotional wellbeing of individuals, families and communities. However, job seekers often face many barriers in pursuing employment, including living with a physical or mental illness or disability, or having caring responsibilities. Indigenous Australians have, on average, lower employment rates than non-Indigenous Australians for a range of reasons. These include lower levels of education and training, living in areas with fewer employment opportunities, higher levels of contact with the criminal justice system, experiences of discrimination, and lower levels of job retention (Gray et al. 2012).

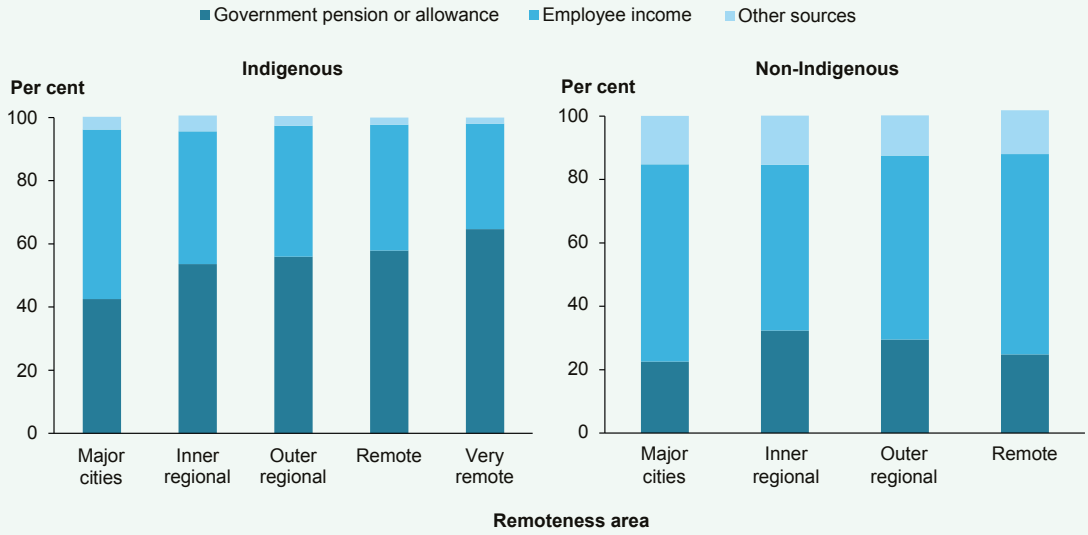
Income

This section looks at income among people aged 15 and over. (People of this age are most likely to be earning or receiving an income, including income support payments and the aged pension). Data for Indigenous Australians are drawn from the Australian Bureau of Statistics (ABS) 2014–15 National Aboriginal and Torres Strait Islander Social Survey (NATSISS), and for non-Indigenous Australians from the 2014 General Social Survey (GSS).

In measuring and comparing income, it is important that the number of people living in a household—particularly children and other dependants—is taken into account. To do this, reported incomes are adjusted to create a comparable measure called equivalised gross household income (see Glossary).

- In 2014–15, an estimated 36% of Indigenous people aged 15 and over had incomes in the bottom 20% of equivalised gross weekly household incomes, compared with 16% of non-Indigenous people in the same age bracket. Comparable trend data are not available for Indigenous people aged 15 and over; however, for Indigenous people aged 18 and over, the proportion with incomes in the bottom 20% of equivalised gross weekly household incomes decreased from 49% in 2008 to 37% in 2014–15. The equivalent proportion for non-Indigenous people in the same age bracket remained relatively stable over time (16% in 2008; 17% in 2014–15) (SCRGSP 2016).
- For people aged 15 and over, the median equivalised gross weekly household income of Indigenous people was lower than that for non-Indigenous people ($556/week compared with $831/week). The median equivalised gross weekly household income for Indigenous people aged 15 and over was also lower in *Very remote* areas ($400/week) than in *Major cities* ($671/week).

- The proportion of people aged 15 and over whose main source of income was a government pension or allowance increased with remoteness for Indigenous people but showed little variation for non-Indigenous people (Figure 7.5.1).
- A higher proportion of Indigenous people aged 15 and over received a government pension or allowance as their main source of income (52%) compared with non-Indigenous people aged 15 and over (25%). This was the case across all age groups (Figure 7.5.2).



Note: The 2014 GSS did not collect data for *Very remote* areas.

Source: AIHW analysis of ABS 2014 GSS (TableBuilder); AIHW analysis of ABS 2014–15 NATSISS (TableBuilder).

Source: AIHW analysis of ABS 2014 GSS (TableBuilder); AIHW analysis of ABS 2014–15 NATSISS (TableBuilder).

Figure 7.5.2: Government pension or allowance as the main source of income, people aged 15 and over, by Indigenous status and age group, 2014–15

Income support

The Department of Social Services compiles Centrelink data on the number of recipients of various Centrelink income support payments and supplements. These data do not include payments made by the Department of Veterans' Affairs. In this section, 'income support payments' are defined as those that cannot occur concurrently, to avoid double counting. These payments include ABSTUDY, the Age Pension, the Disability Support Pension, The Carer Payment, Newstart Allowance and Youth Allowance. People receiving income support payments may also be receiving other allowances or supplements, such as the Carer Allowance or Family Tax Benefit.

At the end of the June quarter of 2016, around 45% of Indigenous Australians aged 15 and over (220,800 people) were receiving some form of Centrelink income support payment, compared with 26% of non-Indigenous Australians of this age (4.9 million people). Though the number of people receiving support payments has grown—from around 209,000 Indigenous Australians and 4.8 million non-Indigenous Australians at the end of June 2014—the proportions of the Indigenous and non-Indigenous populations receiving payments has not changed over this time (AIHW analysis of ABS 2014; DSS 2016).

The most common income support payments received by Indigenous Australians were Newstart Allowance, the Disability Support Pension and the Parenting Payment (Table 7.5.1).

Table 7.5.1: Main Centrelink income support payments received by Indigenous Australians, June quarter 2016

Income support payment	Number of recipients[a]	% of reference Indigenous population	Reference Indigenous population[a]	
Newstart Allowance	68,500	19.3	354,900	(aged 22–64)
Disability Support Pension	47,400	10.2	447,600	(aged 16–64)
Parenting Payment	44,400	9.6	463,500	(aged 15–64)
Youth Allowance	18,800	13.9	134,800	(aged 16–24)
Age Pension	18,200	58.7	31,000	(aged 65+)
Carer Payment	13,400	2.9	463,500	(aged 15–64)
ABSTUDY (Living Allowance)	8,900	1.9	463,500	(aged 15–64)
Total receiving Centrelink income support payments[b]	**220,800**	**44.6**	**494,500**	**(aged 15+)**

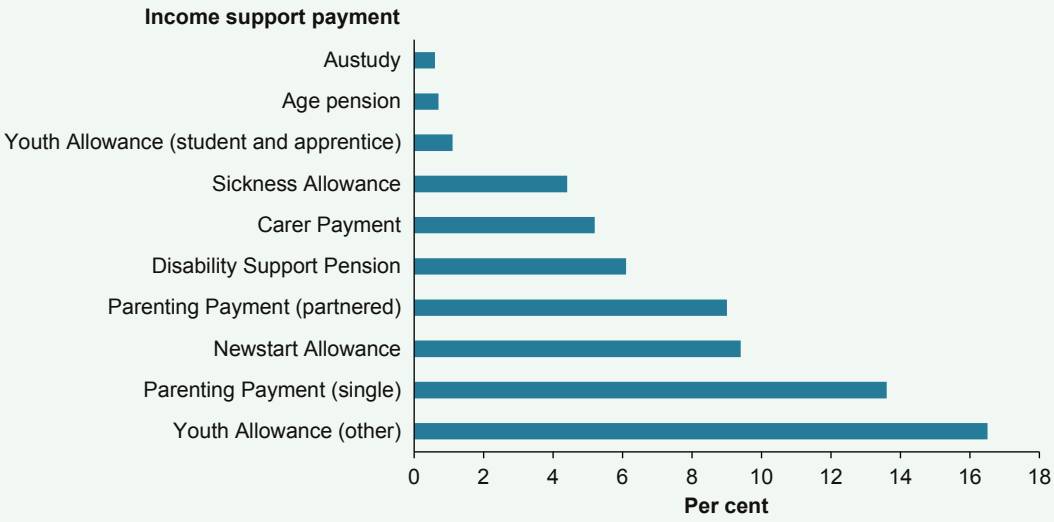
(a) Rounded to nearest hundred.

(b) Columns do not add to total as 'Total receiving Centrelink income support payments' includes other payment types not listed in the table.

Sources: AIHW analysis of ABS 2014; DSS 2016.

Centrelink data on income support recipients confirm that Indigenous Australians are more likely than non-Indigenous Australians to rely on government payments as their main source of income. These data show that almost 17% of recipients of Youth Allowance (other than student/apprentice), almost 14% of recipients of the single Parenting Payment, and around 9% of recipients of the Newstart Allowance and the partnered Parenting Payment were Indigenous Australians (Figure 7.5.3).

The comparatively low proportions of recipients of Austudy and the student and apprentice Youth Allowance who are Indigenous are due to the availability of ABSTUDY, which is an alternative payment specifically for Indigenous students.



Source: DSS 2016.

Figure 7.5.3: Share of Indigenous persons among recipients of specific income support payments, June quarter 2016

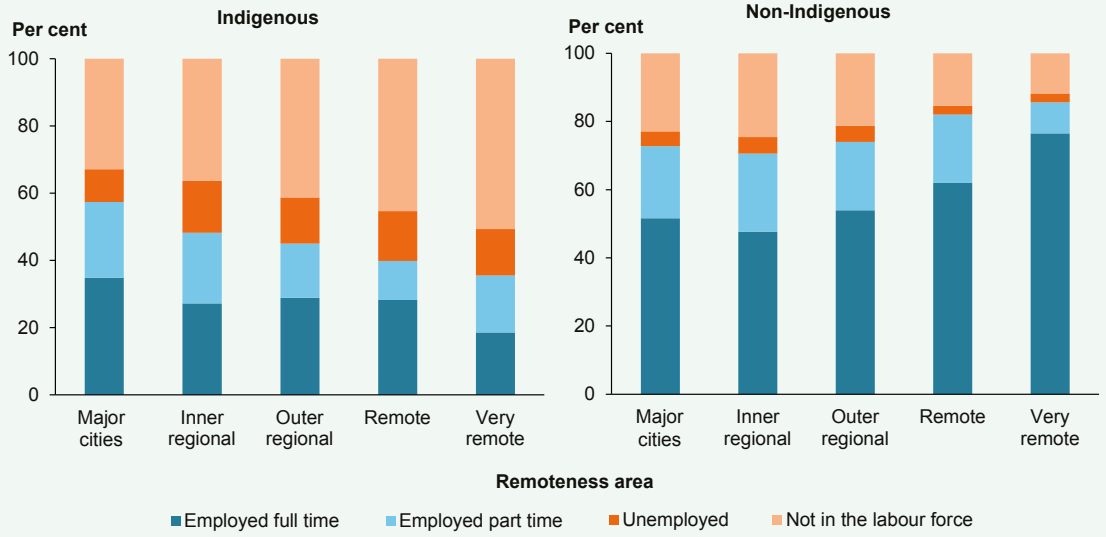
Employment

The labour force comprises all people who are employed (people who have worked for at least 1 hour in the reference week) or unemployed (people who are without work, but have actively looked for work in the last 4 weeks and are available to start work). The remainder of the population is not in the labour force.

According to the ABS 2014–15 NATSISS and the ABS 2014 Survey of Education and Work, among people aged 15–64:

- 61% of Indigenous Australians were in the labour force, compared with 77% of non-Indigenous Australians
- the proportion of employed Indigenous Australians decreased with remoteness, but the proportion of non-Indigenous Australians employed in remote areas was higher than in non-remote areas (Figure 7.5.4)
- the Indigenous unemployment rate (number of people unemployed as a proportion of people in the labour force) was 21% overall—it was lowest in *Major cities* (15%) and highest in *Very remote* areas (28%) (ABS 2016)
- most (92%) Indigenous Australians who were unemployed reported having had difficulties in finding work. The most commonly reported difficulties were that there were no jobs available; there were transport problems; they had no driver's licence; and had insufficient education, training or skills (AIHW analysis of ABS 2014–15 NATSISS (TableBuilder)).

Between 2004–05 and 2014–15, the proportion of Indigenous Australians aged 15–64 in the labour force remained relatively stable (60–65%) (SCRGSP 2016).



Source: AIHW analysis of ABS 2016.

Figure 7.5.4: Labour force status, people aged 15–64, by Indigenous status and remoteness area, 2014–15

Changes in Indigenous community employment programs mean that much of the 2014–15 Indigenous employment information is not comparable with that collected in the 2008 NATSISS (ABS 2016). In 2008, Indigenous people in communities could access the Community Development Employment Projects (CDEP) scheme; they received wages, and were classified in the 2008 NATSISS results as employed. In July 2013, the CDEP was replaced by the Remote Jobs and Communities Program; people accessing this program received income support payments and were classified in the 2014–15 NATSISS results as either unemployed or not in the labour force, depending on whether they were actively looking for work.

Excluding CDEP participants from the 2008 data provides comparable information about the proportion of Indigenous people aged 15–64 who were employed. These data suggest that there has been no change in the Indigenous employment to population ratio, which was 48% in both 2008 and 2014–15.

The Closing the Gap target for employment set by the Council of Australian Governments aims to halve the gap in employment between Indigenous and non-Indigenous Australians within a decade (by 2018). This target is not on track, with Indigenous employment rates (excluding CDEP participants) remaining stable at 48% and non-Indigenous employment rates falling slightly from 75.0% in 2008 to 72.6% in 2014–15 (PM&C 2017).

Main occupations and industry of employment

Data from the 2014–15 NATSISS show that the main occupations of employed Indigenous Australians aged 15 and over were as community and personal service workers (21%), followed by technicians and trades workers (16%), general labourers (16%) and professionals (13%). Only 6.2% listed their occupation in their main job as managers. For the non-Indigenous employed population aged 15 and above, data from the 2014 GSS show that the most common occupation was professionals (22%), followed by clerical and administrative workers (15%), technicians and trades workers (14%) and managers (14%). Less than 20% of employed Indigenous Australians aged 15 and over worked as managers or professionals, compared with 36% of non-Indigenous Australians (AIHW analysis of ABS 2014–15 NATSISS (TableBuilder) and AIHW analysis of ABS 2014 GSS (TableBuilder)).

The main industry or sector of employment for Indigenous Australians aged 15 and over was health care and social assistance (15%), followed by public administration and safety (11%). Three other sectors each had around 9% of total Indigenous employment (construction, accommodation/food services, and retail trade), with the mining sector accounting for a further 3.1% of employed Indigenous persons aged 15 and over in 2014–15 (AIHW analysis of ABS 2014–15 NATSISS (TableBuilder)).

Indigenous participation in the community services workforce

The provision of community services depends on having an adequate, accessible and skilled workforce. The community services workforce comprises people in paid employment who provide services such as personal and social support, child care, and special education services. This is complemented by the assistance of family members, other informal carers, and volunteers.

There is no agreed definition of which occupations make up the community services workforce. This chapter uses the definition outlined in Box 7.5.1, which was developed for *Australia's welfare 2013* in consultation with relevant Australian Government departments.

According to the 2014–15 NATSISS and the 2014 GSS:

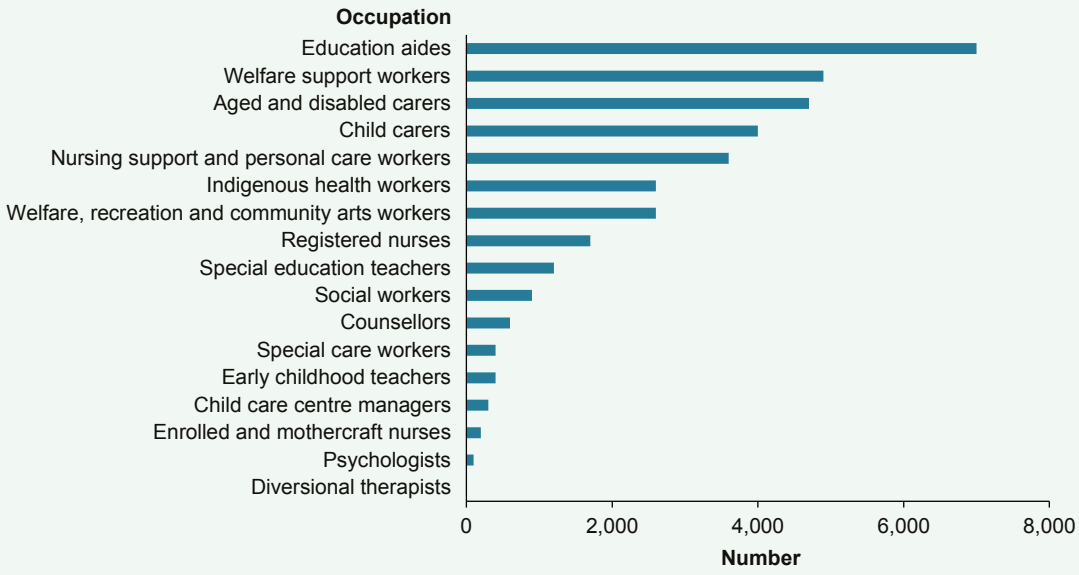
- an estimated 35,200 Indigenous Australians aged 15 or over worked in community services occupations, accounting for 3.7% of all community services workers
- the largest community services occupation group for Indigenous Australians was education aides (an estimated 7,000 workers), followed by welfare support workers (4,900) and aged and disabled carers (4,700) (Figure 7.5.5)
- Indigenous Australians are more likely than non-Indigenous Australians to be employed in the community services workforce. In 2014–15, 7.9% of the Indigenous population aged 15 or over was employed in community service occupations, compared with 5.0% of the non-Indigenous population of this age
- around 1 in 6 (17%) Indigenous Australians who were employed in 2014–15 were part of the community services workforce, compared with around 1 in 13 (7.8%) non-Indigenous employed people (AIHW analysis of ABS 2014–15 NATSISS (TableBuilder) and AIHW analysis of ABS 2014 GSS (TableBuilder)).

Box 7.5.1: Community services occupations

For the purposes of this chapter, 17 occupations are considered to be community services occupations, based on the Australian and New Zealand Standard Classification of Occupations (ANZSCO) (ABS 2013). These are:

- child care centre managers
- child care workers
- education aides
- early childhood (pre-primary school) teachers
- special education teachers
- registered nurses
- enrolled and mothercraft nurses
- nursing support and personal care workers
- Indigenous health workers
- counsellors
- psychologists
- social workers
- welfare support workers
- aged and disabled carers
- special care workers
- welfare, recreation and community arts workers
- diversional therapists.

This definition does not include some relevant occupations due to the absence of relevant categories in the ANZSCO (for example, employment services workers).



Source: AIHW analysis of ABS 2014–15 NATSISS (TableBuilder).

Figure 7.5.5: Indigenous people aged 15 or over employed in community services occupations, by occupation, 2014–15

Where do I go for more information?

Data on income and employment among Indigenous Australians are available in *The health and welfare of Aboriginal and Torres Strait Islander peoples: 2015* and the *Aboriginal and Torres Strait Islander Health Performance Framework*.

7.6 Use of disability and aged care services by Indigenous Australians

Indigenous Australians with disability

Data from the Survey of Disability, Ageing and Carers (SDAC) show that, in 2015, one quarter (24%, 125,000 people) of Aboriginal and Torres Strait Islander Australians living in households reported living with disability—defined as any limitation, restriction or impairment which restricts a person's everyday activities, and has lasted, or is likely to last, for at least 6 months (see also Chapter 8.1 'People with disability') (ABS 2016a). After adjusting for differences in population age structure, Indigenous Australians were 1.8 times as likely as non-Indigenous Australians to be living with disability. Of Indigenous Australians with disability, 38,100 people (7.3% of the total Indigenous population) had severe or profound core activity limitation, meaning they sometimes or always need help with day-to-day activities related to self-care, mobility and communication (ABS 2016a).

Disability prevalence estimates are available from the 2014–15 National Aboriginal and Torres Strait Islander Social Survey (NATSISS), but only for Indigenous people aged 15 and over. These estimates are markedly higher (45%, 199,800 people) than those from the 2015 SDAC (29%, 101,000 people); however, the scope and collection methodology for these two surveys differed (ABS 2016a, 2016b). For example, the SDAC used a larger set of screening questions, which are more effective in differentiating between people with disability and people with long-term health conditions but no disability; this may have contributed to the higher estimates from the NATSISS (ABS 2016a). As well, the SDAC did not include people living in *Very remote* areas and discrete Indigenous communities. Excluding *Very remote* areas from the NATSISS data, however, does not change the estimated disability prevalence rate among Indigenous people aged 15 and over (45%, 173,200 people). Estimates of Indigenous people aged 15 and over with a profound or severe core activity limitation—which has a much narrower definition than overall disability—are similar across the two surveys (NATSISS—7.7%, 34,300 people; SDAC—7.6%, 26,300 people).

Use of disability support services

Under the National Disability Agreement (NDA), government services are provided to people with disability to assist them with areas of daily living, such as accommodation, community involvement and employment. Data on the use of these services are collected and reported by the AIHW in the Disability Services National Minimum Data Set (DS NMDS).

In 2015–16, around 19,300 Indigenous Australians used disability support services under the NDA, accounting for 5.8% of service users. Indigenous service users were generally younger than non-Indigenous service users, with an average age of 28 compared with 35.

Intellectual disability was the most common primary disability reported by Indigenous and non-Indigenous service users (28% and 25%, respectively), followed by physical disability (19% for both) and psychiatric disability (18% and 20%, respectively).

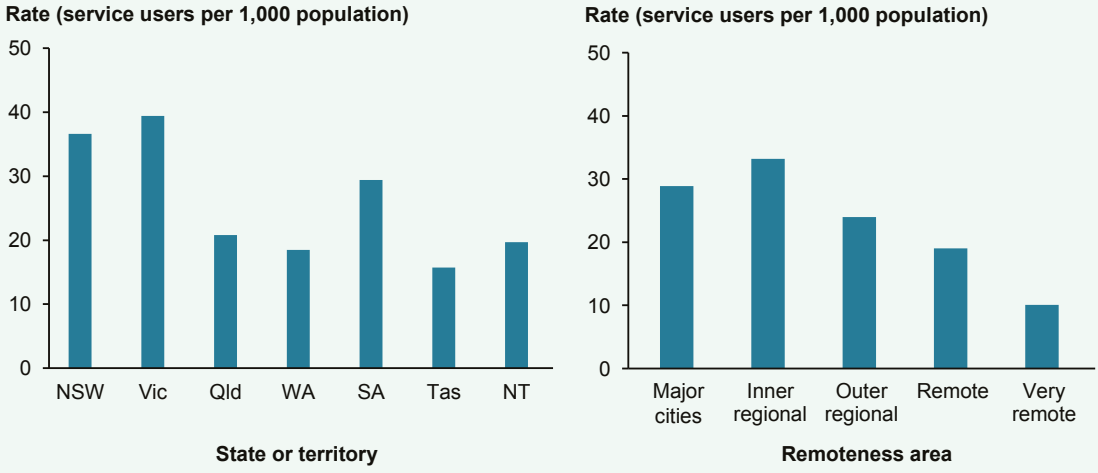
The most common service group used by Indigenous service users was community support (54%), followed by employment (37%), community access (13%), respite (12%) and accommodation support (11%). By comparison, the most common service group used by non-Indigenous service users was employment (46%), followed by community support (44%), community access (15%), accommodation support (12%) and respite (11%).

Almost all service users were aged under 65 (97% of Indigenous and 94% of non-Indigenous service users). After adjusting for differences in population age structure, Indigenous Australians aged under 65 used disability support services at almost twice the rate of non-Indigenous Australians aged under 65 (27 per 1,000 compared with 14 per 1,000 population).

Location

In 2015–16, the rates of Indigenous people using disability support service were highest in Victoria and New South Wales (39 and 37 per 1,000 population, respectively) and lowest in Tasmania (16 per 1,000) (Figure 7.6.1).

The rate at which Indigenous people aged under 65 used disability support services was higher in non-remote areas than in remote areas (Figure 7.6.1).



Note: The Australian Capital Territory Government did not collect DS NMDS data in 2015–16.

Figure 7.6.1: Crude rates (per 1,000 population) of Indigenous people aged under 65 using disability support services, by state and territory and by remoteness area, 2015–16

Labour force

In 2015–16, the proportion of disability support service users aged 15 and over who were in the labour force was similar for Indigenous (68%) and non-Indigenous (70%) people. Among those in the labour force, Indigenous service users were less likely to be employed (21%) than non-Indigenous service users (34%).

National Disability Insurance Scheme

From 1 July 2013, users of disability support services in trial sites began moving to the National Disability Insurance Scheme (NDIS) (see Chapter 8.1 'People with disability' for more information). The NDIS aims to provide Australians aged 65 and under who have permanent and significant disability with the reasonable and necessary support to participate in everyday life (NDIA 2016a). With the progressive roll out of the NDIS across Australia, it is expected that many existing NDA service users will move to it and cease to be counted in the DS NMDS collection over time.

Data on the NDIS are collected by the National Disability Insurance Agency (NDIA) (the independent statutory agency implementing the NDIS) and published in quarterly reports. As at 31 December 2016, Indigenous Australians represented 5.2% (3,200 people) of the 61,200 people with approved plans who are participating in the NDIS (NDIA 2016b). In comparison, of the 4.1 million people with disability living in households in 2015 (based on SDAC data), 3.1% were Indigenous (125,000). Among people with severe or profound disability (1.2 million people), 3.2% were Indigenous (38,100 people) (ABS 2016a).

Aged care services

Aged care support is available to older Australians through three main types of care—the Home Care Packages Program, residential aged care and the Commonwealth Home Support Programme (CHSP) (see Chapter 5.1 'Ageing and aged care' for more information). Data on Indigenous status in the CHSP are not yet available for reporting; for more information see 'What is missing from the picture?' later in this chapter.

Information in this article relates to the use by Indigenous Australians of services in mainstream programs. Flexible care programs are also available, including one specifically aimed at older Indigenous people—the National Aboriginal and Torres Strait Islander Flexible Aged Care Program. As at 30 June 2015, 31 aged care services were funded to deliver 802 aged care places through this program (Department of Health 2015).

Target population

The Indigenous population has a younger age structure and shorter life expectancy than the non-Indigenous population. Conditions associated with ageing may also affect Indigenous Australians earlier. Given these circumstances, the aged care target population comprises Indigenous Australians aged 50 and over and non-Indigenous Australians aged 65 and over.

Of the 3.8 million Australians in the aged care target population in 2016, around 112,000 (3.0%) were Indigenous people.

Home Care

The Home Care Packages Program is designed to provide clients with an individually tailored and coordinated package of services to support them in living independently in the community for as long as possible. Home Care Packages are available at four levels of care. Progressively higher levels of help are offered to support people with basic, low, intermediate, or high care needs.

It should be noted that more than one-third (36%) of home care client records in 2016 did not include Indigenous status (Table 7.6.1). Hence, these data should be used with caution.

As at 30 June 2016, 4.2% of Home Care clients with recorded Indigenous status in client records identified as Indigenous Australians. Of those clients with recorded Indigenous status, 3.9% of those receiving level 1 (basic) care and 5.3% of those receiving level 2 (low) care were Indigenous (Table 7.6.1).

Table 7.6.1: Proportion of people using Home Care Packages, by level of care and Indigenous status, 30 June 2016

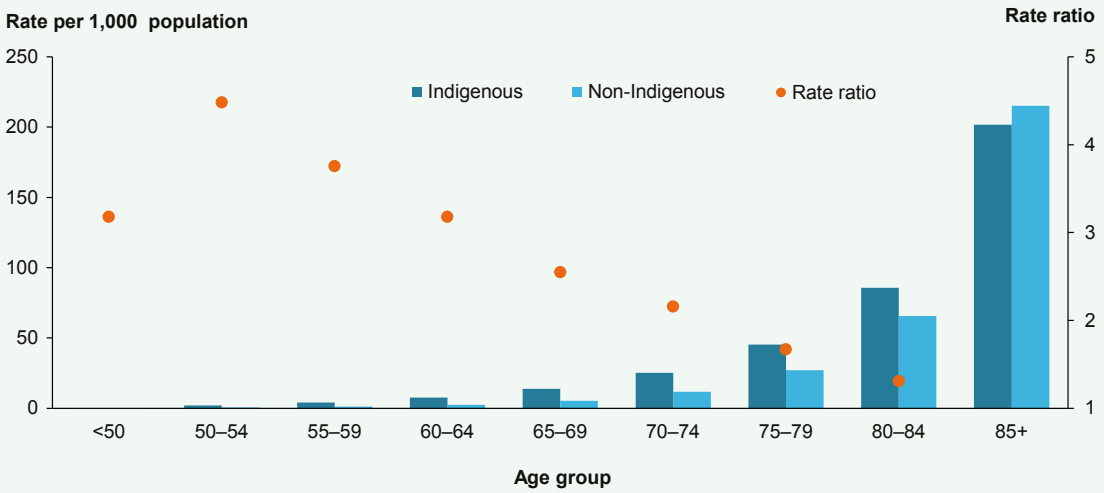
Indigenous status	Home Care levels of care				
	Level 1 (basic care)	Level 2 (low care)	Level 3 (intermediate care)	Level 4 (high care)	Total Home Care
	% of total clients				
Indigenous	1.7	3.3	1.4	1.5	2.7
Non-Indigenous	42.9	58.2	60.3	72.1	61.4
Not stated	*55.3*	*38.6*	*38.3*	*26.3*	*35.9*
All clients	**100.0**	**100.0**	**100.0**	**100.0**	**100.0**
	% of clients with recorded Indigenous status				
Indigenous	3.9	5.3	2.2	2.1	4.2
Non-Indigenous	96.1	94.7	97.8	97.9	95.8
Clients with recorded Indigenous status	**100.0**	**100.0**	**100.0**	**100.0**	**100.0**

Note: Columns may not add to 100% due to rounding.

Residential aged care

As at 30 June 2016, there were 1,531 Indigenous Australians in permanent residential aged care. This represents 0.9% of permanent residential aged care residents and 0.2% of the total Indigenous population.

The age profile of Indigenous people in permanent residential aged care was substantially younger than that of non-Indigenous people. One-quarter (26%) of Indigenous permanent aged care residents were aged under 65 compared with only 3.3% of non-Indigenous aged care residents. Indigenous Australians had higher rates of aged care use in all age groups until age 85 (Figure 7.6.2).



Note: Rate ratio not shown on graph if ratio is less than 1.

Figure 7.6.2: Rate (per 1,000 population) and rate ratio for use of permanent residential aged care, by Indigenous status and age group, as at 30 June 2016

As at 30 June 2016, the rate of Indigenous Australians in permanent residential aged care was highest in *Remote and very remote* areas and lowest in *Major cities* (Figure 7.6.3).

The pattern of aged care residents by remoteness differed for Indigenous and non-Indigenous people, with around one-third (31%) of Indigenous aged care residents in *Major cities*, compared with more than two-thirds (70%) of non-Indigenous residents. The observed patterns of aged care residents by remoteness closely mirrors the corresponding aged care target population patterns (Figure 7.6.3).

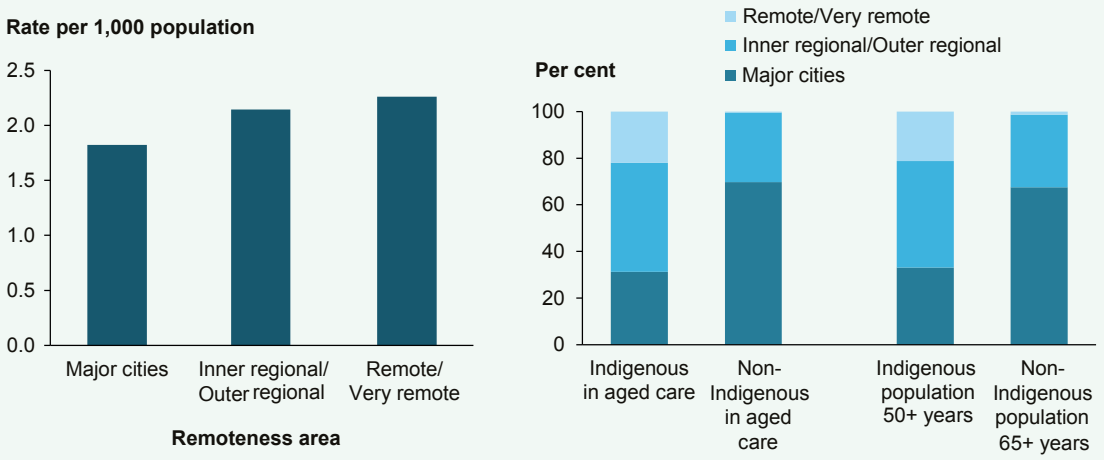


Figure 7.6.3: Crude rate of Indigenous people in permanent residential aged care by remoteness area and proportion of people in permanent residential aged care and proportion of population, by Indigenous status and remoteness area, as at 30 June 2016

What is missing from the picture?

The CHSP was launched in July 2015. It incorporates Home and Community Care (HACC) and several smaller programs, and is the largest of the aged care programs. Because of the transition to a new system some data items, including Indigenous status, were unavailable for reporting in the first year (2015–16).

As self-identifying one's Indigenous status is not compulsory, the number of people presented who identified themselves as being of Aboriginal and Torres Strait Islander origin may be an underestimate of the true number of Indigenous people using these programs.

Information about geographical location (remoteness) is based on the location of the service provider for all programs except HACC. Although the location of care recipients can be inferred from the location of service providers, some care recipients may live outside the geographical areas or jurisdictions of service providers.

Some socio-demographic characteristics of care recipients are recorded when they apply for care; these may have changed by the time recipients are receiving care. These include usual residence status and living arrangements.

Where do I go for more information?

More information about use of disability support services by Indigenous Australians is available from *Disability support services: services provided under the National Disability Agreement 2015-16* and the *Aboriginal and Torres Strait Islander Health Performance Framework*.

More data about the use of aged care services by Indigenous Australians are available from the AIHW National Aged Care Data Clearinghouse.

Chapter 8

Disability and carers

8.0 Introduction

As has been reported throughout *Australia's welfare 2017*, some Australians face profound disadvantages. These can affect not only their physical and mental health, but also their participation in education, employment and social activities. This chapter profiles Australians living with disability and discusses some of the challenges they face, including being meaningfully involved in everyday life.

Living with disability may limit what a person can do in their daily life, or restrict their participation in other ways. Socioenvironmental factors can add to these difficulties—for instance, availability of services, accessibility of the physical environment, and social attitudes towards people with disability. How people with disability participate in society can also be influenced by the opportunities and help available to them, as well as by the severity of their disability.

About 4.3 million Australians (or 18% of the population) have a disability, and about 1.4 million people with disability have a severe or profound core activity limitation. This means that they sometimes or always need help with everyday activities—self-care, mobility and communication.

While the number of people with disability has increased over time (from 4 million in 2003), the proportion of the population with disability has decreased (from 20% in 2003 to 18% in 2015).

The majority of people with disability live in households; only 4.5% live in some form of cared accommodation. People with disability are about 4 times as likely as people without disability to rely on a government pension or allowance as their main source of income. While around 1.1 million people with disability of working age participated in the labour force in 2015, almost as many (1.0 million) did not.

Almost all people with disability take part in some social activities away from home, but this involvement differs by the severity of disability. People with severe or profound limitation are less likely to leave home to take part in everyday activities as often as they would like.

This chapter also profiles Australia's 2.7 million informal carers—about one-third of whom are primary carers for a person with disability. The time and costs of providing care to another person can present challenges for carers. There may be increased financial stress, limited access to education and employment, and restricted involvement in social and community life. One-third of primary carers spend 40 hours or more per week caring for the recipient of care, and one-third have spent 10 or more years in the caring role.

8.1 People with disability

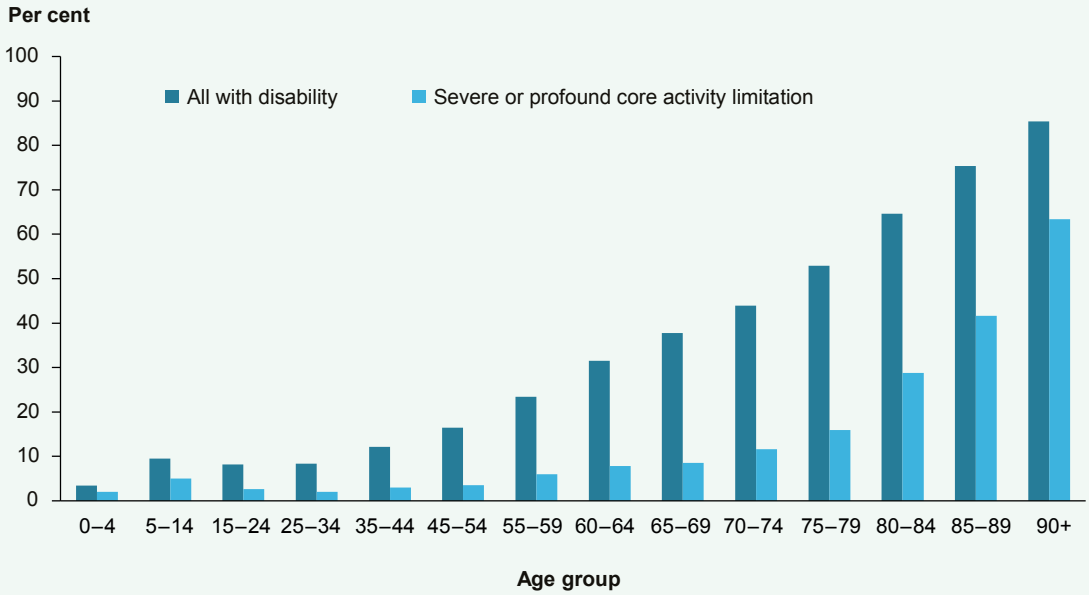
The World Health Organization estimates that 15% of the world's population (1 billion people) have disability, which it defines as any impairment, activity limitation or participation restriction (WHO 2016). The Australian Bureau of Statistics (ABS) Survey of Disability, Ageing and Carers (SDAC) collects information on the wellbeing, functioning and social and economic participation of people with disability in Australia. The SDAC uses a broad construct of disability (Box 8.1.1) designed to align with the WHO's International Classification of Functioning, Disability and Health 2001 (ABS 2016).

Box 8.1.1: Australian Bureau of Statistics definition of disability

The ABS SDAC defines a person with disability as someone who has one or more specified types of limitations, restrictions or impairments that restrict everyday activities, and which has lasted (or is likely to last) for at least 6 months. The severity of disability is further defined by the degree of assistance or supervision required in core activities—self-care, mobility and communication—and grouped for mild, moderate, severe and profound limitation. People can also be identified as having a disability and schooling or employment restriction only, or disability and no restriction or limitation (ABS 2016). The concept 'people with disability' contains all of these definitions, and thus also includes 'people with severe or profound limitation'.

How many Australians have disability?

In 2015, an estimated 4.3 million Australians had disability—nearly 1 in 5 people (18%). While the number of people with disability has increased over time, from 4 million in 2003, the proportion of the population with disability has decreased (from 20% in 2003) (see Chapter 9.2 'Indicators of *Australia's welfare*'). Of the 4.3 million people with disability, about 1.4 million (or 5.8% of the total population) had severe or profound core activity limitation. This means that they sometimes, or always, need help with day-to-day activities related to self-care, mobility and communication. The likelihood of having disability or severe or profound core activity limitation generally increased with age (Figure 8.1.1).



Source: ABS 2016.

Figure 8.1.1: Proportion of the population with disability and severe or profound core activity limitation, by age group, 2015

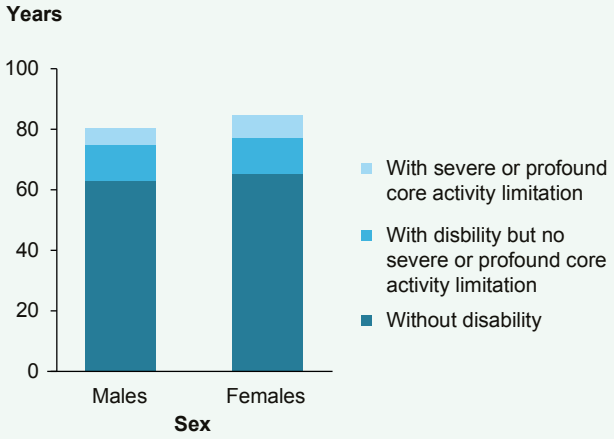
The SDAC also found that, in 2015:

- disability prevalence was similar for males (18%) and females (19%), but females were slightly more likely to report severe or profound core activity limitation (6.4%) than males (5.3%)
- around 8% of people with disability reported having schooling or employment restrictions (see Chapter 8.2 'Participation in society by people with disability' for more information on education and employment for people with disability)
- close to 4 in 5 people (79%) with disability reported a physical condition as their main long-term health condition, with the rest reporting a mental or behavioural disorder (21%). In recent years, there has been a notable increase in people who report mental and behavioural disorders as their main long-term condition—up from 17% in 2009 and 19% in 2012
- the majority of people with disability lived in households—with 75% living with others and 21% living alone. The remaining 4.5% lived in cared accommodation
- a government pension or allowance was the main source of personal income for 42% of people with disability of working age (15–64) living in households, followed by wages or salary (37%). By comparison, wages or salary was the main source of personal income for the majority (68%) of people of working age without disability: fewer than 1 in 10 (8.5%) reported a government pension or allowance as their main source of personal income

- more than half (59%) of people with disability living in households reported needing help with at least 1 of 10 specified activities of daily living. These activities included self-care, mobility, communication, cognitive or emotional tasks, health care, reading or writing tasks, transport, household chores, property maintenance and meal preparation. The most common activity requiring assistance was health care (29%), followed by property maintenance (27%)
- of people who need help with daily activities, 62% reported their needs were fully met, 35% partly met and 2.7% not met at all. The most common activities for which a need for assistance was not fully met were property maintenance (7.7%) and cognitive or emotional tasks (7.5%)
- of people aged 15 and over living in households who received assistance from organised services in the 6 months before the survey, the majority (85%) were satisfied with the quality of service received (where the level of satisfaction could be determined).

How long can we expect to live with and without disability?

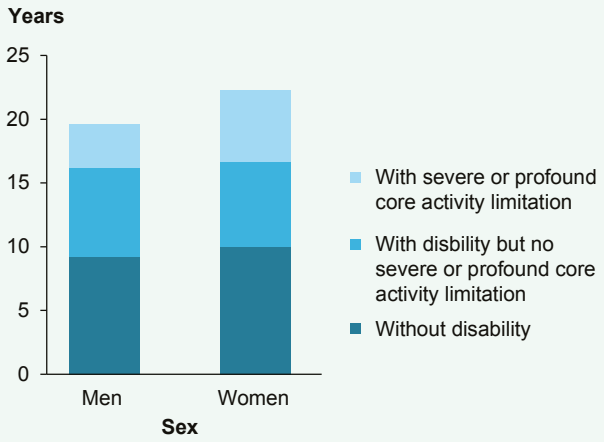
The life expectancy of Australians has continued to increase for both males and females in recent decades. Most of these increases correspond to an increase in disability-free life expectancy, which is the expected number of years living without disability. Between 2003 and 2015, the disability-free life expectancy increased from 59.1 years to 63.0 years for males, and from 62.2 years to 65.2 years for females.



Source: AIHW analysis of unpublished ABS SDAC 2015 data and unpublished ABS abridged Australian life tables 2013–2015.

Figure 8.1.2: Expected number of years of life with and without disability at birth, by sex, 2015

On average, boys born in 2015 could expect to live 63 years without disability and another 17 years with disability, including 5.4 years with severe or profound core activity limitation (Figure 8.1.2). Girls born in 2015 could expect to live an average of 65 years without disability and another 19 years with disability, including 7.5 years with severe or profound core activity limitation.



Source: AIHW analysis of unpublished ABS SDAC 2015 data and unpublished ABS abridged Australian life tables 2013–2015.

Figure 8.1.3: Expected number of years of life with and without disability at age 65, by sex, 2015

Life expectancies at birth are influenced by mortality in early life. Hence, looking at life expectancies at age 65 provides an insight into healthy ageing (Figure 8.1.3). Men aged 65 in 2015 could expect to live, on average, a further 9 disability-free years, followed by 10 years with disability, including 3 years with severe or profound core activity limitation. Women aged 65 could expect to live, on average, a further 10 years without disability and another 12 years with disability, with close to half of those 12 years being with severe or profound core activity limitation.

The disability-free life expectancy estimates of people aged 65 are average estimates for the total population of that age group, including people who already have disability. As such, the number of expected years of life with disability for a person who does not have a disability at age 65 would be fewer than those presented, which average the experience of people both with and without disability at age 65.

Further information on disability-free life expectancy is presented in Chapter 9.2 'Indicators of *Australia's welfare*'.

What support services are available to people with disability?

The disability services environment has changed a lot in recent years. Since 1991, government-funded services for people with disability have been provided under various iterations of the National Disability Agreement (NDA) (see Box 8.1.2). In 2012, the Australian Government introduced the National Disability Insurance Scheme (NDIS) (see Box 8.1.3), which is expected to largely replace the NDA over time.

Both the NDA and the NDIS reflect the intention of the Australian Government to improve the lives of people with disability, their families and carers. This intent is captured in the National Disability Strategy 2010–2020 (DSS 2016b) (see Box 8.1.4).

How many people receive support under the National Disability Agreement?

Under the NDA, government services are provided to people with disability to help them with aspects of daily living, such as accommodation, community involvement and employment.

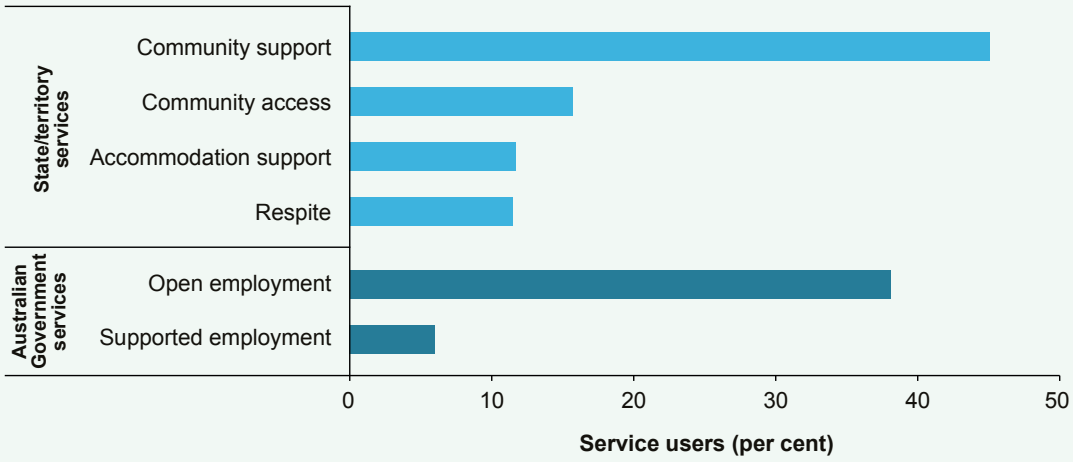
Box 8.1.2: National Disability Agreement

Under the NDA, the Australian and state and territory governments fund a range of disability support services that aim to ensure 'people with disability and their carers have an enhanced quality of life and participate as valued members of the community' (COAG 2009). Eligibility requirements vary between jurisdictions, and the service a person can receive is largely subject to availability (for example, based on the number of available places in certain programs). Services are mainly delivered by 'block-funded' providers, with funding allocated directly to the provider.

Information on the use of services under the NDA is collected and reported by the AIHW in the Disability Services National Minimum Data Set (DS NMDS).

In 2015–16, around 332,000 people used disability support services under the NDA. (Note, however, that this is an underestimate as it excludes data from the Australian Capital Territory Government, which did not collect data in 2015–16.) The average age of service users was 35, and 5.8% were aged 65 or over. More than half (59%) were male and 6.0% were Indigenous. Intellectual disability was the most common primary disability type of service users (25%), followed by psychiatric disability (20%) and physical disability (19%).

Community support services, which support a person with disability in living in a non-institutional setting, were the most commonly used services (45%) (Figure 8.1.4). The next most commonly used services were open employment services (38%), which help people to gain and/or retain employment in the open labour market.



Note: People can use more than one type of service.

Source: Disability Services National Minimum Data Set 2015–16.

Figure 8.1.4: Proportion of disability support service users by service group, 2015–16

Transition of National Disability Agreement service users to the National Disability Insurance Scheme

Although most NDA service users are expected to move to the NDIS as it is rolled out, not all users will be eligible. For example, people aged 65 and over are not eligible to enter the NDIS, but those who turn 65 after becoming an NDIS participant may continue to receive support until they enter the aged care system. As well, some specialist disability support programs, such as open employment services, will not be included in the NDIS and will continue to operate separately. In 2015–16, there were 19,090 NDA service users aged 65 or older, and 126,470 who used open employment services. As not all users of services under the NDA will be supported under the NDIS, governments have set up 'continuity of support' arrangements. These will allow people who do not meet requirements for NDIS entry to continue to receive support services consistent with their current arrangements.

During 2015–16, 3,500 NDA service users were reported in the DS NMDS as having moved to the NDIS, adding to the 9,600 reported to have made the transition since the start of the NDIS. The data published by the National Disability Insurance Agency (NDIA) on people with an approved and active NDIS plan might not match the DS NMDS data on NDA service users who moved to the NDIS (see next section). There are several reasons for this. For instance, the NDIA data include data for people who have not been reported as part of the DS NMDS, such as people referred directly to the NDIS. This is especially the case for very young children and people who meet the early intervention eligibility requirements under the NDIS.

How many people receive support under the National Disability Insurance Scheme?

According to the NDIA, 74,900 people with approved plans were participating in the NDIS (known as 'active participants') as at 31 March 2017 (NDIA 2017b). This excludes 700 people who had received an approved plan but have since exited the scheme, bringing the total number of people who have received support from the NDIS to 75,600. As well, almost 2,400 children have received a referral to the Early Childhood Education Intervention gateway. This initiative is designed to connect children aged 0–6 with early childhood providers to identify needs and provide timely access to information and support.

Box 8.1.3: National Disability Insurance Scheme

The NDIS aims to provide Australians with permanent and significant disability with the reasonable and necessary support needed to participate in everyday life (NDIA 2016). The NDIS is a substantial change to how services are provided to people with disability in Australia. Arrangements under the NDA largely see service providers funded for places in a set number of assistance programs. On the other hand, NDIS participants receive an individualised plan of the support needed to achieve their goals, and a funding package to purchase this support.

The NDIS was introduced through trial sites from 1 July 2013. The transition to the full scheme will occur progressively from 1 July 2016. The roll out of the NDIS varies by state and territory. In some jurisdictions, it is being rolled out geographically: people enter it at different times, according to where they live. In other jurisdictions, people enter it at different times according to their age. Full national roll out is scheduled to be completed by 1 July 2019 in all states and territories except for Western Australia, where roll out will be completed by 1 July 2020 (NDIA 2017a).

The NDIA—an independent statutory agency whose role is to implement the NDIS—collects data on the NDIS, and publishes them in quarterly reports.

NDIS active participants were younger than NDA service users, and more than half of them (52%) were aged 18 and under, as at 31 March 2017 (NDIA 2017b). The majority of participants were male (63%) and 5.1% were Indigenous. Intellectual disability was the most common primary disability group of participants (37%), followed by autism (28%) and psychosocial disability (6.5%).

Once the NDIS is fully implemented, it is estimated that it will support 475,000 people with significant and permanent disability—460,000 aged under 65; and 15,000 aged 65 and over who entered the scheme before turning 65 (Productivity Commission 2017). This represents about 11% of all people with disability in Australia (based on SDAC estimates), and 64% of people with severe or profound disability aged under 65.

Box 8.1.4: The National Disability Strategy

The National Disability Strategy 2010–2020 (DSS 2016b) outlines the shared national vision for improving the lives of Australians with disability, their families and carers. It is an important mechanism to ensure the principles underpinning the United Nations Convention on the Rights of Persons with Disabilities (UN 2006) are incorporated into policies and programs across all levels of government. The Strategy embodies a national approach to inclusive public policy development and to improved access to mainstream services.

The Strategy's first implementation plan, *Laying the groundwork 2011–2014*, set the foundations to drive reform in the planning and delivery of both mainstream and disability specific programs and services. The second implementation plan, *Driving action 2015–2018*, builds on ongoing commitments to improve outcomes for people with disability.

What financial support is available for people with disability?

As well as support services (such as those mentioned in this article that are received under the NDA or through the NDIS), people with disability may be eligible to receive financial assistance to help with activities of daily life. The Disability Support Pension and the Mobility Allowance are two such programs (DSS 2016a). Other financial support, such as to assist with study or housing, may also be available for people with disability.

In 2015–16, close to 782,900 people received the Disability Support Pension. This pension provides financial support for people with a physical, intellectual or psychiatric condition who are unable to work for 15 hours or more per week within the next 2 years because of their impairment and who have participated in a program to help prepare for, find or maintain work; or for people who are permanently blind (DHS 2017; DSS 2016a). The pension is available to people aged between 16 and the age pension age. Pension recipients represent about 18% of the total estimated number of people with disability in 2015 (according to SDAC), and about 36% of people with disability aged 15–64 (the closest comparable age group).

The Mobility Allowance was provided to about 60,000 recipients in 2015–16. This financial support helps with transport costs for people aged 16 and over who cannot use public transport without substantial assistance and who are participating in approved activities, such as work or study.

People with disability may also be eligible for various government concession cards, which provide recipients with access to selected goods and services at a discounted rate (DSS 2017) (see also Chapter 1.3 'Understanding welfare'). People getting the Disability Support Pension will automatically be issued with a Pensioner Concession Card. People who receive the Mobility Allowance but not the Disability Support Pension will receive a Health Care Card. State and territory governments, local governments and private businesses may provide further concessions for health, household costs, education or transport.

Financial support for children with disability is available through payments made to their parents or carers, such as the Child Disability Assistance Payment, which is available to recipients of the Carer Allowance (see Chapter 8.3 'Informal carers').

What is missing from the picture?

It is currently not possible to provide a full picture of the experiences of people with disability in Australia and how these might be changing over time. People with disability interact with every aspect of social policy and programs in Australia. They access both specialist and mainstream services across a wide variety of areas. Although there are many data collections across different agencies that collect information on people with disability (such as the AIHW, the ABS, the Department of Social Services and the NDIA), there is currently no national process to collectively report on available data in a person-centred way, understand data quality issues, or to identify and fill data gaps.

While there is no denying that a comprehensive and consolidated picture of the experiences of, and outcomes for, people with disability is desired, there are challenges involved in doing so. Currently, specialist disability support services are provided through multiple avenues—including under the NDA, NDIS, Basic Community Care, and Disability Employment Services. Hence, the total number of people receiving disability support services, and the extent of overlap of users, is difficult to determine. There are also challenges related to the varying definitions of disability used across different sources of data. Disability is generally defined depending on the type and purpose for which the data were collected. This means that definitions may differ between population surveys as well as in administrative data.

Adding to the challenge, most mainstream services (for example, health and aged care) do not include a way to identify whether a person has disability. So, comprehensive reporting on the use of these services by people with disability, and on the interactions between specialist and mainstream services, is not possible. To help address this, the AIHW has developed a disability 'flag' that can be used to identify records of people with a disability within mainstream data collections. The flag derives from a standard set of questions that assesses a person's level of functioning and need for support in everyday activities. These questions are based on the International Classification of Functioning, Disability and Health, and are broadly consistent with the short disability questions that the ABS uses in a number of its social surveys. Versions of the flag have been implemented in the AIHW's Specialist Homelessness Services Collection and the National Prisoner Health Data Collection, and are in the process of being implemented within other AIHW collections. A wider implementation of the flag would improve the ability to report more comprehensively on people with disability, and to do so in a more person-centred way.

Data linkage is another option that could be used to more comprehensively examine the experiences of people with disability than is possible from a single source. For example, linking disability support services or payments data to national hospital data, the Medicare Benefits Schedule or the Pharmaceutical Benefits Scheme could provide an insight into how people with disability interact with mainstream health services, and how these services complement specialist disability supports. Likewise, linking disability support services data to aged care could help improve understanding of the interactions between these two sectors. Chapter 1.7 'Understanding health and welfare data' explores further the opportunities and challenges associated with using data linkage to fill data gaps, including those related to disability.

Where do I go for more information?

For more information relating to disability and the use of disability support services, see www.aihw.gov.au/disability/. The AIHW reports *Disability support services: services provided under the National Disability Agreement 2015–16* and *Life expectancy and disability in Australia: expected years living with and without disability*, and other recent publications related to disability in Australia are available for free download. Information on people with disability from the most recent ABS SDAC is available from Disability, ageing and carers, Australia: Summary of findings, 2015.

The NDIS website, https://www.ndis.gov.au, provides information about the scheme for people with disability, families and carers, services providers and the wider community.

8.2 Participation in society by people with disability

The *United Nations Convention on the Rights of Persons with Disabilities* sets out rights for people with disability, one of which protects the right of people with disability to participate fully in all aspects of life (United Nations 2006). However, people with disability often face challenges in doing so, and their rates of participation in education, employment and social activities are generally lower than for people without disability.

Any disability may limit the activities a person undertakes in their daily life (such as tasks relating to self-care, mobility and communication), or restrict their participation in other ways. How people with disability participate in society can also be affected by the opportunities and assistance available to them, and by the severity of their disability.

The Australian Bureau of Statistics (ABS) Survey of Disability, Ageing and Carers (SDAC) uses a broad construct of disability, defining it as any limitation, restriction or impairment that restricts a person's everyday activities, and has lasted, or is likely to last, for at least 6 months (see Chapter 8.1 'People with disability' for more detail). Almost 1 in 5 (18%) Australians—4.3 million people—had a disability in 2015. This represented an increase of 8.7% from 2003, at the same time as the general population increased by almost 19%. Around 1 in 3 people with disability (1.4 million) had severe or profound limitation.

The following article presents key findings from AIHW analyses of the 2003 and 2015 ABS SDAC. More detail is available in the related fact sheets (see 'Where do I go for more information?').

Trends in education and work

School attendance

In 2015, there were 336,000 children and younger people with disability aged 5–20 living in households in the community and attending school or an educational institution. This represents 1 in 14 (7.1%) people in this age group. The number of students with disability increased by 4.0% between 2003 and 2015, growing at a slower rate than the number of people in the same age group in the general population (up by 9.2%). At the same time, the number of students with severe or profound limitation increased by 11%.

For students with disability, common schooling options are special schools (those that enrol only students with special needs), special classes within a mainstream school (those that specifically support students with special needs), or ordinary classes within a mainstream school (where students with disability may receive extra, tailored supports). Between 2003 and 2015, there was a shift towards students with disability attending special schools. The number of students who attended a special school increased by 35% for people with disability, and by 31% for people with severe or profound limitation. In 2015, 15% of children and young people with disability, and 26% of students with severe or profound limitation, attended a special school. At the same time, fewer students attended special classes within a mainstream school environment—decreasing from 2003 by 22% for people with disability, and by 8.0% for people with severe or profound limitation. In 2015, 19% of students with disability, and 22% of people with severe or profound limitation, attended special classes in a regular school.

An increasing number of students with disability also needed assistance in other ways with their schooling. This included help provided by a person, by using special equipment, or through other arrangements such as for access, transport or assessment. The need for part-time attendance at school increased considerably. Between 2003 and 2015, the number of students requiring 1 or more days off school each week increased by 47% for people with disability, and by 79% for people with severe or profound limitation. In 2015, 10% of students with disability and 14% of people with severe or profound limitation attended school part-time.

Employment

Labour force participation

Around 1.1 million working-age people (aged 15–64) with disability living in households participated in the labour force, either by working or looking for work in 2015. Almost as many people with disability did not participate in the labour force (1.0 million), with more than half (57%) of them reporting having an employment restriction that meant they were permanently unable to work.

The number of people with disability in the labour force has fallen by 3.0% between 2003 and 2015. This is similar to the 3.3% fall in the overall number of working age people with disability living in households over that period. At the same time, the number of working age people without disability participating in the labour force increased by 23%.

There has been little change in the overall labour force participation rate for people with disability. Around half of working age people with disability were participating in the labour force (53% in 2003 and 2015), compared with 81% and 83%, respectively, for the overall population. The rate of labour force participation varied by the severity of people's disability. Two-thirds (68%) of people with disability and schooling or employment restrictions only, and one-quarter (25%) of people with severe or profound limitation (down from 30% in 2003), were either employed or looking for work in 2015.

Employment

In 2015, around 580,000 working age people with disability were employed full time, and 453,000 part time. The number of people with disability who were working fell (down by 4.6% from 2003), and considerably fewer people with severe or profound limitation were working (down by 17%). In 2015, half (48%) of working age people with disability, and 22% of people with severe or profound limitation, were employed, compared with 79% of people without disability.

The patterns of work changed between 2003 and 2015, with a trend towards part-time work. Between 2003 and 2015, the number of people with disability working full time dropped by 16%, and the number of people with severe or profound limitation by 41%. At the same time, the numbers of those working part time increased by 14% and 7.4%, respectively. By comparison, the number of people without disability in full-time and part-time employment increased over this period (by 12% and 33%, respectively). In 2015, employed people with disability were more likely to work part-time, compared with employed people without disability—44% of employed people with disability, and 63% of those with severe or profound limitation, were working part-time hours, compared with 32% of employed people without disability (see Supplementary Table S8.2.1 for additional information on employment).

Unemployment

Unemployment rates are calculated as the proportion of people participating in the labour force who were unemployed and looking for work. These rates are thus affected by not only the number of unemployed people but also the size of the labour force. Unemployment rates also showed variation by disability severity. Overall, for all people with disability, the unemployment rate was 10% in 2015 (9% in 2003), 13% for people with a schooling or employment restriction (15% in 2003) and 14% for people with severe or profound limitation (11% in 2003).

For more information, see Chapter 9.2 'Indicators of *Australia's welfare*'.

Social activities

There were 2.1 million people aged 15–64 with disability living in households in 2015. The likelihood of participating in some aspects of community life varied, depending on the severity of a person's disability (Table 8.2.1). The differences in general measures of participation were small. For example, in 2015, most people with disability and people with severe or profound limitation had participated in at least one social activity at home (96% and 93%, respectively) and away from home (94% and 89%) in the previous 3 months. On some specific measures, such as internet use, the difference was greater. Overall, four-fifths (81%) of people with disability had used the internet in the previous 3 months; among people with severe or profound disability, the proportion was lower (68%) (Table 8.2.1).

Table 8.2.1: Participation rates in selected social activities for people aged 15–64 with disability or with disability and severe/profound limitation living in households, 2015

Participation type	Disability (%)	Severe/profound limitation (%)
Had a driver's licence[(a)]	84.2	64.0
Destination of last trip was shopping[(b)]	30.0	32.6
Participated in social activities at home[(c)]	96.0	93.4
Visits from friends/relatives	*89.8*	*88.5*
Telephone calls from friends/relatives	*92.8*	*86.6*
Used the internet[(c)]	80.9	68.0
For online banking	*64.7*	*47.2*
For social networking	*72.7*	*70.2*
Left home as often as would like	70.0	48.0
Participated in social activities away from home[(c)]	94.0	89.0
Visited friends/relatives	*92.8*	*90.2*
Went out with friends/relatives	*74.1*	*65.3*
Attended a cultural venue[(d)]	69.0	57.4
Movies	*55.2*	*42.1*
Library	*30.4*	*24.0*
Felt safe/very safe at home after dark	81.1	69.5
Able to find support from others in times of crisis outside of members of own household	90.9	86.3
Difficulty with access[(e)]	26.7	31.6
Avoided community situations due to disability[(d)]	41.3	61.9
Experienced discrimination due to disability	13.8	21.8

(a) Excludes people aged under 17.
(b) People who took a trip in the previous 2-week period.
(c) At least once in the previous 3-month period.
(d) At least once in the previous 12-month period.
(e) Had difficulty with mobility/communication and difficulty accessing community facilities/buildings in the previous 12-month period.

Source: AIHW analysis of ABS 2015 Survey of Disability, Ageing and Carers (TableBuilder).

What is missing from the picture?

With currently available data, it is not possible to provide a full picture of the experiences of people with disability in Australia. The SDAC is a valuable source of information for estimating the number of people with disability and the nature of their disability, but information from other data sources is needed to provide a consolidated picture of the experiences and outcomes of people with disability as they engage in various aspects of life in Australia. For more information, see Chapter 1.7 'Understanding health and welfare data' and Chapter 8.1 'People with disability'.

The SDAC has been conducted regularly since 1981, with changes over the years. Many items, particularly for social and community activities, are either recently introduced, or not comparable across the years, and some items are only applicable to specific subgroups. For example, questions on participation in social and community activities are only asked of people with disability living in households, rather than of all people with disability or people without disability (although these questions are asked of carers and people aged 65 and over). Some populations are also outside of the survey's scope: while data are collected for Indigenous people with disability, the SDAC excludes people who live in *Very remote* areas and discrete Indigenous communities, and the resulting data may not be representative of the prevalence or experience of disability for all Indigenous people.

Where do I go for more information?

More information about people with disability is available at www.aihw.gov.au/disability/. The factsheets for *Disability in Australia: changes over time in inclusion and participation in community living*, *employment* and *education* are available for free download, as well as other recent publications such as *Disability support services: services provided under the National Disability Agreement 2015–16* and *Life expectancy and disability in Australia*.

The ABS also provides information on people with disability through a Summary of findings and supporting data from each Survey of Disability, Ageing and Carers.

8.3 Informal carers

Informal carers provide care to others who need help or support due to disability, health conditions or ageing, outside the formal care sector (where paid care is provided by trained professionals). Often, informal carers are people close to the person in need, such as family and friends. Informal care covers a wide range of activities, such as personal care, transport assistance and medical care. It may be provided alongside formal care, or shared with other informal carers. Informal carers play an important role in assisting people who need help in their daily lives, with an estimated 1.9 billion hours of unpaid care provided in 2015 (Deloitte Access Economics 2015).

This article focuses on carers of people with disability, health conditions, or frailty due to old age, and not on the large number of Australians who provide informal care for children (Box 8.3.1).

Box 8.3.1 Informal carers of children

Other people beside parents or guardians may care for children on an informal basis. Grandparents are the most common informal carers for children aged 12 and under (ABS 2015). Other informal carers may be (step) brothers or sisters, other relatives (including a parent living elsewhere) or other (unrelated) people such as friends, neighbours, nannies or babysitters.

In 2014, 1 in 5 (22%) children aged 12 and under usually received care from a grandparent; grandparents provided an average of 10 hours of care per week—almost all (98%) of their care was unpaid (ABS 2015).

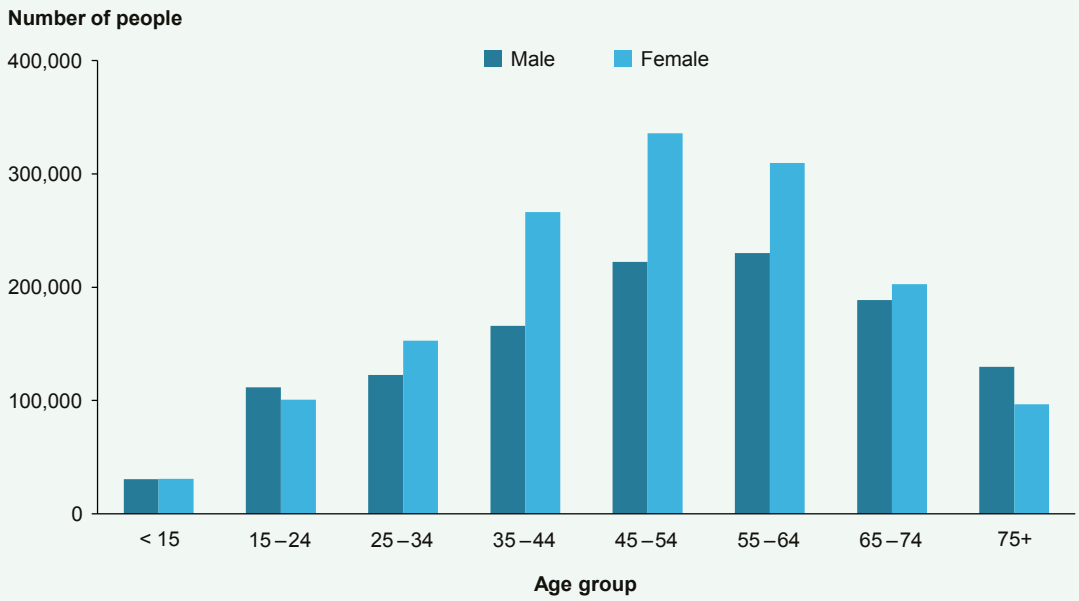
For more information on formal and informal child care in Australia see Chapter 2.1 'Children in child care and preschool programs'.

Being an informal carer can be rewarding, but challenging. Informal carers may experience social isolation, physical and emotional strain and restricted education and employment opportunities. Recent research has shown that carers who provided a high level of care and were employed in the workforce were most likely to be adversely affected (Kenny et al. 2014).

How many informal carers are there in Australia?

In 2015, 1 in 9 Australians (2.7 million people) were informal carers according to the Australian Bureau of Statistics (ABS) Survey of Disability, Ageing and Carers (SDAC). The SDAC collects information about people who provide informal care in Australia—their health, wellbeing and participation in the community and workforce. In particular, information is collected about primary carers (the main caregivers): people aged 15 and over who live in the same household as the person with disability and provide them with the most help. In 2015, there were an estimated 856,100 primary carers in Australia, representing 3.7% of the population.

In 2015, more than half of informal carers were female (56%). There were significantly more female carers than male carers aged 35–64 (Figure 8.3.1). One in 10 (10%) carers were aged under 25, and more than 2 in 10 (23%) were aged 65 and over.



Source: ABS 2016.

Figure 8.3.1: Number of carers, by age group and sex, 2015

Between 2009 and 2015, the number and proportion of carers in Australia has remained steady, with an estimated 2.6 million carers in 2009 and 2.7 million in 2015, representing 12% of the population in both years. Over the same period, the number of primary carers increased from 771,400 (3.6%) to 856,100 (3.7%), although the proportion of primary carers in the population remained similar. Primary carers now make up 32% of all carers, compared with 29% in 2009.

The 2015 SDAC found that:

Almost all (96%) primary carers care for a **family member**.

Two-thirds (67%) of primary carers stated **'family responsibility'** as their reason for taking on a caring role.

2 in 5 (38%) primary carers reported having **disability**, with 1 in 5 (21%) experiencing severe or profound core activity limitation.

40+

One-third (33%) of primary carers spend **40 hours or more each week** caring for their main recipient of care.

10+

One-third (33%) of primary carers have spent **10 or more years** caring for their main recipient of care.

What challenges do carers face?

The time and costs associated with providing care to another person can be challenging for carers, particularly for the primary carer. The caring role may create increased financial stress, limit the carer's access to education and employment, or restrict their participation in social and community life. Table 8.3.1 shows differences in income, employment and education between primary carers, other (non-primary) carers and non-carers.

Table 8.3.1: Income, employment and education levels for primary carers, other (non-primary) carers and non-carers, 2015

Measure	Primary carers	Other (non-primary) carers	Non-carers
Median gross personal weekly income[(a)]($)	520	813	900
Government pension or allowance as main source of income[(a)](%)	42.7	18.0	11.3
Unemployment rate[(b)](%)	7.3	6.4	5.4
Workforce participation rate[(b)](%)	43.3	63.9	69.2
Educational attainment of Year 12 or higher[(b)](%)	63.2	69.0	71.3

(a) People aged 15–64 years.
(b) People aged 15 and over.

Source: ABS 2016.

In 2015, in the 3 months before the survey, most (94%) primary carers had participated in a social or community activity away from home, such as visiting friends or relatives or taking part in sport or physical recreation. Three-quarters (76%) of primary carers took part in such activities without the person they cared for. Primary carers who spent, on average, 40 hours or more caring per week were less likely to participate in social and community activities outside the home without the person they cared for (65%), compared with primary carers who spent fewer than 20 hours on average providing care (86%).

Young carers

Young carers are people aged under 25 who provide informal care for another person, often a parent or family member. According to the 2015 SDAC, there were an estimated 272,200 young carers in Australia, including 59,100 aged under 15 (ABS 2016). This equated to around 1 in 12 (8.3%) people aged under 25 in Australia being carers. About 20,700 carers aged 15–24 were primary carers, and the majority (61%) of these were caring for a parent.

Aspects of the caring role can be enjoyable and rewarding. But an intensive caring role may affect the ability of young carers to participate in life—such as in education, employment and social activities—to the same extent as other young people. Analysis of the SDAC indicates that primary carers aged 20–24 were less likely to have completed Year 12 or equivalent (32%) than both non-primary carers (72%) and non-carers (80%) of the same age (ABS 2016). Primary carers aged 15–24 were also less likely to be employed (43%) than non-primary carers (56%) and non-carers (60%). However, most (97%) young primary carers (aged 15–24) had participated in a social or community activity away from home without the recipient of care in the last 3 months.

Older carers

Older carers are people aged 65 and over who provide informal care for another person, often their spouse or partner, their child, or their own parent. There were an estimated 618,000 older carers in Australia in 2015, representing close to 1 in 5 people (18%) aged 65 and over (ABS 2016). More than one-third of older carers were primary carers (234,100 people). The majority cared for their partner (76%), with a smaller proportion caring for their child (9.1%) or parent (8.1%).

As well as the challenges faced by all carers, older carers may experience increased stress and anxiety over the decline of their own health, or the future care of their care recipient when they are no longer able to provide care (Bellamy et al. 2014). Close to 1 in 5 (19%) older carers reported often feeling worried or depressed due to their caring role, while more than 2 in 5 (44%) reported that their main recipient of care did not have a fall-back informal carer. Many older carers are long-term carers, with 2 in 5 (41%) having been a primary carer for their current recipient of care for 10 years or more. Long-term care may amplify the social, emotional, physical and economic challenges faced by carers (Carers Australia 2010). However, it is important to note that caring can also provide many positive benefits for both the carer and recipient of care, with 40% of older carers reporting that their caring role contributed to a closer relationship with the person they cared for.

Carers of people with autism

People with autism spectrum disorder and their carers are a growing population, in Australia and around the world (WHO 2016). Analysis of the SDAC indicates that, in 2015, an estimated 164,000 people had autism spectrum disorders in Australia (ABS 2016). This number has more than doubled since 2009, when 64,400 people were identified as having autism (ABS 2014). This increase has been mirrored by an increase in the number of people who provide care to someone with autism who is living in their household, from 35,000 primary carers in 2009 to 79,900 primary carers in 2015.

In 2015, there were 69,700 primary carers whose main recipient of care reported autism as their main condition (that is, the condition that causes the most difficulty in daily life). Close to two-thirds (65%) of these carers were women aged 35–54. Compared with primary carers for people with other conditions, primary carers of people with autism were more likely to work part time, care for 60 hours or more per week, and to have reported needing further support in their caring role (Table 8.3.2). Primary carers of people with autism were as likely to be employed full time as other primary carers. These findings, particularly those relating to employment, may be partly related to the age profile of primary carers of people with autism.

Table 8.3.2: Primary carers of people with autism as their main condition compared with primary carers of people with other main conditions, 2015

Measure	Primary carers of people with autism as main condition (%)	Primary carers of people with other main conditions (%)
Employed working full time	16.4	15.1
Employed working part time	38.6	19.0
Provides care for 60 hours or more per week	46.8	31.5
Has suffered financially because of their caring role, through a decrease in their income or an increase in expenses	80.6	52.3
Has lost touch (or is losing touch) with existing friends	37.3	23.6
Has experienced a change in their physical or emotional wellbeing because of their caring role	56.4	38.5
Needs further support to assist in their caring role	58.1	36.4

Source: AIHW analysis of ABS 2015 Survey of Disability, Ageing and Carers (TableBuilder).

What support is available for carers?

A variety of government-funded services and financial support programs are available to assist carers with their caring responsibilities.

Support services

Non-financial support services for carers include counselling, information and advice, and respite care (short-term alternative care arrangements to provide a break for both the carer and the person being cared for). In 2015, 14% of carers reported they had used respite care for their main recipient of care. Female carers were more likely to have used respite care than male carers.

Under the National Disability Agreement, respite services are also available to people with disability, their families and carers. In 2015–16, more than 38,200 people with disability were provided with respite services under this Agreement (excludes data from the Australian Capital Territory Government, which did not collect data in 2015–16; see the AIHW report *Disability support services: services provided under the National Disability Agreement 2015–16* for more information). Most of this group (91%) reported having a primary carer.

The Young Carers Respite and Information Services Program also supports young people with a substantial caring role to complete their secondary education or vocational equivalent (DSS 2016d). The program helps carers who need support due to the demands of their caring role by way of respite care, education support services and information, referral and advice. Respite and education support services are delivered by the national network of 54 Commonwealth Respite and Carelink Centres; information, referral and advice are delivered by Carers Australia and state and territory carers' associations. Respite services will move to the National Disability Insurance Scheme (NDIS) as the scheme rolls out, to be accessed through the care recipient's plan. For more information on the NDIS, see Chapter 8.1 'People with disability'.

Several local and national organisations provide counselling and information services for carers. In 2015–16, Carers Australia, the national peak body representing carers, provided counselling for more than 8,000 carers, and helped more than 60,000 people with information and advice (Carers Australia 2016).

Financial support

Carers may receive financial payments, depending on their caring arrangements and the needs of the person they care for (DSS 2016b). In 2015–16, close to 605,800 people received the Carer Allowance. This is a supplementary payment for carers who provide a certain level of daily care and attention to a person with disability or a severe medical condition (excluding carers whose care recipient qualified for a Health Care Card only) (DSS 2016a). This represents more than two-thirds (71%) of the estimated number of primary carers in 2015 (from SDAC). The number of people receiving the Carer Allowance has increased in recent years, up from around 590,200 recipients in 2013–14 and almost 601,400 recipients in 2014–15 (DSS 2016a). In June 2016, 70% of Carer Allowance recipients were aged 45 and over (DSS 2016c). Carers aged under 25 accounted for 2.0% of recipients.

In 2015–16, financial support was also provided, through the Carer Payment, to almost 260,600 carers who were unable to support themselves through substantial paid employment because of their caring responsibilities (DSS 2016a). As well, there were about 629,000 recipients of the Carer Supplement and around 154,400 recipients of the Child Disability Assistance Payment. (Both these payments depend on recipients receiving specific qualifying payments, such as the Carer Allowance.) Carers may also be eligible for other forms of financial assistance, such as support for education, housing or access to Health Care Cards.

What is missing from the picture?

At present, it is difficult to gain a consolidated picture of the experiences of carers in Australia. While some self-reported information is available from the Survey of Disability, Ageing and Carers, detailed data about the use of support services is limited. Carers may receive support through a number of government and non-government programs across a wide variety of areas, including the disability, aged care and health systems. In addition to specific programs targeted at carers, carers are also affected by the support provided to the person they care for. There is a lack of comprehensive data on the support services used by carers (such as counselling and information services), including interactions with mainstream and specialised services, pathways through these services, and the outcomes of these interactions (including how the type and level of support provided to care recipients impacts carers' lives). This is particularly an issue for groups such as young carers, who face unique challenges because of their age. Data linkage, such as between carer payments and health or education datasets, could enable a better understanding of the experiences of carers in Australia, their interactions with services, and their associated outcomes, providing a clearer evidence base for policy decisions.

The introduction of the NDIS presents an opportunity to collect better data on informal carers of people with disability. From 1 July 2013, people with disability who met eligibility requirements started the transition to the NDIS to receive formal assistance with everyday life (see Chapter 8.1 'People with disability'). Carers of NDIS participants may be involved in planning and implementing a person's care plan. The NDIS reports some information on families and carers of participants, including baseline outcome indicators covering financial support, workforce participation, social participation and health (NDIA 2017). However, detailed information on the carers of NDIS participants, such as their relationship to the participant and the extent of their caring responsibilities (for example, the number of hours spent caring per week, the type of caring activities undertaken) is not currently available. Such information would also be limited to carers of NDIS participants, meaning a gap will remain around those who care for people who are not eligible for the NDIS, such as older Australians.

Where do I go for more information?

For more information on informal carers, see www.aihw.gov.au/informal-care-ageing. Information on carers of people with disability who access disability support services under the National Disability Agreement is available in the bulletin *Disability support services: services provided under the National Disability Agreement 2015–16*, which is available for free download from the AIHW website. Information on carers from the most recent ABS Survey of Disability, Ageing and Carers is available from Disability, ageing and carers, Australia: Summary of findings, 2015.

The Carer Gateway is a national website and phone service launched in December 2015. It provides information and advice to carers, and can connect carers with suitable services in their local area.

Chapter 9

Indicators of *Australia's welfare*

9.0 Introduction

Indicators are commonly used to assess the performance of policies, programs or services, and to meet accountability and transparency requirements. Ideally, they provide information on change in outcomes, and inform quality improvements of services and programs. Indicators are useful in highlighting particular results in an area of interest and in helping people to ask questions about why the result is as it is.

Indicators are simple statistics, such as numbers or rates, that summarise issues that are often complex; therefore, they should not be used in isolation. Contextual information should always be used to interpret and use indicator results.

The AIHW has been reporting on indicators of *Australia's welfare* as part of its biennial welfare flagship reports since 2003. Following a review, the 2015 edition of *Australia's welfare* included a new conceptual framework and a framework for these indicators (see Chapter 8 of *Australia's welfare 2015* for a discussion of the developmental work).

The indicator framework is designed to measure and report on the key components of the conceptual framework guiding the *Australia's welfare 2017* report (see Chapter 1.3 'Understanding welfare' Figure 1.3.1). In doing so, it aims not only to summarise the performance and outcomes of Australia's welfare services but also to provide insight into what determines the demand for them. It also includes several measures relating to the overall wellbeing of the Australian population. The wellbeing domain indicators are reported for the first time in 2017, and their development is discussed in Chapter 9.1 'The *Australia's welfare* indicator framework'. Chapter 9.2 'Indicators of *Australia's welfare*' presents data for 53 indicators across all five domains of the framework, including first results for 14 new wellbeing indicators.

9.1 The *Australia's welfare* indicator framework

The indicator framework for *Australia's welfare* has three core domains—wellbeing, determinants, and welfare services performance (Figure 9.1.1). Two additional domains—contextual factors, and other factors—recognise the role of other influences, such as access to primary care practitioners, population growth and economic conditions. Each component in the framework represents an area for which it is useful to assess progress and which can inform service improvement.

Data were reported against four of the five domains in *Australia's welfare 2015*, but were not presented for the wellbeing domain pending further conceptual development and scoping. A discussion of the wellbeing domain follows.

This 2017 edition of *Australia's welfare* has 61 indicators, including updated or newly reported results for 39 indicators and first results for 14 new wellbeing indicators. See Table 9.2.2 in Chapter 9.2 'Indicators of *Australia's welfare*' for the complete set of indicators across all domains. More information on definitions and context can be accessed online at www.aihw.gov.au/reports/australias-welfare/australias-welfare-2017/related-material.

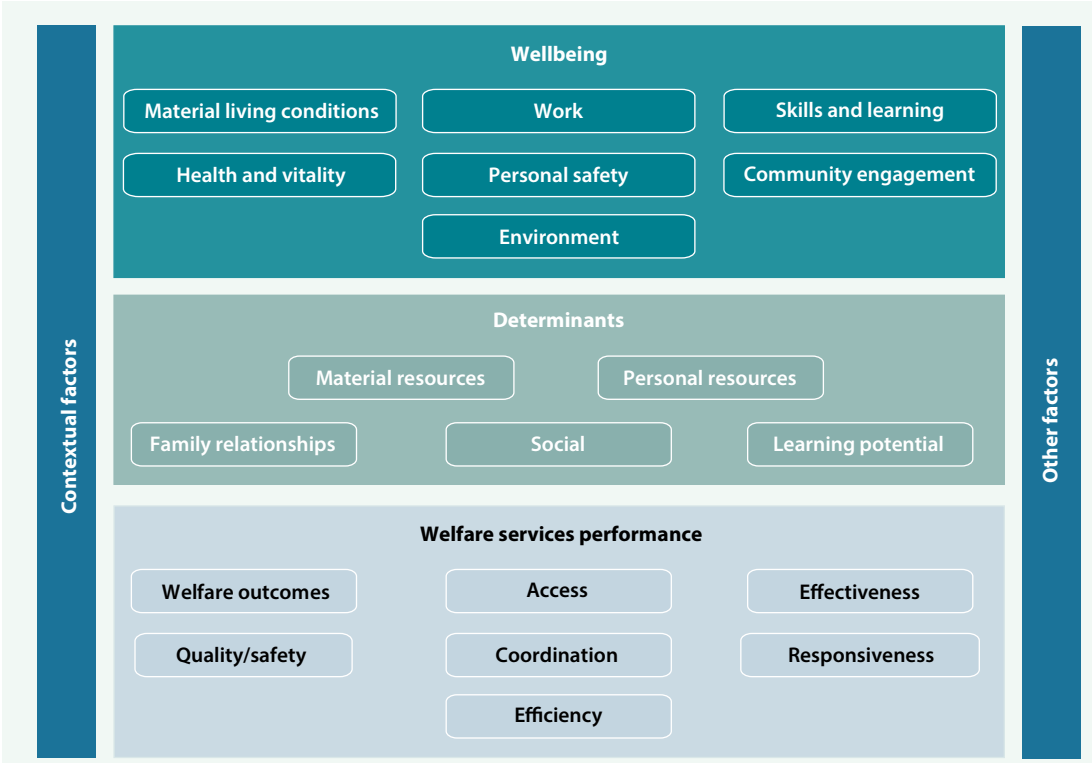

Figure 9.1.1: Indicator framework for *Australia's welfare*

Developing the wellbeing domain for the indicator framework

As discussed in Chapter 1.3 'Understanding welfare', wellbeing is a complex synthesis of factors that influence happiness or satisfaction with our lives. It can be highly individual and subjective, with different meanings for different people, and can change across the life course. Some people place more importance on financial wealth, others on their physical and/or mental health. In reality, wellbeing is a product of many, often interrelated, factors. Measuring wellbeing at the population level therefore presents a range of challenges. This section presents information on current national and international measurement of wellbeing and introduces the wellbeing indicators selected by the AIHW for the indicator framework shown in Figure 9.1.1.

The measurement of the wellbeing of communities and nations has become increasingly widespread, driven, in part, by a growing recognition that traditional high-level summary economic measures such as Gross Domestic Product (GDP) are, at best, partial measures of a nation's progress. Some studies have shown that countries with higher GDPs are well down the list in rankings, based on subjective wellbeing measures, suggesting that factors other than income can matter for wellbeing (Helliwell et al. 2016).

Several national and international wellbeing indicator sets and frameworks were investigated in developing a wellbeing domain for *Australia's welfare*, and are briefly outlined here. They represent just a small subset of work that is being conducted in this field. Composite indexes of wellbeing are used by some organisations. Others use a set of indicators, without any attempt to aggregate or average results to a single number.

The AIHW's approach to the selection of themes for the wellbeing domain has been to initially map existing national and international frameworks sourced from a desktop review. This draws on the extensive body of research in the area. A strong focus is placed on topics that are relevant to the Australian welfare context and to the *Australia's welfare* report series. In selecting the detailed indicators, the availability of Australian data sources was considered, particularly where the data can be disaggregated sub-nationally, or lend themselves to trend reporting.

Wellbeing measurement and reporting in Australia

Australia's interest in investigating national wellbeing and progress is reflected in a variety of frameworks and measures that have been developed for the Australian context.

The Australian Bureau of Statistics (ABS) was a frontrunner in this respect. It published *Measures of Australia's progress* every 2–4 years between 2002 and 2013, with the 2013 report reflecting a major revision undertaken during 2011–12. The framework covers four domains—society, economy, environment, and governance—and provides a useful set of indicators to inform conceptual thinking and to show whether life in Australia is getting better (ABS 2013). The ABS also has a framework for social statistics more broadly, which considers individual and societal wellbeing, and the influences and actions that can have an impact on and change the state of wellbeing (ABS 2015a).

The first *The Australia we want* report of the Community Council for Australia (2016) presented initial findings on how Australia is performing against a set of measures selected by a group of 60 leaders in the Australian charity and not-for-profit sector. The measures define the Australia that these leaders aspire to live in, and how well we are doing in realising these goals across the nation. The indicators for the reporting framework are grouped into four domains or principles: Just, fair, safe; Inclusive, equal opportunity, united, authentic; Creative, confident, courageous, optimistic; and Generous, kind, compassionate. Results are presented at both the national and state/territory level.

The Department of Social Services (DSS), responsible for national social policy and management of welfare services funded by the Australian Government, uses a conceptual wellbeing framework to guide its policy planning and program development. The framework identifies long-term priorities for improving the lifetime wellbeing of people and families in Australia. It is structured around four wellbeing domains that lend themselves to performance measurement and monitoring—independence, life readiness, family functioning, and strong communities—and two cross-cutting domains of access to opportunity and individual risk factors (DSS 2016).

Several Australian states and territories have also invested in developing wellbeing frameworks to govern planning and policy. See Box 9.1.1 for an example of one state's outcomes framework for welfare services that incorporates wellbeing concepts.

Box 9.1.1: Human Services Outcomes Framework of the New South Wales Department of Family and Community Services

The New South Wales Department of Family and Community Services has developed a framework based around the question: *What matters for an individual over the course of their life?* It identifies the factors that have an impact on the life course and, particularly, the interconnectedness of these factors. The framework provides a conceptual underpinning and structure for the department's services and outcomes.

The framework has seven domains of wellbeing: home, health, education and skills, economic, safety, social and community, and empowerment. The department explains that its first application of the framework has been to social housing, which:

> *'…helps focus our collective effort on using social housing assistance to improve outcomes for tenants and users of our services. It makes transparent the continuum from what we deliver to how people benefit and what outcomes they ultimately achieve…'*
>
> NSW Department of Family & Community Services 2016

A number of wellbeing indexes have also been developed or are under development in Australia. Examples include the Australian National Development Index (ANDI) and the Scanlon Foundation's Scanlon-Monash Index (SMI) of social cohesion. The ANDI is a composite index, based on a conceptual framework that encompasses 12 social, economic, health and environmental domains, and is described as 'a holistic measure of national progress and wellbeing' (ANDI 2017). The SMI of social cohesion incorporates five domains: belonging, worth, social justice and equity, political participation, and acceptance/rejection. While these domains are not all directly related to wellbeing, indicators touch on many of the themes seen in other wellbeing measures, such as income equality, community participation, trust, and life satisfaction (Markus 2016).

International wellbeing measurement and reporting

The fifth Organisation for Economic Co-operation and Development (OECD) World Forum on Statistics, Knowledge and Policy in 2015 included a strong focus on the measurement of wellbeing. This reflects the topic's current acceptance in mainstream policy discussions at the highest level (OECD 2015a). Three approaches to the measurement of wellbeing are discussed here—an indicator set approach, a subjective measure and an objective measure.

Since 2011, the OECD has been reporting on wellbeing in *How's life? Measuring well-being*. The report documents a wide range of wellbeing outcomes, with comparative and trend data for OECD countries. It is part of the OECD Better Life Initiative, which aims to promote 'better policies for better lives'. The *How's life* framework has three conceptual areas: material conditions, quality of life, and sustainability. Eleven domains—each with a concise set of relevant indicators—capture these conceptual areas: income and wealth, jobs and earnings, work life balance, housing, environmental quality, health status, education and skills, social connections, civic engagement and governance, personal security, and subjective wellbeing (OECD 2015b).

Countries can be ranked by indicator but there is no overall summary index. Recent findings show that OECD countries ranking in the top third for GDP per capita—such as Australia, Canada, the United States and Norway, among others—do well overall in terms of material resources, such as income. However, these same countries may have weaknesses in other areas, such as in work–life balance, and housing affordability. This shows that all countries have areas for improvement. Australia does not perform particularly well on some measures, such as employees working long hours, and perceived personal safety. The *How's life* report also notes something that is useful to keep in mind when viewing the indicator data in Chapter 9.2: that different groups within a country's population can have very different wellbeing outcomes (OECD 2015b).

The fifth World Happiness Report was published in 2017, ranking more than 150 countries by their happiness (also referred to as subjective wellbeing) levels, based on a global survey in which participants are asked to rate the quality of their current lives on a scale of 0 to 10. The authors use six key variables—GDP per capita, social support (having someone to count on in times of trouble), healthy life expectancy, social freedom (freedom to make life choices), generosity (donations in the previous month) and perceived absence of corruption—to explain most of the variation in subjective wellbeing between countries. Australia was ranked ninth with Norway the highest ranked. New Zealand, the United States and United Kingdom came in at eighth, fourteenth and nineteenth, respectively (Table 9.1.1) (Helliwell et al. 2017).

The United Nations produces the Human Development Index (HDI), which is a summary measure across the dimensions of: a long and healthy life (measured by life expectancy), being knowledgeable (measured by mean years of schooling), and having a decent standard of living (measured by gross national income per capital). The scores of these three dimensions are aggregated into a composite index. The HDI is reported for up to 188 countries, most recently in 2014. Australia was ranked second, after Norway. The United States, Canada and New Zealand were ranked eighth, ninth and tenth, respectively, and the United Kingdom came in at fourteenth (Table 9.1.1) (United Nations 2016).

On each of the above measures, Australia and similar countries generally perform relatively favourably. There are advantages and disadvantages of each type of measure. It can be hard to obtain a holistic view when multiple indicators are used, however, summary measures can also be difficult to interpret as, in isolation, they provide no underlying information as to the composition of the ranking score. For the wellbeing domain in the *Australia's welfare* indicator framework, as described further in this chapter, AIHW chose to follow an approach similar to that of the OECD's *How's life*, with a small set of key indicators rather than an index or aggregate score. An important purpose of the AIHW's wellbeing indicators is the ability to consider them together with indicators in other parts of the indicator framework. For example, trust, perceptions of safety and life satisfaction can be coupled with social connectedness and volunteering in the determinants domain; and indicators of financial and employment stress in the welfare services performance domain. While international rankings are of interest, they are not the main purpose of the AIHW's wellbeing domain.

Table 9.1.1: Country ranks for wellbeing summary measures, selected countries and years

Measure	Year	World best	Australia	New Zealand	Canada	United States	United Kingdom
World happiness report[(a)]	2017	Norway	9	8	6	14	19
UN Human Development Index	2014	Norway	2	10	9	8	14

(a) Ranks are based on national average scores when people are asked to evaluate the quality of their lives on a scale of 0 to 10.

Sources: Helliwell et al, 2017; United Nations 2016.

Themes and indicators for the AIHW wellbeing domain

While there are different views on which measure best represents wellbeing, there is much consensus on what makes us satisfied with our lives, and what is considered human progress (OECD 2015b). There is close alignment across frameworks on such topics as the economy and jobs, education and skills, health, social engagement, personal safety, the environment, and overall life satisfaction or happiness.

As shown in the previous sections on measurement and reporting, wellbeing measures can stand alone; however, in the context of *Australia's welfare*, it is the interrelationships between wellbeing and the other domains of the framework that are of interest. For example, the data should help to assess how the outcomes of welfare service support contribute to achieving and maintaining satisfying and fulfilling lives at the individual, family and community levels. Outcomes measured by indicators in the other domains may influence our wellbeing. In turn, though, our wellbeing will have an impact on our opportunities and choices in life and, to some extent, determine when and how we might interact with the welfare system. The complexity of these interactions means that the placement of indicators within particular domains can be somewhat arbitrary—that is, some indicators could sit just as easily in one domain as another. The AIHW has focused on coverage and completeness of the indicator set as a whole, and encourages readers to view the indicators on the same basis.

The authors' scoping and review resulted in seven themes being selected for the wellbeing domain in the Australia's welfare indicator framework: material living conditions, work, skills and learning, health and vitality, personal safety, community engagement, and environment. Some themes, such as personal relationships, were not included in the wellbeing domain but are represented by indicators in other domains, such as the determinants domain. Fifteen indicators were identified for the wellbeing domain which, together, can meaningfully, usefully and concisely provide a picture of Australia's wellbeing now and into the future (Table 9.1.2). Including a customised wellbeing domain has allowed the AIHW to select the themes, indicators and data for the Australian context, while drawing on global and scientific experience.

The detailed indicators within each theme and indicator area of the wellbeing domain were selected based on standard indicator criteria of relevance, understandability, ability to be actioned/sensitivity to change, feasibility of measurement, and technical robustness. This resulted in 14 indicators being defined. One indicator, for lifelong learning, could not be defined (see Box 9.1.2). As well as this data gap, several gaps remain within other domains of the indicator framework, as set out in the next section.

Table 9.1.2: Indicators for the wellbeing domain

Theme	Indicator number	Indicator summary form	Context
Material living conditions	1	Purchasing power	Measure of national economic wellbeing reflecting real standard of living
	2	Income inequality	Indicator of inequality in the distribution of income in society which is associated with disparities in both health and wellbeing outcomes.
	3	Adequate housing	Indicator of adequate housing which is essential to meet basic needs for shelter, and is a protective factor for health and childhood development.
Work	4	Employment to population ratio	Indicator reflecting a person's resource base as having a job helps protect the household from poverty, and is a major contributor to personal wellbeing.
	5	Employees working 50 or more hours	Measure of [lack of] work–life balance, which reflects complexity of life and residual resources to engage in social interactions.
Skills and learning	6	Non-school qualification	Measure of higher education level which is associated with better material living conditions, better health and greater civic involvement.
	7	Lifelong learning	Indicator of a society that promotes and provides infrastructure for further learning, which is associated with greater wellbeing.
Health and vitality	8	Disability-free life expectancy	Derived measure combining life expectancy with disability prevalence: better reflects aggregate human capacity than life expectancy.
	9	Life satisfaction	Subjective indicator of wellbeing, reflecting the notion that people are their own best judge of their wellbeing. Counterbalances objective measures.
Personal safety	10	Crime victimisation	Measure of safe environment, which is essential to overall mental and physical wellbeing.
	11	Perceptions of safety in the community	Subjective indicator of personal safety, and associated with confidence and social engagement. Counterbalances objective measure.
Community engagement	12	Level of generalised trust	Indicator of, or proxy for, social capital, which is an important contributor to wellbeing directly, and signals other aspects of social participation.
	13	Voter enrolment	Indicator of take-up of basic human right to have a political voice.
Environment	14	Air quality	Indicator of environmental quality. Poor air quality can have a major impact on health, the environment and the economy and can exacerbate conditions such as asthma and other respiratory disorders.
	15	Greenhouse gas emissions	Indicator of environmental sustainability. Increasing greenhouse gas concentrations have an impact on global temperatures and the earth's climate, with consequences for ecosystems and human settlements.

What is missing from the picture?

Inevitably, there will be some compromise between the ideal set of indicators and those that are reportable in practice. In the *Australia's welfare* indicator framework, data gaps have been kept to a minimum, and proxy indicators have been selected in some instances. Remaining data gaps are outlined in Table 9.1.3 and further explored below.

Table 9.1.3: Data gaps—*Australia's welfare* indicator framework

Domain: sub-domain	Indicator number	Indicator (summary form)	Context	Comment
Wellbeing: Skills and learning	7	Lifelong learning	Indicator of a society that promotes and provides infrastructure for further learning, which is associated with greater wellbeing.	No indicator defined. See Box 9.1.2.
Determinants: Material resources	18	Housing security	Indicator of the ability to maintain tenancy in housing of a satisfactory standard which contributes directly to wellbeing, and reflects adequate financial resources.	No data; no proxy.
Welfare system performance: Welfare outcomes	38	Safe return home for children in out-of-home care	Measure of long-term outcome for children in out-of-home care. For some of these children, the best long term outcome is for them to return home after their parents' skills and capacity to care for them have improved.	No data; no proxy. This indicator could be complemented by an indicator for stable permanent placement.
Welfare system performance: Efficiency; sustainability	43	Cost per service output (by sector)	Cost per unit output is a simple measure of the efficiency of service delivery: the aim is to reduce costs without compromising quality.	Data not reported in 2017 due to interpretation issues around the meaning/ desired direction of trends.
	44	Management expense ratio (by sector)	The administrative costs associated with delivering services are a measure of efficiency—and to some extent, indicate sustainability.	No data are available, as, for most programs, the administrative costs are spread over program components, and not separately reportable. While aggregate measures may be possible to compile, they are not readily available.
Welfare system performance: Coordination	50	No indicators identified		

Housing security

When considering how to develop an indicator for housing security, areas such as housing tenure (for example, home owners, renters), affordability, homelessness, and housing mobility might be considered (AIHW 2010). Information about housing tenure is presented in Indicator 58, affordability in Indicator 30, and homelessness in Indicators 29, 41 and 49 (see Chapter 9.2 'Indicators of *Australia's welfare*').

An indicator on housing mobility could be considered as a proxy for housing security (AIHW 2010). Existing data show that renters are more than 6 times as likely as home owners (with or without a mortgage) to have moved at least 4 times in the last 5 years, and people in private rental accommodation are 2 times as likely as people living in state/territory housing to have moved at least 4 times in the last 5 years (ABS 2009, 2015b).

While this could provide some useful information, not moving from a residence does not mean that the residence is satisfactory; there could be issues with housing condition, overcrowding (see Indicators 3 and 31 in Chapter 9.2 'Indicators of *Australia's welfare*') or personal safety. More work is needed to define this indicator.

Safe return home for children in out-of-home care

There are no data currently available to report on this indicator. However, work has been undertaken to facilitate future reporting. The AIHW, in consultation with state and territory departments responsible for child protection, has developed indicator specifications for reporting on the number of children who return home, or for whom alternative permanent care arrangements have been provided. A field test was undertaken as part of the 2015–16 National Child Protection data collection. Data are expected to be reported under the National Standards for Out-of-Home Care, following an assessment of data availability/quality and subject to approval (AIHW 2016).

Efficiency indicators: Cost per service output, and Management expense ratio by sector

Data for Indicator 43, Cost per service output, were included in *Australia's welfare* 2015 but have not been reported in this report due to interpretation issues. There is lack of clarity around which components are included in the costs (for example, administrative costs, rebates and subsidies) and therefore what the desired direction of change should be.

Management expense ratios aim to measure administrative costs, such as overheads as a proportion of total program costs, and are a measure of efficiency. The Report on Government Services (RoGS) has several efficiency output indicators in its community sector performance indicators: for example, *Administrative expenditure as a proportion of total recurrent expenditure* (in the disability services sector), *Expenditure per head of target population* (aged care services), *Expenditure per placement* and *Cost per child in out of home care* (child protection services). However, each sector has different measures and, within sectors, there are issues to do with comparing data, due to different policies in states and territories.

Both indicators will be reviewed for future editions. Readers are referred to the RoGS website for further information on efficiency output indicators by sector: http://www.pc.gov.au/research/ongoing/report-on-government-services/2016/community-services.

Welfare system performance: coordination

This remains a data gap in the framework, but its importance is highlighted in many sectors. For example, the Victorian Royal Commission into Family Violence highlighted the need for better integration of services, including among the justice sector, health services, homelessness services, victim support services, and others (State of Victoria 2016). More work is needed to define 'coordination' and to explore indicators that might measure this concept. This is challenging but measuring and reporting what is important can often lead to increased efforts being directed toward an area.

Lifelong learning

An indicator for *Lifelong learning* in the Wellbeing domain could not be defined (see Box 9.1.2 for further discussion). Although no single indicator seems to adequately measure the complex and expansive concept of lifelong learning, readers are directed to the results of various indicators in the *Australia's welfare* framework—such as Non-school qualification (Indicator 6), Year 12 attainment (Indicator 28), Work–life balance (Indicator 5), Volunteering (Indicator 25), and Access to the internet (Indicator 26)—for insight into factors that contribute to and reflect aspects of lifelong learning.

Box 9.1.2: Lifelong learning

As the term implies, lifelong learning occurs throughout the life course. It is learning that goes beyond traditional schooling or formal study and is flexible, diverse and available in different times at different places. Delors (1996) described four pillars of lifelong learning:

- **Learning to know**—mastering learning tools rather than acquisition of structured knowledge
- **Learning to do**—equipping people for the types of work needed now and in the future, including innovation and adaptation of learning to future work environments
- **Learning to live together, and with others**—peacefully resolving conflict; discovering other people and their cultures; fostering community capability; individual competence and capacity; economic resilience; and social inclusion
- **Learning to be**—education contributing to a person's complete development: mind and body, intelligence, sensitivity, aesthetic appreciation and spirituality.

It is unlikely that any one indicator can capture lifelong learning. Canada uses a measure of progress in this area known as the Composite Learning Index (CLI). The CLI is constructed from 15 indicator areas and 26 specific measures.

Canada's Composite Learning Index—pillars and indicator areas

Learning to know	**Learning to do**
Youth literacy skills	Availability of workplace training
High school dropout rate	Participation in job-related training
Participation in post-secondary education	**Learning to be**
University attainment	Exposure to media
Learning to live together	Learning through sports
Participation in social clubs and organisations	Learning through culture
Learning for other cultures	Access to broadband internet
Volunteering	Access to learning opportunities
	Social and economic outcomes

Source: Lifelong Learning Council Queensland Inc. 2016.

A similar index, the European Lifelong Learning Indicators (ELLI) Index, is constructed from 17 indicators and 36 specific measures organised under the same four pillars as the CLI. It is used to generate a lifelong learning score for European Union member states (Hoskins et al. 2010).

9.2 Indicators of *Australia's welfare*

The *Australia's welfare* indicator framework aims to summarise the performance of Australia's welfare services, track individual and household determinants of the need for welfare support, and provide insight into the nation's wellbeing status more broadly. The framework brings together an overview of key topics and data presented in *Australia's welfare*, and enables many aspects of welfare to be considered in an objective and holistic way. Box 9.2.1 presents some key findings.

Box 9.2.1: Key results

- Nearly two-thirds of us rate our overall life satisfaction as high.
- We are living longer without disability—years of life lived without disability have risen by 3.9 years for males and 3.0 years for females since 2003.
- Crime victimisation decreased between 2008–09 and 2015–16 for most types of serious crime, such as physical assault and malicious property damage. Our perceptions of safety have also improved.
- Around 86% of families report good to excellent family cohesion.
- A total of 89% of 20–24-year-olds in 2016 had completed Year 12 or at least a Certificate III, up from 80% in 2005.
- One in 5 men (20%) and 1 in 14 women (7%) in paid employment were working 50 hours or more per week in 2017; however, these rates have dropped from 26% and 8% respectively in 2004.
- The proportion of Indigenous households living in overcrowded conditions fell from 27% in 2004–05 to 21% in 2014–15.
- In 2013–14, 1 in 2 (50%) lower income rental households spent more than 30% of their gross income on housing costs, an 8 percentage point increase from 2005–06.
- While the distribution of income in Australia has shown little change in recent years, income inequality has risen since the mid-1990s as measured by the Gini coefficient.
- While rates have fluctuated over time, there has been an upward trend for youth unemployment rates and the long-term unemployment ratio (long-term unemployment as a proportion of all unemployment) since 2008–2009.
- There were 1.4 million jobless families in Australia in 2016, representing 22% of all families—similar to rates in 2012 (20%).

Chapter 9.1 'The *Australia's welfare* indicator framework' focused on the concepts underpinning the indicator framework, and the development of its wellbeing domain. This chapter presents the indicator data. The first results for the wellbeing domain and updated results for the other four domains—determinants, welfare services performance, other sectors and context—are reported here. A diagram of the indicator framework depicting its five domains and associated sub domains is included in Chapter 9.1 'The *Australia's welfare* indicator framework'. Table 9.2.1 presents a summary of the status of all indicators.

Table 9.2.1: Indicator status *Australia's welfare 2017*

Indicator status	Number of indicators
Updated since *Australia's welfare 2015*	38
First time reportable (Indicator 41: Unmet demand for homelessness services)	1
New indicators (wellbeing)	14
Not able to be updated (Indicator 29: Homelessness rate; Indicator 23: Partner violence)	2
Not reportable[(a)]	6
Total	**61**

(a) Not reportable: Lifelong learning (Indicator 7), Housing security (18), Safe return home for children in out-of-home care (38), Cost per service output (43), Management expense ratio (44), and Coordination (50).

Information on indicators not reported in 2017 and work in progress to meet the data gaps is provided in Chapter 9.1 '*Australia's welfare* indicator framework'. New in this edition is an assessment of trends for the indicator set (Table 9.2.2), and an explanation of how trends were assessed follows.

Data for some indicators are disaggregated by population subgroups, such as age, sex, Indigenous status, or income quintile. Other indicators are presented as time series. Decisions around how data are presented largely depend on what data are available, the quality of these data, and what will be most informative for the reader. Maintaining consistency of data presentation over time is also a priority.

Indicator results

Table 9.2.2 provides an overview of all indicators and an assessment of trends. Indicator results are then presented by domain, together with a summary of key results.

Assessment of trends

Trend data are presented in the figures wherever possible. Where a trend series is not provided, the commentary usually includes a reference to earlier years' data if this is meaningful.

Where 5 years or more of good-quality trend data are available for at least 3 data points, Table 9.2.2 lists trends as being favourable, unfavourable or unchanged. 'Good quality data' should meet, as far as possible, minimum criteria for accuracy, completeness and comparability (see the AIHW's Metadata Online Registry for more information on data quality: http://meteor.aihw.gov.au/content/index.phtml/itemId/480742).

A favourable trend contributes to greater wellbeing and might mean that the indicator is declining (such as homelessness rates). Where there is a longer time series, it is used in the assessment. So, a trend may appear as favourable or unfavourable in the short term, but be given a contrary assessment in the table, based on a longer time series.

Where sufficient data are available, but the trend direction cannot be confidently determined (due to data quality or other issues), an assessment of 'no clear trend' is made. Changes in definitions can be problematic for determining trends. Further, changes in government policies and programs may mean that some comparisons cannot be made with earlier years.

If sufficient good-quality trend data are not available, an assessment of 'no data/insufficient data' is made.

Table 9.2.2: Indicators of Australia's welfare—trend assessment

Domain/ sub-domain	Indicator number	Indicator	Time period for trend assessment	Trend[a]
WELLBEING				
Material living conditions	1	Purchasing power	1987–2016	Favourable
	2	Income inequality	2003–04 to 2013–14	Unfavourable
	3	Adequate housing	2007–08 to 2013–14	No change
Work	4	Employment to population ratio	1997–2017	No clear trend[b]
	5	Employees working 50 hours or more	2004–2017	Favourable
Skills and learning	6	Non-school qualification	2009–2016	Favourable
	7	Lifelong learning	..	..
Health and vitality	8	Disability-free life expectancy	2003–2015	Favourable
	9	Life satisfaction	..	No data/ insufficient data
Personal safety	10	Crime victimisation	2008–09 to 2015–16	Favourable[c]
	11	Perceptions of safety in the community	2006–2014	Favourable
Community engagement	12	Level of generalised trust	2006–2014	No change
	13	Voter enrolment	2010–2016	Favourable

continued

Table 9.2.2 (continued): Indicators of Australia's welfare—trend assessment

Domain/ sub-domain	Indicator number	Indicator	Time period for trend assessment	Trend[a]
Environment	14	Air quality	1998–2015	Favourable
	15	Greenhouse gas emissions	2000–2016	Favourable
DETERMINANTS				
Material resources	16	Household income	1994–95 to 2013–14	Favourable
	17	Access to emergency funds	..	No data/ insufficient data
	18	Housing security	..	..
Personal resources	19	Psychological resilience	2001 to 2014–15	No change[d]
	20	Self-assessed health status	2004–05 to 2014–15	No change
	21	Functional status	2003–2015	Favourable
Family relationships	22	Family cohesion	..	No data/ insufficient data[e]
	23	Partner violence	..	No data/ insufficient data[f]
Social engagement	24	Social connectedness	2006–2014	No change
	25	Adults who volunteer	2006–2014	Unfavourable
	26	Internet access	2006–07 to 2014–15	Favourable
Learning potential	27	School readiness	2009–2015	Favourable
	28	Year 12 attainment	2005–2016	Favourable
WELFARE SERVICES PERFORMANCE				
Welfare services outcomes	29	Homelessness	2001–2011	No clear trend
	30	Lower income rental households in housing stress	2005–06 to 2013–14	Unfavourable
	31	Indigenous households living in overcrowded conditions	2004–05 to 2014–15	Favourable
	32	Labour force participation for people with disability	2003–2015	No change
	33	Social participation for people with disability	2003–2015	No change
	34	Jobless families	2005–2016	No change
	35	Long-term unemployment ratio	2004–2017	Unfavourable
	36	Youth unemployment rate	2004–2017	Unfavourable

continued

Table 9.2.2 (continued): Indicators of Australia's welfare—trend assessment

Domain/ sub-domain	Indicator number	Indicator	Time period for trend assessment	Trend[a]
	37	Older people with care needs supported	2003–2015	Favourable
	38	Safe return home for children in out-of-home care	..	..
Access	39	Waiting times for social housing	..	No data/ insufficient data[g]
	40	Difficulty accessing child care	..	No data/ insufficient data[h]
	41	Unmet demand for homelessness services	2011–12 to 2015–16	No clear trend[i]
Responsiveness	42	Satisfaction with services	..	No data/ insufficient data
Efficiency	43	Cost per service output	..	..
	44	Management expense ratio	..	..
Safety and quality	45	Compliance with service standards	..	No data/ insufficient data
	46	Safety and security of children and young people in out-of-home care	2010–11 to 2015–16	No change
Effectiveness	47	Job seekers off benefits after participation in employment services	..	No data/ insufficient data[j]
	48	Young people in detention attending education/training	2011–12 to 2015–16	Favourable
	49	Repeat periods of homelessness	..	No data/ insufficient data[k]
Coordination	50	No summary indicators defined	..	..
OTHER SECTORS				
	51	Police operational staffing levels	2009–10 to 2015–16	No change
	52	Access to primary care practitioners	2011–2015	Favourable
	53	Young people not in education, employment or training	2005 to 2016	No clear trend[l]
	54	Emergency services response time	..	No data/ insufficient data

continued

Table 9.2.2 (continued): Indicators of Australia's welfare—trend assessment

CONTEXT[m]	
55	Population size and growth
56	Population ageing and dependency ratio
57	Overseas born population
58	Housing tenure
59	Government welfare expenditure
60	Welfare workforce
61	Economic conditions

(a) Favourable = trend moving in desired direction; Unfavourable = trend moving contrary to desired direction; No change = no movement in the trend; No clear trend = sufficient data are available to assess a trend but the trend cannot be determined with confidence due to potential data quality or confounding issues; No data/insufficient data = trend not assessed due to no trend data being available or insufficient data points over at least 5 years; .. = not applicable.

(b) Continuing a trend that was evident in the late 1970s, the employment to population ratio has risen for women and fallen for men. Overall, there is little change, with a slightly unfavourable trend for all people over the last 10 years and a slightly favourable trend over the last 20 years.

(c) The crime victimisation rate is declining for most types of serious personal and household crime.

(d) Trend is an age-standardised rate for high or very high levels (combined) of psychological distress.

(e) The family cohesion variable in the Longitudinal Survey of Australian Children is not recommended for trend analysis.

(f) Partner violence data for 2016 are expected to be available in late 2017.

(g) Trend data on waiting times for social housing are impacted by state and territory variation in wait list management over time which, together with changes to core systems in 2014–15, impact comparability of data between years.

(h) Comparison with previous surveys for the variable additional days of child care required in the ABS survey of Childhood education and care is not recommended.

(i) Interpretation of the trend is difficult due to changes in service delivery models in some jurisdictions.

(j) Changes in employment programs impact on the comparability of trend data.

(k) A trend assessment cannot be made due to data quality issues with data prior to 2012–13.

(l) The trend is favourable for 15–19-year-olds but unfavourable for 20–24-year-olds.

(m) No trend assessment is made for context indicators.

Wellbeing domain—indicator results

This domain presents indicators of our national wellbeing, reflecting the breadth and complexity of this concept. Over time, the domain will indicate, it is hoped, our progress towards better lives and greater happiness. The domain will highlight our collective strengths and weaknesses and point to areas for improvement. See Box 9.2.2 for key findings from the wellbeing domain.

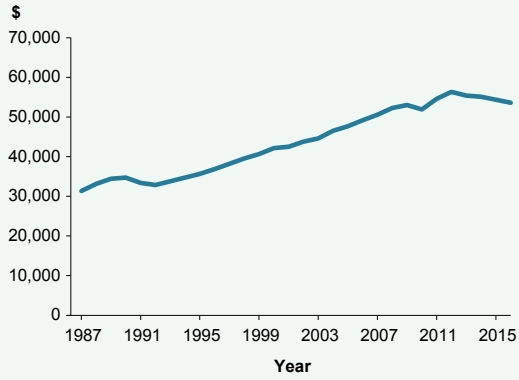
Box 9.2.2: Key results—wellbeing domain

Results from the initial measurement of wellbeing against the new indicator set show that:

- Real net national disposable income per capita rose steadily over the 30 years to June 2016 but has dropped since 2012.
- While the distribution of income in Australia has shown little change in recent years, income inequality has risen since the mid-1990s as measured by the Gini coefficient.
- Achieving a healthy work–life balance can be difficult: 20% of men and 7% of women in paid employment worked 50 hours or more per week in 2015. The rates have declined from 26% and 8%, respectively, in 2004 but are high compared with rates in some European and Nordic countries.
- Nearly two-thirds of Australians rate their overall satisfaction with life as high. Internationally, in 2016, Australia ranked 9th out of 38 Organisation for Economic Co-operation and Development (OECD) countries on life satisfaction.
- Australians are living longer without disability—years of life lived without disability in 2015 had increased since 2003 by 3.9 years for males, to 63 years, and by 3.0 years for females, to 65.2 years.
- Crime victimisation fell between 2008–09 and 2015–16 for most types of serious crime, such as physical assault and malicious property damage. Rates for malicious property damage more than halved over the period (11.1% down to 4.8%). Sexual assault rates have not changed since 2009.
- Our perceptions of safety have improved, although there are still substantial differences between the sexes. In 2014, 72% of men reported they felt safe walking alone in their local area after dark compared with just 34% of women.
- Education and skill levels have been increasing over time in the population, particularly for women. The proportion of women aged 35–44 with non-school qualifications increased from 61% in 2009 to 73% in 2015.
- Our air quality is relatively high. The concentration of fine particulate matter in Australia's atmosphere is lower than the OECD average and has been dropping gradually over time.
- More than 1 in 4 of us (28%) somewhat or strongly disagree that most people can be trusted.

Material living conditions: Purchasing power

Definition: Real net national disposable income (RNNDI) per capita.



Note: Chain volume measures; annual, original series.

Source: ABS 2016b.

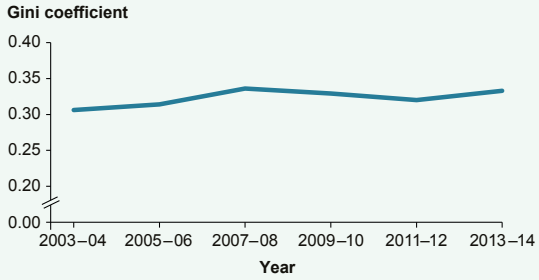
Indicator 1: Real net national disposable income per capita, June 1987 to June 2016

- RNNDI per capita rose from $31,340 in 1987 to $53,630 per annum in 2016.
- Over the 30 year period, RNNDI grew at 1.9% per annum on average.
- RNNDI peaked at $56,330 in June 2012 and then dropped by 1.2% per annum on average, returning to 2009 levels.

See also Indicator 61 'Economic conditions'.

Material living conditions: Income inequality

Definition: The Gini coefficient.



Notes

1. The Gini coefficient is a summary measure of inequality of income distribution, representing the income distribution of a nation's population. It has a score range between 0 and 1. The closer to 1, the higher the income inequality.
2. Estimates from 2007–08 are not directly comparable with those for prior years.

Source: ABS 2015c.

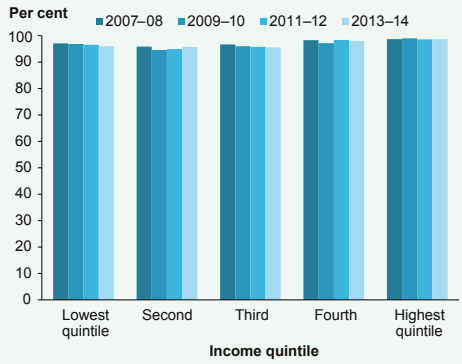
Indicator 2: Gini coefficient—income, 2003–04 to 2013–14

- Australia's Gini coefficient fluctuated around 0.32 for the decade to 2013–14. In 2013–14, the coefficient was 0.333, an increase from 0.306 in 2003–04.
- Australia's income distribution appears to have become more unequal since the mid 1990s, reflected in a slight upward trend in the Gini coefficient (Dollman et al 2015).
- OECD data for 2014 show that the Gini coefficient for Australia (0.337) was similar to that of New Zealand (0.333) and lower than that of the United Kingdom (0.358) and the United States (0.394). It was higher than the OECD average (0.318), which was rescribed in late 2016 as being the highest on record since the mid-1980s (OECD 2016).

See also Indicator 16 'Household income'.

Material living conditions: Adequate housing

Definition: Households that do not require extra bedrooms (%)—Housing utilisation (measured using the Canadian Occupancy Standard) by equivalised disposable household income.



Notes

1. Data are for households who either do not require any extra bedrooms or that have at least one bedroom spare.

Source: ABS 2015d.

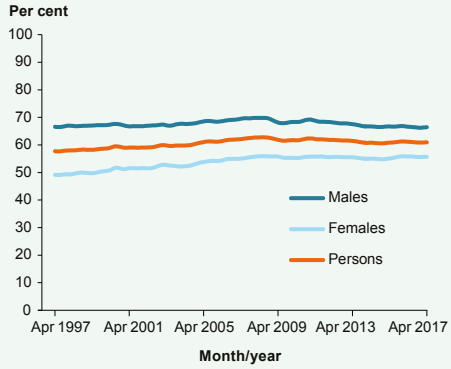
Indicator 3: Households that do not require extra bedrooms, by equivalised disposable household income quintiles, 2007–08 to 2013–14

- In 2013–14, most households had enough bedrooms. However, households in lower income quintiles were less likely to have enough or spare bedrooms (96% for the first, second and third quintiles; 98% for the fourth quintile; and 99% for the highest income quintile).
- This situation has changed little over the 7 years to 2013–14.
- In 2013–14, renter households were less likely than households that owned or were buying their own home to have enough or spare bedrooms (94% compared with 98%).

More information: Chapter 6.1 'Social housing' and Chapter 6.3 'The changing shape of housing in Australia'.

Work: Employment to population ratio

Definition: The number of employed persons expressed as a percentage of the Australian population aged 15 and over.



Note: Trend is a smoothed, seasonally adjusted series of estimates. Denominator is the population aged 15 years and over and includes the employed, unemployed and people not in the labour force.

Source: ABS 2017b.

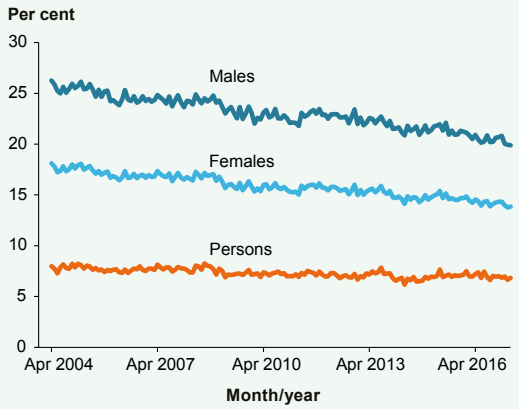
Indicator 4: Employment to population ratio, Australia, 1997 to 2017

- Over the last 20 years, the percentage of the Australian population that is employed has risen slightly, from 58% to 61%.
- The employment to population ratio has changed little for men, at 67%. By contrast, it rose for women from 49% to nearly 56% between 1997 and 2017.
- The ratio peaked at 63% in mid-2008. The highest rate for men was 70% and for women, 56%, both recorded in 2008.
- The employment to population ratio is a high-level summary measure. It does not reflect hours worked, types of employment, employment preferences, or job security.

More information: Chapter 4.2 'Key employment trends'.

Work: Employees working 50 hours or more

Definition: Hours usually worked—proportion of employees working 50 or more hours per week, people aged 15 and over.



Note: Employed persons who usually worked 50 hours or more in all jobs.

Source: ABS 2017d.

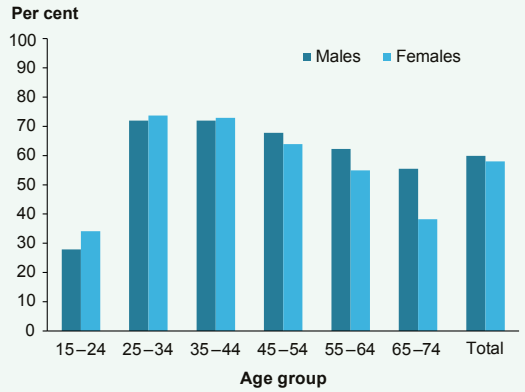
Indicator 5: Employed people 15 years and over working 50 hours or more per week, 2004 to 2017

- Working 50 hours or more per week may affect wellbeing. So, too, can underemployment and a mismatch between desired and actual hours worked.
- About 14% of the population were working 50 hours or more per week in April 2017. One in 5 (20%) males and 1 in 14 (7%) females were working these hours.
- The rates have decreased over time, from 26% for males and 8% for females in January 2004.
- OECD data show that Australia has one of the highest rates for this indicator. It is similar to the rates for New Zealand and the United Kingdom, but lower than Japan. Rates are much lower in many European and Nordic countries, and in Canada (OECD 2017b).

More information: Chapter 4.1 'The changing nature of work and worker wellbeing'.

Skills and learning: Non-school qualification

Definition: The proportion of people aged 15–74 with non-school qualifications.



Source: ABS 2016d.

Indicator 6: People aged 15–74 with a non-school qualification, by age group and sex

- In 2016, 59% of the Australian population aged 15–74 held a non-school qualification, such as a university degree or vocational education certificate.
- The percentage was slightly higher for males (60%) than females (58%).
- Education levels have been rising gradually over time in the population. Between 2009 and 2016, for example, the proportion of the population aged 15–74 with non-school qualifications increased by 3.9 percentage points.
- The gains have been more marked for females. The largest differences over time were for females aged 35–44, 12 percentage points, from 61% in 2009 to 73% in 2016.

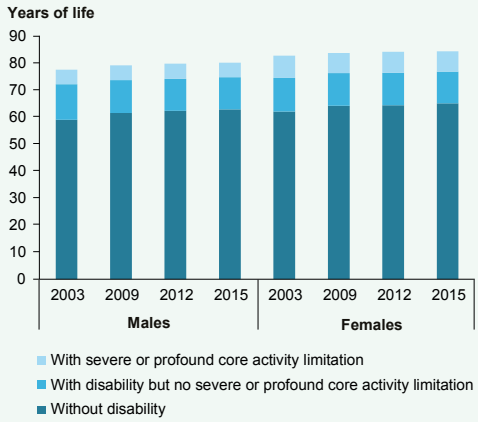
More information: Chapter 3.4 'Tertiary education'.

Skills and learning

Indicator 7: Lifelong learning—no indicator defined. See Chapter 9.1 'The *Australia's welfare* indicator framework', Box 9.1.2 for more information.

Health and vitality: Disability-free life expectancy

Definition: Disability-free life expectancy at birth.



Source: AIHW 2017.

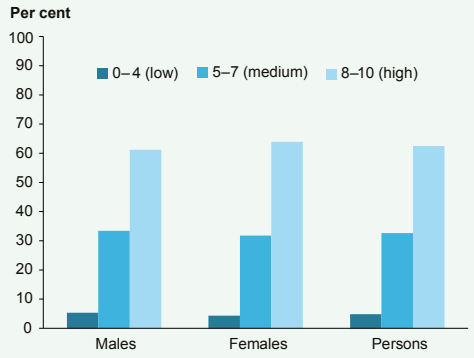
Indicator 8: Expected years of life at birth, by sex, 2003, 2009, 2012, 2015

- A boy born in 2015 can expect to live, on average, 80.4 years and a girl, 84.5 years. This is 2.6 and 1.7 extra years for males and females, respectively, compared with 2003.
- On average, boys born in 2015 can expect to live about 63 years without disability, 11.9 years with disability (but no severe or profound core activity limitation), and a further 5.4 years with severe or profound core activity limitation.
- The equivalent figures for girls born in 2015 are 65.2, 11.8 and 7.5 years.
- Years of life lived without disability have increased by about 2% for both males and females since 2003 (3.9 years for males and 3.0 years for females).

More information: Chapter 8.1 'People with disability'.

Health and vitality: Life satisfaction

Definition: Overall life satisfaction scores for people aged 15 and over (%).



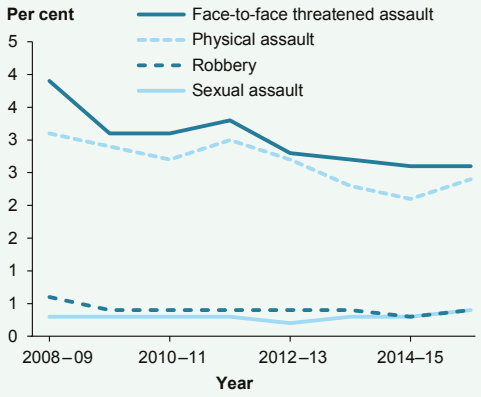
Source: ABS 2015b.

Indicator 9: Overall life satisfaction score in score ranges, people aged 15 and over, by sex, 2014

- In 2014, similar proportions of males and females rated their overall life satisfaction as low (5.3% and 4.3%, respectively); medium (33% and 32%) or high (61% and 64%).
- The average life satisfaction score on a scale of 0 to 10 was 7.6.
- People aged 75 and over were more likely to rate their life satisfaction as high (72%) than people aged 15–24 (63%).
- In 2016, Australia ranked ninth out of 35 countries on this measure, and higher than the OECD average. Australia's average score changed little over 2013–2016 (OECD 2017a).

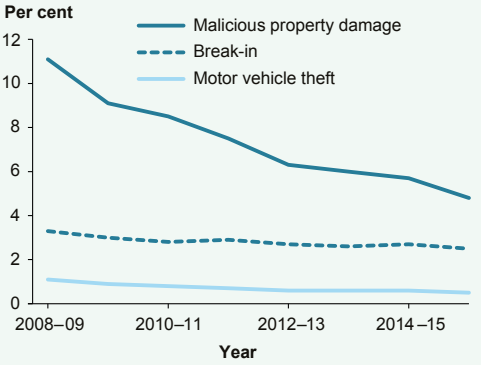
Personal safety: Crime victimisation

Definition: Rate (%) who experienced selected personal and household crime in the last 12 months, people aged 15 and over.



Source: ABS 2017a.

Indicator 10a: Victimisation rate, selected personal crimes, 2008–09 to 2015–16



Source: ABS 2017a.

Indicator 10b: Victimisation rate, selected household crimes, 2008–09 to 2015–16

- Household and personal crime victimisation rates generally fell between 2008–09 and 2015–16. However, the sexual assault rate did not, remaining stable over the period (0.3%).
- Rates for malicious property damage more than halved over the period (11.1% down to 4.8%).
- Data from the ABS General Social Survey also show a drop in crime victimisation rates. In the 12 months leading up to the survey, rates fell from 11% in 2006 to 8.0% in 2014 for threatened or actual physical violence, and from 9.4% in 2006 to 7.1% in 2014 for attempted or actual break-in (ABS 2015b).

Personal safety: Perceptions of safety in the community

Definition: The proportion of adults who report feeling very safe or safe walking alone after dark/alone at home after dark.

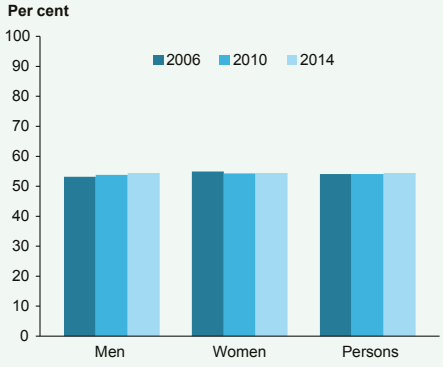
Source: ABS 2015b.

Indicator 11: Adults who report feeling very safe or safe walking alone after dark/being alone at home after dark, 2006, 2010 and 2014

- Perhaps reflecting the results for Indicator 10, adults reported feeling safer in their community in 2014 than in earlier years. More than half (52%) reported feeling very safe or safe walking alone in their local area after dark, compared with 48% in 2006.
- Similarly, the rates for feeling very safe or safe at home alone after dark also improved, from 86% in 2006 to 89% in 2014.
- While improvements were seen for both sexes, men feel much safer in their community than women. In 2014, 72% of men reported that they felt safe walking alone in their local area after dark compared with just 34% of women.

Community engagement: Level of generalised trust

Definition: Proportion of adults who somewhat agree or strongly agree that most people can be trusted.



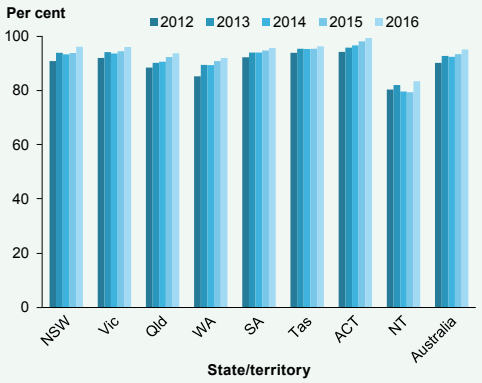
Source: ABS 2015b.

Indicator 12: Adults who somewhat agree or strongly agree that most people can be trusted, by sex, 2006, 2010 and 2014

- Levels of generalised trust did not change between 2006 and 2014, with about 54% of adults strongly agreeing or somewhat agreeing that most people could be trusted.
- Rates were similar for men and women.
- More than one-quarter (28%) of adults in 2014 somewhat or strongly disagreed that most people could be trusted.

Community engagement: Voter enrolment

Definition: Proportion of eligible Australian adults enrolled to vote.



Note: As at 30 June each year.

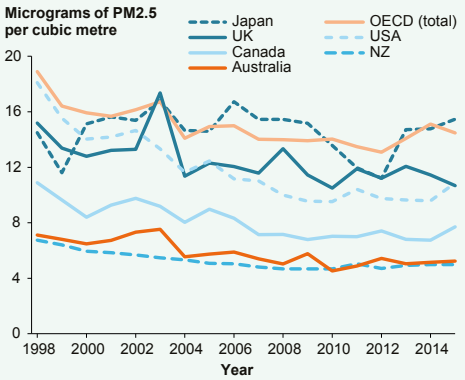
Source: AEC 2017.

Indicator 13: Eligible Australian adults enrolled to vote, by state and territory, 2012 to 2016

- The proportion of eligible Australians aged 18 and over who are enrolled to vote has risen since 2012, from 91% to 95% in 2016.
- The increase was seen in all jurisdictions, with the ACT having the highest enrolled population (99%) and the NT the lowest (84%) in 2016.
- Federal elections in 2013 and 2016 may explain higher rates of increase in those years.
- As at 31 December 2016, more than 800,000 eligible Australian citizens were not on the electoral roll.
- Nationally, the proportion of adults enrolled to vote is higher for women (51%) than men (49%).

Environment: Air quality

Definition: Mean population exposure to PM2.5 micrograms per cubic metre.



Notes

1. PM2.5 is fine particulate matter that is less than 2.5 microns in diameter. The major components of particulate matter are sulphate, nitrates, ammonia, sodium chloride, black carbon, mineral dust and water.
2. The underlying PM2.5 concentrations estimates have been derived using satellite observations and chemical transport models, calibrated against ground-based measurements.

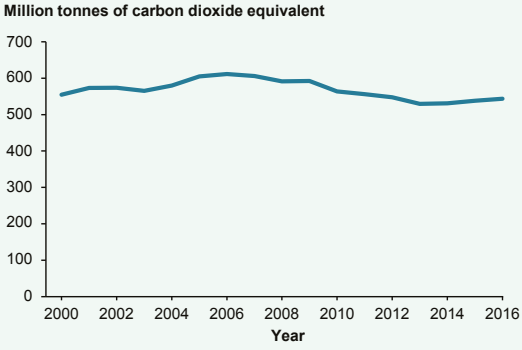
Source: OECD 2017b.

Indicator 14: Micrograms of PM2.5 per cubic metre, 1998 to 2015

- Australia has comparatively good air quality compared with selected OECD countries and the OECD as a whole.
- Australia's concentration of PM2.5 per cubic metre in 2015 (5.2 micrograms) was about one third that of the OECD average (15 micrograms).
- While there have been some fluctuations, the concentration of PM2.5 has dropped in Australia since 1998, from 7.1 to 5.2 micrograms of PM2.5 per cubic metre in 2015.
- All Australia's capital cities have very good air quality, based on assessment of PM2.5, according to findings of the State of the Environment 2016 report (Department of the Environment and Energy 2017a).

Environment: Greenhouse gas emissions

Definition: Greenhouse gas emissions—million tonnes of carbon dioxide equivalent (Mt CO2-e).



Notes

1. National inventory total (including the land sector).
2. Estimates are based on the Kyoto Protocol classification system (Cancun Agreement quantified economy-wide emission reduction target (QEERT)) and are used to track progress towards Australia's 2020 emission reduction target. See also Department of the Environment and Energy 2017b.

Source: Department of the Environment and Energy 2017b.

Indicator 15: Greenhouse gas emissions, million tonnes of carbon dioxide equivalent, 2000 to 2016

- Australia's greenhouse gas emissions have dropped by 2% since 2000 to 543.3 million tonnes (Mt) of carbon dioxide equivalent (CO2-e) in the year to December 2016.
- In the year to December 2016, the energy sector contributed most emissions (79%), followed by agriculture (13%), industrial processes and product use (6%), and waste (2%) (Department of the Environment and Energy 2017b).
- Australia's emissions per capita and per dollar of gross domestic product (GDP) have declined over the last 27 years, reducing by 24% and 39% respectively since 2000 (Department of the Environment and Energy 2017b).

Determinants domain—indicator results

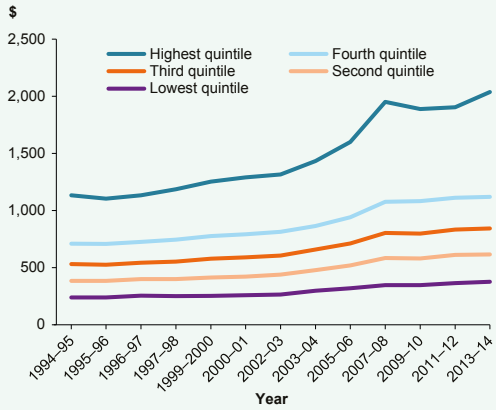
The determinants domain focuses on those factors that influence health and welfare and, potentially, demand for welfare services; that is, they can be risk factors for needing welfare support. The determinants indicators are closely related to the wellbeing indicators. See Box 9.2.3 for key findings from the determinats domain.

Box 9.2.3: Key results—determinants domain

- The prevalence of disability has decreased for all types of disability, from 20% in 2003 to 17% in 2015, as well as for disability with severe and profound core limitation (from 6.2% to 5.4%) (age standardised rates).
- In terms of social connectedness, 95% of the adult population could get support in times of crisis, and 85% could get access to emergency funds in a hurry.
- About one-third of people living in the lowest income households reported they could not get access to emergency funds quickly compared with 2% of people living in the highest income households.
- Around 86% of families report good to excellent family cohesion.
- In 2016, 89% of 20–24-year-olds had completed Year 12 or Certificate III, up from 80% in 2005, and 85% in 2012.
- Household internet access has been increasing over time, and is now at about 86%.
- One in 5 children were developmentally vulnerable on one or more domains in 2015. There is improvement for Indigenous children but the rates are still twice as high as for non-Indigenous children.
- A gradient towards increased disadvantage with increasing remoteness persists. Completion rates for Year 12 decline with increasing remoteness, as does internet access.

Material resources: Household income

Definition: Average weekly household income adjusted for the number of household members.



Note: Intervals between surveys have varied over time so trends should be interpreted with caution. From 2005–06, the survey of income and housing was run every 2 years. Prior to that, it was generally run every year.

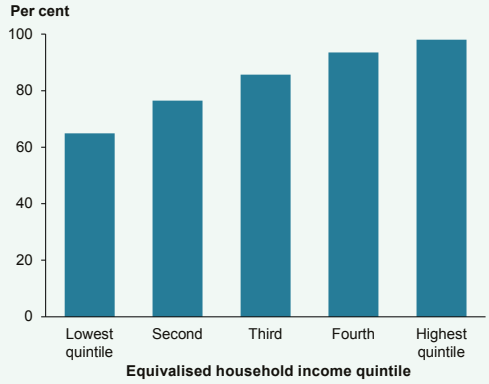
Source: ABS 2016e.

Indicator 16: Equivalised weekly household income, by income quintile, 1994–95 to 2013–14 (constant 2013–14 dollars)

- Equivalised weekly household income has risen for every quintile since 1994–95.
- The highest quintile had the highest growth of 80%, from 1994–95 to 2013–14.
- The growth rates for all other quintiles showed similar trends over the same period; however, since 2003–04, the gap has widened somewhat between each quintile level.
- The difference between the highest quintile and the lowest quintile nearly doubled between 1994–95 and 2013–14.

Material resources: Access to emergency funds

Definition: The proportion of people aged 18 and over able to raise $2,000 in a week for something important.



Source: AIHW analysis of ABS 2014–15 National Health Survey (TableBuilder).

Indicator 17: Ability to raise $2,000 in a week for something important, people aged 18 and over, by equivalised household income quintile, 2014–15

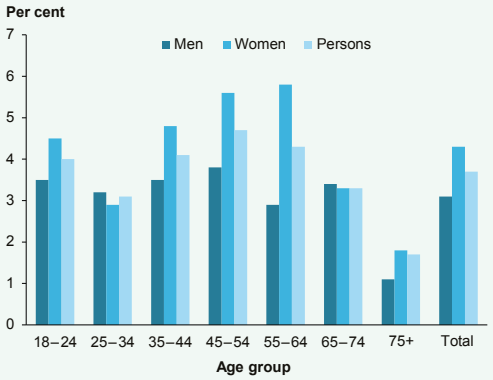
- Based on questions asked in the ABS 2014–15 National Health Survey, 85% of people aged 18 and over could raise $2,000 in a week for something important.
- In contrast, lower income households reportedly had more difficulty in raising emergency funds at short notice. About one-third (35%) of people living in the lowest income households reported they could not do so. This compares with just 2% of people living in the highest income households.
- Similar results were reported for 2011–12. This suggests that the level of financial vulnerability for low-income households has not changed substantially in 4 years.

Material resources: Housing security

Indicator 18: No indicator defined. See Chapter 9.1 'The *Australia's welfare* indicator framework' for more information.

Personal resources: Psychological resilience

Definition: [Proxy used] The proportion of adults with very high levels of psychological distress as measured by the Kessler Psychological Distress Scale—10 items (K10).



Note: The K10 is a scale of non-specific psychological distress based on 10 questions about negative emotional states in the 4 weeks before being interviewed.

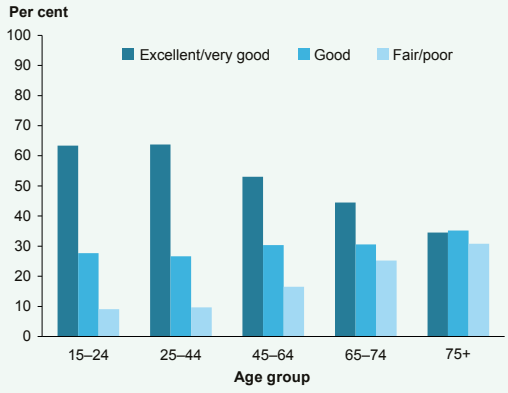
Source: AIHW analysis of ABS 2015e.

Indicator 19: Adults with very high levels of psychological distress, by age group and sex, 2014–15

- In 2014–15, 3.7% of adults had very high levels of psychological distress.
- Women (4.3%) were more likely than men (3.1%) to have very high levels of psychological distress, with women aged 55–64 having the highest rate (5.8%).
- Age-standardised rates of high or very high levels of psychological distress (combined) have not changed significantly between 2001 (13%) and 2014–15 (12%).
- Rates of high or very high psychological distress were more than twice as high for adults living in low socioeconomic areas (18%) than for adults in high socioeconomic areas (7%) (ABS 2015f).

Personal resources: Health status (self-assessed)

Definition: The proportion of people aged 15 and over who self-assess their health as excellent or very good.



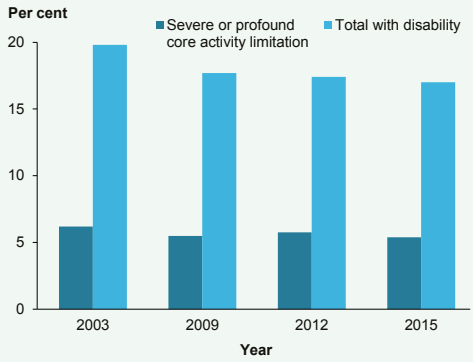
Source: ABS 2015e.

Indicator 20: Self-assessed health status, by age group, 2014–15

- In 2014–15, 56% of Australians aged 15 or over described their health as excellent or very good.
- Younger people were more likely than older people to rate their health as excellent or very good—63% of people aged 15–24 compared with 35% of people aged 75 or over.
- The proportion of people who described their health status as excellent or very good in 2014–15 was similar to the rate in 2004–05.
- Self-assessed health status was slightly higher for females (58%) than males (55%).

Personal resources: Functional status

Definition: [Proxy used] Disability prevalence rate (expressed as age-standardised rate).



Notes

1. Rates have been directly age-standardised to the Australian population as at 30 June 2001.
2. The change between the 2003 and 2009 surveys, being a six year period, should be compared with caution with change between the later surveys run at 3 year intervals.

Source: ABS 2016c.

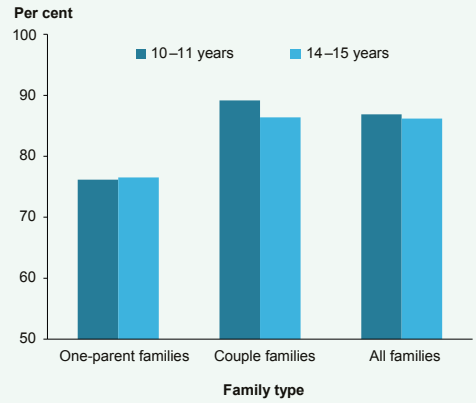
- After adjusting for age structure changes, the proportion of people with disability fell from 20% in 2003 to 17% in 2015.
- Over the same period, the proportion of people with severe or profound core activity limitation also fell, from 6.2% to 5.4%.
- Total disability prevalence was the same for males and females (17%). For people with severe or profound core activity limitation, the rates were 5.2% for males and 5.6% for females.

More information: Chapter 8.1 'People with disability'.

Indicator 21: Age-standardised prevalence of severe or profound core activity limitation, and all with disability, 2003, 2009, 2012 and 2015

Family relationships: Family cohesion

Definition: The proportion of families with children aged 10–11 and 14–15 who reported 'good', 'very good' or 'excellent' family cohesion.



Note: Family cohesion is a measure of family functioning and is defined in the Longitudinal Study of Australian Children as the ability of family members to get along with one another. The primary carer answers the relevant survey question on behalf of the family.

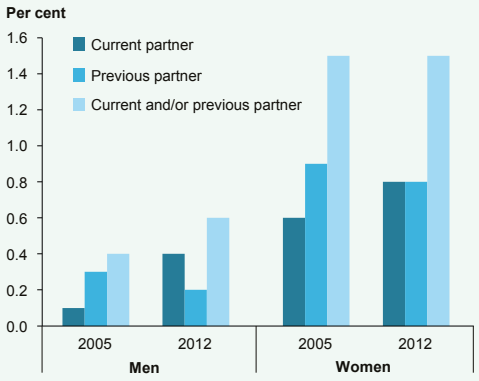
Source: AIHW analysis of DSS, AIFS & ABS 2016.

- According to *Growing up in Australia: The Longitudinal Study of Australian Children* (Wave 6), family cohesion was 'good', 'very good' or 'excellent' in the majority of families with children of both age groups—87% for families with children aged 10–11 and 86% for families with children aged 14–15.
- These results are very similar to those reported for 2012–13.
- A higher proportion of couple families than one parent families reported high levels of family cohesion (89% versus 76% for families with children aged 10–11 and 86% versus 77% for families with children aged 14–15).

Indicator 22: Families with good, very good or excellent family cohesion, families with children aged 10–11 and 14–15, by family type, 2014–15

Family relationships: Partner violence

Definition: The proportion of people who experienced any incident of sexual assault, sexual threat, physical assault or physical threat by a current and/or previous partner in the previous 12 months.



Source: ABS 2013a.

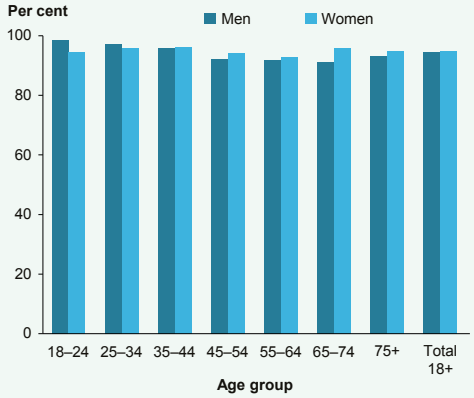
Indicator 23: Experience of partner violence in previous 12 months, by partner status and sex, 2005 and 2012

- Women are more likely than men to have experienced partner violence: in 2012, an estimated 1.5% of women and 0.6% of men aged 18 and over had experienced violence by a current and/or previous partner in the 12 months before the survey.
- Despite appearances, there were no statistically significant changes between 2005 and 2012 in the proportion who reported experiencing partner violence in the 12 months before the survey, for either men or women.
- Partner violence data for 2016 are expected to be available in late 2017.

More information: Chapter 2.7 'Family, domestic and sexual violence'.

Social engagement: Social connectedness

Definition: The proportion of adults who could get support in a time of crisis from people living outside the household.



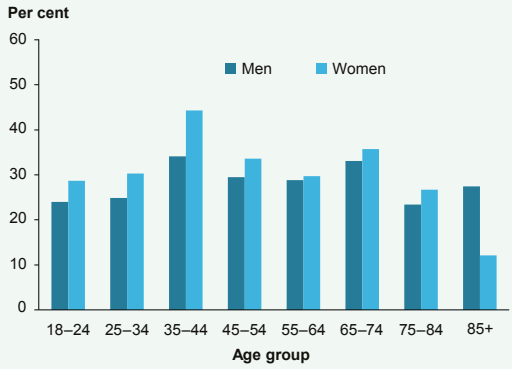
Source: AIHW analysis of ABS 2014 General Social Survey confidentialised unit record file.

Indicator 24: People who could get support in a time of crisis from outside the household, by age group and sex, 2014

- In 2014, 95% of people aged 18 and over indicated that they could get support in a time of crisis from people living outside their own household.
- Women aged 35 and over were slightly more likely than men to be able to get support; the opposite was true for people aged 18–34.
- Family members were the most commonly reported source of support (for 79% of adults), followed by friends (66%) and work colleagues (23%).
- The overall proportion of people able to get support outside the household has stayed much the same, at 93% in 2006 and 95% in 2014.

Social engagement: Adults who volunteer

Definition: The proportion of people who performed voluntary work at least once in the year.



Note: Voluntary work is unpaid help, willingly provided to an organisation or group.

Source: AIHW analysis of ABS 2015b.

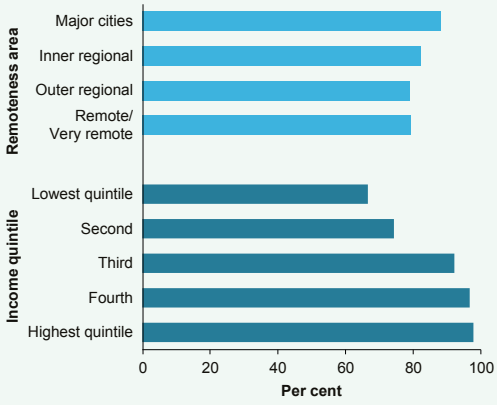
Indicator 25: Adults who volunteer, by age group and sex, 2014

- In 2014, about 5.4 million people aged 18 and over (31% of adults) worked voluntarily for an organisation in the previous 12 months.
- This rate has declined since 2010 (36%) and is lower than in 2006 (34%).
- There were slightly more female than male volunteers (33% and 29%, respectively). Rates were higher for women than men in every age group, except for people aged 85 and over (27% males and 12% females).
- The proportion of people who did voluntary work was highest among people aged 35–44 (39%). Rates for men and women were also highest in this age group (34% and 44%, respectively).

More information: Chapter 4.4 'Working for free—volunteers in Australia'.

Social engagement: Internet access

Definition: [Household access is used as a proxy for personal access.] The proportion of households that have internet access at home.



Note: Estimates presented for 2014–15 are not directly comparable with estimates for previous surveys which allowed the identification of the type of internet connection.

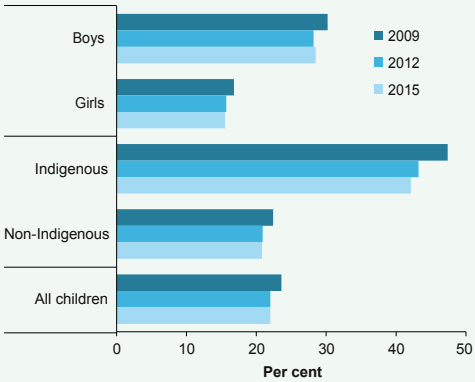
Source: ABS 2016f.

Indicator 26: Households with internet access at home, by remoteness area and by equivalised disposable household income, 2014–15

- Nearly 86% of Australian households had internet access at home in 2014–15, up from 67% in 2007–08.
- Access was higher in *Major cities* (88%) and *Inner regional* areas (82%) than in the more remote parts of Australia (79% for both *Outer regional* and *Remote/Very remote* areas).
- Internet access at home has generally increased for all Australians. However there is still a sharp gradient in access across household income levels. It ranges from 67% among households in the lowest equivalised disposable income quintile to 98% among households in the highest quintile.

Learning potential: School readiness

Definition: The proportion of children developmentally vulnerable on one or more domains of the Australian Early Development Census (AEDC).



Source: DET 2016.

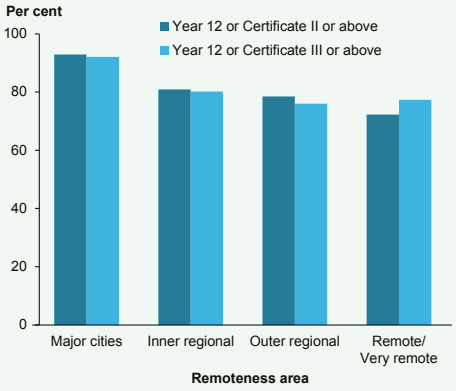
Indicator 27: Children developmentally vulnerable on one or more domains of the AEDC, by sex and Indigenous status, 2009, 2012 and 2015

- In 2015, about 1 in 5 (22%) children were developmentally vulnerable on one or more domains. This was the same as in 2012 and a small improvement on 2009 (24%).
- Boys were almost twice as likely to be developmentally vulnerable on this measure (around 29%) as girls (around 16%).
- Indigenous children were twice as likely to be developmentally vulnerable on one or more domains as non-Indigenous children (around 42% compared with around 21%, respectively).
- The rate of developmental vulnerability of Indigenous children has fallen, from 47% in 2009 to 42% in 2015.

More information: Chapter 2.2 'Transition to primary school' and Chapter 7.4 'Closing the gap in education'.

Learning potential: Year 12 attainment

Definition: The proportion of young people aged 20–24 who have completed Year 12 or gained a qualification at the Australian Qualifications Framework Certificate II/III or above.



Source: ABS 2016d.

Indicator 28: Completion of Year 12 or Certificate II/III or above, people aged 20–24, by remoteness area, 2016

- In 2016, 90% of people aged 20–24 had completed Year 12 or Certificate II or above, and 89% had completed Year 12 or Certificate III or above. These percentages were up from 81% and 80% in 2005, and 86% and 85% in 2012, respectively.
- Completion rates were higher for women than for men—92% compared with 89% for attainment of Year 12 or Certificate II or above and 90% compared with 87% for attainment of Year 12 or Certificate III or above.
- Completion rates decreased with increasing remoteness, from 93% and 92% in *Major cities* for attainment of Year 12 or Certificate II or above, and Year 12 or Certificate III or above, to 72% and 77% in *Remote/Very remote* areas.

More information: Chapter 3.2 'School retention and completion' and Chapter 7.4 'Closing the gap in education'.

Welfare services performance domain—indicator results

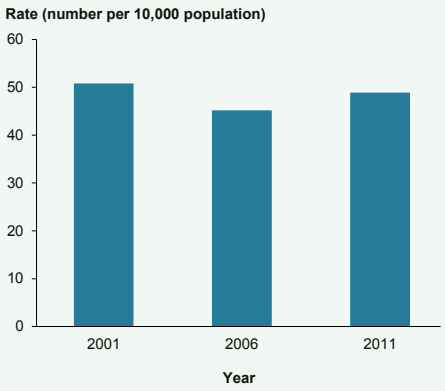
A role of welfare payments and services is to provide a 'safety net' for people who experience disadvantage on a short- or long-term basis. This domain reports on the extent to which the major services, supports, payments and interventions contribute to providing an adequate level of support and achieving better welfare outcomes for Australians. The pathways between welfare support and long-term outcomes are not direct; therefore, these indicators can provide only high-level insights about likely impacts on individuals. See Box 9.2.4 for key findings from the determinants domain.

Box 9.2.4: Key results—welfare services performance

- In 2015, most people (94%) aged 15–64 with disability had participated in social activities away from home in the last 3 months. The majority of people with disability aged 65 and over reported that their needs were fully met (67%) in 2015.
- More than 98% of young people in youth justice detention were in education and/or training. The level of school-aged attendance for this population group increased over the period from 2010–11 to 2014–15.
- The proportion of Indigenous households living in overcrowded conditions dropped from 27% in 2004–05 to 21% in 2014–15, with improvements seen across all remoteness areas.
- Satisfaction with particular services ranged from 67% for clients of Centrelink to 80% for community housing clients.
- After a period of improving rates between 2004 and 2008, there has been an upward trend for the male and female long-term and youth unemployment rates from late 2008/early 2009.
- There were 1.4 million jobless families in Australia in 2016, representing 22% of families. Over half a million children aged under 15 (13% of all children in this age group) were living in jobless families.
- One in 2 (50%) lower income rental households were spending more than 30% of their income on housing in 2013–14, with this figure rising since 2005–06 (42%).

Welfare services outcomes: Homelessness

Definition: The number of homeless people per 10,000 population.



Source: ABS 2012.

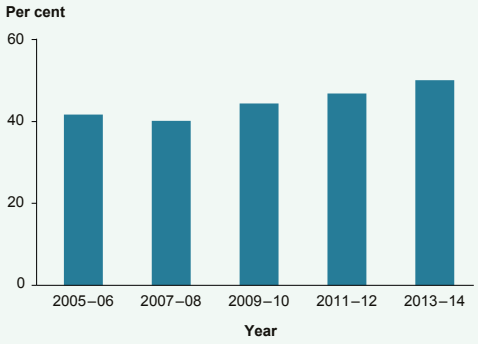
Indicator 29: Homelessness rate, number per 10,000 population, 2001, 2006 and 2011

- In 2011, the homelessness rate was 49 people per 10,000 population as enumerated in the Census.
- The 2011 rate increased by 8% from 45 per 10,000 in 2006, but decreased from 51 per 10,000 in 2001.
- The increase between 2006 and 2011 was due to the increase in people considered to be living in severely overcrowded conditions.
- Specialist Homelessness Services (SHS) client numbers have increased, from 236,429 clients in 2011–12 to 279,196 in 2015–16. Nearly half (47%) of these clients in 2015–16 had sought assistance during the previous 4 years.
- The number of SHS clients who were homeless on presenting to an SHS agency increased from 70,580 (41%) in 2011–12 to 108,570 (44%) in 2015–16 (AIHW 2016a).

More information: Chapter 6.2 'Homelessness'.

Welfare services outcomes: Lower income rental households in housing stress

Definition: The proportion of lower income rental households in housing stress (spending more than 30% of their gross income on housing costs).



Notes

1. Lower income households have 38% of people with equivalised disposable household income (EDHI) between the 3rd and 40th percentiles of EDHI.
2. Excludes households with nil or negative total income.
3. Excludes lower income 'owners without a mortgage' and 'owners with a mortgage'.

Source: ABS 2015d.

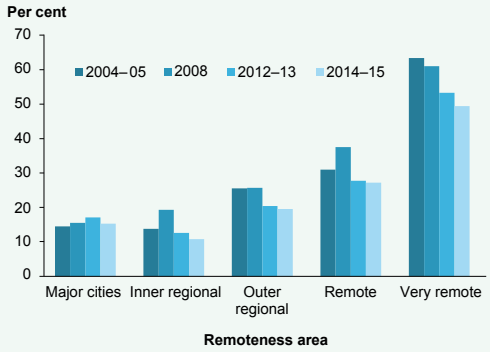
- In 2013–14, 1 in 2 (50%) lower income rental households spent more than 30% of their gross income on housing costs. This is an 8 percentage point rise from 42% in 2005–06.
- The proportion of lower income rental households in housing stress rose steadily between 2007–08 and 2013–14.
- For lower income households renting privately, the proportion in housing stress continued to rise, from 54% in 2011–12 to 62% in 2013–14.

More information: Chapter 6.3 'The changing shape of housing in Australia'.

Indicator 30: Proportion of lower income rental households spending more than 30% of their gross income on housing costs, 2005–06 to 2013–14

Welfare services outcomes: Indigenous households living in overcrowded conditions

Definition: The proportion of Indigenous households that require one or more extra bedroom(s) to accommodate usual residents, based on the Canadian National Occupancy Standard.



Note: See Glossary for 'overcrowding'.

Source: SCRGSP 2016.

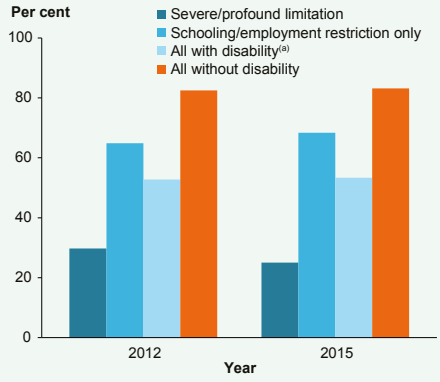
Indicator 31: Overcrowding in Indigenous households, by remoteness area, 2004–05, 2008, 2012–13 and 2014–15

- Between 2004–05 and 2014–15, the proportion of Indigenous households living in overcrowded conditions dropped from 27% to 21%.
- Improvements were seen across each of the remoteness areas, with the greatest change in *Very remote* areas.
- However, a three-fold difference remains in the rate of overcrowding in *Very remote* areas (49% in 2014–15) compared with *Major cities* (15%).

More information: Chapter 7.1 'Community factors and Indigenous wellbeing'.

Welfare service outcomes: Labour force participation for people with disability

Definition: The proportion of people aged 15–64 who are working or looking for work, by disability status.



(a) Includes people with severe/profound limitation and schooling/employment restrictions.

Sources: AIHW analyses of ABS 2012 and 2015 Surveys of Disability, Ageing and Carers.

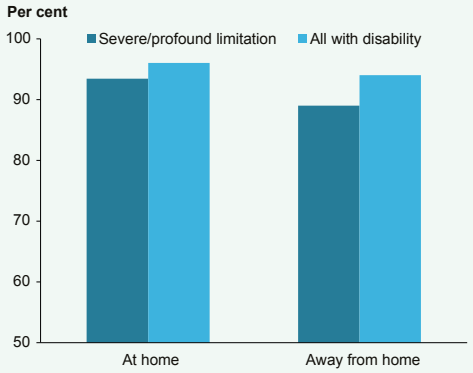
Indicator 32: Labour force participation for people aged 15–64, by disability status, 2012 and 2015

- In 2015, labour force participation was lower for people with disability and severe or profound limitation (25%) than for people with schooling or employment restriction only (68%), or for all people with disability (53%) and people without disability (83%).
- Participation declined slightly for people with severe or profound limitation from 30% in both 2003 and 2012 to 25% in 2015.
- Participation remained steady for people without disability in 2015. However, it rose for people with disability and schooling or employment restriction(s) only (65% in 2012), returning to its 2003 level (68%).

More information: Chapter 8.2 'Participation in society by people with disability'.

Welfare services outcomes: Social participation for people with disability

Definition: The proportion of people aged 15–64 with disability living in households who engaged in social activities at home or away from home in the last 3 months.



Source: AIHW analysis of ABS 2016c.

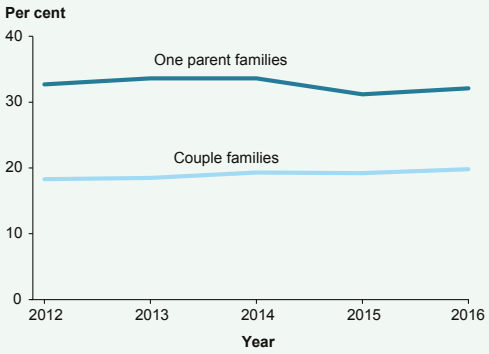
Indicator 33: Participation in social activities, people aged 15–64 with disability, by disability severity, 2015

- In 2015, most people (94%) aged 15–64 with disability had participated in social activities away from home in the last 3 months.
- The proportion was slightly lower for people with disability and severe or profound limitation (89%).
- The difference was less marked for participation in social activities at home (93% for people with severe or profound limitation, and 96% for all people with disability).
- These rates have changed little since 2003.

More information: Chapter 8.2 'Participation in society by people with disability'.

Welfare service outcomes: Jobless families

Definition: The proportion of households where no-one in the family aged 15 and over is employed, including dependants.



Note: A jobless family is a family where no person usually resident in the family (including dependants) is employed.

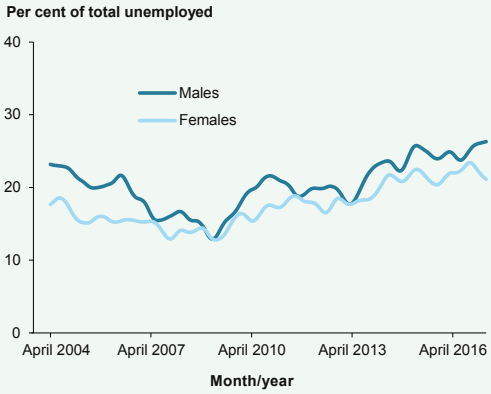
Source: ABS 2017c.

Indicator 34: Jobless families, by family type, 2012 to 2016

- In June 2016, there were 1.4 million jobless families in Australia (22% of all families).
- Of these, around 1.1 million were couple families and around 304,400 were one parent families.
- Eleven percent (127,600) of jobless couple families and 70% (213,900) of jobless one parent families had dependants.
- There were 580,000 children aged 0–14 living in jobless families (13% of all children aged 0–14). This proportion has changed little since 2012.

Welfare services outcomes: Long-term unemployment ratio

Definition: The number of long-term unemployed persons (unemployed for 52 weeks or more) expressed as a percentage of the total unemployed population aged 15 and over.



Note: Figure presents ABS 'trend' series, which is a smoothed seasonally adjusted series of estimates.

Source: ABS 2017d.

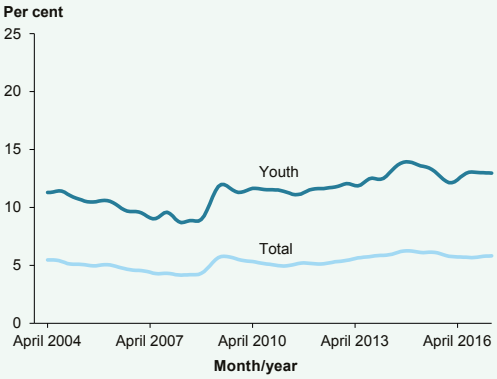
Indicator 35: Long-term unemployment ratio, people aged 15 and over, by sex, 2004 to 2017

- One in 4 (24%) unemployed people had been unemployed for 52 weeks or more, as at April 2017.
- The long-term unemployment ratio was generally higher for males than females from April 2004 to April 2017.
- There has been an upward trend for the male and female long term unemployment ratios since early 2009.
- The difference between the male and female long-term unemployment ratio has fluctuated over the period. As at April 2017, the difference was 5.2% (26.3% for males, and 21.1% for females).

More information: Chapter 4.2 'Key employment trends'.

Welfare services outcomes: Youth unemployment rate

Definition: The number of unemployed people aged 15–24, expressed as a percentage of the total number of people aged 15–24 in the labour force.



Note: Figure presents ABS 'trend' series, which is a smoothed seasonally adjusted series of estimates.

Source: ABS 2017b.

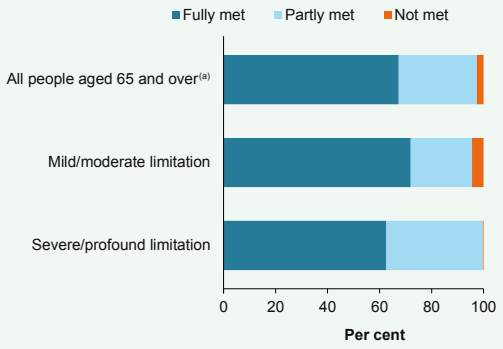
Indicator 36: Youth (aged 15–24) and total unemployment rates, 2004 to 2017

- Between April 2004 and April 2017, the youth unemployment rate was higher than the total unemployment rate.
- The difference in rates between 2004 and 2017 was largest in October 2014, when it was 7.7 percentage points.
- While rates have fluctuated over time, there has been an upward trend in the youth unemployment rate since October 2008, with the rate peaking in October 2014 at 14%.
- At April 2017, the youth unemployment rate was 13% (14% for males, and 12% for females).

More information: Chapter 4.2 'Key employment trends'.

Welfare services outcomes: Older people with care needs supported

Definition: The proportion of people aged 65 and over living in households whose need for assistance was fully met.



(a) Includes people with and without disability.

Source: AIHW analysis of ABS 2016c.

Indicator 37: People aged 65 and over living in households, by extent to which need for assistance was met and disability status, 2015

- The majority of people aged 65 and over had their needs fully met (69%). This is a small improvement since 2003 (64%).
- The proportion of people who reported their needs were fully met was higher among people with mild or moderate core activity limitation than among people with severe or profound core activity limitation (72% and 63%, respectively).
- People with mild or moderate core activity limitation were most likely to report not having their needs met at all (4%).

More information: Chapter 5.1 'Ageing and aged care'.

Welfare services outcomes: Underemployment of parents receiving child care benefits

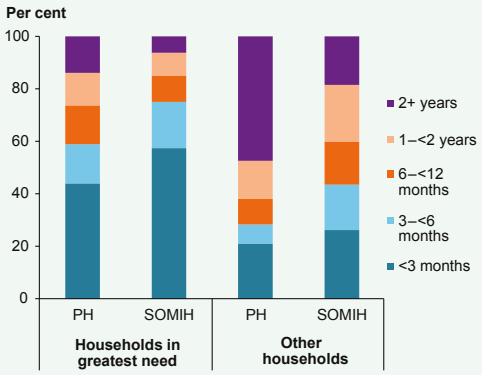
Note this indicator was reported in *Australia's welfare 2015* using proxy data. However a re-assessment of the value of the available data resulted in the decision to remove this indicator from the indicator set.

Welfare services outcomes: Safe return home for children in out-of-home care

Indicator 38: No indicator defined. See Chapter 9.1 'The *Australia's welfare* indicator framework' for more information.

Access: Waiting times for social housing

Definition: The length of time households in greatest need wait to be allocated social housing.



Note: PH = public housing. SOMIH = state owned and managed Indigenous housing.

Source: AIHW—National Social Housing Assistance Data Repository.

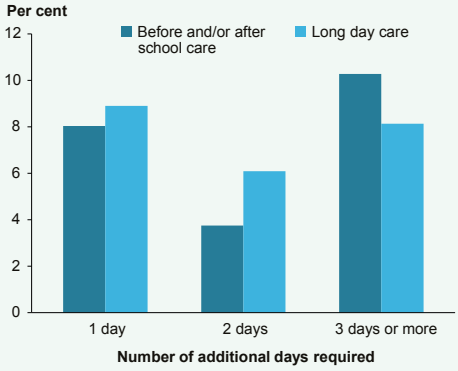
Indicator 39: Waiting time for social housing, households in greatest need and other households, by social housing program, 2015–16

- A total of 14% of households in greatest need for public housing waited 2 years or more to be allocated housing—similar to 2013–14 (15%). 47% of other households also waited 2 years or more.
- For households in greatest need for SOMIH, 6% waited over 2 years to be allocated housing, compared with 19% of other households.
- The proportion of housing allocations made to those in greatest need has remained relatively stable for public housing and SOMIH over the past 5 years (around 75% for public housing and 58% for SOMIH).

More information: Chapter 6.1 'Social housing' and Chapter 6.3 'The changing shape of housing in Australia'.

Access: Difficulty accessing child care

Definition: Proportion of children aged 0–12 attending formal child care who require additional days of care.



Source: ABS 2015a.

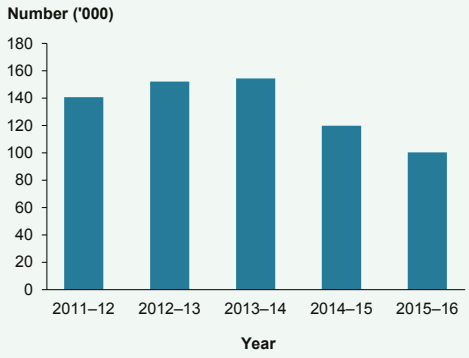
Indicator 40: Proportion of children aged 0–12 attending formal child care who require additional days of care, by number of days and care type, 2014

- In 2014, parents reported that additional formal care was required for 250,800 children aged 0–12 (27% of all children attending formal care; 7% of all children aged 0–12).
- The greatest need was for 3 or more extra days of care in before and/or after school care (10% of children attending before and/or after school care).
- The most common reason parents needed care was for work-related purposes (153,300 children).

More information: Chapter 2.1 'Children in child care and preschool programs'.

Access: Unmet demand for homelessness services

Definition: [Proxy used] Number of unassisted requests for specialist homelessness services (SHS).



Notes

1. Unassisted requests for specialist homelessness services (SHS) assistance relate to people who were not able to be offered any services by an SHS organisation or agency.
2. An unassisted request can relate to one or more people seeking SHS assistance. These people may have approached more than one agency or returned to the same agency another day.
3. Previously published data for 2011–12 have been revised.
4. The 2011–12 data exclude those for South Australia.

Source: Specialist Homelessness Services Collection, 2011–12 to 2015–16.

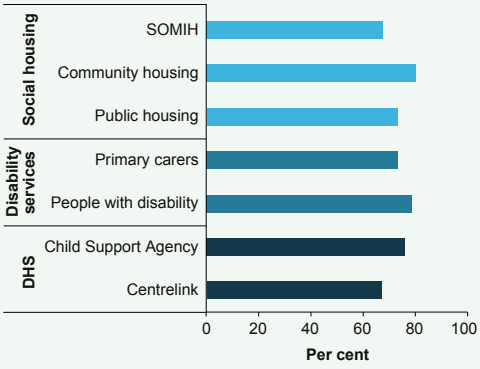
Indicator 41: Number of unassisted requests for SHS, 2011–12 to 2015–16

- Between 2011–12 and 2015–16, nearly 700,000 requests for SHS could not be met by SHS agencies.
- The total number of unassisted requests gradually increased, from 140,700 in 2011–12 to 154,400 in 2013–14.
- The decrease in unassisted requests recorded from 2014–15 was, in part, due to the introduction of new service delivery models in the sector.

More information: Specialist homelessness services annual report, 2015–16.

Responsiveness: Satisfaction with services

Definition: The proportion of clients satisfied with the service received (within specific programs/sectors).



Notes

1. SOMIH = state owned and managed Indigenous housing.
2. Department of Human Services (DHS) data are for financial year 2015-16; disability services data are for calendar year 2015; social housing data are for calendar year 2016.

Sources: DHS 2016; SCRGSP 2017.

Indicator 42: Client satisfaction with service provision, selected services, 2016 (or nearest available year)

- For the services included here, satisfaction ranged from 68% for clients of SOMIH services to 73% for clients of public housing, and 80% for community housing clients.
- There was a 10 percentage point increase in SOMIH client satisfaction, from 58% in 2014 to 68% in 2016.
- A total of 79% of people with disability and 73% of primary carers were satisfied with services received. This was not significantly different from what it was in 2012.
- Client satisfaction with Centrelink was steady in 2015–16 (67%) compared with 2013–14 (68%); however, it had decreased for the Child Support Agency, from 84% to 76%.

More information: Chapter 6.1 'Social housing' and Chapter 6.3 'The changing shape of housing in Australia'.

Efficiency: Cost per service output

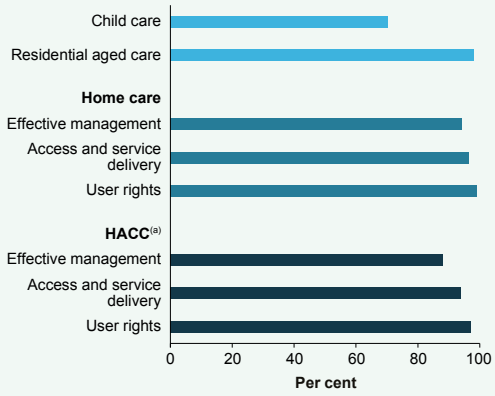
Indicator 43: Data not reported. See Chapter 9.1: 'The *Australia's welfare* indicator framework'.

Efficiency: Management expense ratio

Indicator 44: No indicator defined. See Chapter 9.1: 'The *Australia's welfare* indicator framework'.

Safety and quality: Compliance with service standards

Definition: The proportion of services that comply with applicable service standards (by sector).



(a) In most jurisdictions, Home and Community Care (HACC) has been consolidated into Home Care; therefore, HACC figures here are only for Western Australia.

(b) For information on programs included, see online data tables and SCRGSP 2017.

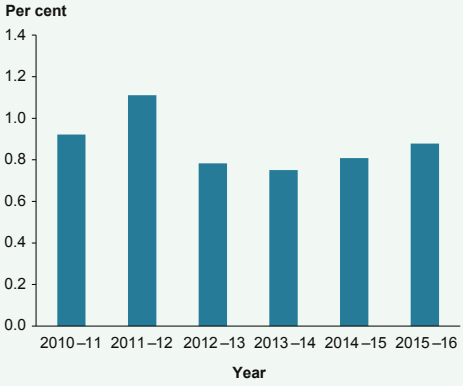
Source: SCRGSP 2017.

Indicator 45: Compliance with service standards, selected sectors(b), 2015–16

- As at 30 June 2016, 70% of approved child care services with a quality rating achieved an overall rating that met or exceeded National Quality Standards, slightly higher than for the previous year (67%).
- In 2015–16, 98% of residential aged care services held 3-year accreditation, similar to results for the previous year.
- Community aged care services are assessed against three service standards. In 2015–16, the proportion of Home Care services meeting the standards ranged from 94% to 99%. For HACC services (Western Australia only), the proportion ranged from 88% to 97%. Figures are not comparable with those for previous years.

Safety and quality: Safety and security of children and young people in out-of-home care

Definition: [Proxy used]: Children in out-of-home care who were the subject of a child protection substantiation and the person responsible was living in the household.



Notes

1. Children in out-of-home care include young people up to 17 years.
2. Excludes the Northern Territory for all years and South Australia for 2014–15 and 2015–16, as data were not available for this indicator.

Source: SCRGSP 2017.

Indicator 46: Children in out-of-home care who were the subject of a child protection substantiation and the person responsible was living in the household, 2010–11 to 2015–16

- In 2015–16, less than 1.0% of children in out-of-home care were the subject of a child protection substantiation where the person responsible was living in the household.
- Over the period from 2010–11 to 2015–16, the number of children in this group has varied slightly, with a low of 365 children (0.8%) in 2013–14 and a high of 522 children (1.1%) in 2011–12.
- The 2015 national pilot survey on the views of children and young people in out-of-home care found that 91% reported feeling both safe and settled in their current placement (AIHW 2016b).

More information: Chapter 2.4 'Child protection'.

Effectiveness: Job seekers off benefits after participation in employment services

Definition: The proportion of job seekers off benefits after participation in employment services.

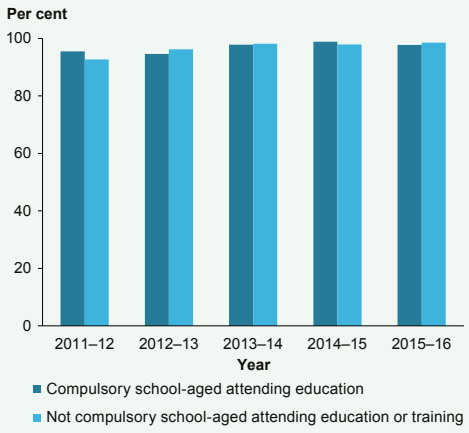
- On 1 July 2015, Job Services Australia was replaced with a new employment program, jobactive. Six months of data were collected for job seekers participating in jobactive from 1 July 2015 to 31 December 2015. Their income support status was measured six months later between 1 January 2016 and 30 June 2016.
- The results showed that 43% of job seekers moved off income support or substantially reduced their reliance on income support 6 months after participation in the jobactive program.

Source: Department of Employment 2016.

Indicator 47: Proportion of job seekers off benefits after participation in employment services

Effectiveness: Young people in detention attending education/training

Definition: The proportion of young people in detention attending education/training.



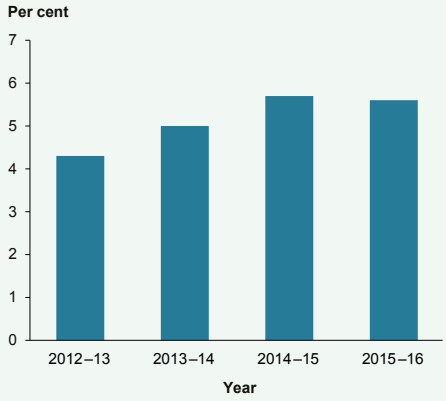
Source: SCRGSP 2017.

Indicator 48: Young people in youth justice detention attending education/ training, by school age, 2011–12 to 2015–16

- The vast majority (almost 98%) of young people in youth justice detention were in education and/or training.
- There were very similar results for both compulsory school-aged and non-compulsory school-aged young people in youth justice detention.
- The level of compulsory and non-compulsory school-aged attendance rose over the period from 2011–12 to 2015–16 (96% to 98% for compulsory education; 93% to 99% for non-compulsory education).

Effectiveness: Repeat periods of homelessness

Definition: The proportion of homelessness services clients who had more than one period of homelessness within the reporting period.



Source: Specialist Homelessness Services Collection, 2012–13 to 2015–16.

Indicator 49: Clients experiencing repeat periods of homelessness, 2012–13 to 2015–16

- During 2015–16, 5.6% of clients receiving specialist homelessness assistance had more than one period of homelessness.
- On average, 1 in 20 clients of specialist homelessness services had more than one period of homelessness in a year.
- The proportion of clients experiencing repeat homelessness increased between 2012–13 and 2015–16 (7% annual growth on average).

More information: Chapter 6.2 'Homelessness'.

Coordination: no indicators identified

Indicator 50: No indicator defined. See Chapter 9.1: 'The *Australia's welfare* indicator framework'.

Other sectors domain—indicator results

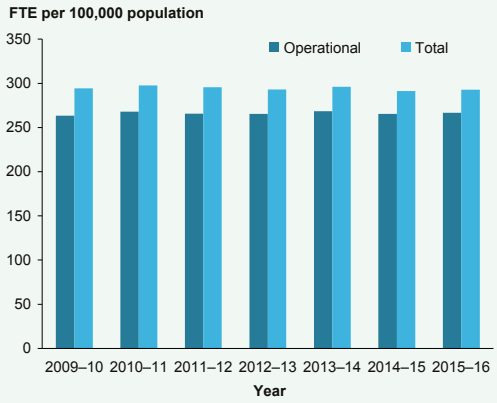
This domain recognises the contribution of other sectors to the determinants of wellbeing, and outcomes of welfare services. The four indicators presented here are not intended to provide a comprehensive summary of each sector. They are included to acknowledge the many complexities that have an impact on welfare and wellbeing. See Box 9.2.5 for key findings from the other sectors domain.

Box 9.2.5: Key results—other sectors

- Young people not in education, employment or training are at risk of social exclusion, and more likely to require welfare support. Rates have reduced slightly since 2013; however, in 2015, 5.1% of people aged 15–19 and 12% of people aged 20–24 were not working or studying.
- The highest rate for full-time equivalent (FTE) general practitioners in 2015 was in *Remote/Very remote* areas, with 136 FTE general practitioners per 100,000 population. Rates increased in all remoteness areas between 2011 and 2015.

Other sectors: Police operational staff levels

Definition: The number of operational full-time equivalent police staff per 100,000 population.



FTE = full-time equivalent

Note: Estimated resident population as at 30 June each year.

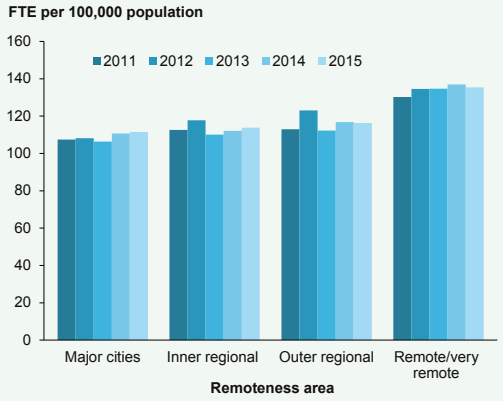
Sources: ABS 2016a; SCRGSP 2017.

- The rate of FTE operational police staff has been steady over the 7 years to 2015–16, at around 266 police per 100,000 population.
- The proportion of operational to total police staff has also been steady over the period, at about 90%.
- Around 75% of the population were generally satisfied with police services.

Indicator 51: Operational and total police staff per 100,000 population, 2009–10 to 2015–16

Other sectors: Access to primary care practitioners

Definition: The number of full-time equivalent general practitioners per 100,000 population.



Notes

1. FTE = full-time equivalent
2. The FTE number is based on total weekly hours worked. A standard working week is 40 hours.
3. Data cannot be compared with data presented in *Australia's welfare 2015* that were based on Medicare data which only take into account MBS-billable work.
4. From 2013 the survey directs Australian General Practice Training program trainees to select Specialist in training rather than General practitioner.

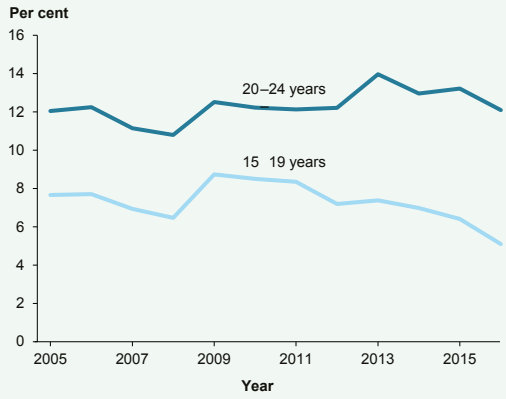
Source: National Health Workforce Data Set medical practitioners 2015.

- In 2015, the highest general practitioner (GP) FTE rate was in *Remote/Very remote* areas, with 136 FTE GPs per 100,000 population. The lowest FTE rate was in *Major cities*, at 112 FTE per 100,000 population.
- Although there were some fluctuations, GP FTE rates increased in all areas between 2011 and 2015.
- The National Health Workforce Data Set used here captures total hours worked, including hours not billed to Medicare. This is particularly relevant for rural and remote GPs who may do a broader scope of work than their urban counterparts, including work that would not normally be considered primary care.

Indicator 52: General practitioners per 100,000 population, 2011 to 2015

Other sectors: Young people not in education, employment or training

Definition: The proportion of young people (aged 15–24) not engaged in education, employment or training.



Source: AIHW analysis of ABS 2016d.

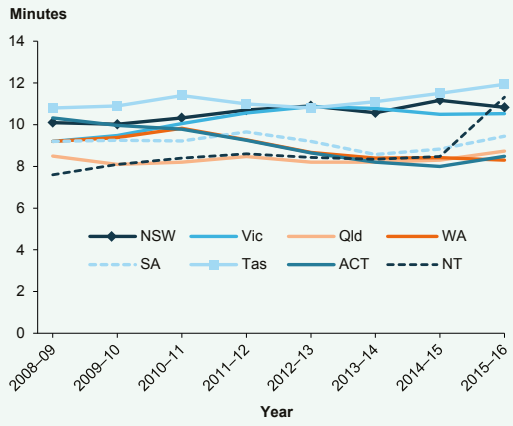
Indicator 53: Young people not in education, employment or training, by age group, May 2005 to May 2016

- After peaking at 8.7% in May 2009, the rate of people aged 15–19 who were not in education, employment or training fell to 5.1% in 2016.
- The rate for people aged 20–24 peaked in 2013 at 14% and then fell to 12% in 2016, equivalent to the rate in 2005.

More information: Chapter 3.1 'Pathways through education and training'.

Other sectors: Emergency services response time

Definition: [Proxy used] The time taken between the arrival of the first responding ambulance resource at the scene of an emergency in code 1 situations (emergency—immediate response under lights and sirens required), and the initial receipt of the call for an emergency ambulance at the communications centre, in urban centres.



Note: Data cannot be aggregated to a national total.

Source: SCRGSP 2017.

Indicator 54: Median ambulance response time to emergency incidents, capital cities, by jurisdiction, 2008–09 to 2015–16

- In 2015–16, ambulance services nationally made 1.85 million emergency responses, a rate of 77 per 1,000 population.
- The median ambulance response time for emergency (or code 1) incidents ranged from 8.3 minutes in Perth to 11.9 in Hobart.
- Response times varied across the states and territories, with the Australian Capital Territory and Western Australia showing decreases in response time since 2008–09. Trends should be interpreted with caution due to changes in reporting methods.

Context domain—indicator results

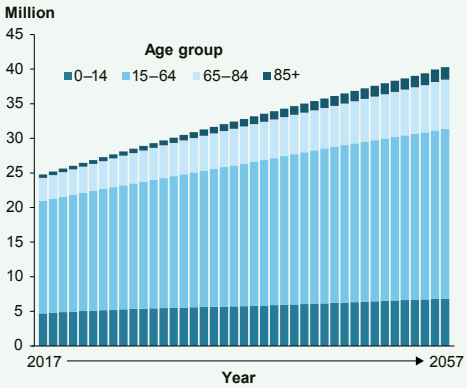
This domain provides broad contextual information that is expected would aid in the interpretation of other indicators, and overall performance. It covers major sociodemographic factors, such as population ageing and migration, and general economic conditions. See Box 9.2.6 for key findings from the context domain.

Box 9.2.6: Key results—context domain

- Australia's population is projected to grow from 24.8 million in 2017 to 40.1 million in 2057.
- The 85 and over age group is projected to grow from around 500,000 people in 2017 to 1.8 million in 2057. This age group is expected to grow at the fastest rate of all age groups.
- The total dependency ratio for Australia is expected to increase from 52 dependants per 100 working-aged people in 2017 to 64 per 100 in 2057.
- The proportion of home owners without mortgages has declined by 25% and the proportion of private renter households has increased by 7 percentage points over 1994–95 to 2013–14.
- Gross Domestic Product has risen since 2010 in line with other OECD countries.

Context: Population size and growth

Definition: The projected number of usual residents.



Note: Series B projections. Population projections make assumptions about future fertility and mortality patterns and net overseas migration. The ABS Series B projections make modest assumptions about each of these components.

Source: ABS 2013b.

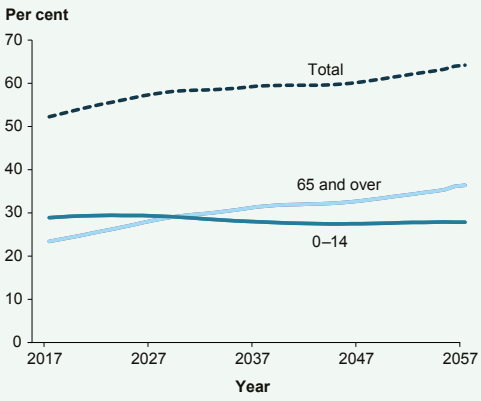
Indicator 55: Projected population, by age group, 2017 to 2057

- Australia's population is projected to grow from 24.8 million in 2017 to 40.1 million in 2057.
- The 85 and over age group is projected to grow at 3.2% per year, from around 500,000 people in 2017 to 1.8 million in 2057. It is the fastest growing age group, followed by people aged 65 to 84.
- The 0–14 age group has the slowest annual growth rate (0.9%) of all the age groups.

More information: Chapter 1.1 'Who we are'.

Context: Population ageing and dependency ratio

Definition: The number of people aged under 15 and the number of people aged 65 and over, divided by the number of people aged 15–64, expressed as a percentage.



Note: Series B projections.

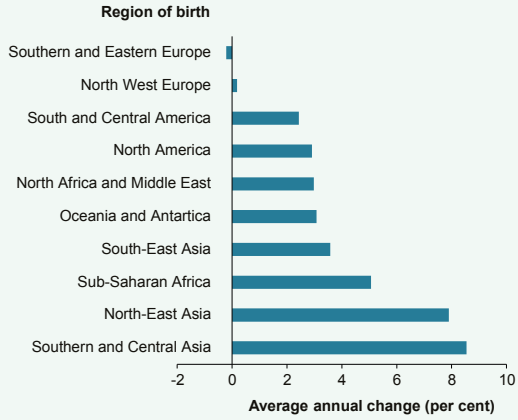
Source: ABS 2013b.

Indicator 56: Projected dependency ratio, by age group, 2017 to 2057

- The total dependency ratio for Australia is expected to increase from 52 dependants per 100 working-aged people in 2017 to 64 per 100 in 2057.
- This is mostly driven by the increase in the 65 and over dependency ratio, from 23% in 2017 to 36% in 2057. This is consistent with the rapid increase in the number of people at older ages compared with people aged under 65.
- Although the 0–14 dependency ratio is expected to drop slightly over this period, the smaller size of the child population and slower growth relative to the older age population means the effect is minimal on the total dependency ratio.

Context: Overseas born population

Definition: The change in the number of people usually resident in Australia who were born overseas.



Source: AIHW analysis of ABS 2017e.

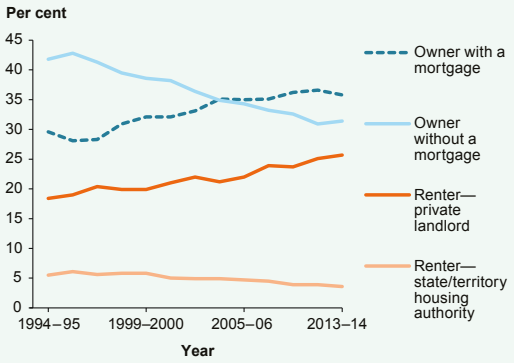
Indicator 57: Average annual change in estimated resident population, by region of birth, 1992 to 2016

- Over the period 1992 to 2016, the proportion of the total Australian population born overseas has increased from 23% to 29%.
- The number of Australian residents born in Southern and Central Asia has risen the most rapidly, from 112,000 in 1992 to 803,000 in 2016 (a rate of 8.5% per year). Immigrants from North-East Asia and Sub-Saharan Africa had the next highest growth rates for the period, at 7.9% and 5.1%, respectively.
- Compared with 1992, the number of residents in 2016 born in Southern and Eastern Europe has declined.

More information: Chapter 1.1 'Who we are'.

Context: Housing tenure

Definition: The proportion of total households by housing tenure.



Notes

1. Housing tenure refers to the nature of the legal right to occupy the dwelling in which the household members reside.
2. Excludes 'Renter—other landlord type' and 'Other tenure type', which were steady at around 1.5% and 2.5%, respectively.

Source: ABS 2015c.

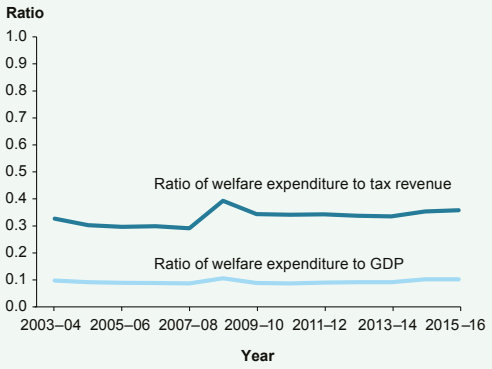
Indicator 58: Housing tenure, by selected tenure types, 1994–95 to 2013–14

- About two-thirds (67%) of all households were home owners in 2013–14 (36% with a mortgage; 31% without).
- Owners with a mortgage made up the majority of household tenures—after a 25% decrease, since 1994–95, of owners without mortgages.
- Private renter households increased by 7.3 percentage points between 1994–95 and 2013–14.

More information: Chapter 6.3 'The changing shape of housing in Australia'.

Context: Government welfare expenditure

Definition: The ratio of government welfare expenditure to tax revenue and to Gross Domestic Product (GDP).



Note: Estimates for states and territories have been modelled for 2011–12.

Source: AIHW welfare expenditure database.

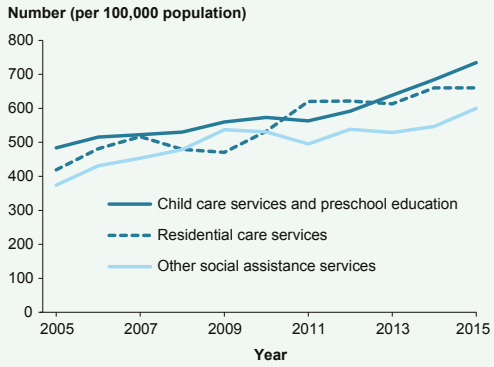
Indicator 59: Ratio of government welfare expenditure to tax revenue and GDP, 2003–04 to 2015–16

- Since 2008–09, the ratio of welfare expenditure to tax revenue and welfare expenditure to GDP have remained relatively stable (at around 0.34 and 0.09, respectively).
- The peak in both ratios in 2008–09 coincides with the GFC. The GFC had a negative impact on both tax revenues and GDP. The government's response included short-term increases in spending.

More information: Chapter 1.4 'Welfare expenditure'.

Context: Welfare workforce

Definition: The number of people employed in the welfare workforce per 100,000 population.



Source: AIHW analysis of ABS Labour Force Surveys 2005 to 2015.

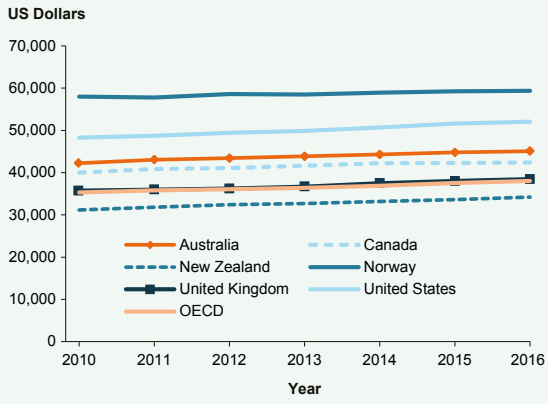
Indicator 60: Number of employed people in the welfare workforce per 100,000 population, by type of community service industry, 2005 to 2015

- The number of people in community service occupations employed in community service industries (the welfare workforce) generally rose between 2005 and 2015.
- The child care services and preschool education industry increased from 484 employed people per 100,000 population in 2005, to 734 per 100,000 in 2015.

More information: Chapter 1.5 'Welfare workforce'.

Context: Economic conditions

Definition: Gross Domestic Product (GDP) per capita (US Dollars (USD), constant prices, constant Purchasing Power Parities (PPPs)).



Note: Countries are compared on a constant price basis, with constant PPPs and using a common base year of 2010. See OECD 2017d for more information on PPPs.

Source: OECD 2017c.

Indicator 61: GDP per capita Australia, selected OECD countries and OECD total, 2010 to 2016

- Australia's GDP per capita in 2016 was USD 45,083. This was higher than New Zealand (USD 34,211) and the OECD average (USD 38,019) but lower than the USA (USD 52,066).
- Norway had the highest GDP per capita among selected OECD countries at USD 59,366 and New Zealand had the lowest at USD 34,211.
- GDP per capita in Australia rose from USD 42,239 to 45,083 over the period, an average annual increase of 1.1%.
- Average annual growth was highest in New Zealand (1.6%) and lowest in Norway (0.4%).

Glossary
Acronyms and abbreviations
Methods and conventions
Symbols

Glossary

Aboriginal or Torres Strait Islander: A person of Aboriginal and/or Torres Strait Islander descent who identifies as an Aboriginal and/or Torres Strait Islander. See also **Indigenous**.

absolute income poverty: A state of poverty where a person does not have enough income to cover the cost of a given basket of goods that provides an agreed minimal level of decency.

accommodation support: Services that provide accommodation to people with disability, and services that provide support to enable a person with disability to remain in their existing accommodation or to move to more suitable or appropriate accommodation.

administrative data collection: A data set that results from the information collected for the purposes of delivering a service or paying the provider of the service. This type of collection is usually complete (that is, all in-scope events are collected), but it may not be fully suitable for population-level analysis because the data are collected primarily for an administrative purpose.

adoption: The process by which a person legally becomes a child of the adoptive parent(s) and legally ceases to be a child of his/her existing parent(s). Intercountry adoptions are of children from countries other than Australia who are legally able to be placed for adoption, but who generally have had no previous contact or relationship with the adoptive parents.

age pension age: The age at which a person becomes eligible to receive the age pension (subject to income, asset and residency requirements). The age pension age has changed over time and depends on a person's date of birth. Between 1 July 2013 and 30 June 2017 the age pension age was 65 years. From 1 July 2017, the qualifying age increased to 65 years and six months, and will increase by 6 months every 2 years to reach 67 years by 1 July 2023.

The age pension age is also used to determine eligibility for other payments, such as the Disability Support Pension, for which recipients must be aged between 16 and the age pension age.

age structure: The relative number of people in each age group in a population.

aged care services: Regulated care delivered in either residential or community settings, including the person's own home. Most formal care is funded through government programs but may also be purchased privately.

age-specific rate: A rate for a specific age group. The numerator and denominator relate to the same age group.

age-standardisation: A method of removing the influence of age when comparing populations with different **age structures**. This is usually necessary because the rates of many diseases vary strongly (usually increasing) with age. The age structures of the different populations are converted to the same 'standard' structure, and then the disease rates that would have occurred with that structure are calculated and compared.

age-standardised rate: A rate for which the influence of age is removed by converting the age structures of the different populations to the same 'standard' structure. This provides a more valid way to compare rates from populations with different age structures.

apparent retention rate: The percentage of full-time students who remain in secondary education from the start of secondary school (Year 7 or 8, depending on the state or territory) to a specified year (usually Year 10 or Year 12).

apprentice: A person aged 15 to 64 who enters into a legal contract (training agreement or contract of training) with an employer, to serve a period of training to attain tradesperson status in a recognised trade.

attendance rate (school): The number of actual full-time equivalent student-days attended by full-time students in Years 1 to 10 as a percentage of the total number of possible student days attended over the period.

Australian Standard Geographical Classification (ASGC): Common framework defined by the Australian Bureau of Statistics for collecting and disseminating geographically classified statistics. The ASGC was implemented in 1984 and the final release was in 2011. It has been replaced by the **Australian Statistical Geography Standard** (ASGS).

Australian Statistical Geography Standard (ASGS): Common framework defined by the Australian Bureau of Statistics for collecting and disseminating geographically classified statistics. The ASGS replaced the **Australian Standard Geographical Classification** (ASGC) in July 2011.

average day: A measure that reflects the number of people within a service on a typical day during the year. It takes into account the number of people, the number of contacts and the duration of each contact.

Bachelor degree or higher: An undergraduate or post-graduate qualification at a university.

big data: There is no single, agreed definition, but the term is commonly used to describe the relatively recent global growth in the number of very large data sets, and the growing volume of unstructured data emerging from the increasing digital transfer of information.

Canadian National Occupancy Standard: A standard used to assess overcrowding in households, based on the number, sex, age, and relationships of household members.

capital expenditure: Expenditure incurred for goods and services with a life equal to or longer than a year. Compare with **recurrent expenditure**.

care and protection order: Legal order or arrangement that gives child protection departments some responsibility for a child's welfare. The level of responsibility varies with the type of order or arrangement. These orders include guardianship and **custody orders**, third-party parental responsibility orders, supervisory orders, interim and temporary orders, and other administrative arrangements.

casual worker: Employed person who generally works irregular hours, usually fewer than a full-time worker, and is not entitled to paid leave.

Centrelink: A program of the Department of Human Services. Centrelink delivers a range of government payments and services for retirees, the unemployed, families, carers, parents, people with disability, Indigenous Australians, and people from diverse cultural and linguistic backgrounds at times of major change.

children receiving child protection services: Children who are the subjects of an **investigation** of a notification; on a **care and protection order**; and/or in **out-of-home** care.

civilian population: All usual residents of Australia aged 15 and over, except members of the permanent Defence Force, certain diplomatic personnel of overseas governments customarily excluded from Census and estimated population counts, overseas residents in Australia, and members of non-Australian defence forces (and their dependants) stationed in Australia.

clients exiting custodial arrangements (specialist homelessness services): Specialist homelessness service clients are counted as leaving a custodial setting if, in their first support period during the reporting period, either in the week before or at presentation:

- their dwelling type was: adult correctional facility, youth or juvenile justice detention centre or immigration detention centre, or
- their reason for seeking assistance was: transition from custodial arrangements, or
- their source of formal referral to the agency was: youth or juvenile justice detention centre, or adult correctional facility.

Some of these clients were still in custody when they began receiving support.

Children aged under 10 identified as exiting from adult correction facilities or youth/juvenile justice detention centres have been excluded because of concerns about the quality of the data; children aged under 10 cannot be charged with a criminal offence in any jurisdiction in Australia.

clients with a current mental health issue (specialist homelessness services): A specialist homelessness service client was identified as having a current mental health issue if they provided any of the following information:

- at the start of a support period, they were receiving services or assistance for their mental health issues, or had in the past 12 months
- their formal referral source to the specialist homelessness agency was a mental health service
- 'mental health issues' was a reason for their seeking assistance
- their dwelling type either a week before presenting to an agency, or when presenting to an agency, was a psychiatric hospital or unit
- they had been in a psychiatric hospital or unit in the last 12 months
- at some stage during their support period, a need was identified for psychological services, psychiatric services or mental health services.

This analysis does not include clients aged under 10.

community access: Services designed to provide opportunities for people with disability to gain and use their abilities to enjoy their full potential for social independence.

community-based supervision: Supervision of a young person in the community by a juvenile justice agency while that person is waiting either for an initial court appearance for an alleged offence or for a court hearing or outcome, or completing an order after the finalisation of a court case. It includes supervised bail, probation, community service orders, suspended detention and parole.

community living: A living arrangement where the place of usual residence is a private or non-private dwelling, as distinct from **residential aged care**, a hospital or other type of institutional accommodation. Community settings include private dwellings (a person's own home or a home owned by a relative or friend) and certain types of non-private dwellings; for example, retirement village accommodation.

community support: Services that provide the support needed for a person with disability to live in a non-institutional setting.

constant prices: Estimates that indicate what expenditure would have been if prices for a given year had applied in all years (that is, removing the inflation effect). Changes in expenditure in constant prices reflect changes in volume only. An alternative term is 'real expenditure'. Compare with **current prices**.

core activity: Term used in discussions of disability, referring to the basic activities of daily living; namely, self-care, mobility and communication.

core activity limitation: A limitation where someone needs help with—or is having difficulty in using aids and equipment for—self-care, mobility and/or communication. See also **disability**, **severe or profound core activity limitation** and **mild or moderate core activity limitation**.

couch surfer: A person who is homeless and who typically moves from household to household intermittently, who is not regarded as being part of those households, and who does not have any form of leased tenure over any accommodation.

couple family: A **family** comprising two people in a registered or de facto marriage and who are usually living in the same household. A couple family may be with or without children, and may or may not include other related individuals.

current prices: Expenditures reported for a particular year, unadjusted for inflation. Changes in current price expenditures reflect changes in both price and volume.

custody orders: Orders that place children in the custody of the state or territory department responsible for child protection, or a non-government agency. These orders usually involve the child protection department being responsible for the daily care and requirements of the child, while the parent retains legal guardianship. Custody alone does not bestow any responsibility regarding the long-term welfare of the child.

data linkage: The bringing together (linking) of information from two or more different data sources that are believed to relate to the same entity; for example, the same individual or the same institution. This linkage can provide more information about the entity and, in certain cases, provide a time sequence, helping to 'tell a story', show 'pathways' and perhaps unravel cause and effect. The term is used synonymously with 'record linkage' and 'data integration'.

dementia: A general term for disorders characterised by worsening mental processes (such as Alzheimer disease or vascular dementia). Symptoms include impaired memory, understanding, reasoning and physical functioning.

dependency ratio: The number of people likely to be 'dependent' on others due to not being in the labour force, compared with the number in the **labour force** and therefore potentially able to provide support.

dependent child: A person who is either a child aged under 15, or a **dependent student**. Note, this definition applies to the Australian Bureau of Statistics Census of Population and Housing and may differ somewhat the definitions in other collections. See also **non-dependent child**.

dependent student: A natural, adopted, step or foster child who is aged 15 to 24 and who attends a secondary or tertiary educational institution as a full-time student and for whom there is no identified partner or child of his/her own usually resident in the same household. Note, this definition applies to the Australian Bureau of Statistics Census of Population and Housing and may differ somewhat from the definitions in other collections. See also **dependent child**.

detention: Supervision of a young person in a remand or detention centre by a juvenile justice agency while he/she is waiting for either an initial court appearance for an alleged offence or for a court hearing or outcome, or completing an order after the finalisation of a court case. It includes remand and sentenced detention.

disability: An umbrella term for any or all of: an impairment of body structure or function, a limitation in activities, or a restriction in participation. Disability is a multidimensional concept, and is considered as an interaction between health conditions and personal and environmental factors. See also **core activity limitation** and **severe or profound core activity limitation**.

disability-free life expectancy: An indication of how long a person can expect to live without disability. See also **life expectancy**.

Disability Support Pension (DSP): A pension that provides financial support for people aged between 16 and **age pension age**, with a physical, intellectual or psychiatric condition, who:

- are unable to work for at least 15 hours per week at or above the relevant minimum wage, or
- be re-skilled for such work, for more than 2 years because of their disability, and have participated in a program to help prepare for, find or maintain work, or
- are permanently blind.

domestic violence: A set of violent behaviours between current or former intimate partners, where one partner aims to exert power and control over the other through fear. Domestic violence can include **physical violence**, **sexual violence**, **emotional abuse** and **psychological abuse**.

dwelling: A structure or a discrete space within a structure intended for people to live in, or where a person or group of people live. Thus, a structure that people live in is a dwelling regardless of its intended purpose, but a vacant structure is only a dwelling if intended for human residence. A dwelling may include one or more rooms used as an office or workshop, provided the dwelling is in residential use.

early childhood education and care worker: A category of workers that includes child carers, child care centre managers and early childhood (pre-primary school) teachers.

early intervention: In the childhood development sector, this describes programs used to improve health and developmental outcomes among children aged 0 to 6 who have, or are at risk of, developmental delay or disability. Programs may include physiotherapy, speech therapy, occupational therapy and special education. The term 'early childhood intervention' is sometimes used to distinguish these from other forms of early intervention.

elder abuse: A single or repeated act, or lack of appropriate action, occurring within any relationship where there is an expectation of trust, which causes harm or distress to an older person.

emotional abuse (children): Any act by a person having the care of a child that results in the child suffering any kind of significant emotional deprivation or trauma. Children affected by exposure to family violence would also be included in this category.

emotional abuse from a partner: Abuse between current or former cohabiting partners that occurs when a person is subjected to behaviours or actions (often repeatedly) aimed at preventing or controlling their behaviour, with the intent to cause them emotional harm or fear through manipulation, isolation or intimidation.

employed: Describes people aged 15 and over who, during the reference week of the Australian Bureau of Statistics Labour Force Survey, worked for 1 hour or more for pay, profit, commission or payment in kind in a job or business, or on a farm, or worked for 1 hour or more without pay in a family business or on a farm (that is, contributing family workers). This includes employees who had a job but were not at work and were away from work for less than 4 weeks up to the end of the reference week, or away from work for more than 4 weeks up to the end of the reference week and received pay for some or all those 4 weeks. It also includes those who were away from work as a standard work or shift arrangement, on strike or locked out, on workers' compensation and expected to return to their job, or were employers or own account workers, who had a job, business or farm, but were not at work. Note, this definition applies to the Australian Bureau of Statistics Labour Force Survey and may differ somewhat from the definitions in other collections. Compare with **unemployed**. See also **labour force**.

employment restriction: A restriction determined for persons aged 15 to 64 with one or more disabilities if, because of their disability, they: were permanently unable to work; were restricted in the type of work they can or could do; needed or would need at least 1 day a week off work on average; were restricted in the number of hours they can or could work; required or would require an employer to provide special equipment, modify the work environment or make special arrangements; required assistance from a disability job placement program or agency; needed or would need to be given ongoing assistance or supervision; or would find it difficult to change jobs or get a better job. Note, this definition applies to the Australian Bureau of Statistics Survey of Disability, Ageing and Carers and may differ somewhat from other collections' definitions. See also **schooling restriction**.

employment to population ratio: The number of employed people in a specified group expressed as a percentage of the **civilian population** in the same group.

enrolled: Describes a person's status who is registered for a course of study at an educational institution.

episode of care: The period during which a child remains in **out-of-home care**. During this period, a child may have one or more different out-of-home care placements, including placements lasting fewer than 7 days. If a child has a return home or a break of less than 60 days before returning to the same or different placement, he or she is considered to be continuously in care during this period.

equivalised household income (disposable or gross): An indicator of the economic resources available to a standardised household. For a lone-person household, it is equal to income received. For a household comprising more than one person, equivalised income is an indicator of the household income that a lone-person household would require to enjoy the same level of economic wellbeing as the household in question. Equivalised *disposable* household income is based on income after essential costs are deducted, as opposed to *gross* (that is, total) income, or *net* (that is, after-tax) income.

estimated resident population (ERP): The official Australian Bureau of Statistics estimate of the Australian population. The ERP is derived from the 5-yearly Census counts, and is updated quarterly between Censuses, based on births, deaths and net migration. It is based on the usual residence of the person. Rates are calculated per 1,000 or 100,000 mid-year (30 June) ERP.

family: Two or more persons, one of whom is aged at least 15, who are related by blood, marriage (registered or de facto), adoption, step or fostering, and who are usually living in the same household. Each separately identified couple relationship, lone parent to child relationship or other blood relationship forms the basis of a family. Some households contain more than one family.

family day care: Comprises services provided in the carer's home. The care is largely aimed at children aged 0 to 5, but primary school children may also receive care before and after school, and during school vacations. Central coordination units in all states and territories organise and support a network of carers, often with the help of local governments.

family group home: A home for children provided by a department or community-sector agency that has live-in, non-salaried carers who are reimbursed and/or subsidised for providing care.

family violence: Includes violence between family members as well as current or former intimate partners. For example, family violence can include acts of violence between a parent and a child. Family violence is the preferred term used to identify experiences of violence for Indigenous people as it encompasses the broad range of extended family and kinship relationships in which violence may occur.

finalised guardianship orders: Orders involving the transfer of legal guardianship to the relevant state or territory department or non-government agency responsible for child protection. These orders involve considerable intervention in the child's life and that of their family, and are sought only as a last resort. Guardianship orders convey responsibility for the welfare of the child to the guardian (for example, regarding the child's education, health, religion, accommodation and financial matters). They do not necessarily grant the right to the daily care and control of the child, or the right to make decisions about the daily care and control of the child, which are granted under **custody orders**.

formal aged care: Regulated care delivered in either residential or community settings, including the person's own home. Most formal care is funded through government programs, but may also be purchased privately.

formal child care: Regulated care away from the child's home. The main types of formal care are before and/or after school care, **long day care**, **family day care** and occasional care.

foster care: A form of **out-of-home care** where the caregiver is authorised and reimbursed (or was offered but declined reimbursement) by the state/territory for the care of the child. (This category excludes relatives/kin who are reimbursed.) There are varying degrees of reimbursement made to foster carers.

full-time employees: Permanent, temporary and casual employees who normally work the agreed or award hours for a full-time employee in their occupation and received pay for any part of the reference period. If agreed or award hours do not apply, employees are regarded as full time if they ordinarily work 35 hours or more a week. Note this definition applies to the Australian Bureau of Statistics Survey of Employee Earnings and Hours and may differ somewhat from the definitions in other collections.

full-time workers: Employed people who usually worked 35 hours or more a week (in all jobs) and those who, although usually working fewer than 35 hours a week, worked 35 hours or more during the reference week of the ABS Labour Force Survey. Note, this definition applies to the Australian Bureau of Statistics Labour Force Survey and may differ somewhat from the definitions in other collections. Compare with **part-time workers**.

greatest need (pertaining to housing): Households that, at the time of allocation, are either homeless or at risk of homelessness, in housing inappropriate to their needs, in housing placing them at risk or in housing with very high rental costs.

gross domestic product: A statistic commonly used to indicate national income. It is the total market value of goods and services produced within a given period after deducting the cost of goods and services used up in the process of production, but before deducting allowances for the consumption of fixed capital.

home-based out-of-home care: Care provided for a child who is placed in the home of a carer, who is reimbursed (or who has been offered but declined reimbursement) for the cost of care of that child. Home-based out-of-home care includes care provided by relatives/kin who are reimbursed, foster care, third-party parental care and other home-based out-of-home care.

homeless: As defined by the Australian Bureau of Statistics, people who do not have suitable accommodation alternatives and their current living arrangement:

- is in a **dwelling** that is inadequate (is unfit for human habitation and lacks basic facilities such as kitchen and bathroom facilities)
- has no tenure, or if their initial tenure is short and not extendable
- does not allow them to have control of, and access to, space for social relations (including personal or household living space, ability to maintain privacy and exclusive access to kitchen and bathroom facilities).

hospitalisation: Synonymous with admission and separation; that is, an episode of hospital care that starts with the formal admission process and ends with the formal separation process. An episode of care can be completed by patients being discharged, transferred to another hospital or care facility, or dying, or by a portion of a hospital stay beginning or ending in a change of type of care (for example, from acute to rehabilitation).

household: A group of two or more related or unrelated people who usually reside in the same dwelling, and who make common provision for food or other essentials for living. Can also be a single person living in a dwelling who makes provision for his or her own food and other essentials for living, without combining with any other person.

household composition: The grouping of people living in a **dwelling**. Household composition is based on couple and parent–child relationships. A household is a *single-family* type if it contains a main tenant, and if that main tenant lives with a partner and/or the main tenant's children. *Group households* consist of two or more tenants aged 16 or over, who are not in a couple or parent–child relationship. *Mixed households* are households not described by the other two types; for example, multiple single-family households.

housing affordability: The cost of housing compared with the financial situation of households. This term is generally used to refer to housing across major cities, states or nationally, as opposed to individual households. Housing affordability is often measured using the proportion of households in a given area in **housing stress**.

housing stress: A measure of **housing affordability**, where the proportion of household income spent on basic housing costs (that is, rent or mortgage) is calculated. Low-income households spending 30% or more of their income on housing are considered to be in housing stress.

impairment: Any loss or abnormality of psychological, physiological or anatomical structure or function.

improvised dwelling: A **dwelling** that was not designed for human habitation or is considered unfit for human habitation. This may include shacks, sheds, cabins, boats or tents.

income support payments: A range of pensions and benefits paid by Australian Government to support people who have little or no private income, or to help with particular costs such as those associated with raising children or caring for a person with severe disability or illness. This comprises a range of income support payments and supplementary payments.

income unit: An income unit may consist of:

- a single person with no dependent children
- a sole parent with one or more dependent children
- a couple (married, registered or defacto) with no dependent children
- a couple (married, registered or defacto) with one or more dependent children.

A non-dependent child living at home, including one who is receiving an income support payment in his or her own right, is regarded as a separate income unit. Similarly, a group of non-related adults sharing accommodation are counted as separate income units.

Index of Relative Socio-Economic Disadvantage: One of the set of **Socio-Economic Indexes for Areas** for ranking the average socioeconomic conditions of the population in an area. It summarises attributes of the population such as low income, low educational attainment, high unemployment and jobs in relatively unskilled occupations.

Indigenous: A person of Aboriginal and/or Torres Strait Islander descent who identifies as an Aboriginal and/or Torres Strait Islander. See also **Aboriginal or Torres Strait Islander**.

Indigenous household: A household that contains one or more **Indigenous** people.

Indigenous status: Whether a person identifies as being of **Aboriginal or Torres Strait Islander** origin.

informal carer: A person of any age who provides any informal assistance, in terms of help or supervision, to people with disability or long-term conditions, to children, or to people aged 65 and over. This assistance must be ongoing, or likely to be ongoing, for at least 6 months. See also **primary carer**.

informal child care: Non-regulated care, arranged by a child's parent or guardian, either in the child's home or elsewhere. It comprises care by (step) brothers or sisters, care by grandparents, care by other relatives (including a parent living elsewhere) and care by other (unrelated) people, such as friends, neighbours, nannies or babysitters. In the context of the ABS Childhood Education and Care Survey, it may be paid or unpaid.

International Classification of Functioning, Disability and Health: The World Health Organization's internationally accepted classification of functioning, disability and health. The classification was endorsed by the World Health Organization in May 2001.

investigation: The process whereby the relevant child protection department obtains more detailed information about a child who is the subject of a **notification** received. Departmental staff assess the harm or degree of harm to the child and their protective needs. An investigation includes sighting or interviewing the child where it is practical to do so.

labour force: People who were **employed** or **unemployed** (not employed but actively looking for work) during the reference week of the ABS Labour Force Survey. Note, this definition applies to the ABS Labour Force Survey and may differ somewhat from the definitions in other collections. See also **not in the labour force**.

labour force participation rate: For any group, the **labour force** expressed as a percentage of the civilian population aged 15 and over in the same group.

lateral violence: Violence that is directed at one's peers or community members. It may include bullying behaviours such as gossip, intimidation, shaming, backstabbing and attempts to cause social isolation, as well as physical violence. It is a learned behaviour where an oppressed or powerless person or group directs their anger at those around them, instead of at their oppressors. It is believed to occur worldwide in minorities, and particularly Aboriginal peoples.

life expectancy: An indication of how long a person can expect to live, depending on the age they have already reached. Technically it is the average number of years of life remaining to a person at a particular age if age-specific death rates do not change. The most commonly used measure is life expectancy at birth.

lone parent: A person who has no spouse or partner usually living in the household but who forms a parent-child relationship with at least one child usually resident in the household.

long day care: Comprises services aimed primarily at children aged 0 to 5, which are provided in a centre usually by a mix of qualified and other staff. Educational, care and recreational programs are provided based on the developmental needs, interests and experience of each child. In some jurisdictions, primary school children may also receive care before and after school, and during school vacations. Centres typically operate for at least 8 hours per day on normal working days.

long-term unemployed: People aged 15 and over who have been **unemployed** for 52 weeks or more.

long-term unemployment ratio: The number of **long-term unemployed** people, expressed as a percentage of the total unemployed population.

Longitudinal data: A data source that collects data from the same sample of subjects multiple times over a given time.

main tenant: The tenant who is party to the residential tenancy agreement. Where this is not clear, it is the person who is responsible for rental payments.

median: The midpoint of a list of observations that have been ranked from smallest to largest.

median age: For a given measure, the age at which half the population is older and half is younger.

mild or moderate core activity limitation: A person who needs no help but has difficulty with core activities (moderate) or has no difficulty (mild) with core activities, but uses aids or equipment, or has one or more of the following limitations:

- cannot easily walk 200 metres
- cannot walk up and down stairs without a handrail
- cannot easily bend to pick up an object from the floor
- cannot use public transport
- can use public transport but needs help or supervision
- needs no help or supervision but has difficulty using public transport.

See also **disability**, **core activity limitation**, and **severe or profound core activity limitation**.

mortality rate: The number of deaths in a given period, adjusted to take account of population age structure, expressed per 1,000 population.

neglect: Any serious acts or omissions by a person having the care of a child that, within the bounds of cultural tradition, constitute a failure to provide conditions essential for the healthy physical and emotional development of a child.

net overseas migration: The number of incoming international travellers minus the number of outgoing international travellers, where the movement to or from Australia is for 12 months or more.

non-dependent child: A natural, adopted, step or foster child of a couple or lone parent usually resident in the household, who is aged 15 or over and is not a full-time student aged 15 to 24, and who has no identified partner or child of his/her own usually resident in the household. Note, this definition applies to the Australian Bureau of Statistics Census of Population and Housing and may differ somewhat from definitions in other collections. See also **dependent child**.

non-Indigenous: People who have indicated that they are not of **Aboriginal or Torres Strait Islander** descent.

non-school qualification: Educational attainments other than those of pre-primary, primary and secondary education. They include qualifications at the following levels: Post-graduate degree, Graduate Diploma and Graduate Certificate, Bachelor degree, Advanced Diploma and Diploma, and Certificates I, II, III and IV. Non-school qualifications may be attained concurrently with school qualifications. See **post-school qualification**.

Notification (child protection): Contact made to an authorised department by people or other bodies alleging child abuse or neglect, child maltreatment or harm to a child.

not in the labour force: People who are not **employed** and not **unemployed**. See also **labour force**.

occasional care: A type of formal care (see **formal child care**) provided mainly for children who have not started school. These services cater mainly for the needs of families who require short-term care for their children. Compare with **out-of-school hours care**.

older household: A **household** with a **reference person** aged 65 and over.

older person: For the purposes of this report (unless noted otherwise), a person aged 65 or over.

one-parent family: A family consisting of a lone parent with at least one **dependent** or **non-dependent child** (regardless of age) who is also usually living in the **household**. Examples of one-parent families include a parent aged 25 with dependent children, and a parent aged 80 living with a child aged 50.

Organisation for Economic Co-operation and Development (OECD): An organisation of 35 countries (including Australia) that are mostly developed but some are emerging (such as Mexico, Chile and Turkey); the organisation's aim is to promote policies that will improve the economic and social wellbeing of people around the world.

other family: A family of other related individuals living in the same household. These individuals do not form a couple or parent-child relationship with any other person in the household and are not attached to a couple or a one-parent family in the household.

out-of-home care: Overnight care for children aged 0–17, where the state makes a financial payment or where a financial payment has been offered but has been declined by the carer. See also **residential care**, **family group homes**, **foster care**, **relative/kinship care**, independent living, other out-of-home care.

out-of-school-hours care: Services provided for school-aged children (that is, aged 5 to 12) outside school hours during term and vacations. Care may be provided on student-free days and when school finishes early. Compare with **occasional care**.

outside-school-hours care: See **out-of-school-hours care**.

overcrowding: Describes a situation in a dwelling where one or more additional bedrooms are required to adequately house its inhabitants, according to the **Canadian National Occupancy Standard**. Compare with **underutilisation (housing)**.

over-representation: The likelihood of occurrence for one population compared with another population. This may be expressed as a rate ratio and may be calculated as: population A rate divided by population B rate. See also **rate ratio**.

owner (of dwelling): A household in which at least one member owns the dwelling in which the household members usually live. Owners are divided into two categories:

- owner without a mortgage—if there is no mortgage or loan secured against the dwelling
- owner with a mortgage—if there is any outstanding mortgage or loan secured against the dwelling.

participation: The **International Classification of Functioning, Disability and Health** defines participation in terms of involvement in life situations, from basic learning and applying knowledge, through general tasks and demands, to domestic life, relationships, education and employment, and community life.

participation rate: See **labour force participation rate**.

partner violence: A set of violent behaviours a respondent experienced from a person they currently live with, or lived with at some point; does not include violence by a boyfriend/girlfriend or date.

part-time worker: Employed person who usually worked fewer than 35 hours a week (in all jobs) and either did so during the reference week of the ABS Labour Force Survey, or was not at work in the reference week. Note this definition applies to the ABS Labour Force Survey and may differ somewhat from definitions in other collections. Compare with **full-time workers**. See also **employed**.

Persistent disadvantage: In this report, a measure derived using the Social Exclusion Monitor (SEM). The SEM is a composite measure that considers the seven domains of material resources, employment, education and skills, health and disability, social support, community participation, and personal safety perceptions. Disadvantage (social exclusion) is scored from 0 to 7, with scores of 2 or more defined as *deep exclusion* and of 3 or more defined as *very deep exclusion*.

physical abuse: Any non-accidental physical act inflicted upon a child by a person having the care of a child.

post-school qualification: See **non-school qualification**.

preschool: Services licensed and/or funded by state or territory governments to deliver preschool services at a particular location. Preschool comprises a structured educational program provided by a qualified teacher in a variety of settings, usually aimed at children in the year before they start formal schooling.

primary carer: A person who provides most of the informal assistance, in terms of help or supervision, to a person with one or more disabilities or aged 65 and over in one or more of the core activities (communication, mobility and self-care). The 2015 Survey of Disability, Ageing and Carers included as carers people aged 15 and over who identified themselves as carers or were nominated by a care recipient as a carer. See also **informal carer**.

projection (population): Is not a forecast but instead illustrates changes that would occur if the stated assumptions were to apply over the period in question.

psychological abuse: Behaviours including limiting access to finances, exclusion from contacting family and friends, demeaning and humiliation, and any threats of injury or death directed at the victim or their children.

quintile: A group derived by ranking a population according to specified criteria (for example, income) and dividing it into five equal parts. The term can also mean the cut-points that make these divisions—that is, the 20th, 40th, 60th and 80th percentiles—but the first use is the more common one. Commonly used to describe socioeconomic groups based on **socioeconomic position**. Also used to describe income groups.

rate: One number (the numerator) divided by another number (the denominator). The numerator is commonly the number of events in a specified time. The denominator is the population 'at risk' of the event. Rates (crude, age-specific and age-standardised) are generally multiplied by a number such as 100,000 to create whole numbers.

rate ratio: A rate ratio shows the relative difference between two rates and may be calculated as: the rate for population A divided by the rate for population B. Rate ratios are commonly used to compare rates between:

(i) two points in time for the same population, or

(ii) between different populations at the same point in time.

A rate ratio of 1 indicates no difference between the rates. A rate ratio less than 1 indicates that rates have decreased over time (use i), or that the rate for population A is lower than that for population B (use ii). A rate more than 1 indicates an increase over time or that the rate for population A is higher than that for population B.

recurrent expenditure: Expenditure incurred for goods and services with a life of less than 1 year. Compare with **capital expenditure**.

reference person: The reference person for each **household** is chosen by applying, to all household members aged 15 and over, the selection criteria below, in the order listed, until a single appropriate reference person is identified:

- one of the partners in a registered or de facto marriage, with **dependent children**
- one of the partners in a registered or de facto marriage, without dependent children
- a lone parent with dependent children
- the person with the highest income
- the eldest person.

This definition applies to the ABS Survey of Income and Housing and may differ somewhat from definitions in other collections.

Relative income poverty: The proportion of households with an equivalised income that is less than 50% of the national median equivalised household income. (Note that there is more than one measure for relative income poverty, and therefore this definition may differ somewhat from definitions in other reports).

relative kinship care: A form of out-of-home care where the caregiver is a relative (other than parents), considered to be family or a close friend, a member of the child or young person's community (in accordance with their culture), or who is reimbursed by the state/territory for the care of the child (or who has been offered but declined reimbursement). For Aboriginal and Torres Strait Islander children, a kinship carer may be another Indigenous person who is a member of their community, a compatible community or from the same language group. See also **out-of-home care**.

remoteness classification: A classification that divides each state and territory into several regions based on their relative accessibility to goods and services (such as general practitioners, hospitals and specialist care) as measured by road distance. These regions are based on the **Accessibility/Remoteness Index of Australia (ARIA)** and defined as Remoteness Areas by either the **Australian Standard Geographical Classification (ASGC)** (before 2011) or the **Australian Statistical Geographical Standard (ASGS)** (from 2011 onwards) in each Census year.

residential aged care: Care provided to a person in an Australian Government-approved aged care home, including accommodation (bedding and other furnishings, meals, laundry, social activities), personal care (bathing/showering, toileting, dressing, eating, moving about), and nursing and allied health services if required. Residential aged care can be provided on a permanent basis, or a short-term basis for respite or emergency support. Before July 2014, care was provided at a 'high' or 'low' level, relative to the resident's care needs; however, since July 2014, there is no distinction among permanent residents as needing high or low care.

residential care (aged care and younger people with disability): See **residential aged care**.

residential care (out-of-home care): A type of out-of-home care where the placement is in a residential building whose purpose is to provide placements for children and where there are paid staff.

respite services: Services that support community living by people receiving assistance from informal carers. Direct respite is respite care where the primary purpose is to meet carer needs by providing them with a break from their caring role; this may be delivered in the person's home, in a day centre or community-based overnight respite unit, and in residential aged care homes. Indirect respite is the 'respite effect' achieved by relieving the carer of other tasks of daily living, which may or may not be directly related to their caring responsibility.

restriction: A person has a restriction if he/she has difficulty participating in life situations, needs assistance from another person or uses an aid.

retirement: People are considered to have retired when they have previously worked for 2 weeks or more; have retired from work, or from looking for work; and are not intending to look for, or take up, work in the future.

schooling restriction: A restriction determined for people aged 5 to 20 who have one or more disabilities if, because of their disability, they were unable to attend school, a special school or special classes at an ordinary school; needed at least one day a week off school on average; or had difficulty at school. Note, this definition applies to the ABS Survey of Disability, Ageing and Carers and may differ somewhat from definitions in other collections. See also **employment restriction**.

severe or profound core activity limitation: A person who needs help or supervision *always* (profound) or *sometimes* (severe) to perform activities that most people undertake at least daily—that is, the core activities of self-care, mobility and/or communication. See also **core activity limitation** and **disability**.

severely crowded dwelling: A dwelling that requires four or more extra bedrooms to accommodate the usual residents of that dwelling, according to the **Canadian National Occupancy Standard**. Note, this definition applies to the ABS Census and may differ somewhat from definitions in other collections.

sexual abuse: Any act by a person, having the care of a child that exposes the child to, or involves the child in, sexual processes beyond his or her understanding or contrary to accepted community standards.

sexual violence: Behaviours of a sexual nature carried out against a person's will using physical force or coercion (or any threat or attempt to do so). Sexual violence can be perpetrated by partners in a domestic relationship, former partners, other people known to the victims, or strangers.

sleeping rough: The state of sleeping with no shelter on the street, in a park or in the open, or in a motor vehicle. See also **homeless**.

social exclusion: The opposite of **social inclusion**.

social housing: Rental housing that is funded or partly funded by government and is owned or managed by the government or a community organisation and let to eligible persons. This includes public rental housing, state owned and managed Indigenous housing (SOMIH), mainstream and Indigenous community housing and the Crisis Accommodation Program.

social housing programs: Social housing is rental housing funded, or partly funded by government, that is owned or managed by the government or a community organisation. There are four main social housing programs in Australia:

- public rental housing
- state owned or managed Indigenous housing (SOMIH)
- mainstream community housing
- Indigenous community housing.

social impact bonds: An approach for financing social service programs. They are offered to investors, who provide capital to fund specific projects—which are expected to result in improved social outcomes and public sector savings—in return for a future financial return paid on delivery of those specific social outcomes. They are also known as 'social benefit bonds'.

social inclusion: According to the former Social Inclusion Board, an inclusive society is one in which all members have the resources, opportunities and capability to learn, work, engage with and have a voice in the community. See also **social exclusion**.

social investment: An investment activity that has an expected social outcome (or improvement) and a financial return (or savings). More generally, it is spending on programs up front to provide better long-term outcomes for a given population.

socioeconomic position: An indication of how 'well off' a person or group is. In this report, socioeconomic groups are mostly reported using the **Socio-Economic Indexes for Areas**, typically for five groups (quintiles), from the most disadvantaged (worst off or lowest socioeconomic group) to the least disadvantaged (best off or highest socioeconomic group).

Socio-Economic Indexes for Areas (SEIFA): A set of indexes, created from Census data, that aim to represent the **socioeconomic position** of Australian communities and identify areas of advantage and disadvantage. The index value reflects the overall or average level of disadvantage of the population of an area; it does not show how individuals living in the same area differ from each other in their socioeconomic group. This report generally uses the **Index of Relative Socio-Economic Disadvantage**.

specialist disability services: Services provided under the National Disability Agreement for people with intellectual, psychiatric, sensory, physical or neurological impairments that manifest before 65 years of age, and which result in a need for assistance with one or more core activities of life. Services currently include accommodation support, community support, community access, respite and employment.

specialist homelessness service: Assistance provided specifically to people who are experiencing homelessness or who are at risk of homelessness.

substantiations (child protection): Substantiations of notifications received during the current reporting year are child protection notifications made to relevant authorities between 1 July and 30 June, which were investigated and the investigation was finalised by 31 August of the reporting period, and where it was concluded that there was reasonable cause to believe that the child had been, was being, or was likely to be, abused, neglected or otherwise harmed. Substantiation does not necessarily require sufficient evidence for a successful prosecution and does not imply that treatment or case management was provided. Substantiations may also include cases where there is no suitable caregiver, such as when children have been abandoned or their parents are deceased.

superannuation: Money set aside over a person's lifetime to provide for their retirement. It can be accessed when a person reaches eligible age (between 55 and 60, depending on year of birth) and retires, or when they turn 65. Access can be through pension payments or a lump sum.

Survey data collection: A data set that results from sampling individual units from the population. No sample will ever be fully representative of the population, but if carefully designed and implemented, samples will be highly representative for drawing conclusions about characteristics of the whole population.

tertiary education: Tertiary education in Australia can be broadly categorised as either 'higher education' or vocational education and training (VET). Higher education is generally delivered in a university setting, leading to a Bachelor, Master or Doctoral degree. VET focuses on delivering skills and knowledge for a specific industry, leading to Certificate and Diploma qualifications. It is delivered by Registered Training Organisations such as Technical and Further Education institutions.

traditional working age: In this report, refers to the ages of 15 to 64.

underemployed: Employed persons aged 15 and over who want, and are available for, more hours of work than they currently have. They comprise people employed part time who want to work more hours and are available to start work with more hours, either in the reference week or in the 4 weeks after the survey; and persons employed full time who worked part-time hours in the reference week for economic reasons (such as being stood down or insufficient work being available). Note, this definition applies to the ABS Labour Force Survey and may differ somewhat from definitions in other collections.

underemployment rate: The number of underemployed workers expressed as a percentage of the labour force.

underutilisation (housing): Occurs where a dwelling contains one or more bedrooms surplus to the needs of the **household** occupying it, according to the **Canadian National Occupancy Standard**. Compare with **overcrowding**.

unemployed: Describes people aged 15 and over who were not employed during the reference week of the ABS Labour Force Survey, and had actively looked for full- or part- time work at any time in the previous 4 weeks, or were waiting to start a new job within 4 weeks of the end of the reference period. Note, this definition applies to the ABS Labour Force Survey and may differ somewhat from definitions in other collections. Compare with **employed**.

unemployment rate: The number of **unemployed** people, expressed as a percentage of the **labour force**.

usual resident: Refers to all people, regardless of nationality, citizenship or legal status, who usually live in Australia, except foreign diplomatic personnel and their families. It includes usual residents who are overseas for less than 12 months over a 16-month period. It excludes overseas visitors who are in Australia for less than 12 months over a 16-month period.

victimisation rate (crime): The total number of people/households who experienced a crime type, expressed as a percentage of all people/households. This is a measure of how prevalent a crime type is in a given population.

volunteer: Someone who, in the previous 12 months, willingly gave unpaid help, in the form of time, service or skills, through an organisation or group.

volunteer rate: The number of volunteers as a percentage of the relevant population.

working-time mismatch: When the number of hours a week an employed person works does not align with their preferences for working hours.

Methods and conventions

Age-standardisation

This is a method of removing the influence of age when comparing populations with different age structures—either different populations at 1 time or the same population at different times. For this report, the Australian estimated resident population as at 30 June 2001 has been used as the standard population. The same population was used for males and females to allow valid comparison of age-standardised rates between the sexes (see Table A1).

Two different methods of age-standardisation can be used: direct and indirect. Direct age-standardisation has been used in this report.

Direct age-standardisation

This is the most common method of age-standardisation, and is used in this report for prevalence, hospitalisations and most deaths data. This method is generally used when the populations under study are large and the age-specific rates are reliable. The calculation of direct age-standardised rates has 3 steps:

Step 1: Calculate the age-specific rate for each age group.

Step 2: Calculate the expected number of cases in each age group by multiplying the age-specific rate by the corresponding standard population for each age group.

Step 3: Sum the expected number of cases in each age group and divide this sum by the total of the standard population to give the age-standardised rate.

Table A1: Age composition of the Australian population at 30 June 2001

Age group (years)	Australia, 30 June 2001
0	253,031
1–4	1,029,326
5–9	1,351,664
10–14	1,353,177
15–19	1,352,745
20–24	1,302,412
25–29	1,407,081
30–34	1,466,615
35–39	1,492,204
40–44	1,479,257
45–49	1,358,594
50–54	1,300,777
55–59	1,008,799
60–64	822,024
65–69	682,513
70–74	638,380
75–79	519,356
80–84	330,050
85 and over	265,235
Total	**19,413,240**

Average annual rates of change

Average annual rates of change or growth rates have been calculated as geometric rates:

$$\text{Average rate of change} = \left(\left(\frac{P_n}{P_o} \right)^{\frac{1}{N}} - 1 \right) \times 100$$

where P_n = value in later time period

P_o = value in earlier time period

N = number of years between the two time periods.

Data linkage

Data linkage, also known as data integration and record linkage, is a powerful statistical tool both for identifying multiple appearances of individuals within a data set and for integrating client information across data sets.

There are two main types of data linkage:

- Probabilistic linkage—in which the linkage of records in two (or more) files is based on the probabilities of agreement and disagreement between a range of match variables. Probabilistic matching allows for variation in reported characteristics by deriving a measure of similarity across variables used to identify matches, called the match weight. This is then used to decide whether a particular pair-wise comparison between records on two data sets is accepted (high weight) or rejected (low weight) as a match, or link.
- Deterministic key-based linkage—in which the linkage of records is based on exact agreementof match variables, or a statistical linkage key. Linkage using a single match key cannot allow for variation in reporting. However, algorithms can be constructed that can, and the AIHW has developed a stepwise key-based linkage algorithm that allows for ariation in reported data linkage items.

The method used for a particular linkage process depends on both the data items and resources available to undertake the linkage.

Data subject to revision

This report draws data from a range of administrative and survey data sets, all of which are subject to change. For example, data may be updated on a regular annual cycle or revised due to discovered errors or anomalies.

Wherever possible, the latest version of a data set has been used; in cases where the data change frequently, the date of the release is noted in the text or table.

Effects of rounding

Entries in columns and rows of tables may not add to the totals shown, because of rounding. Unless otherwise stated, derived values are calculated using unrounded numbers. Percentage distributions may not always sum exactly to 100 due to rounding. Where numbers are rounded to whole numbers or one decimal place, the number is rounded down for values 0–4 and rounded up for values 5–9. As a general rule, single-digit numbers are rounded to one decimal place. Numbers over 10 are rounded to whole numbers unless accuracy to one decimal place is required for differentiation.

Supplementary technical information

This section contains technical information related to the purchase affordability indicator in Chapter 6.3 'The changing shape of housing in Australia' (S6.3) and the housing assistance data presented in Chapter 7.1 'Community factors and Indigenous wellbeing' (S7.1).

S6.3.1 Purchase affordability indicator

Affordable dwelling: A dwelling sold in the reference year where mortgage repayments represent up to 30% of gross household income, assuming a home loan of 100% of the value of the dwelling, a term of 25 years, and the standard variable housing loan rate of banks as reported by the Reserve Bank, averaged out over the financial year (5.97% in 2013–14).

Computation:

1. Median gross household income was estimated for the following household groups, within each equivalised disposable household income quintile and within household (composition) groups (couple with no dependent children, couple family with dependent children, lone persons, one parent family with dependent children) within each housing market. Data were sourced from the 2013–14 Survey of Income and Housing (ABS 2016).
2. These income data were applied in a mortgage calculation to determine the maximum dwelling price that was affordable to particular household groups (equivalised disposable household income quintiles and household composition groups).
3. The proportion of dwellings sold in each location at or below each of these maximum prices was then calculated. Data were sourced from CoreLogic RP-data (CoreLogic RP-Data 2016).

S7.1.1 Converting income units to household numbers

Recipients of Commonwealth Rent Assistance (CRA) are 'income units', rather than households. More than one person/group within a household can receive CRA. To derive an estimate of the rate of Indigenous households receiving CRA, data at the income unit level must be converted to the household level.

Because the Australian Bureau of Statistics (ABS) 2011–12 Survey of Income and Housing (SIH) collects information about both income units and households, information from this survey can be used to derive a conversion factor. Those data suggest that, among CRA recipients, there are an estimated 93.4% as many households as income units in Australia (unpublished data from the ABS SIH).

To enable estimates of rates of households receiving CRA to be derived for this paper, this conversion factor was applied to the data about CRA income units. For example, for Indigenous income units:

(a) 67,387 Indigenous income units received CRA as at 26 June 2016

(b) applying the conversion factor of 93.4% provides an estimated number of Indigenous households receiving CRA of 62,939.

A conversion factor by Indigenous status is not available and how the conversion factor may differ between Indigenous households and other households is not clear; thus, the one factor is applied to both Indigenous and other income units. Note also:

- the proportion of households to income units is an estimate calculated from a survey sample

- methods to collect information about income units vary between the CRA data collection (which are administrative data pertaining to a specific day) and the SIH (self-reported survey data collected throughout a yearly cycle)
- care should be taken when comparing data from different data sources due to the different methodologies used (AIHW 2014).

S7.1.2 Estimating number of households

Chapter 7.1 'Community factors and Indigenous wellbeing' presents information on the proportion of Indigenous households receiving assistance from the various social housing programs and CRA in June 2016.

To calculate these proportions, information is required on the total number of households in Australia in 2016, by Indigenous status. ABS produces projections of household growth (ABS 2015); however, these are not published by Indigenous status. Hence, to estimate the number of Indigenous and other Australian households, information from the 2011 Census has been used. To derive such estimates for 2016, the proportion of Indigenous households as enumerated in the 2011 Census was applied to the total projected number of households for 2016 (using series II—the middle range of the three different projection scenarios).

An example of the process is set out here, using the number of Indigenous households across Australia:

(a) the number of households with an Indigenous member, as enumerated in the 2011 Census count, was 209,048—representing 2.7% of all households enumerated (7,760,322) (AIHW analysis of 2011 Census TableBuilder)

(b) according to the ABS series II household projections, the total number of households in 2016 was 9,241,497

(c) applying the (unrounded) Census-derived proportion of the number of households that are Indigenous provides an estimated count of 248,948 Indigenous households in 2016.

This estimated count was then used as the denominator when calculating rates of usage of social housing and CRA by Indigenous households at the national level.

The approach assumes that the proportion of households with an Indigenous member as identified in the 2011 Census accurately reflects the proportion of households with an Indigenous member in 2016. While there is likely to be some under-identification of Indigenous households in the Census, this issue is mitigated to some degree as there is also under-counting in administrative data on the number of all households living in social housing. In other words, there is some degree of under-counting in both the numerator and the denominator of the social housing rates presented, but the extent of such under-counting is not known.

Australia's welfare 2017: in brief

This edition of *Australia's welfare* is accompanied by a mini companion report, *Australia's welfare 2017: in brief*, that summarises key statistics and concepts from the main report.

Australia's welfare 2017 is the 13th biennial welfare report of the Australian Institute of Health and Welfare. This comprehensive report provides an authoritative overview of the wellbeing of Australians, examining a wide range of relevant topics.

The report covers:

- Understanding welfare
- Australia's welfare spending and workforce
- Child wellbeing
- Young people
- Working age
- Growing older
- Diversity and disadvantage in Australia
- Indicators of *Australia's welfare*.

Wage theft, underpayment and unpaid work in marketised social care

The Economic and Labour Relations Review
2018, Vol. 29(1) 80–96

RMIT University, Australia

Abstract
Marketised models of social care provision in Australia are placing pressures on service providers and driving changes in work organisation and employer practices, with potential to degrade social care jobs. While international experience of marketised social care has demonstrated the vulnerability of social care workers to wage theft and other violations of employment laws, Australia's relatively strong industrial relations safety net might be expected to be better able to protect these low-paid workers. Nevertheless, there is emerging evidence of negative impacts on the pay and entitlements of frontline workers in the expanding community support and homecare workforce. This study investigates the paid and unpaid work time of disability support workers under Australia's new National Disability Insurance Scheme. The research takes a novel approach combining analysis of working day diaries and qualitative interviews with employees to expose how jobs are being fragmented and work is being organised into periods of paid and unpaid time, leaving employees paid below their minimum entitlement. The article highlights the role of social care policy along with inadequate employment regulation.

Introduction

This article reports on research investigating underpayment of wages of low-paid social care workers under Australia's new National Disability Insurance Scheme (NDIS). As a

Corresponding author:

Email: fiona.macdonald@rmit.edu.au

'cash-for-care' scheme, the NDIS individualises and marketises disability support and shifts the location of much care and support work from public organisational settings to more diverse settings, including private households, as well as introducing new demands for flexibility, for very short working hours and for travel between multiple work locations (Macdonald and Charlesworth, 2016). Similar pressures and arrangements in adult social care in the United Kingdom have seen social care workers become highly vulnerable to wages underpayment (Low Pay Commission, 2016).

This study explores working time arrangements and pay of disability support workers (DSWs) in the context of employment regulation and the new disability support arrangements. It addresses the following questions: what regulatory gaps contribute to any wages' underpayments and what roles (if any) do the design and management of the social care system (the NDIS) play in this?

Rubery et al. (2015) suggest a homecare worker's comment 'it's all about time' encapsulates 'the central importance of time in the management and employment arrangements in home care work' (p. 756). This phrase also encapsulates our findings that the tight control of time as a contested resource in disability support in the home and community underlies wage theft, underpayment and low pay. Underpayment of workers is made possible by various gaps in employment regulation, in addition to inadequate enforcement. While the regulatory deficiencies are not new, the changing industry structure under the new marketised social care arrangements may be exacerbating the issues.

Beginning with a short overview of the regulatory context for wages underpayment and minimum wage compliance in Australia, we then review relevant international literature on working time and wages in social care. We then outline the changing industry and regulatory context of disability support work in Australia. After outlining our method and framework for analysing paid and unpaid work, we present key findings from (1) analysis of disability support work 'working day' time diaries and (2) interviews with DSWs about their jobs and working time. We end with a reflection on the funding and regulatory frameworks that contribute to wages underpayment, and point to some possible responses.

Background

Wage theft, underpayment and employment regulation in Australia

Wage theft refers to the non-payment or underpayment of the full wages to which employees are legally entitled (Galvin, 2016: 325; Milkman et al., 2010; Vosko et al., 2017). Thus, wage theft is seen as arising from non-compliance with employment laws, and multiple types of wage theft reflect different kinds of violations. While violation of minimum wages regulation is the most 'blatant' type of wage theft (Wilson, 2011: 6), others include overtime violations, rest break violations, time 'off-the-clock' violations and illegal employer deductions (Milkman et al., 2010).

There has been little research into the extent of minimum wage non-compliance in Australia (Maconachie and Goodwin, 2010; Nelms et al., 2011). Historically, with wide workforce coverage, union recognition and union membership preference provisions, the centralised industrial arbitration system has been characterised by relative ease of

enforcement of standards, with trade unions playing a significant role (Johnstone et al., 2012: 27). In addition, a feature of the system has been a comparatively wide array of minimum employment standards contained in industry or occupation-based industrial awards including working time arrangements such as standard working times, minimum and maximum shifts, shift and overtime penalty payments, minimum call-back times and other rostering arrangements.

However, changes in the labour market and organisation of work and significant de-regulation and de-collectivisation of industrial relations (Quinlan and Sheldon, 2011) have seen more employment likely to be affected by 'gaps' in regulation. Unchecked non-compliance with employment laws resulting in wage theft can be seen as arising from a regulatory gap whereby evasion is made possible by limits in enforcement. Other forms of regulatory gaps have contributed to the growth of employment forms with inferior rights and benefits, including lower payment for comparable work, although there may not be any violation of employment laws. Taking the range of protections of terms and conditions for full-time permanent employees as a normative standard, regulatory gaps exist for most workers outside this form of employment. Different forms of regulatory gaps contribute to inferior employment. Special rules and exemptions in employment regulation establish some forms of employment with diminished conditions and benefits (e.g. casual employment), while limits in regulatory scope leave some workers, such as self-employed contractors, entirely outside all or most employment law (Pocock et al., 2004). An additional regulatory gap involves the absence of legal mechanisms for ascribing responsibility for pay and conditions to network lead organisations that, while not being the direct employer, control the way work is organised (Johnstone et al., 2012). All these types of regulatory gaps are relevant to the underpayment of social care workers' wages, including wage theft through non-compliance.

Employment regulation is one important element in the broader institutional context in which wage theft and underpayment occur. Other social institutions also have significant influence. In the next section, we review some of the international evidence relating to working time in social care. This review highlights that employer practices leading to underpayments (including wage theft) are also strongly shaped by gendered norms of unpaid care work and the design of public social care systems.

Social care work, working time and underpayment of wages

International comparative research has shown there are real differences in social care systems in developed economies in regard to outcomes for social care workers (Simonazzi, 2009). However, in general, workers are low-paid and have poor working conditions (Cristiano et al., 2016; Razavi and Staab, 2010). In the context of pressures to cut care costs, there is also convergence between care systems, to more home-based care, private provision and cash transfers for care recipients. From the developing international literature on working time and pay in social care we draw three insights especially relevant to our Australian study. First, analysis of the organisation of work shows work time has been excised from paid time, embedding unpaid time in home-based care work (Boivin, 2016; Hayes, 2017; McCann, 2016). Second, the gendered nature of care work and strong norms of unpaid time combine with employer strategies and worker resistance to contribute to

overwork and high levels of unpaid work (Baines et al., 2017; Hayes, 2017; Palmer and Eveline, 2012). Third, public authorities and funding bodies maintain significant control over the organisation of work and over care workers' pay and conditions, using time as the main control mechanism (Atkinson and Crozier, 2016; Boivin, 2016; Rubery et al., 2015).

Of particular relevance is the UK experience, as social care systems across Britain share many features with Australia's developing individualised and marketised disability support system (Macdonald and Charlesworth, 2016). Social care workers have been identified as at greater risk than other UK workers of not receiving the National Minimum Wage (NMW) (Low Pay Commission, 2016: xxvii), and it has been estimated that about half of social care companies have not met their minimum wage obligations (HM Revenue and Customs, 2013). Homecare workers – who provide care and support to frail aged and people with disability in private homes and the community – are particularly vulnerable to underpayment with one estimate that 60% of such workers are underpaid (Bessa et al., 2013: 27–28).

In particular, the social care workforce experience in England highlights how, by paying workers for only some of the time they work, 'nominal' wages may be above the statutory minimum wage but 'effective' wages can be much lower (Koehler, 2014: 5). In England, homecare workers have typically been paid only for contact time with care recipients and have not been paid for much of the work they perform, including the time they travel between private residences where they provide care (Hayes, 2017: 135–138; Rubery et al., 2015). This has been considered to be wage theft (Hayes, 2014) and recent legal challenges to the practice have strengthened regulation specifying that travel between work assignments must be paid (United Kingdom Government, 2017).

Similarly, until recently, homecare and DSWs in New Zealand were not paid for time spent travelling between 'clients', with Briar et al. (2014) arguing this brought the employees' hourly wages below the national minimum wage. Following a long-running campaign and a legal case pursued by the Public Service Association (PSA), a sector-wide arrangement for payment of travel time has now been introduced (New Zealand Parliament, 2015). In Europe, recent legal cases under the European Working Time Directive have also challenged the non-payment of homecare workers' time spent travelling between home visits (McCann, 2016).

Despite some ambiguity about travel as 'work' (McCann, 2016), much other unpaid overtime undertaken by social care workers is undoubtedly work (comprising face-to-face client care and support, administration and communication). Non-payment of work time is underpinned by unfair job design with extremely tight specification of time and tasks and no provision at all for some aspects or for any variability in the work (Hayes, 2017; Moore and Hayes, 2017: 103). In addition, work scheduling techniques that 'drain waged-time from the working day' and the devolution to workers of the risks of variable client demand result in fragmented, often varying and unpredictable work schedules: short periods of paid time (invariably face-to-face contact time with care recipients) are interspersed with other also fragmented, variable and unpredictable periods of unpaid 'non-work' time (McCann, 2016: 44–45; Rubery et al., 2015). So, workers have long work days for little recompense, contributing to low pay. Gaps of unpaid time in the day may not be work but neither are they available to the worker as personal time (Boivin, 2016: 301).

Non-payment of social care work is supported by the gendered legacy of care work as women's work (Hayes, 2017; Palmer and Eveline, 2012). With care work continuing to

be mainly performed unpaid by women in the family, it is often regarded as performed for altruistic reasons and as unskilled and not deserving of decent pay. These norms have a powerful role in social care, influencing employer strategies and also workers' preparedness to perform unpaid work. Furthermore, much social care work is performed in not-for-profit agencies that have long traditions and strong norms of volunteering that contribute to pressures on workers (Baines et al., 2017).

A final insight from the international literature concerns the role funding models and commissioning practices play in determining care workers' pay and conditions. The UK and Canadian studies have identified the use of time as a control mechanism by public funding and commissioning bodies (Atkinson and Crozier, 2016; Boivin, 2016; Rubery et al., 2015). These bodies have no direct responsibility for the employment of care workers but nevertheless determine many aspects of care provision, including the organisation of work. They tightly specify 'care quality' and work on the basis of time and tasks, leaving employers with little scope in relation to workforce strategy. They determine the duration and scheduling of work and, through tight hourly based funding, they also determine pay.

The multiple factors underpinning the underpayment of homecare workers, including marketised, poorly funded care systems which build on a gendered legacy of care work as non-work, are now more visible in the Australian context of disability support work.

Social care, the NDIS, working time and pay in Australia

The Australian care workforce is predominantly female and the work of frontline social care workers is low-paid (Martin and Healy, 2010). Some 70,000 people were employed in specialist disability support services before the NDIS (Martin and Healy, 2010: 109) and the effective full-time disability support workforce is predicted to more than double by 2019–2020 (Buckmaster and Dunkley, 2017). In 2017, this workforce comprised 43% permanent part-time, 41% casual and only 12% permanent full-time employees (National Disability Services (NDS), 2017: 4).

The gendered undervaluation of social care work is reflected in the historical development of working conditions standards for social care workers in Australia (Charlesworth, 2012). The growth of the paid workforce was accompanied by a long struggle for industrial recognition, and it was not until 1990s that most social care workers gained industrial award coverage, providing them with minimum wage rates and employment conditions that were already available to 'over 90% of the Australian workforce' (Briggs et al., 2007: 498). Recently, some recognition of the gendered undervaluation of care work has been achieved with the success of an equal pay case acknowledging this undervaluation (Macdonald and Charlesworth, 2013).

In comparison to the UK, employees in Australia might be expected to be protected by this country's much more comprehensive set of minimum standards for pay and conditions. However, as Charlesworth and Heron (2012) have argued – specifically drawing on the case of social care work – inferior conditions are established for 'non-standard' part-time and casual employees in both the statutory National Employment Standards and in industrial awards, and this regulatory gap has a gendered impact due to women's concentration in these forms of employment. These authors document a range of inferior working time standards for employees covered by the Social Community Home Care and Disability

Support (SCHADS) award compared to employees covered by the Manufacturing Award. Such regulatory gaps include the absence of minimum engagement periods for part-time employees and of provisions for notice of changes to rostered work time and silence on the question of pay for time spent travelling between work assignments (Charlesworth and Heron, 2012). Based on overseas experience, it could be expected that these regulatory gaps are now more significant to the working conditions of care workers under the NDIS than under previous block-funding contracts for disability services.

The publicly funded disability support system in Australia has undergone significant reform with a national system, the NDIS, replacing multiple piecemeal services provided by states and territories. Services are now allocated and funded on an individual basis and provided through the market. Traditional service providers are now competing with new providers, including private for profits. A national agency, the NDIS, manages the market, assessing eligibility, determining individual support packages, setting prices and funding supports. Funding for the personal support provided by DSWs is determined on the basis of an hourly price, varied in some circumstances. Recent study suggests this fee has been set too low to enable the minimum SCHADS Award conditions to be met for DSWs (Cortis et al., 2017). The study also found that the pricing model did not reflect existing employees' classification levels and provided inadequate allowance for training, workers' time not spent providing face-to-face support (3 minutes an hour), travel between clients (providers can include a 20-minute journey but without any adjustment for support to be provided), and supervision (both levels and workloads). These assessments are supported by findings of an employer survey in which two-thirds of respondents disagreed with the statement 'NDIS prices enable us to meet our industrial obligations' (Cortis and Blaxland, 2017: 3).

Here, we report on a qualitative case study of DSWs' paid and unpaid work time. Our findings shed light on the ways in which social care work may be organised under the various pressures and within the regulatory context outlined above and on some of the impacts this can have on employees and their pay.

Method

Qualitative research combined collection of data from 'working day' diaries and semi-structured interviews with DSWs employed under the new NDIS arrangements. The purpose of collecting diary data was to explore working time arrangements and any unpaid work associated with DSWs' jobs. Interviews explored employees' experiences and views of their jobs, working time arrangements and pay.

Participants were recruited through advertisements in newspapers and job websites and through snowballing. We interviewed 22 employees providing home and community-based support services to people with disability. This article reports on analyses of interviews and working day diaries for 10 DSWs: a total of 20 interviews and 30 self-completed diaries. The 10 women all provided support and care under the NDIS. They were employed by 10 different service providers: four for-profit, five not-for-profit and one government provider. All worked in the same region that was one of the first NDIS implementation sites. At the time of the fieldwork in late 2016, the NDIS had been in place in the region for 3 years. The other 12 participants who are not reported on in this article were not providing NDIS services.

The 10 DSWs cannot be seen as representative of all DSWs working under the NDIS. However, this study can provide valuable insights into some of the ways in which work

is being organised under the NDIS and impacts on employees. Despite the small sample size, our interviews were approaching saturation (Morse, 1995), with issues raised in interviews highly consistent across the 10 participants. While there was considerable dissimilarity in paid and unpaid work patterns recorded in diaries, common issues and themes emerged from all 10 workers' diaries. The issues are also similar to those identified in recent surveys of DSWs and providers examining NDIS workforce issues (Cortis et al., 2017; NDS, 2016). Nevertheless, the data we present is indicative only and our findings warrant further investigation through a larger study.

Each DSW participated in two individual face-to-face semi-structured interviews with one of the researchers. In the first interview, each participant was asked about what her job/s involved, the support she provided, working time arrangements, rates of pay and likes and dislikes. At the end of the interview, the participant was given a paper 'diary' on which she was asked to record time, duration and a brief description of each work-related activity and 'breaks' for the next three work days. At the second interview (1–4 weeks later), the researcher went through the diary with the participant seeking additional details and views of the 'diarised' time use. Informed consent in writing was obtained from all participants. Participants were given retail vouchers in recognition of their time and in lieu of payment for any expenses incurred.

Analytic framework

To identify and quantify any apparent underpayment of employees' work time, we categorised time recorded in the diaries as follows:

a. Paid work time.
b. Unpaid overtime comprising: *support work and administrative work* (paperwork, communications and meetings with supervisors, support recipients and families).
c. Unpaid travel directly between support recipients (for a single employer).
d. *Other unpaid time in the work day* comprising: unpaid travel between the employee's home and work during and at the beginning and end of the work day; and unpaid 'breaks' between work-related activities.

We also recorded the *length of the work day* (e), defined as the duration of time from when the worker first left home in the morning until she returned home from her last shift for the day.

On the basis of our literature review, we considered that, on the face of it, time spent on (b) unpaid overtime and (c) unpaid travel directly between support recipients should undoubtedly be paid work time. In this article, we focus on these categories to investigate underpayment of wages for the DSWs. It is much more difficult to ascertain the extent of any wrongful underpayment for time in category (d) and, as it would require considerably more space to do so, we have largely excluded this time from our analysis. This time is, nevertheless, critical to the structuring of employees' work days and pay as workers are often expected to travel long distances from home for very short shifts and can have their work scheduled so that they experience long periods of 'dead' time between shifts.

Here, we have space to provide detail of this time only where it sheds light on the overall organisation and time structure of the work.

Findings

Overview of employees' work and pay

In total, 9 of the 10 DSWs were multiple job holders: five worked in two or three different DSW jobs. Other jobs included aged care and residential support. The main reason women gave for holding multiple jobs was that their main job provided insufficient income. In their main job, seven women were permanent part-time and three were casual employees. Part-time employees had contracts specifying minimum hours, although these minimums were as low as 2 hours a fortnight. All employees had highly variable daily and weekly hours and all were regularly 'expected' to do additional work, often at very short notice. Part-time employees' hourly rates ranged from AUD19.80 to AUD25 and casuals' from AUD25 to AUD29, rates consistent with employment at or just above the relevant classifications in the SCHADS Award. Nine DSWs said they were paid penalty rates for weekend and evening work. The 10th said her employer told her she was paid penalties only when they were included in her clients' NDIS support plans.

Only two DSWs (both employees of the same long-established and large service provider) were paid for time spent travelling between clients. However, seven DSWs (including those two), received a per-kilometre reimbursement for using their own cars when travelling between clients. Notably, the industrial award specifies employees must receive this reimbursement 'where required and authorised by their employer to use their motor vehicle *in the course of their duties*' (our emphasis) (SCHADS Award 2010:: cl 20.5(a)). All DSWs were reimbursed for using their cars to transport clients, as long as the distance was within the kilometre range specified in the client's NDIS funding package.

Employees' paid work time was primarily spent in direct contact with clients, providing in-home assistance, personal care and/or support for community and social participation. All 10 workers said they enjoyed or even loved many aspects of the work; they valued making a difference in people's lives and enjoyed spending time with clients. However, most were unhappy with their pay and conditions and several were seeking other employment. The work aspect identified as a serious problem by all 10 workers was the way their working time was structured. Many frequently worked long days, 6 or even 7 days a week to try to earn an adequate income; yet many spoke of their difficulties earning enough to pay their bills. The women's jobs often left them exhausted and with little time for friends and families.

The working day: The time diaries

The working day diaries documented a total of 30 working days (comprising 3 diarised days for each of the 10 DSWs). They reveal four important aspects of DSWs' working days.

First, the diaries show that the DSWs' days were typically made up of several relatively short paid work 'shifts' spent with support recipients, interspersed with often long periods of unpaid time. Over the 30 days, the 10 DSWs worked between one and five

separate shifts per day. The shortest recorded shifts of paid work were around 30 minutes and the longest was over 10 hours. Most paid work periods were 2 hours or less. Second, the DSWs' working days (from first departure from home for work to last arrival home from work) were long. Two-thirds of the 30 diarised days were 10 hours or longer. Third, though days were often very long, the proportion of the total working day that was paid work was often small. On 17 of the 30 work days, employees were paid for 5 or fewer hours' work in the context of a long span of working hours. As an example, one day in DSW9's diary showed that she left home at 8:45 am and finished her day 13.5 hours later, at 10:15 pm, having completed four shifts and earned only 5 hours' pay. This pattern of paid work was not uncommon: the diaries showed that for each worker, on average over their 3 working days, paid work time was between 27% and 73% of the working day (Table 1). Fourth, the diaries showed very substantial periods of the working day consumed by unpaid activities, structured and often occupied by work.

In the presentation of findings below our focus is on the unpaid work time employees spend travelling between clients and undertaking support and administrative work, time that apparently should be paid work time. However, the organisation of disability support work often renders unusable as 'free' or 'personal' time much other time in a worker's day. For example, workers spent time travelling back and forth from home to work in breaks between periods of paid work, and they often found themselves too far from home to make it worthwhile returning so they simply waited somewhere near their next client's home.

Turning to the unpaid work that clearly directly contributes to underpayment, all 10 DSWs undertook unpaid work either travelling between clients or unpaid overtime (administration and face-to-face support), or both, over the 3 diarised days. For individual workers, the total amount of such unpaid work undertaken over the 3 days ranged from 22 minutes to over 6 and a quarter hours. For some DSWs, unpaid work time was equivalent to a third or more of paid work time in a single day and comprised up to 25% of the duration of the working day (Table 1). If all travel between clients and overtime had been paid, these employees would have received between 2% and 27% more pay than they actually received for the 3 days. In the discussion that follows, this unpaid work and the factors driving it are examined in detail.

Unpaid work: Travel between clients

Travel to clients' homes is an essential part of home and community-based disability support work. The amount of unpaid travel directly between clients varied considerably among the 10 employees on the 3 diarised days. The two women who were paid for the time they spent travelling directly between clients had paid travel time in their enterprise agreement with the same long-standing service provider. Our interviewees informed us, and it was later confirmed, that this provider had ceased providing disability support services because they could not afford to do so under the NDIS. For other DSWs unpaid travel between clients was equivalent to between 1% and 15% of the employee's paid time over the 3 days, and as much as 25% in a single day. One DSW spent an hour and a half travelling directly between clients in a single day. A total of 15 of the diarised days showed no unpaid travel directly between clients, but this was often because employees had large unpaid gaps between paid work periods and went home before travelling to the next client.

Table 1. Disability Support workers' paid and unpaid work time for 3 days[w].

DSW: disability support worker.
[w]Times are reported in hours and minutes.
[x]DSW employed by more than one disability support provider.
[y]Administration time adjusted as one employer paid for 30 minutes a week.
[z]DSW paid for travel between clients by one employer.

Most interviewees raised the issue of unpaid travel time as a major shortcoming of the job, particularly when paid work periods were short and the ratio of unpaid to paid working time was high. Women's gave a variety of explanations for undertaking shifts that involved at lot of unpaid travel and little paid work. For some it was a sense of responsibility to clients, a manager or both. Fear of jeopardising further work opportunities was often cited as a strong motivator for not refusing shifts. One DSW who had been in her job under 6 months was very conscious of the impact of travel time on her effective pay rate and also found the driving stressful:

> … but a big part, as you know, is driving for the job. So I think at the end of the day I'm so knackered, so tired because I'm thinking, I've just been stressed all day worrying about the traffic, whether I'm going to have a prang, just trying to get to these places on time. All for what? For say 3 hours' work. (DSW2)

Yet this employee was unwilling to complain about her pay and conditions as it had been difficult for her to find work. This sense of vulnerability may have been well-placed: another DSW, who had consistently refused to take certain poor shifts, believed she had been punished by having work taken away. By comparison, a very experienced worker reported resisting or refusing shifts where the ratio of paid to unpaid work was too low:

> I don't do any less than an hour. … [Employer B] don't do less than an hour. [Employer A] try to get you to do half hour ones like for medication runs or things like that but, no to me it's not worth it especially when you have to drive like half an hour there, get paid half an hour and a half an hour back and you don't get paid for travelling. (DSW1)

However, this DSW spent nearly 2 hours travelling directly between clients over the 3 days, unpaid and without a car allowance.

Unpaid work: Overtime providing support and undertaking administration

A second type of unpaid work was the additional time DSWs spent providing support to clients and undertaking administrative tasks. Five of the ten employees accrued 50 minutes or more of such unpaid work over the 3 days. For four workers, this was equivalent to 10% or more of the time they were paid for work.

This form of unpaid work appeared endemic. Six of the ten employees provided unpaid support on 29 occasions over the 30 recorded days. Though often only for short periods this unpaid work added up to between 15 and 50 minutes over the three days. Employees' fragmented work schedules meant that this additional work was often absorbed into unpaid time between scheduled support for clients – rendering it invisible to the employer. Contributors to unpaid support included unexpected events (e.g. client illness), unpredictable behaviours, client requests for extra supports; new/unfamiliar clients; family carers returning home late, and mismatches between client needs and funded supports, as described here:

> Sometimes when the support team goes out to a client's home or interviews them, [or] interview them over the phone, they may think 'Oh this is only going to take half an hour' but they haven't actually done it [the work]so they might guestimate that it's half an hour where it's a bit longer. [DSW4]

Administration work was a further significant component of unpaid overtime. Eight of the ten employees completed multiple, often small, amounts of unpaid overtime every day. The range of unpaid administrative tasks included: completing client notes and incident reports, communicating with supervisors about client needs, organising rosters and extra shifts and completing travel forms and timesheets. Most tasks were central to client care and/or the organisation of work. While one organisation paid employees 30 minutes a week for administration, DSWs were not otherwise allocated paid time for these tasks which often consumed considerable amounts of time and could be highly disruptive to personal time. One employee, who had many serious concerns about her clients, spent nearly 4 and a half hours over the 3 days writing up client notes, usually very late at night. This unpaid administration was equivalent to almost 20% of her paid work time. Another seven employees undertook between 10 minutes and just under 2 hours of unpaid administration over the 3 days. Two employees did no unpaid administration work at all.

DSWs gave two main reasons for undertaking unpaid work. Many workers did so out of a personal commitment to providing good quality, and usually essential, care. This included one employee who said she and colleagues arranged staff meetings in unpaid time to induct new staff and discuss clients' support needs. Most employees linked their unpaid overtime to job insecurity and some reported responding to pressure to complete additional unpaid tasks at clients' request because they feared losing shifts if a client requested a different support worker.

In theory employees could claim pay for some of their unpaid overtime while in practice it was often difficult or impractical to do so. One employee commented: 'I mean I guess if we specifically rang our boss and we're like "hey, this ran 15 minutes over, I'm going to put it on my timesheet," and they knew, then we would. But if it happens every single day, I don't think that many of us really ring her every single day. And she's very hard to contact as well' [DSW10]. Nevertheless, employees sometimes accepted responsibility for not claiming time:

> I: Do you get paid for that extra ten minutes, when (the family carer's) late?
>
> P: No. Well, that's my fault; I'm not going to ring something like that in.
>
> I: No. When would you ring it in? How many minutes late would they have to be for you to call in?
>
> P: Half an hour, twenty minutes, half an hour, it depends. This is a nice lady, she doesn't mean to be home [late]. [DSW6]

In some cases, explicit organisational arrangements required employees to absorb unpaid work without remuneration. Further, employees articulated it was in their best interests to undertake this work in order to have better outcomes for clients. For example, one employee (DSW5) explained that it was in her position description to arrive at work 10 minutes before the commencement of her paid work. While she considered this 'a nuisance' it also enabled her to talk with the client's family carer and get any issues 'sorted'.

Finally, workers' sense of insecurity and lack of support in challenging their working conditions was often evident in their explanations for undertaking unpaid work. One employee feared losing shifts if she 'rock[ed] the boat' (DSW2), another said she was afraid of 'making ripples' and risking confrontation (DSW5), and others reported they

had been 'punished' with removal of shifts for attempting to challenge an employer (DSW1) and for refusing to take poor shifts (DSW8). In contrast the two employees of the large long-established and highly unionised service provider reported numerous instances of challenging management to improve conditions for workers.

The financial cost to employees of the unpaid work of travel between clients and overtime was significant, even for those who undertook relatively little unpaid work. For five of the ten employees, 2%–6% of their work over the 3 days was unpaid. On the basis of the standard hourly rate each DSW was paid (i.e. disregarding any penalty rates), we estimate those five employees were underpaid by between AUD8.84 and AUD30.42 over the 3 days. The other five DSWs were not paid for 12% or more of their work time, including one who was not paid for 21%. That employee, who had both the highest number and proportion of unpaid work hours, was underpaid by around AUD180 over 3 days. The remaining four employees were underpaid by between AUD24.75 and AUD92.08 over 3 days.

Discussion and conclusion

Our case study findings demonstrate some of the ways in which disability support work is being organised under NDIS implementation, leaving employees underpaid for significant amounts of their working time. While it is not possible to generalise from the experiences of this small sample it is worth noting that underpayment for travel and overtime was experienced by employees of nine of the ten different employers in this study. Further, we argue that the significance of this study, beyond mapping the dimensions of wage theft and underpayment for a small group of workers, is its analysis of how the funding and regulatory environments facilitate systemic non-payment of working time for homecare workers – an analysis which is broadly applicable to the many workers employed in the same context.

In part, underpayment of the DSWs was rendered invisible by the gendered norms of care work. The findings of this study echo those of Hayes (2017) that in the UK 'homecare workers who wish to provide care in a way which is compatible with self-respect must do so on an unpaid basis' (p. 127). The underpayment of wages was hidden and ambiguous, owing to the regulatory gaps which supported it. Non-payment for travel time was apparently enabled by the absence of a specific entitlement in the industrial award, while the absence of a minimum engagement period for part-time employees saw work periods reduced to as little as 20 minutes. Employers appear to have actively exploited the lack of clear minimum standards: paying vehicle allowances for travel between assignments suggests acceptance of this activity as work – while not paying wages for this time.

Inferior benefits and conditions for social care workers were established in Australian employment regulation long before the introduction of the NDIS. However, our findings support the view that the NDIS is further institutionalising employment practices that produce wages underpayment. Notably, in the context of identified under-pricing of personal support services under the NDIS, the only employees in our study who were paid for travel time lost work as their employer's disability services provision was deemed not viable under the new funding model. Also notably, in this workplace, employees had gained their superior benefits through collective bargaining, while union organisation and representation were less apparent for other employees in our study.

Addressing deficiencies in employment minimum standards is one strategy for resolving some of the problems of underpayment for social care workers. Embedding gender equality objectives in award review processes is potentially a way of achieving this (Macdonald and Charlesworth, 2013). More fundamentally, addressing underpayment of wages of social care workers is likely to require acknowledgement of the limitations of regulation fashioned around the normative standard of full-time permanent employment and the binary employment relationship. In this regard there is a variety of innovative regulatory responses that target network lead or top of supply chain organisations, including in Australia's textile, clothing and footwear industry (Johnstone et al., 2012). Safeguarding and quality regulation under the NDIS could be framed to ensure disability workers are paid fairly and all participants in the supply chain take responsibility, as was previously done in the road transport sector (Johnstone et al., 2015). The fact that the government is effectively the top of the supply chain body in publicly funded social care systems such as the NDIS highlights the need for embedding accountability for labour standards in public policy more generally.

Author biographies

Fiona Macdonald is Senior Research Fellow in the School of Management and Centre for People, Organisations and Work (CPOW) at RMIT University. Her research is investigating workforce challenges of marketised social care systems, through an examination of the organisation of work and changes to disability support workers' jobs and employment arrangements under Australia's NDIS, in international comparison.

Eleanor Bentham is a researcher in the School of Management and CPOW at RMIT University. She has 10 years' experience researching disadvantage in labour markets and education, and has spent the past 2 years investigating the impact of the NDIS on disability support work.

Jenny Malone is a researcher in the School of Management and CPOW at RMIT University. She is researching dimensions of care work, including the ways in which gender, migration and the organisation and regulation of care work intersect to shape working conditions.

Dear Providers

This letter provides an update on the Independent Pricing Review (IPR).

In response to market feedback that, in some areas, price limits set by the NDIA required more detailed consideration, the National Disability Insurance Agency (NDIA) Board engaged McKinsey & Company in June 2017 to undertake an Independent Pricing Review for the National Disability Insurance Scheme (NDIS). As the NDIS is rolled out across Australia, the establishment of the IPR reflected the NDIA's commitment to developing a vibrant provider sector that can provide reasonable and necessary supports to NDIS participants to help them live a better life.

As part of this independent process, McKinsey & Company consulted with over 1000 individuals, held ten open forums, nine webinars, and 45 one-on-one meetings in the second half of 2017.

The IPR was commissioned recognising the important role that price plays as a key driver of value for participants, particularly during transition. In commissioning the review, it was acknowledged that prices paid to providers must be sufficient to create adequate supply to meet the short and longer term needs of participants. To that end, the IPR undertook detailed analysis of provider economics, market development, and Scheme and sector data, resulting in a deeper understanding of the complex environment in which providers operate.

In March 2018, the full IPR and the NDIA Response were published, including in principle endorsement of the report's 25 recommendations. The NDIA response also outlined that additional work was required prior to implementation for some of the more complex recommendations.

The disability sector has welcomed the IPR's message that close attention must be paid to price, and in particular that action was needed to support providers during their transition to the participant centred funding approach that is integral to the NDIS . The NDIA has continued to engage and consult with providers about the impact of the IPR's recommendations, and has committed to communicate with providers and implement the IPR recommendations in a thorough and timely way. Following those initial soundings, the NDIA provided an update to the market in April, 2018 revising those recommendations that would be progressed immediately and those where further work was required.

The NDIA now confirms the specific IPR recommendations that will be implemented for 2018/19 from 1 July 2018. These changes will give providers immediate support to meet the challenges of transitioning to the participant centred NDIS funding approach.

Price limits for most supports will increase. For standard intensity attendant care supports, price limits will include a new 2.5% loading, following the IPR recommendation to give providers temporary support for their overhead costs (TSO). 'Attendant care' refers both to assistance with daily personal activities and assistance with community participation.

The initial IPR recommendation was that this should be put in place for one year. However, the NDIA Board has decided that this TSO measure will remain partially in place (at 1.25%) in 2019/20, rather than be removed after 12 months as originally recommended. While this

TSO loading is in place, the NDIA will continue to work to deliver initiatives which will reduce provider administrative costs and deliver a better NDIS provider experience. Significant progress has been made, with the NDIA delivering provider portal enhancements, payments process improvements, and continuous development of helpful tools such as the provider finder. The NDIA has clear initiatives for delivery over the coming financial year, which will build on this work, and will also work with providers to help improve their efficiency.

New price limits will also take full account of growth in wage costs under the Social, Community, Home Care and Disability Services Industry Award and the Equal Remuneration Order. The cumulative impact of both is 5.14%. When combined with the TSO of 2.5% for the year, this means that the price limit for standard attendant care supports will increase by 7.6% from 1 July 2018.

Group community participation supports will be converted to a new, consistent structure in the NDIS support catalogue, to give providers and participants more clarity and flexibility. Providers will also benefit from new price limits that recognise per-person costs when delivering group supports, and include an allowance for capital costs when these supports are delivered in a specialist centre.

New, more flexible arrangements for provider travel and appointment cancellations will also be introduced from 1 July 2018.

To ensure that participants are not adversely impacted by this price increase and that they can purchase their reasonable and necessary supports, the 1 July 2018 price limit changes will be accompanied by automatic updates to participant budgets and service bookings. These adjustments will reflect the additional costs that each individual participant will face as a result of the increases in price limits. Other changes, such as for cancellation and travel cannot readily be adjusted, but will be monitored closely for individual participants to ensure they are not adversely affected.

Full details of all price limit changes are being published at the same time as this advice is provided.

As advised in April, some other changes—originally envisaged to be implemented on July 1—will be delayed pending further consultation.

Specifically, this applies to therapy support. Therapy support is crucial for many participants, and providers are responding to the opportunity that the roll-out of the NDIS provides. For instance, while variations in growth rates occur among states and territories, in the year to 30 March 2018, the number of registered providers across Australia offering therapeutic supports more than doubled from 3560 to 7161. Therapy providers are the single largest group of registered providers in all states, other than Western Australia where many are expected to register now that the NDIS is fully national.

However, based on therapy provider feedback since the IPR; the interrelationship of therapy prices with the IPR's recommendations in relation to pricing for complexity; and Western Australia's decision to join the NDIS, the NDIA has asked McKinsey & Company to ensure the appropriateness of its therapy price control recommendations. The NDIA was particularly eager to ensure that initial IPR recommendations captured differences among states, including those with a substantial number of participants in remote areas, along with differentiation by therapy types. For this reason, adjustments to therapy prices will only be implemented after this work is complete and fully considered.

This approach reflects the NDIA's commitment to working collaboratively with the sector to deliver a strong, vibrant and innovative market for quality disability supports.

Following implementation of the first set of IPR recommendations, the NDIA will move immediately to finalise the next set of recommendations, including therapy price limits and complexity. Consultation with provider groups and experts from the sector in relation to these recommendations will occur before implementation. We expect the outcomes of the important work on therapy and complexity to be implemented in late 2018.

You can find more information relating to the implementation of IPR recommendations on the NDIS website: https://www.ndis.gov.au/providers/independent-pricing-review.html.

Regards

Robert De Luca
Chief Executive Officer
National Disability Insurance Agency

IPR Implementation

The NDIA confirms that the Independent Pricing Review (IPR) recommendations that will be implemented for 2018/19, taking effect on 1 July 2018 are as follows:

- 4 - Regional Travel
- 9 – High intensity loading for centre-based activities
- 10 - Short Term Accommodation
- 14 - Temporary Support for Overheads (TSO)
- 15 - Cancellation policy for core supports
- 16 - Group supports
- 18 - Therapy Assistants (phase one)
- 19 - Therapy travel (phase one)
- 20 – Cancellation policy for therapy
- 21 – Reports requested by the NDIA

Full details of these changes are available in the link to the 2018-19 NDIS Price Guide. Key changes, to take effect on 1 July 2018, include the following:

- A TSO loading of 2.5 per cent will be applied to all standard intensity attendant care price limits in the 2018-19 Price Guide.
  - This measure will provide temporary financial relief for providers as they transition to the NDIS funding approach of individualised participant packages.
  - Half of this loading (1.25%) will remain in place during 2019-20.
  - The loading will be removed in 2020-21, as an adjustment to the annual price review.
  - While the TSO loading is in place, the NDIA will continue to work on pathway initiatives that will provide ongoing cost reductions and an improved and easier experience for disability support providers.. Initiatives already underway or completed include improvements to the provider portal, provider payments systems, and helpful tools such as the provider finder.

Standard needs attendant care price limit per hour	Without TSO	TSO for 12 months	Decision - extended TSO
2017/18	$44.72	$44.72	$44.72
2018/19	$47.02	$48.14	$48.14
2019/20*	$49.44	$49.44	$50.02

*The 2019/20 figures are projections only, assuming a 3.5% growth in Modern Award wage levels on 1 July 2019.

- As in previous years, price limit increases for attendant care take full account of growth in wages under the *Social, Community, Home Care and Disability Services Industry (SCHADS) Award* as well as the Equal Remuneration Order (ERO) by Fair Work Australia. This results in the following adjustments.

	Component	Cumulative
ERO 1 December 2017	2.27%	
SCHADS wage growth 1 July 2018	3.50%	5.14%*
TSO (applies to standard intensity supports)	2.50%	7.64%

* See Appendix A for further detail.

- Combined with annual 'indexation' adjustments to account for growth in provider costs, this means that price limits will increase in 2018/19 by:
  - 7.64% for standard intensity attendant care supports (including TSO),
  - 5.14% for high intensity attendant care supports (TSO does not apply – see Appendix A), and
  - 2.1% for capacity-building supports, including therapy, based on growth in the national Wage Price Index (these supports are delivered by highly skilled workers, for whom the SCHADS award is not an appropriate reference).
- Based on provider feedback, a new price limit will be added for Short Term Accommodation (STA) to allow for a 1:3 support worker to participant ratio. The new limit will be consistent with existing STA price limits, and will provide more flexibility to providers and participants in making support arrangements.
- Providers will be able to charge 90 per cent of the service booking price for short notice cancellations, up to a maximum of 12 cancellations per year for core supports and 6 hours per year for therapy.
- New price limits will be introduced for both standard and high intensity community-based group supports, to allow for support ratios of 1:4 and 1:5 (i.e. worker:participant ratio).
- A capital allowance will be included in the price limits for centre-based group care.
- Therapy travel recommendations that will benefit providers will also be introduced from 1 July 2018 (i.e. allowing providers to charge up to 45 minutes of travel time in rural areas). More specific travel claiming arrangements for remote areas that were flagged in the IPR (allowing travel costs on a quote basis) will be implemented as soon as possible. In the meantime, travel cost arrangements for remote areas can still be claimed, subject to explicit agreement by the participant in advance.

The implementation schedule for the remaining IPR recommendations remains as outlined in the 24 April update (https://www.ndis.gov.au/news/ipr-implementation-update.html).

The NDIA is committed to ensuring that providers are supported as they transition from block funding to the participant-led NDIS, and the eventual creation of a deregulated market for services.

Participant Plans will be adjusted to match the indexation increases in price limits for disability supports, ensuring participants will maintain their purchasing power for reasonable

and necessary supports. The specific impact on each participant's budget will vary, according to the mix of supports that are reasonable and necessary for each individual.

Changes to the group support price limit tiers and cancellation and travel policies will not be adjusted in participant plan budgets. While these changes will have a positive impact on individual participants through increased flexibility, changes to support arrangements between providers and participants will only come into effect through an individual participant's choice, making it difficult to make broader adjustments. The NDIA will monitor cancellation practices, particularly in areas with high risk of cancellations and heavy reliance on provider travel (e.g. participants living in regional areas). The NDIA will consider targeted action if there is a risk to the delivery of reasonable and necessary supports, without the need for a plan review.

The 'Supported Independent Living (SIL) tool', used to determine reasonable and necessary support budgets for participants in shared accommodation arrangements, will be updated before 1 July 2018. The new version, for use in 2018/19, will include specific changes to provide for an 'indexation' adjustment of 5.14% to account for growth in wages. Consistent with the IPR recommendation, the TSO will not apply to SIL calculations. Because the SIL tool will be in use from July 1, there is no requirement for SIL benchmarks, and they will be removed from the NDIS Price Guide.

Nonetheless, existing service bookings between providers and participants for SIL will be updated as appropriate in the following ways:

- The NDIA understands that SIL providers will experience the same wage cost growth on 1 July 2018 as other providers of attendant care supports, but may not have factored this growth into their original quotes. For this reason, the NDIA is taking steps to make sure that any SIL service bookings (and participant budgets) that continue into the 2018/19 financial year are adjusted appropriately.
- In future years, SIL service bookings will not be subject to automatic updates to account for inflation. Instead, the NDIA expects that SIL providers will use the updated SIL tool to anticipate wage growth during the course of their service bookings and factor in indexation as part of their quote.

APPENDIX A

Price limits increase in the NDIS line with the increase in costs that providers face in delivering different supports. For attendant care, most of the cost is driven by wages of support workers, who are employed under the *Social, Community, Home Care and Disability Services Industry* (SCHADS) Award. Their wages increase in line with national minimum wage decisions and the Equal Remuneration Order (ERO). Some other costs that providers face, such as overheads, increase at a different rate, typically in line with general measures of inflation such as CPI. Combining these increases for different costs results in an indexation adjustment to attendant care price limits of 5.14% in 2018-19. The following table explains this calculation in detail.

<table>
<tr><th colspan="3">Components of cost growth</th><th>Cost growth</th><th>Estimated proportion of costs</th><th>Weighted average cost growth</th></tr>
<tr><td rowspan="2">Labour cost</td><td>ERO 1 December 2017</td><td>2.27%</td><td rowspan="2">A. 5.8%</td><td rowspan="2">C. 82%</td><td rowspan="3">5.14%
A * C + B * D</td></tr>
<tr><td>SCHADS wage growth 1 July 2018</td><td>3.5%</td></tr>
<tr><td>Other Cost</td><td>CPI</td><td>1.9%</td><td>B. 1.9%</td><td>D. 18%</td></tr>
</table>

Combined with annual ‘indexation’ adjustments to account for growth in provider costs, this means that price limits will increase in 2018/19 by:

- 7.64% for standard intensity attendant care supports (including TSO),
- 5.14% for high intensity attendant care supports (high intensity supports will be addressed by more specific IPR recommendations, so the IPR recommended that the TSO apply to standard intensity supports only), and
- 2.1% for capacity-building supports, including therapy, based on growth in the national Wage Price Index (these supports are delivered by highly skilled workers, for whom the SCHADS award is not an appropriate reference).

NDIS Price Guide 2019-20

Scope of the NDIS Price Guide

Where possible, the National Disability Insurance Agency (NDIA) utilises market mechanisms to deliver the level of supply required by the National Disability Insurance Scheme (NDIS) to meet participant demand and deliver the correct mix of goods/services, produced at market clearing (efficient) prices. However, in underdeveloped or non-existent markets, reliance on a deregulated market mechanism may not meet participant demands; may not deliver adequate supply; may not deliver the correct mix of disability supports and may not produce efficient prices. To address these issues, the NDIA has a role, as market steward, to create an efficient and sustainable marketplace through a diverse and competitive range of suppliers who are able to meet the needs of a consumer driven market.

As part of its market stewardship role, the NDIA imposes price controls on some supports by limiting the prices that registered providers can charge for those supports and by specifying the circumstances in which registered providers can charge participants for supports. Price controls are in place to ensure that participants receive value for money in the supports that they receive. In the short to medium term, price controls are required for some disability supports because the markets for disability goods and services is not yet fully developed. The longer-term goal of the NDIA is to remove regulatory mechanisms from the markets for disability supports.

This Price Guide is a summary of NDIS price limits and the associated pricing arrangements that will apply from 1 July 2019 as set by the NDIA. It is designed to assist participants and disability support providers, both current and prospective, to understand the way that price controls for supports and services work in the NDIS. The price limits within this Price Guide are the maximum prices that Registered Providers can charge NDIS participants for specific supports. There is no requirement for providers to charge at the maximum price for a given support or service. Participants and providers are free to negotiate lower prices.

Currently, the NDIA varies its approach to the regulation of prices, depending on market conditions, between:

- **No regulation** (deregulated markets): this is typically used in cases where markets are highly competitive – for example, transport.
- **The imposition of price limits**: these represent a maximum allowable price payable by participants for types of supports. This approach is used in a significant number of markets, which are still developing and growing, such as those for attendant care.
- **Quotable supports**: in which participants are expected to obtain quotations from suppliers to provide to the NDIA, which will verify that the prices are fair and reasonable. This approach is typically used in the case of highly specialised, differentiated supports that may not have a high level of competition – for example, assistive technology. They are also used in cases, such as supported independent living, where a bundle of supports is being purchased.

This Price Guide is principally concerned with NDIS supports that are subject to price limits. A comprehensive list of all NDIS supports (“the Support Catalogue”) is at

https://www.ndis.gov.au/providers/price-guides-and-information. The Support Catalogue includes item descriptors to assist providers to claim payments using a “best-fit” approach, and to assist participants in engaging and negotiating with service providers.

The NDIA publishes separate price guides for:

- Assistive Technology at https://www.ndis.gov.au/providers/essentials-providers-working-ndia/providing-assistive-technologies-and-home-modifications
- Specialist Disability Accommodation at https://www.ndis.gov.au/providers/essentials-providers-working-ndia/specialist-disability-accommodation

Application of this Price Guide

The price limits and other arrangements in this Price Guide must be followed when supports are delivered to NDIS participants who have either an agency-managed plan or a plan manager.

A provider of supports to a participant with an agency-managed plan (or of a support that is agency managed):

- must be a registered provider with the NDIS;
- must declare relevant prices to participants before delivering a service, including any notice periods or cancellation terms;
- must adhere to the arrangements in the Price Guide, including ensuring that their prices do not exceed the price limits prescribed in the Price Guide

Plan managers can purchase supports on behalf of participants from either registered or unregistered providers, but they are registered providers themselves, and therefore responsible for ensuring that prices paid for supports on behalf of their participants adhere to the arrangements in the Price Guide, including price limits.

Self-managing participants can use registered or unregistered providers and are not subject to the pricing arrangements in the Price Guide.

In addition, all registered providers, regardless of whether funding for the support is managed by the participant, managed by a registered provider, or managed by the NDIA, must not add any other charge to the cost of the supports they provide, including credit card surcharges, or any additional fees including any ‘gap’ fees, late payment fees or cancellation fees.

Support Purposes, Categories and Line Items

This section describes the way that the NDIS categorises disability supports. These categories can be relevant to rules for participants about how they can spend their support budgets, and for providers when seeking payment for delivered supports.

Support Purpose Types

NDIS participant budgets can be allocated to three separate types of support purpose:

1. CORE – Supports that enable participants to complete activities of daily living. Participant budgets often have a lot of flexibility to choose specific supports with their core support budgets, but cannot reallocate this funding for other support purposes (i.e. capital or capacity building supports).
2. CAPITAL – Investments, such as assistive technologies - equipment, home or vehicle modifications, or for Specialist Disability Accommodation (SDA). Participant budgets for this support purpose are restricted to specific items identified in the participant's plan.
3. CAPACITY BUILDING - Supports that enable a participant to build their independence and skills.

Support Categories aligned to the NDIS Outcomes Framework

Participant budgets are allocated at a support category level and must be used to achieve the goals set out in the participant's plan.

Support categories are aligned with the NDIS Outcomes Framework, which has been developed to measure goal attainment for individual participants and overall performance of the Scheme. There are eight outcome domains in the Framework, which help participants think about goals in different areas of their life and assist planners explore where supports in these areas already exist and where further supports are required. These domains are:

1. Daily Living	5. Work
2. Home	6. Social and Community Participation
3. Health and Wellbeing	7. Relationships
4. Lifelong Learning	8. Choice and Control

NDIS service providers should be aware that all supports and services for NDIS participants must contribute to the achievement of their individual goals as outlined in the participant's plan. Support purpose categories are designed to align with the Outcomes Framework and the 15 support categories (listed below). This helps participants choose supports that help them achieve their goals, and providers to understand how the supports they provide contribute to the participant's goals. The following table shows the links between support purpose types, domains in the Outcomes Framework and support categories.

SUPPORT PURPOSE	OUTCOME DOMAINS in FRAMEWORK	SUPPORT CATEGORY
CORE	Daily Living Daily Living Daily Living Social & Community Participation	Assistance with Daily Life Transport Consumables Assistance with Social & Community Participation
CAPITAL	Daily Living Home	Assistive Technology Home Modifications and Specialised Disability Accommodation (SDA)
CAPACITY BUILDING	Choice & Control Home Social and Community Participation Work Relationships Health & Wellbeing Lifelong Learning Choice and Control Daily Living	Support Coordination Improved Living Arrangements Increased Social and Community Participation Finding and Keeping a Job Improved Relationships Improved Health and Wellbeing Improved Learning Improved Life Choices Improved Daily Living Skills

Support Line Items

Each support category has many specific supports and services that are recognised in the NDIS payment system. These are referred to as 'support line items' and are, in most cases, not prescribed in participant plans.

Providers should claim payments against a support line item that most closely aligns to the service they have delivered.

Each support line item has a unique reference number, according to the following structure:

For example:

01_013_0107_1_1 - Assistance With Self-Care Activities - Standard - Saturday

Support Category	Sequence Number	Registration Group	Outcome Domain	Support Purpose
1	013	0107	1	1

Units of Measure

The NDIS payment system includes units of measure to suit each support line item as follows:

• Each	• Hour	• Daily
• Week	• Month	• Annual

Claiming supports and services

Registered Providers can make a claim for payment for a support once that support has been delivered or provided. Where price limits apply, prices charged to participants must not exceed the price limit prescribed for that support in this Guide. Providers cannot add any other charges to the cost of the support, including credit card surcharges, or any additional fees including any 'gap' fees, late payment fees or cancellation fees unless otherwise stated in this Price Guide.

When claiming, it is the responsibility of the provider to ensure that the claim accurately reflects the supports delivered, including the frequency and volume of supports. Falsifying claims for any aspect of supports delivered, is a serious compliance issue and may result in action against the provider. Providers are also required to keep accurate records of claims, which are subject to audit at any time.

Providers should claim payments against a support line item that most closely aligns to the service they have delivered.

Service Agreements

A Service Agreement is a formal agreement between a participant and provider. They help to ensure there is a shared understanding of:

- expectations of what supports will be delivered and how they will be delivered; and
- the respective responsibilities and obligations of the provider and the participant and how to resolve any problems that may arise.

Service Bookings

Service bookings are used to set aside funding for an NDIS registered provider for a support or service they will deliver. Each service booking sets out the specific supports or support domains agreed to be provided and the length of time that agreement is applicable within the current participant plan dates. Service bookings are not the same as 'service agreements', which set out the terms and conditions negotiated with the participant.

The Agency recommends that service bookings are created at the category level, where possible. This allows providers and participants to negotiate or access supports on a more flexible basis, especially for on-the-spot assessments or less predictable support needs. This is preferable to having to edit existing service bookings or create another service booking for that item at a later date or have funds locked into a support line item that may not eventuate, which restricts funding for alternate services.

See the 'NDIS Myplace Provider Portal Step-by-step guide' on the Provider Toolkit for further information.

Special NDIS Pricing Arrangements

Regional, Remote and Very Remote Areas

The NDIA uses the Modified Monash Model (MMM) to determine regional, remote and very remote areas using a scale based on population size and locality (see Table below).

	Zones	MMM	Inclusion
Metropolitan	MMM 1-3	1	All areas categorised as Major Cities of Australia.
		2	Areas categorised as Inner Regional Australia or Outer Regional Australia that are in, or within 20km road distance, of a town with population >50,000.
		3	Areas categorised as Inner Regional Australia or Outer Regional Australia that are not in MM 2 and are in, or within 15km road distance, of a town with population between 15,000 and 50,000.
Regional	MMM 4-5	4	Areas categorised as Inner Regional Australia or Outer Regional Australia that are not in MM 2 or MM 3, and are in, or within 10km road distance, of a town with population between 5,000 and 15,000.
		5	All other areas in Inner Regional Australia or Outer Regional Australia.
Remote	MMM 6	6	All areas categorised Remote Australia that are not on a populated island that is separated from the mainland and is more than 5km offshore.
Very Remote	MMM 7	7	All other areas – that being Very Remote Australia and areas on a populated island that is separated from the mainland in the ABS geography and is more than 5km offshore.

Further details on the MMM can be found on the Department of Health's DoctorConnect website, which contains a resource to look up the MMM area for particular locations[1].

Participants located in MMM4 and MMM5 areas are classified as 'Regional', MMM6 as 'Remote', and MMM7 as 'Very Remote'. In general, price limits are 40% higher in remote areas and 50% higher in very remote areas. There is no additional loading applied for supports in regional areas.

Providers should refer to support price limits based on where the support is delivered, which is not necessarily where the participant lives. For example, if a participant living in a Remote location visits a therapist in their capital city, the therapist should not attempt to claim a price that is higher than the price limit for the support in that city. On the other hand, if the therapist was to visit the participant in their local area to deliver the support, then the therapist could claim a price that is within the limit set by the 'Remote' Price Guide.

If local providers are not available, the NDIA may enter into arrangements (and at times contracts) with specific providers for provision of services to more remote regions. The contract with a service provider will specify the cost of travel and any other associated expenses in these areas.

Temporary Transformation Payment (TTP)

Providers of attendant care and community participation supports who meet the eligibility criteria set out below will have access to a higher price limit through a Temporary

[1] www.doctorconnect.gov.au/internet/otd/publishing.nsf/Content/locator

Transformation Payment (TTP). This conditional loading will assist providers to continue transforming their businesses in the move towards a more competitive marketplace. This replaces the Temporary Support for Overheads.

In order to access the higher TTP price limits, providers will have to:

- publish their service prices;
- list their business contact details in the Provider Finder and ensure those details are kept up-to-date; and
- participate annually in an Agency-approved market benchmarking survey.

TTP Providers will have to until 31 December 2019 to meet these requirements, and to include in their contractual arrangements with their participants that they are entitled to use the TTP support items (and price limits) because they are compliant with the TTP terms.

That is, in the first year, providers can commence making claims using the TTP items from 1 July 2019, and will have until 31 December 2019 to meet the three compliance requirements. In later years, providers will need to be complaint by the start of the financial year, noting that the Benchmarking Requirement is met up until 31 December of any year by the provider's intention to take part in the next Benchmarking Survey, and after that date by actual participation in the most recent Benchmarking Survey.

Providers who become non-compliant during a financial year should not claim for TTP items while they are non-compliant.

Every support item in scope of the TTP has two support line items and two price limits. The non-TTP item should be used by providers who are not compliant with the TTP conditions. The TTP item should be used by providers who are compliant with the TTP conditions, an example is given in the following Table.

01_011_0107_1_1	Assistance With Self-Care Activities - Standard - Weekday Daytime
01_011_0107_1_1_T	Assistance With Self-Care Activities - Standard - Weekday Daytime - TTP

There will be no formal registration process for TTP. Providers will be required to acknowledge compliance to the TTP terms when submitting a payment request through the myplace Provider Portal. By claiming TTP items through the NDIA payment system, or from a plan manager, providers are warranting that they have complied with the TTP conditions, or intend to comply with the TTP conditions by the relevant time.

Plan managers will not be responsible for ensuring providers are TTP compliant – that is, they will be able to accept the claim for a TTP support item by a provider as proof of TTP compliance.

Billing for non-direct services

Provider Travel

Providers can only claim travel costs from a participant in respect of the delivery of a support item if the Support Catalogue indicates that providers can claim for Provider Travel in respect of that support item.

Providers who intend to claim travel costs from a participant must have the agreement of the participant in advance (i.e. the service agreement between the participant and provider should specify the travel costs that can be claimed).

Where a worker is travelling to provide services to more than one participant in a 'region' then the provider can apportion that travel time between the participants equally as long as they have the agreement of each participant in advance.

Where a provider is permitted to claim for travel time then they can only claim for travel time if either:

- the provider is required to pay the worker delivering the support for the time they spent travelling as a result of the agreement under which the worker is employed; or
- the provider is a sole trader and is travelling from their usual place of work to or from the participant, or between participants.

Where a provider claims for travel time in respect of a support then the maximum amount of travel time that they can claim for each participant (for each eligible worker) is 30 minutes in MMM1-3 areas; and 60 minutes in MMM4-5 areas. (Note the relevant MMM classification is the classification of the area in which the participant lives.)

Claims for travel in respect of a support need are made separately to the claim for the support using the line item for the support and the code "Provider Travel".

When claiming for travel in respect of a support a provider can use the same hourly rate as they have agreed with the participant for the support for the basis of calculating the claimable travel cost.

Cancellations

Where a provider has a short notice cancellation (or no show) they are able to recover 90% of the fee associated with the activity, subject to the terms of the service agreement with the participant.

A cancellation is a short notice cancellation (or no show) if the participant has given

- less than 2 clear business days' notice for a support that is less than 8 hours continuous duration and worth less than $1000; and
- less than 5 clear business days' notice for any other support.

There is no limit on the number of short notice cancellations (or no shows) that a provider can claim in respect of a participant.

However, providers have a duty of care to their participants and if a participant has an unusual number of cancellations then the provider should seek to understand why they are occurring.

The NDIA will monitor claims for cancellations and may contact providers who have a participant with an unusual number of cancellations.

NDIA Reporting

Providers will be expected to provide progress reports to the participant and NDIS at agreed times. A provider may charge for the time taken to write a therapy report (including functional assessment) that is requested by the NDIA, and claim this against the appointment at the hourly rate for the relevant support item. A report requested by the NDIA is considered a report that is required at the commencement of a plan which outlines plan objectives and goals, and at plan review which measures functional outcomes against the originally stipulated goals. Providers are also expected to make recommendations for ongoing identified needs (informal/community/mainstream and/or funded supports). Providers may charge for any other NDIA-requested therapy report that is stipulated as being required in a participant's plan.

Non-Face-to-Face Supports

Non face to face activities are billable if:

- the activities are part of delivering a specific disability support item to that participant (rather than a general activity such as enrolment, administration or staff rostering),
- the provider explains the activities to the participant, including why they represent the best use of the participant's funds (i.e. explains the value of these activities to the participant),
- the proposed charges for the activities comply with the NDIS Price Guide, and
- the participant agrees to pay for the activities (preferably in a formal service agreement).

For example, the Assistance with Self Care support items are described as covering activities "Assisting with, and/or supervising, personal tasks of daily life to develop skills of the participant to live as autonomously as possible". Therefore, time spent on non-face to face activities that assist the participant - for example, writing reports for co-workers and other providers about the client's progress with skill development – could be charged against this support item.

On the other hand, time spent on administration, such as the processing of NDIS payment claims for all clients, is outside the description of the support item and should not be claimed against an individual participant's budget. The NDIS price controls include an allowance for overheads, so that providers can fully recover the efficient costs, including the costs of administration tasks.

The method of charging is as hours of support time against the relevant support item, rather than a separate fee. Service agreements with each client can ‘pre-authorise' these activities, but providers should only charge a participant for delivering a support item if they have completed activities that are part of the support for that participant. Charging a fee that is not linked to completed activities would not be appropriate.

It is not appropriate to charge all participants an average additional fee. The additional fee must be worked out in each case and related specifically to the non-face-to-face services delivered to the particular participant. This is not to say that the same additional fee might end up being charged to a number of participants, but it must be worked out separately.

Administrative activities, even if they can be attributed to individual clients, are not billable. These are covered by the overhead component of the price, such non-billable activities include:

- Pre-engagement visits
- Developing and agreeing Service Agreements
- Entering participant details into system
- Making participant service time changes
- Staff / participant travel monitoring and adjustment
- Ongoing NDIS plan monitoring
- Completing the Quoting tool
- Making service bookings
- Ending participant services in the system

Other Payment Considerations

This section outlines various other considerations that may be relevant to participants and providers. These should be reviewed when entering into a new Service Agreement or if there is a significant change in the participant’s circumstances.

Medicare and insurance

Some elements of a participant’s care may be covered by funds outside the NDIS. These expenses are commonly medical, including those covered by private health insurance or Medicare. These medical expenses are not funded under the NDIS, even if they are related to, or a symptom of the disability. These expenses should be claimed under the relevant health care scheme or insurance policy. Some providers (e.g. therapists) may need to distinguish between the health services and disability supports that they provide to a single client, and make separate payment claims (e.g. claim payments from Medicare for health services, and the NDIS for disability supports).

Prepayments

Registered Providers can make a claim for payment once that support has been delivered or provided. Prepayment is not permitted unless the NDIA has given prior approval in writing to the Registered Provider. This will only occur in exceptional circumstances such as for certain assistive technologies, home modifications and remote area servicing where this has been agreed to by the participant.

Co-Payments for Capital items, including assistive technology

Co-Payments by the participant are not required; however, where the participant would like a customisation to a support or assistive technology that is not considered reasonable or necessary, they are required to pay for this themselves. These may include an aesthetic customisation to an assistive technology or modifications to a vehicle that are additional to the assistive components.

Goods and Services Tax (GST)

Most items are GST-Free, as per Australian Tax Office information about GST and NDIS and the application of section 38-38 of the GST Act[2]. For a small number of items where GST is applicable (for example, delivery fees and building materials), the price is inclusive of GST.

Other fees (Commissions and exit fees)

Participants are not required to pay exit fees, even when changing providers part way through a plan. A core principle of the NDIS is choice and control for participants, allowing them to change providers without expense. Further information on establishment fees claimable by the incoming provider can be found below under *Establishment fee for personal care/community access*.

[2] http://www8.austlii.edu.au/cgi-bin/viewdoc/au/legis/cth/consol_act/antsasta1999402/s38.38.html

Core – Assistance with Daily Life (includes Supported Independent Living)

This support category relates to assisting with and/or supervising personal tasks of daily life to enable the participant to live as autonomously as possible. These supports are provided individually to participants and can be provided in a range of environments, including but not limited to, the participant's own home.

Daily Personal Activities, including High Intensity Daily Personal Activities

A hierarchy of price controls applies to this group of supports, based on:

A) The time of day that the support is delivered;

B) The day of week that the support is delivered;

C) Whether the support is Standard Intensity or High Intensity;

D) If the support is High Intensity then whether it is a Level 1(Standard), Level 2 (High Intensity) or Level 3 (Very High Intensity) support; and

E) Whether the provider is eligible for the Temporary Transformation Payment.

Time of day

In determining which price control is applicable to a support, providers should note that a support is considered to be:

- A Daytime Support is it is delivered between 6 am and 8 pm;
- An Evening Support if it is delivered after 8 pm and before 12 midnight; and
- An Overnight Support is it is delivered between 12 midnight and 6 am.
- Overnight is where the support finishes after 12 midnight and before 6am.

Day of week

In determining which price control is applicable to a support, providers should note:

- A weekday is Monday to Friday;
- The extra rates paid for Saturday, Sunday and Public holidays are in substitution for, and not cumulative upon, the shift premiums payable for evening and overnight supports.
- The extra rates for Saturday/Sunday/Public holidays do not increase further when the support finishes after 8pm.

High intensity

A support is considered a high intensity support if the participant requires assistance from a support worker with additional qualifications and experience relevant to the participant's complex needs. The high intensity price limits may be considered when:

- Frequent (at least 1 instance per shift) assistance is required to manage challenging behaviours that require intensive positive behaviour support; and/or
- Continual active support is required due to high medical support needs (such as unstable seizure activity or respiratory support)

In determining which price limit for High Intensity Supports should apply to a given support, the provider should consider the skills and experience of the worker delivering the support. In general, the Level 2 price limit applies to most high intensity supports. However, if the particular instance of support is delivered by a worker who does not have the skills and experience to deliver a high intensity support then the Level 1 price limit should be applied. If the particular instance of the support is delivered by a more highly skilled or experienced worker then the provider can consider applying the Level 3 price cap, with the participant's prior agreement.

Other matters

Provisions for 'shadow shifts'

Shadow shifts may be considered where the participant has complex individual support needs that are best met by introducing a new worker to the participant before it is reasonable that they commence providing the support independently. These are considered where the specific individual support needs include:

- Very limited communication;
- Behaviour support needs; and/or
- Medical needs/procedures such as ventilation or home enteral nutrition.

Where the individual would require shadow shifts to assist with the introduction of new workers, and this is the desired method by the participant or their family, the provider may claim for up to 6 hours of weekday support per year.

Introducing new workers is not designed to replace formal, recognised training that will be provided by an employer to their workforce, such as Shadowing (or "Buddying") less experienced staff or new staff with experienced workers or informal carers to help build knowledge and social capital (worker retention), which is not claimable under the NDIS.

Establishment fee for personal care/community access

This fee applies to all new NDIS participants in their first plan where they receive at least 20 hours of personal care/community access support per month. This payment is to cover non-ongoing costs for providers establishing arrangements and assisting participants in implementing their plan. The establishment fee is claimable by the provider who assists the participant with the implementation of their NDIS Plan, delivers a minimum of 20 hours per month of personal care/community access support and has made an agreement with the participant to supply these services.

The establishment fee will operate as follows:

- Providers can charge $500 against a plan if assisting a new participant, who is new to NDIS and new to the provider.
- A provider can charge $250 when they are maintaining an existing client of theirs who is commencing as a participant of the NDIS.
- Should a participant wish to change providers on commencing their first NDIS plan, $250 is available to the new provider. This is to assist the participant in changing providers.
- A budget of $750 is included in the first plan for NDIS participants, in case they need this type of assistance from providers to design and implement support arrangements.

Assistance with household tasks

These support items enable participants to maintain their home environment. This may involve undertaking essential household tasks that the participant is not able to undertake.

Preparation and delivery of meals

This support item is for the preparation and delivery of food to participants who are unable to do this themselves, and are not in receipt of other supports that would meet the same need. The cost of the food itself is not covered by the NDIS. The cost of this support will vary based on the number of meals prepared and the deliveries required.

Assistance in Shared Living Arrangements – Supported Independent Living

Supported Independent Living (SIL) is the assistance with and/or supervising tasks of daily life in a shared living environment, with a focus on developing the skills of each individual to live as autonomously as possible. The support is provided to each person living in the shared arrangement in accordance with their need.

SIL does not include rent, board and lodging or other day to day usual living expenses such as food and activities. It also does not include the capital costs associated with a participant's accommodation.

SIL does not have fixed price limits, and providers can quote for the specific SIL service that they offer to each participant. To assist providers with quoting, the NDIA has developed a Provider SIL Pack[3]. The Provider SIL Pack contains templates that assist providers in developing an individualised quote. The purpose of this quote is to identify:

- The individual supports that will be available for the person, focused on maximising the person's capacity to be as independent as possible with household decision making, personal care and domestic tasks,
- The typical roster of supports that is shared between participants to maximise the efficient use of resources, and

[3] https://www.ndis.gov.au/providers/essentials-providers-working-ndia/supported-independent-living

- What supports are available to all residents to ensure the smooth operation and running of the household.

Once a quote is received, the NDIA uses a 'SIL Tool' to analyse provider quotes and to make sure that they represent value for money. In some cases, negotiation between the NDIA and providers will be necessary to agree appropriate prices for SIL.

Short Term Accommodation and Assistance

From time to time, participants may require temporary supports that are different from their usual arrangements. These are non-typical days and may include short stays in a group-based facility (short term accommodation), or the purchase of additional in-home support.

For the purposes of this Price Guide, the 'short term accommodation' price limit includes all expenses in a 24 hour period including assistance with daily personal activities, accommodation, food and negotiated activities. Typically, this type of support would be used for short periods of up to 14 days at a time. For longer term arrangements, other options are likely to be more appropriate (e.g. Supported Independent Living).

In cases where a participant will receive substantially less than 24 hours of assistance with daily personal activities, it may be appropriate for the participant and provider to negotiate a lower price than the maximum price specified in this Guide, based on the actual support provided. This situation might arise, for example, if a participant enters a short term accommodation facility in the evening, and exits again early the following morning. Also, where a participant enters accommodation late in the day, it may be appropriate to claim the daily rate for the day of the week that the majority of the support is provided. In each case, support arrangements, including price, should be **agreed with participants in advance**.

Short term accommodation price limits vary according to the support needs of the participant and the day of the week the support is provided. Providers claiming at the rates for high intensity (i.e. ratio of 1 support worker for 2 participants) or 1:1 support must deliver assistance with daily personal activities at those support ratios for the duration of the participant's stay.

CORE - Transport

Transport enables participants to access disability supports outside their home, and to pay for transport that helps them to achieve the goals in their plan. Transport supports generally do not have price controls; however, participants should use the least expensive transport that meets their needs. Transport funding is paid fortnightly in advance to self-managed participants. Funding transport assistance is limited to those who cannot use public transport due to their disability. If the participant has questions about their transport support, providers may direct them to the NDIS factsheet available on the NDIS Website[4].

Accompanying participants for community access

Providing community access supports may, at the request of a participant, involve a worker accompanying a participant on a community outing and/or transporting a participant from their home to the community. In these situations, the worker's time can be claimed at the hourly rate for the relevant support item for the total time the worker provides support to one or more participants, including time spent accompanying and/or transporting the participant. Where a provider is transporting two or more participants on the same trip, the worker's time should be claimed at the appropriate group rate for the relevant support.

Contribution towards costs of transport itself

If a provider incurs costs, in addition to the cost of a worker's time, when accompanying and/or transporting participants in the community (such as cost of ticket for public transport), they may negotiate with the participant for them to make a reasonable contribution towards these costs. A participant's support budget may include funding for transport, and this funding can be used for these types of contributions, which should be clearly specified in the service agreement.

[4] https://www.ndis.gov.au/participants/creating-your-plan/plan-budget-and-rules/transport-funding

CORE - Consumables

Consumables are a support category available to assist participants with purchasing everyday use items. Supports such as continence and home enteral nutrition (HEN) products are included in this category. More information on these supports can be found in the *Assistive Technology and Consumables Code Guide* on the Assistive Technology webpage[5].

[5] https://www.ndis.gov.au/providers/essentials-providers-working-ndia/providing-assistive-technologies-and-home-modifications

CORE - Assistance with Social and Community Participation

These supports enable a participant to engage in community, social or recreational activities. They may be provided in a centre or in community settings at standard or higher intensity rates. If arranged in advance with participants, providers may charge up to 4 hours for each plan period to document proposed supports and expected outcomes. Price limits vary according to the support needs of the participant and the day of the week the support is provided.

Providers should not claim payment for:

- Expenses related to recreational pursuits, such as event tickets for the participant, as they are not covered by the NDIS.
- The cost of travel or entry for a paid support worker to attend a social or recreational event.

A hierarchy of price controls also applies to this group of supports, based on:

A) The time of day that the support is delivered;

B) The day of week that the support is delivered;

C) Whether the support is Standard Intensity or High Intensity;

D) If the support is High Intensity then whether it is a Level 1(Standard), Level 2 (High Intensity) or Level 3 (Very High Intensity) support; and

E) Whether the provider is eligible for the Temporary Transformation Payment.

(See the definitions and notes in the Assistance with Daily Living Support Category.)

Community and social activity costs

This support is included in a participant's plan to enable them to pursue recreational activities and engage in the community when associated with a participant's disability and goals. Participants may use this funding for activities such as camps, vacation and outside school hours' care, course or membership fees. More information can be found in the Operational Guidelines[6]

Where appropriate, funded hours in a Community Access budget may be converted to a fee and claimed by a provider for these purposes.

Group based supports

Assistance to access community, social and recreational activities is often provided in a group setting, either in the community or in a centre.

A hierarchy of price controls applies to group based supports, based on:

[6] https://www.ndis.gov.au/about-us/operational-guidelines/including-specific-types-supports-plans/including-specific-types-6

A) The time of day that the support is delivered;

B) The day of week that the support is delivered;

C) Whether the support is Standard Intensity or High Intensity (complex);

D) Whether the provider is eligible for the Temporary Transformation Payment;

E) The size of the group and ratio of staff to participants; and

F) Whether the support is provided in a Centre or in the community.

(See the definitions and notes in the Assistance with Daily Living Support Category.)

For support ratios that are not stated in this Guide (e.g. two workers for three participants), participants and providers should discuss and agree the most appropriate line item to be used for payments, and the appropriate price to be paid (which might be lower than the price limit for that line item).

Capital – Assistive Technology

This support category includes all aids or equipment supports that assist participants to live independently or assist a carer to support the participant. It also includes related delivery, set-up and some training support items. Usually, providing independent advice, guidance, trials, set-up and training (not bundled with sale of an item) is funded through a capacity building support.

More detailed information on assistive technologies and consumables codes can be found in the *Assistive Technology and Consumables Guide* on the Assistive Technology webpage[7].

Vehicle Modifications

Vehicle modifications include the installation of, or changes to, equipment in a vehicle to enable a participant to travel safely as a passenger or to drive.

A participant is free to choose a more expensive option at their own expense, where the more expensive option is not considered to be reasonable and necessary. An example of this situation would be where a vehicle modification has been approved for a participant, but the participant would like cosmetic or personalised fittings that are not related to their disability or are more expensive than others that have an equivalent function. In this situation, the NDIA will cover the reasonable and necessary component of the modification, and the participant will pay the additional cost.

[7] https://www.ndis.gov.au/providers/at/supplying-at.html

Capital – Home Modifications and Specialist Disability Accommodation

This support category includes home modifications and Specialist Disability Accommodation (SDA) supports.

Home Modifications

Home modifications include design, construction, installation of or changes to equipment or non-structural components of the building, and installation of fixtures or fittings, to enable participants to live as independently as possible or to live safely at home. All home modifications in excess of $1,500 are quotable.

A participant is free to choose a more expensive option or modification that achieves the same outcome at their own expense, where the more expensive option is not reasonable and necessary. For example, where a home modification has been approved for a participant, but the participant would like cosmetic or personalised fittings that are not reasonable and necessary, the NDIA will provide funding for the reasonable and necessary component of the modification, and the participant will pay any extra costs.

Specialist Disability Accommodation (SDA)

SDA funding is intended for participants who require a specialist dwelling that reduces their need for person-to-person supports, or improves the efficiency of the delivery of person-to-person supports. SDA funding will only be provided for participants who meet the eligibility criteria. Participants who meet the eligibility criteria will have an extreme functional impairment and/or very high support needs.

SDA does not refer to the support services, but the homes in which these are delivered. SDA may include special designs for people with very high needs or may have a location or features that make it feasible to provide complex or costly supports for independent living.

SDA payments are an adjusted contribution to the cost of capital required for the land and physical building required for SDA needs. Importantly, SDA funding is not intended to cover personal support costs, which are assessed and funded separately by the NDIS. SDA also does not cover accommodation costs where these are not linked to a person's disability or where specialist accommodation with integrated supports is not required. SDA is a separate support category and does not replace Supported Independent Living (SIL) or any other support. Participants receiving SDA could also be eligible for SIL supports in their package.

All providers who are registered with the NDIA for the Registration Group 'Specialist Disability Accommodation' will also be required to declare and ensure that the infrastructure meets the NDIA's specialist built form requirements and the relevant legislation and standards applicable to the state in which the accommodation is situated. These individual sites/locations must also be enrolled with the NDIA.

Due to the nature of the support, the identification of maximum SDA prices and the process by which providers can claim for SDA are more complex than for most other supports. Providers should refer to the Specialist Disability Accommodation section of the NDIS

website for detailed information about maximum prices that can be charged, dwelling enrolment and participant assessments[8].

SDA has two support line items: Specialist Disability Accommodation and SDA person-specific adjustments.

Each SDA dwelling has a unique maximum price, based on a standard set of factors. There are also limits on the amount that providers of SDA can charge participants in addition to the SDA price, for rent and other board-like services provided. Providers should refer to the SDA section of the NDIS website for detailed guidance on maximum prices[9]. Participants are able to choose to move between SDA dwellings, as long as the SDA dwelling is commensurate with their SDA budget.

SDA person specific adjustments

In certain limited circumstances, the NDIA will continue to make SDA payments on behalf of a participant who has moved out of an enrolled SDA dwelling. Provided all conditions are met in section 6.3 of the *National Disability Insurance Scheme (Specialist Disability Accommodation) Rules 2016*, vacancy payments may continue to be made for a period of up to 90 days if the dwelling is enrolled to house four or five residents, or up to 60 days if the dwelling is enrolled to house two or three residents[10]. Vacancy payments will not be made where a dwelling is only enrolled to house one resident. Vacancy payments will only be payable if the vacancy is available to another NDIS participant and the NDIA has been notified.

Capacity Building - Support Coordination

Support Coordination (if required) is included in the Capacity Building budget. This is a fixed amount for strengthening participant's abilities to coordinate and implement supports in their plans and to participate more fully in the community.

There are three items in the NDIS Price Guide that describe different layers of support coordination activity.

Level 1: Support Connection

Assistance for participants to implement their plan by strengthening the ability to connect with the broader systems of supports and understand the purpose of the funded supports and participant in the community Support Connection will assist a participant to understand their NDIS plan, connect participants with broader systems of supports, and provide assistance to connect with providers. Support Connection will assist participants to achieve effective utilisation of their NDIS plan.

Support Connection will increase a participant's capacity to maintain (or in some cases change) support relationships, resolve service delivery issues, and participate independently in NDIA processes.

Where a participant aged 0-6 years is receiving assistance from Partners in the Community (PITC) delivering Early Childhood Early Intervention (ECEI) services, linking the family to a service provider/s (under ECEI best practice principles, a service provider operating under the key worker approach) and support through changes in circumstance will be delivered through Partner arrangements.

Where a participant aged 7 and over is receiving assistance from Partners in the Community (PITC) delivering Local Area Coordination (LAC) services, plan implementation and monitoring support will be delivered by a Participant's Local Area Coordinator.

Level 2: Coordination of Supports

The delivery of Coordination of Supports is to assist strengthening a participant's ability to design and then build their supports with an emphasis on linking the broader systems of support across a complex service delivery environment. Coordination of Supports is to focus on supporting participants to direct their lives, not just their services. This involves working together to understand the funding, identify what participants expect from services, and how participants want this designed. Coordination of Supports also includes coaching participants, and working with participants to develop capacity and resilience in their network.

Support coordinators are focused on assisting participants to build and maintain a resilient network of formal and informal supports.

It is generally expected participants will develop their capacity to implement and manage their supports and network more independently over time. Some participants, however, will require Coordination of Supports funding in subsequent plans to support ongoing capacity

building or manage the complexity within the participant support environment and/or circumstances. This is to be identified in the plan review process.

Over time, as a participant's capacity is strengthened, this support may be replaced by Support Connection or the introduction of a Local Area Coordinator or Early Childhood Early Intervention Partner in subsequent plans.

Level 3: Specialist Support Coordination

Specialist Support Coordination is delivered utilising an expert or specialist approach, necessitated by specific high complex needs or high level risks in a participant's situation. Specialist Support Coordination is delivered by an appropriately qualified and experienced practitioner to meet the individual needs of the participant's circumstances such as a Psychologist, Occupational Therapist, Social Worker, or Mental Health Nurse. Specialist Support Coordination will address highly complex barriers impacting on the ability to implement their plan.

Specialist support coordination is expected to address complex barriers impacting a participant's ability to implement their plan and access appropriate supports. Specialist support coordinators assist participants to reduce complexity in their support environment, and overcome barriers to connecting with broader systems of supports as well as funded supports.

Specialist support coordinators are expected to negotiate appropriate support solutions with multiple stakeholders and seek to achieve well-coordinated plan implementation. Specialist support coordinators will assist stakeholders with resolving points of crisis for participants, assist to ensure a consistent delivery of service and access to relevant supports during crisis situations.

Specialist support coordination is generally delivered through an intensive and time limited period necessitated by the participant's immediate and significant barriers to plan implementation. Depending on individual circumstances, a specialist support coordinator may also design a complex service plan that focuses on how all the stakeholders in a participant's life will interact to resolve barriers and promote appropriate plan implementation. Once developed a specialist support coordinator will continue to monitor the plan, but it may be maintained by one of the participant's support workers or other care supports.

In some instances, depending on the individual circumstances, a participant may have specialist support coordination, as well as Coordination of Supports, funded in the same plan; for instance, when immediate complex barriers have been addressed and the participant still requires more general coordination of supports for the remainder of their plan period. For others, they may have specialist support coordination in one plan, and Coordination of Supports in subsequent plans.

Capacity Building and Training in Plan and Financial Management by a Support Coordinator

This reasonable and necessary support focuses on strengthening the participant's ability to undertake tasks associated with the management of their supports. This includes:

- Building financial skills
- Organisational skills
- Enhancing the participant's ability to direct their supports
- Develop self-management capabilities

Plan and Financial Capacity Building providers are expected to assist the participant to develop their skills for self-management in future plans, where this is possible. As a part of this capacity building support, providers are to assist the participant to build capacity in the overall management of the plan including engaging providers, developing service agreements, paying providers and claiming payment from the NDIA and maintain records.

Capacity Building - Improved Living Arrangements

Support is provided to guide, prompt, or undertake activities to ensure the participant obtains and/or retains appropriate accommodation. This may include assisting to apply for a rental tenancy or to undertake tenancy obligations in line with the participant's tenancy agreement.

Capacity Building - Increased Social and Community Participation

This support category involves supports for participation in skills-based learning to develop independence in accessing the community.

Skills Development and Training

These support items are price controlled. Providers of these supports can also claim for: Provider Travel; Cancellations, NDIA Report Writing and Non Face to Face supports.

The group rate is based on a staff/participant ratio of 1:3. If the group size differs, providers should claim at the rate applicable for the group size. A higher staff ratio for groups may be indicated when a participant has challenging behaviour or high medical support needs, which require additional assistance from another worker and this is referred to as a higher intensity support.

Innovative Community Participation

This support item is not price controlled. It is designed to allow providers to offer new and innovative services to NDIS participants. Any standards applicable to the industry in which the provider operates would need to be met.

Community Participation Activities

These support items are not price controlled. They are designed to enable providers to claim for tuition fees, art classes, sports coaching and similar activities that build skills and independence. Camps, classes and vacation activities that have capacity building components. These may include assistance to establish volunteer arrangements in the community, mentoring, peer support or individual skill development.

All supports funded under these items need to be determined as reasonable and necessary given the participant's plan goals and could include, but are not limited to:

- Universal recreational activities: A limited number of lessons could be funded to enable a participant to try out an activity and test their capability and interest in further pursuing this activity – such as horse riding, art, dance or singing classes
- Funding to attend a "camp" or groups that build a person's relationship skills and offer a range of activities and opportunities to explore wider interests.
- Other items or adjustments such as customised tools required because of the person's disability could also be funded.

Capacity Building - Finding and Keeping a Job

Workplace assistance

These supports provide workplace assistance that enables a participant to successfully obtain and/or retain employment in the open or supported labour market.

School Leaver Employment Supports (SLES)

School Leaver Employment Supports (SLES) is a support for school leavers to assist them to transition from school into employment. Some students may already be engaged with the mainstream Disability Employment Services (DES) Eligible School Leaver (ESL) program during Year 12 and therefore not require SLES.

These support are designed to plan and implement a pathway to inclusive employment, focusing on capacity building for goal achievement. With appropriate supports, it is expected that the majority of SLES participants will transition to DES to undertake the job seeking, placement and post placement support phases of their pathway.

Supports will have an individualised approach, with a strong emphasis on “try and test” work experience opportunities, (generally in work places that would pay award wages). Capacity building should focus on hard and soft skill development.

Supports, more generally, should facilitate positive experiences that contribute to developing an understanding of work capability and confidence to step into employment. SLES should also help inform the level and nature of future supports needed to obtain and sustain employment.

Capacity Building - Improved Relationships

This support category is the provision of specialised assessment where the participant may have complex or unclear needs, requiring long term and/or intensive supports to address behaviours of concern.

Behaviour support requires a behaviour support plan to be developed that aims to limit the likelihood of behaviours of concern developing or increasing once identified. This plan outlines the specifically designed positive behavioural support strategies for a participant, their family and support persons that will achieve the intended outcome of eliminating or reducing behaviours of concern.

This support category includes specialist behavioural intervention support, which is an intensive support for a participant, intending to address significantly harmful or persistent behaviours of concern.

Capacity Building - Improved Health and Wellbeing

Physical Wellbeing Activities

These activities support, maintain or increase physical mobility or well-being through personal training or exercise physiology. Physical well-being activities promote and encourage improved physical capacity and health.

Dietetics

These supports provide individual advice to a participant on managing diet for health and wellbeing due to the impact of their disability.

Capacity Building - Improved Learning

This support is for provision of skills training, advice, assistance with arrangements and orientation to assist a participant moving from school to further education.

Capacity Building - Improved Life Choices

Plan Management – Financial Administration

Plan Management – Financial Administration funding applies to registered providers who undertake financial administration of a plan on behalf of a participant.

Plan Management – Financial Administration funding includes a setup fee to establish the payment arrangements with providers and a monthly processing fee. This support assists a participant by:

- Giving increased control over plan implementation and utilisation with plan financial assistance
- Managing and monitoring budgets over the course of the plan
- Managing NDIS claims and paying providers for delivered service
- Maintaining records and producing regular (at least monthly) statements showing the financial position of the plan
- Providing access to a wider range of service providers, including non-registered providers whilst remaining in line with the price limits contained within this Guide.

A Plan Management – Financial Administration provider will possess bookkeeping / accounting skills and qualifications with have systems in place for efficiently processing payments on behalf of a participant.

Capacity Building and Training in Plan and Financial Management by a Plan Manager

This reasonable and necessary support focuses on strengthening the participant's ability to undertake tasks associated with the management of their supports. This includes:

- Building financial skills
- Organisational skills
- Enhancing the participant's ability to direct their supports
- Develop self-management capabilities

Plan and Financial Capacity Building providers are expected to assist the participant to develop their skills for self-management in future plans, where this is possible. As a part of this capacity building support, providers are to assist the participant to build capacity in the overall management of the plan including engaging providers, developing service agreements, paying providers and claiming payment from the NDIA and maintain records.

Funding for this capacity building support where reasonable and necessary will be included in the plan an hourly rate.

Capacity Building - Improved Daily Living

This support category includes assessment, training, strategy development and/or therapy (including Early Childhood Intervention) supports to assist the development or increase a participant's skills and/or capacity for independence and community participation. Supports can be delivered in groups or individually.

Therapy Services (over 7 years)

In the NDIS, therapy supports are for participants with an established disability, where maximum medical improvement has been reached, to facilitate functional improvement. For people who access the Scheme as 'early intervention' NDIS participants, reasonable and necessary supports are likely to be a blend of medical and disability therapies, but should be predominantly disability therapy supports. Therapy in this context must be aimed at adjustment, adaption and building capacity for community participation.

For NDIS participants whose medical condition, illness or disease requires a particular treatment to maintain the functioning of a body part, or slow/prevent the deterioration, the NDIS may fund reasonable and necessary training for non-skilled personnel to undertake this intervention as part of the usual daily personal care. For participants where such treatment can only be met through skilled rather than non-skilled care, this treatment is to be funded through medical funds, not the NDIS.

Ongoing funding for therapy is subject to a detailed support plan that is designed to deliver progress or change for the participant. Providers develop this plan with the participant and it should clearly state the expected therapy outcomes and demonstrate a link to the participant's goals, objectives and aspirations.

Massage Therapy (over 7 years)

Massage, delivered directly to impact a body part or body system, is more appropriately provided by the health system and is therefore not funded by the NDIS.

Maintenance Therapy (over 7 years)

Where maintenance therapy is reasonable and necessary, it is funded as part of ongoing direct support hours (delivered by carers who are or can be trained in this if required), and is not funded as ongoing therapy.

For participants whose medical condition or disability requires a particular regime to maintain functioning of a body part, or to slow the deterioration of a medical condition or body part, the NDIS will fund reasonable and necessary training for non-qualified personnel to assist the individual as part of usual daily care.

Where a skilled therapist is involved in establishing a therapy program for a participant, funding can include the development of a plan and training for a therapy assistant, informal or funded carers, as part of usual care. Building capacity with family and carers to undertake therapy or exercises under the supervision of a skilled therapist can deliver ongoing benefit to NDIS participants.

Group Supports for Therapy

The NDIA prefers to allow participants and providers flexibility in negotiating arrangements, so there may not be price controls or support items for specific group ratios beyond what is currently in place.

For support ratios that are not stated in this Guide (such as one therapist to two participants, or one therapist to four participants), the NDIA encourages participants and providers to discuss arrangements both parties agree to, including price. Therapy delivered in a group may be claimed using the relevant therapy support line item but with lower prices than the price limit as agreed between provider and participant. This arrangement for support ratios is intended to allow providers to offer a range of services and discuss with participants about more flexible arrangements which both parties prefer.

Early Childhood Intervention Supports (under 7 years)

Early childhood intervention (ECI) provides specialised support and services for infants and young children with disability and/or development delay and their families, to help their development, well-being and participation in family and community life.

The aim of ECI is to ensure that parents and other important adults in the child's life can provide young children with disability and/or developmental delay, with experiences and opportunities that help them gain and use the skills they need to participate meaningfully in their everyday lives.

Families know their child best and will continue to be involved in their child's life. Family centred ECI services understand that parents and caregivers have the most powerful influence on their child's development. ECI services partner with families to ensure that family life and family priorities and choices drive what happens in planning and intervention.

We know that children learn best in everyday situations with familiar people. ECI is about encouraging and supporting everyday learning to naturally build on opportunities for learning and development already being provided at home, childcare, preschool, playgroups and in the community such as parks and shopping.

Early intervention is much more effective if the adults who have the deepest relationships and spend the most time with the child, are skilled to provide intervention through the child's everyday activities and daily routines.

This category includes supports provided in small groups or to individual families by an ECI provider. It can also include supports provided by an allied health assistant under the supervision of a therapist and/or any other combination of ECI supports.

Eligible participants will have budgets built by Early Childhood Partners to reflect the child and family individual needs, applying the reasonable and necessary criteria as per the Early Childhood Early Intervention (ECEI) approach. Budgets will allow flexibility in service delivery by ECI providers to reflect the changing needs of the participant.

The provision of supports under ‘capacity building supports for early childhood’ are expected to deliver outcomes for the child that will enable them to participate meaningfully in everyday

life. Each child's NDIS plan will focus on functional, participation based goals and will summarise the outcomes expected from early intervention and will be reviewed at regular intervals.

These supports are price controlled. Providers of these supports can also claim for: Provider Travel; Cancellations, NDIA Report Writing and Non Face to Face supports.

Multidisciplinary Team Intervention (over 7 years)

This support item enables a coordinated multidisciplinary approach to be delivered to participants beyond the age covered by the Early Childhood Early Intervention approach. All team members will claim against a single support item, thereby increasing flexibility in service delivery to reflect the changing needs of a participant. This support item is not price controlled.

FAIR WORK COMMISSION

AMENDED DRAFT DETERMINATION OF HSU

Fair Work Act 2009

Part 2-3, Div 4 – 4 Yearly reviews of modern awards

Social, Community, Home Care and Disability Services Industry Award 2010

(ODN AM2014/285) MA000100

Health and Welfare

<<PLACE, MONTH, YEAR>>

Review of modern awards to be conducted.

A. Further to the Full Bench decision issued by the Fair Work Commission on DD MM YYYY, the above award is varied

[1] By deleting clause 10.4 (c), and inserting a new clause 10.6:

The minimum engagement for employees under this award will be 3 hours

[2] By amending the current clause 26 by deleting the following words:

and the casual loading prescribed in clause 10.4(b)

[3] By deleting the current clause 25.6 and replacing it with the following:

25.6 Broken Shifts

(a) This clause only applies to:

(i) social and community services employees when undertaking disability services work; and

(ii) home care employees.

(b) For the purposes of this clause, broken shift means a shift worked by a casual or part-time employee that includes no more than one break (other than a meal break) and where the span of hours is not more than 12 hours.

(c) A broken shift may only be worked where there is mutual agreement between

the employer and employee.

*(d) Where an employee works a broken shift, they shall be paid at the appropriate rate for the reasonable time of travel from the location of their last client before the break to their first client after the break, and such time shall be treated as time worked. The travel allowance in clause **20.5** also applies.*

(e) The minimum period of engagement specified in clause 10.6 shall apply to each period of work in a broken shift.

(f) In addition to the rates at 14.4(d) penalty rates and shift allowances in accordance with clause 20.2 – Shiftwork and clause 19 – Overtime apply.

(g) Shift allowances will be determined by the starting or finishing time of the broken shift, whichever allowance is higher. The allowance will apply across both parts of the shift.

(h) All work performed beyond the maximum span of 12 hours for a broken shift will be paid at 200% of the minimum hourly rate.

(i) An employee must receive a minimum break of 10 hours between broken shifts rostered on successive days.

[4] By deleting clause 25.8 – 24 hour care and renumbering clause 25.9 as clause 25.8

[5] By deleting the words *'a 24 hour care shift pursuant to clause 25.8 or'* in clause 25.7.

[6] By inserting a new provision at clause 20.3 and renumbering the current 20.3-20.9 accordingly

20.3 Damaged clothing allowance

(i) Where an employee, in the course of their employment suffers any damage to or soiling of clothing or other personal effects (excluding hosiery), upon provision of proof of the damage, employees shall be compensated at the reasonable replacement value of the damaged or soiled item of clothing.

(ii) This clause will not apply where the damage or soiling is caused by the negligence of the employee.

[7] By deleting the current clause 20.6 and replacing it with

20.7 Telephone allowance

Where the employer requires an employee to use a mobile phone for any work related purpose, the employer will either:

(a) provide a mobile phone fit for purpose and cover the cost of any subsequent charges; or

(b) refund the cost of purchase and subsequent usage charges on production of receipts

[8] By inserting a new clause 26.1:

Saturday and Sunday work

(a) Casual employees will receive their casual loading in addition to the Saturday and Sunday rates at clause 26

(b) The rates are:

(i) in substitution for and not cumulative upon the shift premiums prescribed in clause 29 —Shiftwork; and

(ii) not applicable to overtime worked on a Saturday or a Sunday.

[9] By inserting a new clause 34.2(c):

(c) A casual employee will paid the casual loading under clause 10.4(b) in addition to the public holiday penalty rate at clause 34.2(a)

[10] By inserting a new clause 20.5(c):

First aid refresher

(i) Where an employee is required to maintain first aid certification, the employer will pay the full cost of the employee updating their first aid certification by:
a. reimbursing the employee's registration and attendance expenses; or
b. paying the registration and attendance costs.

(ii) Attendance at first aid refresher courses will be work time and paid as such.

[11] By deleting clause 28.1(b)(ii), and replacing it with the following:

28.1(b)(ii) All time worked by part-time or casual employees which exceeds 8 hours per day, will be paid at the rate of time and a half for the first two hours and double time thereafter, except on Sundays when overtime will be paid for at the rate of double time, and on public holidays at the rate of double time and a half.

[12] By deleting clause 28.1(b)(iii), and replacing it with the following:

28.1(b)(iii) All time worked by part-time employees which exceeds the hours agreed in clause 10.3(c) will be treated as overtime and paid at the rate of time and a half for the first two hours and double time thereafter, except on Sundays when overtime will be paid for at the rate of double time, and on public holidays at the rate of double time and a half.

[13] By deleting the words "by 5.00 pm the day prior" in clause 25.5(f)(i) and replacing them with the words "*at least 48 hours in advance*".

[14] By deleting the words *"minimum specified hours"* in clause 25.5(f)(ii) and replacing them with the words *"rostered hours for that visit".*

[15] By renumbering the text appearing below the heading of clause 28.4 with "(a)".

[16] By inserting the following after clause 28.4(a):

b. Where an employee is required to perform work from home after leaving the employer's or client's premises, including:

i. Responding to phone calls, message or emails;
ii. Providing advice ("phone fixes")
iii. Arranging call out/rosters of other employees; and
iv. Remotely monitoring and/or addressing issues by remote telephone and/or computer access;

the employee will be paid for a minimum of one hours' work at the overtime rate for each time recalled.

[17] By replacing clause 25.7(c) with the following:

(c) The span for a sleepover will be a continuous period of eight hours. Employees will be provided with:
(i) a separate and securely lockable room with a peephole or similar in the door, a bed and a telephone connection in the room; and
(ii) suitable sleeping requirements such as a lamp and clean linen;
(iii) use of appropriate facilities (including staff facilities where these exist), and
(iii) free board and lodging for each night when the employee sleeps over.

[18] By inserting, at the end of clause 20.5(a) the following:

Disability support workers and home care workers shall be entitled to be so reimbursed in respect of all travel:

(a) from their place of residence to the location of any client appointment;
(b) to their place of residence from the location of any client appointment;
(c) between the locations of any client appointments on the basis of the most direct available route.

B. This determination will come into operation from DD MM YYYY.

Fair Work Commission
Four Yearly Review of Modern Awards
Social, Community, Home Care and Disability Services Industry Award
Matter No: AM2014/285 and AM2018/26

SUBMISSIONS OF HEALTH SERVICES UNION – FOUR YEARLY REVIEW – SUBSTANTIVE ISSUES

OVERVIEW

1. These submissions are made by the Health Services Union (HSU), in accordance with the Directions of President Ross, dated 13 November 2018.

2. The *Fair Work Amendment (Repeal of 4 Yearly Reviews and Other Measures) Act* 2018 was assented to on 11 December 2018. That Act repealed the parts of the *Fair Work* Act 2009 (FW Act) providing for the conduct of 4 yearly reviews of modern awards. However, Schedule 4, Application and transitional provisions, of that Act preserved the operation of the relevant provisions in the FW Act in respect of reviews of modern awards conducted as part of 4 yearly reviews of modern awards, if such review was commenced, but not completed, prior to 1 January 2018.

3. The present review was commenced by the FWC in February 2014. Accordingly, the review may continue pursuant to the provisions of the FW Act notwithstanding their repeal.

4. The task of the Fair Work Commission (**FWC**) in conducting the present review is to review the *Social, Community, Home Care and Disability Services Industry Award* (**the Award**) by reference to the modern awards objective in s.134. That section provides:

What is the modern awards objective?

(1) The FWC must ensure that modern awards, together with the National Employment Standards, provide a fair and relevant minimum safety net of terms and conditions, taking into account:

(a) relative living standards and the needs of the low paid; and

(b) the need to encourage collective bargaining; and

(c) the need to promote social inclusion through increased workforce participation; and

(d) the need to promote flexible modern work practices and the efficient and productive performance of work; and

(da) the need to provide additional remuneration for:

(i) employees working overtime; or

(ii) employees working unsocial, irregular or unpredictable hours; or

(iii) employees working on weekends or public holidays; or

(iv) employees working shifts; and

(e) the principle of equal remuneration for work of equal or comparable value; and

(f) the likely impact of any exercise of modern award powers on business, including on productivity, employment costs and the regulatory burden; and

(g) the need to ensure a simple, easy to understand, stable and sustainable modern award system for Australia that avoids unnecessary overlap of modern awards; and

(h) the likely impact of any exercise of modern award powers on employment growth, inflation and the sustainability, performance and competitiveness of the national economy.

HSU Claims

5. The HSU makes claims for variation of the Award to ensure that it achieves the modern awards objective by:

a) providing that all employees, whether full-time, part time or casual are entitled to a minimum engagement of three hours in all sectors covered by the award (clause 10; Exposure Draft (**ED**) clauses 8-11) – S10;

b) varying the broken shifts clause to ensure that broken shifts can only be worked by agreement and short shifts are not broken (clause 25.6; ED clause 13.6**) –** S35;

c) amending the "Travelling, transport and fares" clause, to ensure that employees are compensated appropriately for the cost of travel required to perform their duties – (clause 20.5; ED 16.3(c)) - S19;

d) varying the overtime clause to ensure it applies to all employees, including part-time and casual employees, when working beyond their rostered hours, and that overtime is paid for shifts greater than 8 hours (clause 28.1(b); ED clause 18.1(b)) – S50;

e) ensuring that casual loading is paid in addition to weekend and public holiday rates (clause 10.4(b); ED clause 11.2) – S13, S48;

f) amending the telephone allowance to reflect the requirement to have a mobile phone for work-related purposes (clause 20.6; ED clause 16.3(d)) – S19;

g) amending the uniform allowance to ensure that a uniform is provided or an allowance is paid; and providing a new entitlement for replacement of damaged clothing (clause 20.2; clause 16.3(a)) – S19;

h) amending the existing first aid allowance to provide for payment of an allowance for first aid certificate renewal and CPR training (clause 20.4; ED clause 16.2) – S19;

i) deleting the 24-hour care clause (clause 25.8; ED clause 13.8) – S43;

j) varying the recall to work provisions to ensure that workers who respond to work calls or emails out of hours receive compensation for the performance of such work (clause 20.9; ED clause 16.2(d)) – S22;

k) varying the cancellation provisions to ensure that adequate notice is given to home care workers of changes of shift as a consequence of client changes or cancellations (clause 25.5(f); ED clause 13.5(g)) – S29;

l) amending the Sleepover clause to ensure appropriate facilities are provided (clause 25.7; ED 13.7) – S38.

6. The HSU submits that the proposed amendments provide for the safety net of terms and conditions established in the Award to be fair and relevant and thereby enable the Award to meet the modern awards objective.

7. Annexed to these submissions are **draft orders** with the HSU's proposed variations.

HSU Evidence

8. The HSU relies on the evidence of a number of witnesses in support of its claims. The HSU has filed, along with these submissions, witness statements of:

    a) Dr. Fiona Macdonald, Senior Research Fellow and Australian Research Council Discovery Early Career Research Award Fellow at the School of Management, RMIT University;

    b) Mark Farthing, Senior Policy Advisor for the Health Services Union (**HSU**) Victoria No. 2 Branch;

    c) James Eddington, Legal and Industrial Officer at HSU Tasmanian Branch;

    d) William Elrick, Area Organiser for the Health Services Union (**HSU**) Victoria No. 2 Branch;

    e) Rob Sheehy, Manager Aged Care and Disabilities at the Health Services Union NSW/ACT/QLD Branch;

    f) Christopher Friend, Bargaining Officer at the Health Services Union NSW/ACT/QLD Branch;

    g) Pamela Wilcock, Community Care worker for Hammond Care on the Central Coast of NSW;

    h) Heather Waddell, Community Care worker for Hammond Care in Nowra (NSW);

    i) Thelma Thames, Support Worker employed by Uniting (NSW)

    j) Bernie Lobert, Disability Support Worker (Victoria).

9. The HSU also relies on the following research papers and reports, which have been filed along with these submissions:

a) Cortis, Natasha, *Working under the NDIS: Insights from a survey of employees in disability services* (Report prepared for Health Services Union, Australian Services Union and United Voice, June 2017), Social Policy Research Centre, University of New South Wales, Sydney.

b) Cortis, Natasha et al, *Reasonable, necessary and valued: Pricing disability services for quality support and decent jobs* (SPRC Report 10/17, June 2017), Social Policy Research Centre, University of New South Wales, Sydney.

c) McKinsey & Company, *Independent Pricing Review: National Disability Insurance Agency* (Final Report, February 2018)

d) National Disability Services, *Australian Disability Workforce Report* (Report, February 2018).

e) National Disability Services, *State of the Disability Sector Report* (Report, 2018).

i) NDIS 2018-2019 Price Guide Update Summary

OVERVIEW OF INDUSTRY

10. The Award covers employees falling within its classifications in the following sectors:

a) crisis assistance and supported housing sector;
b) social and community services sector;
c) home care sector;
d) family day care scheme sector;

11. The two largest sectors are the social and community services sector and the home care sector, which include, respectively, disability support work (including such work provided under the National Disability Insurance Scheme) and aged care and dementia care delivered in the home.

12. Casual workers made up about 42% of the disability support workforce as at September 2017[1]. Of the permanent workforce of disability support workers, part-time work is the dominant, and increasing, mode of employment, rising from about 65% of the permanent workforce in September 2015 to 81% in September 2017[2]. Over that same period, the average weekly hours per worker have decreased from about 26 to about 20 hours per week.

13. Similar trends are evident in the home care sector of the aged care workforce.

14. The approach of providing aged care in the home is growing in scope in part due to an increasing preference amongst aged persons for such care, which is reflected in both policy and funding arrangements. In 2016, some 86,000 workers (or 66% of the home care and home support aged care workforces) were employed in direct care roles, or which some 72,000 were community care workers[3].

15. In the period since the establishment of the Award, there has been an increase in the proportion of direct care workers employed for fewer hours[4].

16. The pattern of increasing use of part-time workers (evident in respect of both the above sectors) is not one which is evident across the labour market in general[5].

17. The evidence of the HSU shows that a concern about getting enough hours of work is a significant one amongst both part-time and casual workers employed under the Award, who are amongst some of the lowest paid members of the workforce. Those concerns, and the above workforce trends are relevant when the Commission comes to consider the degree of flexibility currently available to employers under the Award, and the appropriate safety net for such workers.

THE HSU'S CLAIMS

18. The HSU's claims, and its arguments in support of its claims are dealt with in turn below.

Minimum Engagement – clause 10; ED clauses 8-11

[1] p11, National Disability Services, *Australian Disability Workforce Report* (Report, February 2018)
[2] p22, National Disability Services, *Australian Disability Workforce Report* (Report, February 2018)
[3] p69, Australian Government Department of Health, *The Aged Care Workforce, 2016,* March 2017, Canberra
[4] Ibid, p70
[5] p28, National Disability Services, Australian Disability Workforce Report (Report, February 2018)

19. The HSU seeks a minimum engagement of three hours for all workers.

20. The Award presently provides no minimum engagement for full-time and part-time employees in any of the sectors it covers. This issue is of particular concern for part-time workers. The provisions regarding rostering and span of hours mean this issue is of less import for full-time workers.

21. For casual employees, minimum engagement depends on the sector in which they work. For home care workers, the minimum engagement is one hour. For SACS employees (except disability support workers) the minimum is three hours. For all other casual employees it is two hours (clause 10.4; ED clause 11.3).

22. The union contends that the minima in respect of casual workers are inadequate (except in respect of SACS workers who are not disability support workers).

23. The rationale for minimum engagement periods is:

> *"to ensure that the employee receives a sufficient amount of work, and income, for each attendance at the workplace to justify the expense and inconvenience associated with that attendance by way of transport time and cost, work clothing expenses, childcare expenses and the like. An employment arrangement may become exploitative if the income provided for the employee's labour is, because of very short engagement periods, rendered negligible by the time and cost required to attend the employment. Minimum engagement periods are also important in respect of the incentives for persons to enter the labour market to take advantage of casual and part-time employment opportunities (and thus engage the consideration in paragraph (c) of the modern awards objective in s.134)".*[6]

24. It is striking (and counter-intuitive), having regard to that rationale, that the least protection by way of minima in respect of casual employees, applies to home care and disability support workers, about whom it might reasonably be concluded the expense and inconvenience associated with each shift of work is greatest. It is also striking that no minimum engagement applies in respect of part-time employees.

25. The question of minimum engagement periods did not receive any systematic consideration in the award modernisation process[7], and the *Casual and Part-Time Employment Case* rejected the adoption of a consistent minimum across awards[8]. Having regard to the changes in the industries covered by this Award since modernisation: the marketisation of service delivery, the proliferation of part-time

[6] *Casual and Part-Time Employment Case* [2017] FWCFB 3541 at [399]
[7] Ibid, at [402]
[8] Ibid, at [406]

employment on decreased hours (as set out above), and the evidence as to working arrangements in the industry, it is timely for the Commission to consider the issue.

26. Part-time employees are strictly entitled, under clause 10.3(c) to have an agreed written pattern of hours and days of work. However, that obligation appears to have little relevance, with the requirement either not being observed, or honoured, or not operating due to the existence of enterprise agreements with contrary provision[9]. At the time of engagement employees are least able to advocate for a fair pattern of hours. In any event, the evidence before the Commission will show that in the particular circumstances of much of the industry operating under the present Award, clause 10.3(c) does not operate (as would be wished) to ameliorate the unfairness associated with the absence of fair minimum engagement periods for part-time employees, disability support workers and home care workers.

27. Whilst the Award envisages part-timers have set patterns of work, they are commonly asked to work, and do in fact perform, work additional to their agreed hours[10]. Given the trends of increasing numbers of workers performing increasing numbers of hours the evidence points to a level of underemployment within the industry, leaving employees with less bargaining power. The absence of any penalty or loading associated with the performance of additional hours by part-timers creates a structural incentive to enter arrangements with part-timers with less hours than are likely to be required, and to use part-time employees like a pool of casual workers.

28. It is a common feature of employment, particularly amongst disability support workers and home care workers, that employees are not performing work at the same location every day. Rather, their work locations are the homes of their clients and/or the communities in which the employer's client lives. Those locations change a number of times during the course of the day. Employees may not therefore count on travelling the same route to and from the workplace on every work day, have any certainty about how long travel will take and may not practicably, rely on public transport to travel to and from work and between clients. Employees are either explicitly required to provide their own vehicle to travel between work locations (and to transport clients) or are compelled by the nature of the work to provide such vehicle themselves. The mental burden of planning and navigating such trips should not be gainsaid. This feature of the work warrants particular consideration when the minimum engagement period is

[9] Waddell [6]; Wilcock [3] – [4]; Thames [1], [9], [11]; Eddington [25]; Friend [11] – [14]
[10] Friend [20]; Wilcock [4]; Thames [21] – [22]

considered. Relative to workers attending the same workplace every time, the above workers make a greater investment of time and effort for the performance of each shift.

29. The evidence to be called by the HSU will show it is commonplace within the industry for employees to be "rostered" to perform very short shifts – sometimes less than an hour, and often corresponding with the period of an appointment with a client of the service – interspersed with unpaid breaks between such periods of work/appointments. During the break in shift employees are required to travel (sometimes considerable distances) between clients in their own vehicles.

30. The impact of those practices is compounded by the fact that within the industry the majority of workers are employed on Award rates only. Few workers receive above Award rates as a consequence of contractual arrangements or enterprise agreements. For the small cohort of workers covered by enterprise agreements, rates of pay exceed Award minimum rates only modestly. In effect, the *minimum* rates in the Award are *paid rates.*

31. Workers are accordingly spending many hours, and travelling considerable distances, in pursuance of their employment, only to be paid minimum award rates in respect of part only of the overall time expended.

32. The absence of appropriate minimum engagement provisions means that the Award fails to provide a fair and relevant minimum safety net of terms and conditions for the employees it covers. Those workers are some of the lowest paid and vulnerable workers in the modern award system – those performing care work for vulnerable clients including the elderly, those with dementia or people with disabilities, in their homes.

33. The HSU's proposed variation to the award provides for a minimum engagement of three hours for all employees. The utility of the provision would be defeated if shifts of the minimum period were able to be broken. To make a minimum engagement clause effective in the circumstances of the industry, broken shifts should not be available for the minimum engagement.

Broken shifts - clause 25.6; ED clause 13.6

34. The broken shift clause in the Award applies only to social and community services employees undertaking disability services work and home care employees.

35. The only current restraint on the utilisation of broken shifts is that the shift may not span more than 12 hours (cl 25.6(a)).

36. Such provision is manifestly open to exploitation when it operates in the absence of a minimum engagement provision (as is the case for part-time workers), or where there are short minima (as is the case for casual employees).

37. Under the existing provisions, a home care worker could be required to work two blocks of one hour (or less) broken by a period of 10 hours. The capacity to have more than one break during the shift can mean that an employee may be required to work three or more separate periods of work over the course of many hours in order to generate a reasonable amount of earnings. The evidence of the HSU's witnesses shows that a disturbing trend has emerged in the industry for disability support workers and home care workers to have their shifts "broken" by the time between successive clients, meaning that they are paid for a proportion only of the time that is expended in performing the work required by their employer. That circumstance also leaves some employees in the invidious position of deciding whether to incur the costs of driving home and back to the next client in the "break", or to endure stretches of dead or waiting time in the vicinity of the next client's house during the course of the day[11].

38. The broken shift clause should contain provisions to prevent exploitation of employees.

39. The relevant restrictions should be:

    a) that the shift may only be broken once and not multiple times;
    b) that the minimum period of engagement should be applied to each period of work in a broken shift; and
    c) that the employee is paid, as if working, for the time necessary to travel between clients required to be undertaken during any break in the shift.

[11] Eddington [20] – [22], [31]-[32]; Sheehy [7] – [9]; Friend [47] – [48]; Waddell [11]-[12]; Thames [15]; see also McDonald et al, Wage theft, underpayment and unpaid work in marketized social care (2018) Vol 29(1), Economic and Labour Relations Review, 80-96, at p88.

Travelling, transport and fares – (clause 20.5; ED 16.3(c))

40. The Award currently provides that an employee required or authorised by their employee to use their motor vehicle in the course of their duties is entitled to be reimbursed at a rate of $0.78 per kilometre.

41. The evidence of the HSU discloses that disability support workers and home care workers are as a matter of course required to travel considerable distances during the course of their working days in order to perform their work for their employers, particularly in regional areas. The evidence suggests employers regard the travel to the first client and from the final client of the day as not travel which occurs in the course of the employee's duties. If that were correct, there would be a perverse incentive for employers to schedule the furthermost clients at the start and finish of each day. The evidence indicates this approach is already being taken by some employers. Such travel is a fundamental part of the duties performed by those workers. It is necessary in order to perform the principal caring duties, and well exceeds the usual travel engaged in by employees to and from their workplaces.

42. The HSU's evidence demonstrates that the existing broken shift provision in the Award, combined with the absence of minimum shifts for part-time workers, enables employers to engage employees to perform a series of periods of work over the course of a day, with the expectation that the "break" in the shift will be used to travel on to the next client. Where such arrangements are utilised, workers are required to travel significant distances in the course of a day, on their own time, and in many cases, because the travel is not regarded as occurring in the course of duties because it occurs during a break in the shift, without any compensation.[12]

43. Dr Macdonald and her fellow authors dealt with these trends in the article annexed to her witness statement: *Wage theft, underpayment and unpaid work in marketized social care* (2018) Vol 29(1), Economic and Labour Relations Review, 80-96. In that article, the authors analyse the impact of marketisation of the provision of disability support care in Australia in light of international experience, and consider the efficacy of labour market regulation in protecting the low paid workers engaged in social care. The article notes the greater demands for flexibility, for shorter working hours and travel between multiple locations associated with the NDIS. Unpaid travelling time formed a

[12] Eddington [20] – [22]

significant part of the working days of many of the disability workers analysed in the article.

44. It is no part of the modern awards objective to have employees incurring substantial costs for the benefit of the employer without recompense. The Award should be amended accordingly.

Overtime - clause 28.1(b); ED clause 18.1(b)

45. The way in which overtime functions under the Award for part-time employees does not meet the Modern Award Objective, which recognises (at s.134(da)), the need to provide additional remuneration for employees working overtime; or employees working irregular or unpredictable hours.

46. Part-time employees only receive payment of the overtime rate for hours which exceed 10 in any shift, 38 in a week or 76 in a fortnight. Part-time employees should be entitled to overtime for work beyond their rostered hours. The absence of any penalty associated with the performance of such work creates a structural incentive to underestimate the hours of work required of a part-time employee at the time of engagement and/or rostering, and to utilise part-time workers like a pool of casual employees. The evidence above suggests the increasing tendency towards engagement of part-time employees in both home care and disability support work, with such employees working less hours.

47. Overtime for casual and part-time workers should be paid for shifts longer than 8 hours rather than 10. Work performed by carers in private homes and in the community providing personal or domestic assistance for elderly clients or clients with a disability is both physically and mentally taxing,[13] which is compounded by the (often unrecognised and unpaid) travel involved in the performance of the work. During long shifts there may be little opportunity, or appropriate facility, for workers to take proper breaks and rest.[14]

Casual loading - clause 10.4(b); ED clause 11.2

48. Casual loading should be paid in addition to any overtime, weekend and public holiday penalty. That approach is consistent with the function of casual loading, which is to

[13] Thames [6] – [7]; Lobert [21]
[14] Thames [13] – [17]

compensate casual employees for the paid leave entitlements available to permanent employees which are forgone by reason of their less secure position. It is consistent with the "default approach" discussed by the Full Bench in the *Penalty Rates Decision* [2017] FWCFB 1001 (at [338]), which has the advantage of being simple and easy to understand, consistent with s134(1)(g).

49. The Full Bench in the *Penalty Rates Decision* noted, in considering the *Hospitality Award*, the distinct purposes of penalty rates and casual loadings, observing that:

> [889] *As we have mentioned, the [Productivity Commission] Final Report makes reference to the interaction of penalty rates and casual loadings and concludes that:*
>
> > *'For neutrality of treatment, the casual loading should be added to the penalty rate of a permanent employee when calculating the premium rate of pay over the basic wage rate for weekend work.'*
>
> [890] *There is considerable force in the Productivity Commission's conclusion.*
>
> [891] *Casual loadings and weekend penalty rates are separate and distinct forms of compensation for different disabilities. Penalty rates compensate for the disability (or disutility) associated with the time at which work is performed.*

50. The Full Bench went on to hold that under the *Hospitality Industry (General) Award*, casual loading should be added to the Sunday penalty rate, because clause 13.1 in that award, concerning casual loading, did not state that the loading was intended to compensate employees for Sunday work. The Full Bench found that:

> [895] *The distinct purpose of the casual loading is made clear from clause 13.1 of the Hospitality Award: 'The casual loading is paid as compensation for annual leave, personal/carer's leave, notice of termination, redundancy benefits and other entitlements of full-time or part-time employment'*
>
> [896] *Importantly, the casual loading is not intended to compensate employees for the disutility of working on Sundays.*
>
> [891] *In our view, the casual loading should be added to the Sunday penalty rate when calculating the Sunday rate for casual employees. We propose to adopt the Productivity Commission's 'default' method. Accordingly, the Sunday rate for casual employees in the Hospitality Award will be 25 + 150 = 175 per cent.*

51. Clause 10.4(b) of the Award is relevantly identical to the corresponding provision in the Hospitality Award. It provides that: *'A casual employee will be paid per hour calculated at the rate of 1/38th of the weekly rate appropriate to the employee's classification. In addition, a loading of 25% of that rate will be paid instead of the paid leave entitlements accrued by full-time employees.*

52. It is clear from the terms of the clause that the casual loading is paid in substitution for the leave entitlements otherwise available to permanent employees and does not operate to compensate for any other aspect of the work, or its performance, including the inconvenient or unsociable time at which the work is performed.

53. For casual employees covered by the Award, the loss of a client or of a regular engagement presents an ongoing threat to the security of their employment and hours of work. Such employees take steps such as working more than one job in the industry to hedge against that risk.[15]

54. Clause 28.1(b)(iv**)**, (see clause 18.1(b), exposure draft) provides that: '*Overtime rates payable under this clause will be in substitution for and not cumulative upon:*

(A) the shift premiums prescribed in clause 29—Shiftwork; and
(B) the casual loading prescribed in clause 10.4(b),
and are not applicable to ordinary hours worked on a Saturday or a Sunday.

55. Clause 26 provides:

Saturday and Sunday work
'Employees whose ordinary working hours include work on a Saturday and/or Sunday will be paid for ordinary hours worked between midnight on Friday and midnight on Saturday at the rate of time and a half, and for ordinary hours worked between midnight on Saturday and midnight on Sunday at the rate of double time. These extra rates will be in substitution for and not cumulative upon the shift premiums prescribed in clause 29 – Shiftwork and the casual loading prescribed in clause 10.4(b), and are not applicable to overtime hours worked on a Saturday or a Sunday.'

56. Clause 34.2 provides that:

(a) An employee required to work on a public holiday will be paid double time and a half of their ordinary rate of pay for all time worked.

(b) Payments under this clause are instead of any additional rate for shift or weekend work which would otherwise be payable had the shift not been a public holiday.

57. The HSU contends against the adoption of the above clauses in those terms, to the extent they operate to subsume casual loading within other penalties.

[15] Lobert [17]

58. Neither overtime rates, weekend penalties, nor public holiday penalties are designed to compensate casual workers for the loss of leave entitlements. Casual employees should not be denied such compensation because they receive a payment in respect of another feature of the work.

Telephone allowance - clause 20.6; ED clause 16.3(d)

59. The current telephone allowance clause – as worded in both the exposure draft and current award – is outdated. The language of the clause refers to a landline telephone. The Commission would safely conclude that the vast bulk of employees now have mobile phones and that they are available to them during the course of their work.

60. Employers frequently require or expect care workers to be contactable by mobile phone when performing their duties. Employees commonly need to use smart phones to check their rosters, make notes on clients, take photographs, log onto company apps or portals, call ambulances or supervisors in emergencies, as well as answer calls about their availability for shifts, often at the last minute.[16] Any employees required to use a phone for work in this way should receive a telephone allowance which reflects the cost of maintaining and using such mobile phone. Employees required to use a smart phone should be reimbursed for the cost of purchasing one if such purchase is necessary.

Uniform allowance and damaged clothing allowance - clause 20.2; clause 16.3(a)

61. Clause 20.2 of the Award provides for payment of an allowance for uniforms and their laundering. The reality of work in the industry, particularly for home carers and disability support workers, is that employees are not provided with uniforms, but wear their own clothes to work, which are at risk of being soiled or damaged in the course of their duties[17].

62. The award should include a damaged clothing allowance, which takes into account that employees' clothing will frequently become damaged, soiled or worn given the nature of the work they do. Where such damage occurs, upon provision of proof of the damage, employees should be compensated at the reasonable replacement value of the damaged or soiled item of clothing.

[16] Thames [23]; Waddell [33] – [34]; Wilcock [22] – [23]; Lobert [18] – [20]
[17] Wilcock [11]; Waddell [36]

First aid certificate renewal - clause 20.4; ED clause 16.2

63. The evidence shows many employees engaged in disability support or home care roles are required to hold a current first aid certificates in their roles. Even where such qualification is not explicitly required, the holding of such qualification is likely to be beneficial for the employer in that the employee is better equipped to deal with a medical emergency. Where an employee is required to maintain their first aid certification, that they should be entitled to be reimbursed the costs of maintaining their certification by their employer.

24 hour care - clause 25.8; ED clause 13.8

64. The 24 hour care clause is unclear and rarely used. It should be removed, and extended periods of care dealt with in accordance with the provisions otherwise in the Award.

65. The clause leaves employees open to exploitation as:

a) it does not compensate employees for the entire time they are required to be available for the performance of their duties. It is a fundamental principle of employment law that *"they also serve who only stand and wait".* Where an employee is required by the employer and is not free to get on with their own chosen activities, they should be compensated for that as work;
b) it does not specify what would happen if an employee works more than 8 hours in a 24 hour period;
c) the sleepover clause provides that a sleepover span must be a continuous period of eight hours, and provides that if an employee's sleep is interrupted and they are required to perform work, they are required to be paid overtime rates;
d) there are no provisions under this clause for the employee to be provided a continuous number of hours for sleep, or what happens if the employee's sleep is broken;
e) it provides that a bed in a private room will be provided 'where appropriate' but it is not clear when it would not be appropriate for an employee working a 24 hour shift to not be provided with such a bed.

66. The clause does not meet the modern award objective. It provides for remuneration at a discounted rate during a period where an employee is required to be available for work.

Cancellation - clause 25.5(f); ED clause 13.5(g))

67. The Award enables home care workers to have their shifts cancelled or changed at 5.00 p.m. the day before a rostered shift without the employer being required to pay wages in respect of that cancelled shift.[18] The brevity of the notice has the capacity to be disruptive for employees seeking to arrange other responsibilities around work commitments.

68. The capacity to cancel on such terms undermines the entitlement of part-time workers to regular and guaranteed days and hours of work. Employees should receive greater notice than that currently provided.

Recall to Work Overtime - clause 20.9; ED clause 16.2(d)

69. The Award provides (at clause 20.9) for payment of an on call allowance for employees who are required to be available for recall to duty.

70. Clause 28.4 regulates the payment for when an employee is recalled to work. Where an employee is recalled to work overtime after leaving the work, the employee is paid for a minimum of two hours work at the appropriate rate for each recall, but must be released if the work is completed within that period.

71. The award does not clearly identify whether employees required to perform additional work without attending the place of work are entitled to compensation. Many employees are now able to perform valuable work for the employer outside the employer's premises connecting remotely with employer systems. Such work should be compensated appropriately.

72. The HSU contends the Award should be amended to make clear that employees required to perform work out of hours should be compensated, with a minimum payment of one hour attached to such work.

[18] Waddell [16] – [21]; Thames [11]

Sleepover – clause 25.7; ED clause 13.7

73. The clause should be amended to ensure appropriate facilities are provided when employees are required to perform a sleepover shift. Such shifts are compensated modestly.

74. The HSU initially foreshadowed a claim for review of the rate paid, as well as other substantive amendments, in respect of the performance of such shifts. No such claim is currently pressed, however, the HSU anticipates it will likely advance such a claim outside the scope of the 4-Year review process in future, and reserves its rights in that respect.

4 yearly review of modern awards
Social, Community, Home Care and Disability Services Award

Dear Casey,

At the hearing yesterday in the above matter, the Full Bench raised questions about NDIS pricing structures. In response, I write to draw their attention to pages 36 – 38 of the 2018 NDIS Price Guide which was filed with the HSU's submission as report (h). These tables outline how the price caps vary depending on when the support is delivered (afternoon, night, Saturday, Sunday, public holiday) and the complexity of the client being supported (Level 1, 2 or 3).

I also attach the media release referred to by our witness, Mr Farthing, which was requested by the Full Bench. The detail, including the 2019 increased price caps for weekday, afternoon, night, Saturday, Sunday, and public holiday shifts are listed on the NDIA website at this page: https://www.ndis.gov.au/annual-price-review.

Regards,
Rachel

THE HON PAUL FLETCHER MP

Minister for Families and Social Services

THE HON SARAH HENDERSON MP

Assistant Minister for Social Services, Housing and Disability Services

MEDIA RELEASE

30 March 2019

NDIS price increases for a sustainable and vibrant disability services market

The Morrison Government has today announced an increase to price limits for therapy, attendant care and community participation under the National Disability Insurance Scheme (NDIS), effective 1 July 2019. These price increases will inject more than $850 million into the NDIS market in 2019-20 so that NDIS participants can access the quality and innovative services and supports that meet their individual needs.

Minister for Families and Social Services, Paul Fletcher, and Assistant Minister for Social Services, Housing and Disability Services, Sarah Henderson said the new prices include a minimum increase of almost $11 per hour for therapists and up to a 15.4 percent price increase to the base limit for attendant care and community participation.

“We are committed to the development of a vibrant disability services market that enables NDIS participants to have genuine choice and control over the services and supports they need,” Mr Fletcher said.

“We have consulted widely with participants, providers and the sector to inform and implement these changes.

“These changes form part of the National Disability Insurance Agency’s (NDIA) annual price review to update prices that reflect market trends, costs in wages and other influences. It also responds to regular monitoring of markets and responding to emerging issues.

“These processes have identified the need to increase prices for attendant care and community participation and we are responding to that.

“Substantial increases to the hourly rates for therapy also follow a comprehensive review of the price control arrangements and other market settings for therapy services through December 2018 to March 2019.

“These price increases are part of an overarching pricing strategy and commitment to review and respond to pricing evidence as required, and will encourage the development of a disability services market of appropriate size, quality and innovation,” Mr Fletcher said.

Ms Henderson said providers of attendant care would also be eligible for an additional pricing boost through a temporary transformation payment.

“The Government recognises the transition to a competitive market may be difficult for some providers and the changes we are announcing today complement a broad range of initiatives to support that transition,” Ms Henderson said.

“With the NDIS well under way, demand for disability services is growing rapidly, with more than 90,000 new jobs to be created over the next five years.

“The changes are part of ongoing pricing considerations that will be communicated to the sector in coming months, including the outcomes from the WA Market Review, in the lead up to the implementation of the new 2019-20 prices, effective 1 July 2019,” Ms Henderson said.

Graeme Innes, one of two independent members of the NDIA’s Pricing Reference Group and the former Australian Disability Discrimination Commissioner, explained that the pricing changes were considered by the Pricing Reference Group over a number of meetings and were supported by a strong body of evidence.

“We endorse the changes because we are satisfied that the increases are reflective of the adjustment that is needed to address sector concerns and ensure participants continue to be supported in achieving their goals,” Mr Innes said.

In addition to the support of the NDIA Pricing Reference Group, Andrew Rowley, a member of the NDIA’s Industry Reference Group and Managing Director and CEO of Ability First Australia (AFA), a not for profit strategic alliance between 14 of Australia’s leading disability service providers also welcomed the price increases.

“AFA expects this will help encourage investment in attendant care and therapy supports amongst the members of Ability First Australia,” Mr Rowley said.

The NDIA’s Pricing Reference Group guides NDIS price regulation activities and decisions to support NDIS objectives during the transition to a competitive market place. The NDIA would continue to improve market and price settings, using benchmarking methodologies to guide the process.

For further information about these prices changes please visit the NDIS website.

Minister Fletcher: Brooke Leembruggen | 0447 743 835 | brooke.leembruggen@dss.gov.au
Assistant Minister Henderson: Bree Willsmore | 0475 975 778 | bree.willsmore@dss.gov.au

Additional Information

From 1 July 2019:

- Price limits for therapy supports (excluding psychology and physiotherapy) will increase by almost $11 per hour (/hr), from $179 to $190.
- Psychologists and physiotherapists will also see increases based on the location in which these supports are delivered.

  Psychology:

  - In the Australian Capital Territory, New South Wales, Queensland and Victoria psychology support price limits will increase from $179 to $210/hr.
  - In the Northern Territory, South Australia, Tasmania, and Western Australia, psychology support price limits will increase from $179 to $230/hr.

  Physiotherapy:

  - In the Australian Capital Territory, New South Wales, Queensland and Victoria physiotherapy support price limits will increase from $179 to $190/hr.
  - In Northern Territory, South Australia, Tasmania, and Western Australia physiotherapy support price limits will increase from $179 to $220/hr.
- Attendant care and community participation will increase from between 5.6 per cent and 15.4 per cent dependent on variables such as location, times and days of shifts, and level of worker;

Providers of attendant care will also be eligible for a temporary transformation payment to assist providers to cover the costs associated with transitioning to the NDIS. In 2019-20, this conditional loading will be set at 7.5 per cent. It will reduce 1.5 per cent each year thereafter.

From 1 July, the combined effect of the increased price limits and the temporary transformation payment is an increase of between 10.9% and 20.4%, dependent on variables such as location, times and days of shifts, and level of worker. Increases will be further indexed for wage inflation and the Fairwork Commission's Equal Remuneration Order prior to implementation.

Funding in participant plans will be automatically adjusted to reflect the changes in the price limits for therapy, attendant care and community participation, effective from 1 July 2019 as part of the annual indexation of plans.

Other initiatives designed to assist providers to transition to a competitive NDIS market include an online NDIS Demand Map (at blcw.dss.gov.au) which provides data on the demand for NDIS supports and services by region, to help providers understand opportunities for their business.

NDIS providers and organisations can now also apply for up to $20,000 of tailored business support to help them transition to the NDIS under the $5.6 million Transition Assistance Funding program. Providers can apply for Transition Assistance Funding by firstly completing a readiness assessment at blcw.dss.gov.au/readiness

HSU NATIONAL

IN THE FAIR WORK COMMISSION

AM2018/26
S 156 - Four Yearly Review of Modern Awards - Group 4 Awards
Social, Community, Home Care and Disability Services Industry Award 2010

SUBMISSION OF THE HEALTH SERVICES UNION

1. The Health Services Union (**HSU**) make these submissions in response to the Directions of the Full Bench dated 1 May 2019 (**the Directions**), in relation to the four yearly review of the Social, Community, Home Care and Disability Services Industry Award (**SCHCDS Award**).

2. These submissions are made in response to the questions raised by the Full Bench in paragraph F of the Directions, which are as follows:

> *In the Part-time employment and casual employment decision the Full Bench described the operation of the NDIS at paragraphs [554] and [630] – [633]. Do the parties take issue with any of the observations made at those paragraphs? Is there any more up to date information?*

3. The HSU does take issue with some of the observations made at paragraphs [554] and [630]-[633] for the reasons outlined below. We also provide some up-to-date information on the operation of the NDIS.

Paragraph [554]

4. We take issue with the following contention of Australian Business Industrial and the NSW Business Chamber (**ABI**) which was summarised in paragraph [554] of the Part-time and Casual decision[1]:

> *ABI contends that the NDIS is radically changing the disability support services sector, in that employers have lost a large degree of control over when work is required to be performed, and accordingly require much greater flexibility in the allocation of working hours to part-time employees so that they can operate in a way which is responsive to client demand.*

5. Whilst it is true that the nature of the funding system has changed, the needs of people with disabilities have not changed because of the NDIS. For example, NDIS participants requiring personal care during the morning and evening will still predominantly need that support during the morning and evening. Claims from

[1] [2017] FWCFB 3541

ABI that the NDIS has and will lead to radical changes on a daily basis are incorrect.

6. We also note that paragraph [554] by no means represents the concluded view of the Full Bench on the operation of the NDIS. The paragraphs fall under the heading '*5.1 ABI and NSWBC claim*' and represents a summary of ABI's claim and characterisation of how the NDIS operates.

7. In fact, the Full Bench rejected ABI's characterisation of the NDIS later in the decision, particularly in paragraphs [636] - [640].

8. Relevantly, the Full Bench found at [636] that:

> *The evidence makes it clear that there remains considerable uncertainty as to how the NDIS will operate and what will be the pattern of service demand from participants once the NDIS is fully implemented. We consider it to be likely that this uncertainty is a major reason for the current degree of preferment for casual employment, and that once the NDIS has been fully implemented and its operation becomes more certain and stable, part-time employment will be maintained as a substantial feature of the sector.*[2]

9. It found at [639]:

> *The basic elements of the NDIS lend themselves to reasonably predictable workforce planning. Many of the forms of support that are funded in individualised NDIS plans are (as Mr Bowden said) regular and predictable. The service agreement between the participant and the provider of a support service allows for providers to deal with participants in a structured and consistent way, with requirements for cooperation and communication as to when services are provided, notice periods for cancellations, payment where insufficient notice of a cancellation is provided, and notification to the NDIA for a review of the plan if cancellations become excessive. Ultimately an agreement may be terminated by the provider if it becomes impracticable and financially unviable.*

10. It found at [640]:

> *Fourth, we consider it unlikely that the market for disability support services which the NDIS is establishing will give participants the degree of market power that some of the employer witnesses implicitly suggested it would. It is clear that for many types of supports, participants value support workers who provide a high quality and amenable service, and they also value having continuity in the personnel who provide the service. In that context, we cannot envisage that participants will be in a position to demand from providers as a matter of course the disability service worker they prefer at whatever time they may choose to nominate from week to week. The massive expansion in the number of participants which will occur as the NDIS is rolled out, and the*

[2] [2017] FWCFB, [636]

concomitant expansion in the workforce which will be required in order to service these participants, tend to indicate that providers will need to, and will be in a position to, limit the extent to which participants can demand the provision of services on a discretionary and unplanned basis.

Paragraph [630]

11. For accuracy, the second sentence in paragraph [630] should read '*Participants in the scheme (and/or their carers) are required to prepare an NDIS plan…'* [amended text underlined].

12. We say that the 3rd and 9th sentences in paragraph [630] are inaccurate. These state:

Supports may be fixed – that is, regularly required at a fixed time each day or week – or be flexible, which means the participant has scope to rearrange the supports to suit themselves within the overall budget.

…

The example plan required each identified support to be purchased as described, and prohibited swaps from one item to another.

13. An NDIS plan has 3 overall categories of supports: (i) core supports; (ii) capital supports, and; (iii) capacity building supports. The significant majority of funded NDIS supports are core supports. Core supports are generally fully flexible within the category, and not as prescriptive as the discussion of the example plan suggests. Only capacity-building and capital supports would identify prohibits on swaps.

14. We do not agree with the second from last sentence of paragraph [630]:

In pricing items, the NDIA has been aggressive in trying to set the absolute minimal cost so as to control the cost to government of the NDIS as a whole.

15. Recently, there have been significant pricing increases announced. The NDIA has not publicly released the reference formulas for the new prices that have been announced but not yet come into effect (they will on 1 July 2019).

16. The NDIA is not simply concerned with keeping costs at a minimum; it also aims to set prices at what it deems to be high enough to encourage supply. This is apparent in the recent NDIA Quarterly Report, dated 31 March 2019,[3] which states the following in relation to NDIS pricing:

The NDIA is acutely aware of its role as market steward and the need to set prices that encourage market development, particularly in thin markets.

[3] National Disability Insurance Agency (NDIA), *COAG Disability Reform Council Quarterly Report* (31 March 2019).

Supplementing the work of the Independent Pricing Review, which is currently being implemented, and the Western Australia Market Review, the NDIA has undertaken extensive consultation on therapy prices and pricing for attendant care. That work, initiated and promoted by the NDIA, has been rigorous and fact-based, using extensive data not previously available to the Independent Pricing Review.

As a consequence, it was announced towards the end of the quarter that from 1 July 2019 significant price increases will be made for both therapy and attendant care.

…

In relation to attendant care, increases of between 5.6% and 15.4% to the base price for attendant care, depending on location, times and days of shifts, and skill level will be available from 1 July 2019. In addition, a Temporary Transformation Payment of 7.5% will also be made to providers, reducing by 1.5% each year over 5 years. This conditional loading will assist providers continue to transform their businesses as the market evolves.

Overall, the increases will help ensure the availability of supply in the attendant care and therapy markets, thereby assisting participants to achieve their goals.[4]

17. Additionally, the NDIA indexes prices on an annual basis to take into account wage inflation (the minimum wage order and the equal remuneration order) and non-wage inflation (CPI).

18. Furthermore, a significant area of NDIS supports, known as '*Supported Independent Living (SIL)*' is not subject to price caps of any kind.

Paragraph [631]

19. Paragraph [631] is inaccurate in its characterisation of self-managed compared with agency managed NDIS plans.

20. We outline the categories of plans below. The statistics are taken from the NDIA Quarterly Report.[5]

21. At the plan approval stage, participants can opt to manage their funding in three different ways (or a combination of each)

Agency-Managed Funding

[4] Ibid, 45.
[5] Ibid, 85.

22. The first option is to have an agency-managed plan. This means that the National Disability Insurance Agency (NDIA) pays disability service providers on behalf of participants. NDIS participants who select this option can only purchase NDIS-funded services from service providers who are registered with the NDIA. As at 31 March 2019, 47% of NDIS participants had agency-managed funding.

Plan-Managed Funding

23. The second option is plan management, where the NDIA will fund a financial intermediary (a Plan Manager) who will pay providers for purchased supports and manage financial reporting. NDIS participants who use plan-managed funding can use both registered and unregistered providers. As at 31 March 2019, 27% of Victorian NDIS participants had plan-managed funding.

Self-Management

24. The third option is self-managed funding, where the NDIA provides funds directly to the NDIS participant who is responsible for managing their own plan. Self-managing NDIS participants can use registered or unregistered providers and directly employ their own staff (or engage them as independent contractors). As at 31 March 2019, 15% of NDIS participants were fully self-managing their funding, with another 11% partly self-managing. Self-managing participants are not subject to the price caps contained in the NDIA Price Guide.

25. Paragraph [631] refers to an example of a 'service agreement'. Service Agreements are contracts between an NDIS service provider and an NDIS participant. Certain rules are imposed, which are articulated by the NDIA's Terms of Business and Price Guide.[6] It's important to state that providers will generally set the terms of a service agreement. The provisions in the example of a service agreement listed in dot points under paragraph [631], particularly around the participant informing the provider about certain changes, are not standard across the sector.

Paragraph [632]

26. The second sentence of paragraph [632] states:

> *The full implementation rollout began in July 2016, but it is not expected to be completed until 2019.*

27. This statement is out of date. The rollout targets have not been met and it can be expected that rollout will continue well into 2020.

28. The data in paragraph [632] is generally out of date. According to the NDIA Quarterly Report, as at 31 March 2019:

[6] 'Terms of Business for Registered Providers'
https://providertoolkit.ndis.gov.au/sites/g/files/net3066/f/ndis_terms_of_business.pdf

(i) There were 277,155 NDIS participants. Of these 85,489 were receiving support for the first time.[7]

(ii) The total number of registered providers was 20,208. Of this 57% (11,418) were "active" on 31 March 2019. "Active" means that they had claimed a payment from the NDIA for delivering a service. Of the total number of providers, 45% are individual/sole traders.[8]

29. The '*data collected and benchmarked by NDS*' referred to in paragraph [633] will have changed since 2017. Moreover, the data appears to refer to the NDS 'Workforce Wizard' data. This data is collected through self-reporting of NDS members. It is therefore not rigorous or accurate in the same way as ABS data, for example, would be.

Social, Community, Home Care and Disability Services Industry Award
Matter No: AM2018/26

SUBMISSIONS IN REPLY OF HEALTH SERVICES UNION

OVERVIEW

1. These submissions in reply are made by the Health Services Union (**HSU**), in accordance with paragraph (2) of the amended directions of the Full Bench, dated 2 September 2019.

2. The HSU has also filed the Further Statement of Mark Farthing dated 16 September 2019 and relies on that statement in support of the arguments below.

3. These submissions are in response to:
    a) the proposed variations in the draft determination filed by the Australian Business Lawyers and Advisors Pty Ltd (**ABL**) on 2 April 2019**,** on behalf of Australian Business Industrial (**ABI**) the NSW Business Chamber (**NSWBC**), Aged & Community Services Australia (**ACSA**) and Leading Age Services Australia (**LASA**);
    b) the submissions filed in support of the abovementioned draft determination, consisting of:
        i. the submissions of ABL of 2 July 2019 on behalf of ABI, NSWBC, ACSA and LASA, including the witness statements of Scott Harvey dated 2 July 2019, Joab Darbyshire dated 28 June 2019 and Graham Shanahan dated 28 June 2019**;**
        ii. the submissions of National Disability Services **(NDS)** of 2 July 2019, including the witness statement of Steven Miller dated 28 June 2019;

iii. the submissions of the Australian Federation of Employers and Industries (**AFEI**) of 4 July 2019, which provide no evidence in support of the variations.

4. These submissions also respond in part to the submissions of the Australian Industry Group (**AIG**) insofar as they are relevant to ABL's claims as set out in their draft determination of 2 April 2019 and their submissions of 2 July 2019. AIG has not explicitly stated its support of ABL's claims, and has provided no evidence in support of the variations.

5. For ease of reference these submissions refer collectively to the parties supporting ABL's submissions, including ABI, NSWBC, ACSA, LASA, NDS, AFEI and AIG as '**the employers'**.

6. Consistent with the understanding at the conclusion of the discussion of the parties concerning the remote response allowance in the conciliation conferences before Commissioner Lee in August and September 2019, no submission is made herein in respect of that matter. The HSU reserves its right to make further submissions about that issue subject to the outcome of the discussions in respect of that matter.

VARIATIONS PROPOSED BY THE EMPLOYERS

7. In seeking to ensure a 'stable' system of modern awards, in accordance with the modern awards objective, in particular s 134(1)(g), the Full Bench held that where a '*significant change*' to a Modern Award is proposed in the four yearly review process, '*it must be supported by a submission which addresses the relevant legislative provisions and be accompanied by probative evidence properly directed to demonstrating the facts supporting the proposed variation*'.[1]

8. The employers' proposed variations, and the HSU's response to each submission, are dealt with in turn below.

Variation 1: ordinary hours of work in clause 25.1 (clause 13.1 in Exposure Draft (ED))

9. The employers propose to delete 25.1. That clause currently provides:

25.1 Ordinary hours of work

[1] [2014] FWCFB 1788, [23].

(a) The ordinary hours of work will be 38 hours per week or an average of 38 hours per week and will be worked either:

(i) in a week of five days in shifts not exceeding eight hours each;

(ii) in a fortnight of 76 hours in 10 shifts not exceeding eight hours each; or

(iii) in a four week period of 152 hours to be worked as 19 shifts of eight hours each, subject to practicality.

(b) By agreement, the ordinary hours in clause 25.1(a) may be worked up to 10 hours per shift.

10. The employers propose to replace clause 25.1 with the following:

25.1 Ordinary hours of work

(a) The ordinary hours of work will be 38 hours per week or an average of 38 hours per week over the employee's roster period, up to a maximum of four weeks.

(b) Subject to clause 25.1(c), the maximum ordinary hours that can be worked per shift is 8.

(c) By agreement between an employer and an individual employee, ordinary hours may be worked up to 10 hours per shift.

11. The HSU opposes the proposed variation. No imperative or proper basis for the variation is demonstrated.

12. The proposed change to clause 25.1 is not a '*minor or technical variation'* as ABI contends[2]. A significant amendment of the current wording is proposed.

13. No evidence demonstrating the erroneous or otherwise undesirable operation of the current clause is produced. It is not apparent what roster arrangements ABI says should be facilitated, but which are impeded by the current clause. No concrete alternative roster arrangement appears to be contemplated by any of ABI's witnesses. ABI has filed witness statements from:

    a) Scott Harvey, whose organisation Connectability does not employ any workers in direct support roles on a full-time basis[3], and who does not identify any rostering difficulties concerning full time workers in other roles;

[2] ABI Submissions, 2 July 2019, para 4.9
[3] Witness Statement of Scott Harvey dated 2 July 2019 [20]
