b) Joab Darbyshire, whose organisation Macleay Options Incorporated employs 50 full-time employees in classifications which are not identified and in respect of whose rostering, no evidence is given[4];

c) Graham Shanahan, from Coffs Coast Health and Community Care Pty Ltd, which employs 6 full-time employees, whose classifications and rosters are not disclosed[5];

d) Jeffery Wright, from HammondCare, which employs 798 full-time employees in classifications which are not identified[6]. Mr Wright's statement does not identify any impediment posed by clause 25.1 to the sensible and efficient rostering of those staff;

e) Andrew Collins, from the Benevolent Society, which employs 812 full-time employees in classifications which are not identified[7]. Mr Collins' statement also does not identify any impediment posed by clause 25.1 to the sensible and efficient rostering of those staff;

f) Deb Ryan, from Community Care Options, which employs 23 full time employees in classifications which are not identified[8]. Ms Ryan's statement does not identify any difficulties in respect of the the rostering of such full-time staff;

g) Therese Adami, from Catholic Healthcare Limited, which employs 546 full-time employees in classifications which are not identified. Ms Adami's statement does not address the rostering of those employees[9];

h) Wendy Mason, from Baptist Care NSW & ACT, which employs 555 full-time employees including 176 such employees in its Home Services (home care) division. Ms Mason's statement does not address the rostering of such employees[10].

14. NDS supports the claim but has provided no evidence to demonstrate the necessity either the wisdom or necessity of this proposed amendment. It has filed a witness

[4] Statement of Joab Darbyshire, 28 June 2019, [10]
[5] Statement of Graham Shanahan, 28 June 2019 (**Shanahan**), [16].
[6] Statement of Jeffery Wright, 12 July 2019 (**Wright**) [14].
[7] Statement of Andrew Collins, 12 July 2019, [20].
[8] Statement of Deb Ryan, 12 July 2019, [21].
[9] Statement of Therese Adami, 12 July 2019.
[10] Statement of Wendy Mason, (undated) July 2019.

statement from Steven Miller from the Endeavour Foundation, which employs 236 full-time employees.[11] However, nothing in Mr Miller's evidence touches on the organisation's rostering practice, let alone demonstrates why any proposed change to clause 25.1 is necessary and consistent with the Modern Awards objective.

15. Contrary to the ABL Submission at [4.7], not all the *key elements* of the clause as currently drafted would be retained if the amendment were made. The amendment would remove the entitlement (albeit condition) of employees on a four week roster to a rostered day off. The employers' evidence does not address the question of rostered days off at any point.

16. The Commission should decline to make the change sought.

Variation 2: 'period of work' in clause 25.4(a) (clause 13.4 in Exposure Draft)

17. The employers propose to vary clause 25.4(a). Clause 25.4 currently provides:

> ***25.4 Rest breaks between rostered work***
>
> *(a) An employee will be allowed a break of not less than 10 hours between the end of one shift or period of work and the start of another*
> *(b) Notwithstanding the provisions of subclause (a), by agreement between the employee and the employer, the break between:*
> *i. the end of a shift and the commencement of a shift contiguous with the start of a sleepover; or*
> *ii. a shift commencing after the end of a shift contiguous with a sleepover may not be less than eight hours.*

18. The employers propose that the clause be amended to read as follows:

> ***25.4 Rest breaks between rostered work***
>
> *(a) An employee will be allowed a break of not less than 10 hours between the end of one shift and the start of another*
> *(b) Notwithstanding the provisions of subclause (a), by agreement between the employee and the employer, the break between:*
> *i. the end of a shift and the commencement of a shift contiguous with the start of a sleepover; or*

[11] Statement of Steven Miller, 28 June 2019 [11].

ii. a shift commencing after the end of a shift contiguous with a sleepover may not be less than eight hours.

19. The effect of the proposed variation would be to remove the words "period of work" from clause 25.4(a) and thereby diminish the scope of the protection for employees that is contained in that clause. The HSU opposes the proposed variation.

20. The term "period of work" has a meaning that is broader than the term "shift". It includes sleepovers (as the qualification in clause 25.4(b) demonstrates) and excursions. Whilst not characterised as "shifts" under the Award, they are nonetheless periods of work, from which an employee should be entitled to recover before commencing further work. The elimination of the phrase from the clause would significantly impact its operation, and would shorten the period of rest between periods of work.

21. No evidence demonstrating the presently erroneous or otherwise undesirable operation of the current clause is produced. Indeed, nothing in the employer evidence addresses this issue at all. No basis for the variation is demonstrated.

Variation 3: change in roster - sub-clause 25.5(d)(ii) (clause 13.5(f) in Exposure Draft)

22. The employers propose to delete sub-clause 25.5(d)(ii).

23. Clause 25.5(d) currently provides:

(d) Change in roster

(i) Seven days' notice will be given of a change in a roster.

(ii) However, a roster may be altered at any time to enable the service of the organisation to be carried on where another employee is absent from duty on account of illness, or in an emergency.

(iii) This clause will not apply where the only change to the roster of a part-time employee is the mutually agreed addition of extra hours to be worked such that the part-time employee still has four rostered days off in that fortnight or eight rostered days off in a 28 day roster cycle, as the case may be.

24. The employers propose that sub-clause 25.5(d) should be varied as follows:

(i) Seven days' notice will be given of a change in a roster.

(ii) However, a roster may be altered at any time:

A. by agreement between the employer and relevant employee, provided the agreement is recorded in writing;

B. to enable the service of the organisation to be carried out where another employee is absent from work on account of personal/carer's leave, compassionate leave, community service leave, ceremonial leave, leave to deal with family and domestic violence, or in an emergency; or

C. where the change involves the mutually agreed addition of hours for a part-time employee to be worked in such a way that the part-time employee still has four rostered days off in that fortnight or eight rostered days off in a 28 day roster cycle.

25. The proposed variation would:

    a) facilitate the change of rosters at any time where the employee has agreed to such variation; and

    b) expand the circumstances where a unilateral variation may be effected beyond illness or emergency.

26. The HSU opposes the proposed variation.

27. There is no evidence demonstrating the necessity for such a variation, nor that there is any proper case for such a variation in this industry. Amendments to the *Nurses Award* are inapposite. It is not appropriate to carry over on a piecemeal basis, provisions from awards that contain a raft of different conditions for employees and which have application in different circumstances.

28. So far as part-time employees are concerned, the amendment appears designed to undermine a fundamental protection: the entitlement to a regular pattern of work which appears in clause 10.3(c). Given that employees under this Award (unlike nurses) have no entitlement to an overtime loading until their hours of work exceed 10 in a day, 38 in a week or 76 in a fortnight[12], any dilution of the effect of clause 10.3(c) should not be regarded by the Commission as fair.

[12] Clause 28.1(b)

29. The evidence before the Commissions shows a high incidence of part-time work within the industries covered by the Award, and a high incidence of underemployment of those employees. The employer evidence indicates employers organisation their operations on the assumption that part-time workers will want to work additional shifts[13]. The absence of any penalty for doing so creates a structural incentive to do so. The employers' proposed variation to allow change of roster where there is agreement is unlikely to provide any real and substantial protection for employees. The facility to make changes by agreement should remain limited to changes to perform additional shifts.

Variation 4: client cancellation in clause 25.5(f) (clause 13.5(g) in Exposure Draft)

30. The employers propose to delete sub-clause 25.5(f).

31. Clause 25.5(f) currently provides:

> *(f) Client cancellation*
>
> *(i) Where a client cancels or changes the rostered home care service, an employee will be provided with notice of a change in roster by 5.00 pm the day prior and in such circumstances no payment will be made to the employee. If a full-time or part-time employee does not receive such notice, the employee will be entitled to receive payment for their minimum specified hours on that day.*
>
> (ii) *The employer may direct the employee to make-up time equivalent to the cancelled time, in that or the subsequent fortnightly period. This time may be made up working with other clients or in other areas of the employer's business providing the employee has the skill and competence to perform the work.*

32. The employer's proposed clause reads:

> *(f) Client cancellation*
>
> *(i) This clause applies where a client cancels or changes a scheduled home care or disability service which a full-time or part-time employee was rostered to provide.*
>
> *(ii) Where a service is cancelled by a client under clause 25.5(f)(i), the employer may either:*

[13] Wright [35] – HammondCare offered 14,000 additional hours above contract hours in May 2019, or the equivalent of 92 FTE positions; Shanahan [30] – Coffs Coast Health offered an additional 902 hours of work to its 31 part-time employees in May 2019, an average of about 30 hours each or 7.5 hours per week.

A. direct the employee to perform other work during those hours in which they were rostered; or
B. cancel the rostered shift.

(iii) Where clause 25.5(f)(ii)(A) applies, the employee will be paid the amount payable had the employee performed the cancelled service or the amount payable in respect of the work actually performed, whichever is the greater.

(iv) Where clause 25.5(f)(ii)(B) applies, the employer must either:
A. pay the employee the amount they would have received had the shift not been cancelled; or
B. subject to clause 25.5(f)(v), provide the employee with make up time in accordance with clause 25.5(f)(vi).

(v) The make up time arrangement cannot be utilised where the employee was notified of the cancelled shift after arriving at the relevant place of work to perform the shift. In these cases, clause 25.5(f)(iv)(B) applies.

(vi) Where the employer elects to provide make up time:
A. the make up time must be rostered in accordance with clause 25.5(a);
B. the make up time must be rostered to be performed within 3 months of the date of the cancelled shift;
C. the employer must consult with the employee in accordance with clause 8A regarding when the make up time is to be worked prior to rostering the make up time; and
D. the make up shift can include work with other clients or in other areas of the employer's business provided the employee has the skill and competence to perform the work.

33. The HSU opposes the proposed variation.

34. The HSU agrees with primary position of United Voice that there should be no cancellation provision in this Award. If there is to be a cancellation clause, it should be on strictly limited terms. The employers' submissions and draft variation concede, implicitly, the inequity of the current position of not paying workers for a shift that has been cancelled the evening before it is to be performed. That inequity is glaring in an award in which the certainty of days and hours of work of part-time workers has been said to compensate for the absence of an entitlement to overtime penalties within ordinary full time hours.

35. The employers have neither demonstrated:

    a) a proper basis on the evidence for the extension of cancellation provisions to the disability worker stream; nor

b) that its proposed variation would establish a fair safety net for workers.

36. As to the former issue, the position for employers has improved considerably with the changes to the NDIS cancellation rules effective 1 July 2019. These changes are articulated in the NDIS Price Guide 2019-20, p. 17 available from the NDIS website: https://www.ndis.gov.au/media/1455/download. In his further statement concerning the pricing mechanisms under the NDIS[14], Mark Farthing summarises the extensive pricing changes which took effect at the commencement of the present financial year. Those changes include both substantial increases to service rates compared to increases to wages over a comparable period as well as significant increases to loadings and the like.

37. Significantly, the rules around cancellation provide greatly expanded scope for services to recoup their costs in the event of cancellation. The updated cancellation rules provide for the following:

    a) a provider can charge an NDIS participant for a "short-notice" cancellation up to 90% of the fee associated with the scheduled activity/service. Such fee well exceeds the total labour costs of the service;
    b) a "short-notice" cancellation is defined as such if the participant:
        i. does not show up for a scheduled support within a reasonable time, or is not present at the agreed place and within a reasonable time when the provider is travelling to deliver the support (i.e. a "no-show"); or
        ii. has given less than 2 clear business days' notice for a support that meets both of the following conditions:
            - the support is less than 8 hours continuous duration; AND
            - the agreed total price for the support is less than $1,000; or
        iii. has given less than 5 clear business days' notice for any other support.
    c) There is no limit on the number of short notice cancellations (or no shows) that a provider can claim in respect of a participant.

38. The claims made by ABI regarding the operation of the cancellation provisions under the NDIS in paragraphs 5.12 and 5.13 of its submissions are incorrect.

39. The revised cancellation rules in the updated NDIS Price Guide provide a generous mechanism for service providers to recoup the costs of service cancellations.

[14] Statement of Mark Farthing, 16 September 2019

40. The suggestion by Mr Harvey[15], that the circumstances in which short notice cancellations may be claimed are "*very specific"* is obtuse and misleading. Rather than limiting the scope for such payment, the change to the provisions has greatly expanded the scope for such payment. The requirements now operate to ensure either 2 full business days' notice of cancellation or 90% payment (for most ordinary attendances) and 5 full business days' notice or 90% payment for appointments of greater length and cost. In those circumstances it is unclear how it may be posited[16] that client short notice cancellations give rise to hours that are unable to be billed. Rather, given the generosity of the notice required, it is likely employees may be deployed usefully or lucratively for the period of the cancelled service.

[16] Harvey [47]

Fair Work Commission
Four Yearly Review of Modern Awards
Social, Community, Home Care and Disability Services Industry Award
Matter No: AM2018/26

FURTHER STATEMENT OF MARK FARTHING

1. I am employed as the National Campaigns and Projects Officer at the Health Services Union (**HSU)**. I have been employed in this position since September 2019.
2. I was previously employed as a Senior Policy Advisor for the Health Services Union (**HSU**) Victoria No. 2 Branch, also known as the Health and Community Services Union (**HACSU Victoria**) from March 2016 until September 2019.
3. I have substantial research experience in the health and community services sector, with particular expertise in disability services and the National Disability Insurance Scheme (NDIS), as well as more broadly in industrial and workforce research and policy.
4. Between 2013 to 2016 I was employed as the Senior National Project Officer in the Health Services Union National Office.
5. My work background is set out further in my previous witness statement dated 15 February 2019.

Overview of Changes to NDIS Price Guide

6. The National Disability Insurance Agency (NDIA) is responsible for setting price limits and policies relating to the delivery of NDIS-funded supports.
7. This function of the NDIA is achieved through the production of a document known as the “Price Guide”.
8. Price Guides typically operate for a full financial year (1 July to 30 June).
9. At least once per year, usually just prior to the end of the financial year, the NDIA revises the Price Guide to account for wage rises and general inflation. However, in some years more substantial variations to prices are implemented, either at that time or otherwise

because of Commonwealth Government policy decisions and/or at the behest of the NDIA Board.

10. In the 2019-20 Price Guide, which came into operation on 1 July 2019 and is in operation as at the time of the making this statement, significant changes were made to several price categories and policies. In summary these were:

    a. General price increases and significant above-inflation increases for therapists and attendant care and community participation supports. For example, the price for attendant care and community participation supports delivered during the daytime on a weekday to a standard needs participant was increased from the previous financial year by 9.78% (or 18.01% when the TTP Payment is taken into account). The rates were as follows:

       Assistance With Self-Care Activities – Standard – Weekday Daytime (Level 1) [01_011_0107_1_1]

       2018-19 = $48.14

       2019-20 = $52.85/$56.81 TTP

    b. The introduction of a Temporary Transformation Payment (TTP), which is a conditional loading calculated at 7.5% of Level 1 (standard needs) prices, but applicable in respect of Level 2 and Level 3 supports as well. The TTP will reduce each subsequent year by 1.5%. Providers can claim the higher TTP prices as long as they publish their service prices, list and keep up-to-date their business contact details in the NDIA's "Provider Finder" and participate in an annual NDIA-approved market benchmarking survey.

    c. A doubling of the remote and very remote loadings from 20% to 40%, and from 25% to 50%, respectively, of the price of the scheduled attendance. The rates for attendant care and community participation supports delivered during the daytime on a weekday to a standard needs participant are as follows:

       Assistance With Self-Care Activities – Standard – Weekday Daytime (Level 1) [01_011_0107_1_1]

       Metro = $52.85/$56.81 TTP

       Regional = $73.99/$79.53 TTP

       Rural = $79.28/$85.22 TTP

    d. Increases to the length of time that providers can claim for the time spent travelling to participants from 20 to 30 minutes within city areas, and from 45 to 60 minutes in regional areas.

e. Clearer rules around charging for non face-to-face time, with the NDIA stipulating that these activities are billable if they are part of delivering a disability support item to a participant such as writing a report about the participant's progress (rather than a general activity such as staff rostering).

f. A revised cancellation policy which abolishes the limit on the number of cancellations or "no shows" that be charged per year (see section below for more detail on client cancellation policy changes)

Response to AiG Submission

11. In paragraph 76 of its submissions dated 13 July 2019, the AiG suggests that the only increase applied in the 2019-20 Price Guide was the 4.5% increase relating to the Commission's Annual Wage Review decision and the operation of the Equal Remuneration Order. This overlooks the increases announced by the Commonwealth Government on 30 March 2019, the key elements of which I refer to in paragraph 10 above, and which were incorporated into the 2019-20 Price Guide in addition to the 4.5% increase.

12. In paragraph 77 of its submission the AiG suggests that *"the information published by the NDIA to date does not suggest that the assumptions underpinning the pricing arrangements have been changed or that any additional funding has been released to address broader concerns previously expressed by employers about the inadequacy of the funding to cover the various costs associated with providing the relevant services, including labour costs."*

13. While the NDIA has not released materials explicitly identifying the methodology underpinning price limits for supports in the 2019-20 Price Guide, it does not necessarily follow that prior published pricing methodologies and assumptions are still correct, for the reasons I set out below.

14. In section 5.3 of its submission, the AiG refers to the NDIA's "Reasonable Cost Model" (**RCM**) and the report published by the University of NSW in June 2017 titled *"Reasonable, necessary and valued: pricing disability services for quality support and decent jobs".* (**UNSW Report**)

15. The HSU along with the ASU and United Voice commissioned this report. I was intimately involved in working with the research team during the production of this report and was identified as such in the acknowledgements section prefacing the report, and am in a position to comment on the parameters of that research.

16. The UNSW report examined NDIS prices as they were in the NDIA's 2016-17 Price Guide, with the focus of analysis on the "base hourly rate" for standard needs, weekday, daytime support at $42.79 per hour, specifically the support item: *Assistance With Self-Care Activities - Standard - Weekday Daytime*

17. In the 2019-20 Price Guide the price limit for *Assistance With Self-Care Activities - Standard - Weekday Daytime* is $52.85 ($56.81 with the Temporary Transformation Payment (**TTP**) loading). This represents a 23.51% increase (32.76% with the TTP) compared with the 2016-17 price limit.

18. The 2016-17 rate for a SACS 2.3 worker was $24.70 per hour, whilst the current (2019-20) rate for the same worker is $28.44. This represents a 15.14% increase over the same period. These wage rates are inclusive of the ERO component.

19. The NDIS price item has increased at a rate which is substantially greater than the increase in wages for the average level disability support worker. The price limits in the 2019-20 Price Guide therefore do not reflect the assumptions that were contained in the NDIA's original RCM, which was the focus of the UNSW report.

20. The AiG's claim in Paragraph 151 that *"there is nothing to suggest that the fundamental problems identified in the UNSW Report with the RCM will be alleviated by the funding increases"* appears to disregard the fact that the price increases and additional payments set out above well and truly outstrip wage growth, provide some significant new bases of entitlement to payment and presupposes that the assumptions contained in the RCM are still built into the price structure.

21. The UNSW report also critiqued a number of NDIA policies contained within the 2016-17 Price Guide which have subsequently been addressed in the 2019-20 Price Guide. These include:

    a. Increasing the intensity loading for more complex participants, from two levels (standard and high-intensity) in 2016-17, to three levels Level 1 (standard), Level 2 (high intensity/complex) and Level 3 (higher intensity/more complex) supports in 2019-20;

    b. A doubling of the remote and very remote loadings from 20% to 40%, and from 25% to 50% respectively of the price of the scheduled attendance.

    c. Updates to the length of time that providers can claim for the time spent travelling to each participant to 30 minutes within city areas and 60 minutes in regional areas. This is an increase from 20 and 45 minutes, respectively.

d. Clearer rules around charging for non face-to-face time, with the NDIA stipulating that these activities are billable if they are part of delivering a disability support item to a participant such as writing a report about the participant's progress (rather than a general activity such as staff rostering).

e. A revised cancellation policy which abolishes the limit on the number of cancellations or "no shows" that be charged per year (see section below for more detail on client cancellation policy changes)

22. In summary, the AiG submission relies heavily on the UNSW report, which is predicated on an analysis of NDIS prices in the 2016-17 Price Guide. In light of the significant changes to both price limits and pricing policies contained in the 2019-20 Price Guide, much of the analysis in the UNSW report is no longer relevant.

Client Cancellation

23. The NDIA has significantly revised its cancellation rules in recent Price Guides.

24. In the 2015-16, 2016-17, 2017-18 Price Guides, the NDIA allowed providers to charge a participant the full amount of a scheduled personal care or community support up to 8 times per year when there was a short-notice cancellation or a "no show" by a participant. A short-notice cancellation was defined as such if the participant advised the provider after 3pm the day before the scheduled service.

25. In the 2018-19 Price Guide, the NDIA revised its cancellation rules which increased the number of times a provider could charge a participant for a short-notice cancellation or "no show" from 8 to 12 times per year, however, it reduced the amount that a provider could charge from 100% of the cost of the scheduled personal care or community support to 90%.

26. The 2018-19 Price Guide did not set 12 cancellations per year as a hard limit, instead specifying that "beyond this threshold, the NDIA will require the provider to demonstrate they are taking steps to actively manage cancellations."

27. In the 2019-20 Price Guide, which came into operation on 1 July 2019 and is in operation as at the time of the making this statement, the NDIA revised its cancellation rules again.

28. The revised cancellation rules provide for the following:

a. A provider can charge an NDIS participant for a "short-notice" cancellation up to 90% of the fee associated with the scheduled activity/service.

b. A "short-notice" cancellation is defined as such if the participant:

i. does not show up for a scheduled support within a reasonable time, or is not present at the agreed place and within a reasonable time when the provider is travelling to deliver the support (i.e. a "no-show"); or

ii. has given less than 2 clear business days' notice for a support that meets both of the following conditions:

- the support is less than 8 hours continuous duration; AND
- the agreed total price for the support is less than $1,000; or

iii. has given less than 5 clear business days' notice for any other support.

c. There is no limit on the number of short notice cancellations (or no shows) that a provider can claim in respect of a participant.

29. By way of example, a participant who had booked 2-hours of standard-needs community access between 9am to 11am on a Thursday at a cost of $125.38 who cancelled any time after 9am on the Tuesday prior could be charged $112.84 by their provider. Whereas a participant who had booked a full-day stay at a respite facility on a Thursday to receive 1:1 supports at a cost of $1,546.39 who cancelled anytime after 9am Friday the prior week could be charged $1,391.75.

30. In summary, the 2019-20 Price Guide provides significantly more flexibility and certainty to providers by abolishing the limit on the number of cancellations that may be charged per year and extending the definition of a "short notice" cancellation from 3pm the day before the scheduled service to less than 2 clear business days before the scheduled support.

31. The claims made by ABI in paragraphs 5.12 and 5.13 are therefore no longer correct in light of the 2019-20 Price Guide.

32. The revised cancellation rules in the 2019-20 Price Guide provide a significantly expanded capacity for service providers to recoup the costs of service cancellations.

16 September 2019

Fair Work Commission
Four Yearly Review of Modern Awards
Social, Community, Home Care and Disability Services Industry Award
Matter No: AM2018/26

SUPPLEMENTARY SUBMISSIONS IN REPLY OF HEALTH SERVICES UNION

OVERVIEW

1. These submissions in reply are made by the Health Services Union (**HSU**) in response to the claim, by Australian Business Lawyers and Advisors Pty Ltd (**ABL**) on behalf of Australian Business Industrial (**ABI**) the NSW Business Chamber (**NSWBC**), Aged & Community Services Australia (**ACSA**) and Leading Age Services Australia (**LASA**) (referred to herein as **the employers)** to insert a remote response work clause in the *Social, Community, Home Care and Disability Service Award* (**the Award**).

2. That claim is contained in the submission of ABL dated 2 July 2019 and its draft determination of 2 April 2019.

3. The Commission will recall that in its submissions of 15 February 2019 in support of its Draft Determination dated 15 February 2019, the HSU contended that remote work should be compensated by a one hour minimum payment at the overtime rate.

4. In its Reply submission dated 16 September 2019, the HSU deferred its response to the employers' claim and the ABL submissions in keeping with the understanding of the parties following the conciliation of the issue in August and September 2019. In that submission the HSU reserved its rights to respond to the employer claim.

REMOTE RESPONSE ALLOWANCE

5. The employers' claim implicitly concedes that the issue of employees working from home is one which is appropriate to be addressed in the current review, and should, in

accordance with the Modern Awards objective, be addressed by a variation to the Award. The HSU embraces that implicit concession. It contends that work performed remotely by employees after ordinary hours should be remunerated under the Award.

6. The difference between the parties does not appear to be one of principle, rather the principal differences between the parties are as to the scope of work to be covered by such a clause, and as to the approach to be taken in determining and regulating payment of the remuneration for such work.

7. The HSU notes that the employers' claim is the subject of submissions by the Australian Services Union (**ASU**) dated 23 September 2019. Those submissions contain a number of observations about the employer claim, with which observations the HSU broadly agrees, namely:

   a) At [3(a)], the ASU contends that the definition of "remote response duties" does not describe work in the SCHCDS Industry. The HSU adopted similar language in its draft variation of 15 February 2019. However, that description was an *inclusive* one. The HSU did not intend for that description to be an exhaustive one which performed the function of excluding from an entitlement to remuneration any other type of work required of employees outside of normal hours remote from their workplace, such as administrative work. Rather, the HSU's intention was to make clear that the types of work described were included as remunerated work in circumstances where such work is frequently required of employees outside ordinary hours, and performed, without remuneration;

   b) At 3(b), the ASU observes that the proposed variation would appear to entitle an employer to direct an employee to perform work outside of their ordinary hours contrary to the reasonable hours limitation in s.62 of the FW Act. The HSU shares that concern and contends that at the very least, the employers' proposed clause may be perceived to have that effect;

   c) At 3(c) and (d), the ASU notes the impact the employers' proposed clause would have on the current regulation of "on-call" work. The ASU's proposed variation deals with that issue by having a greater minimum payment for such work when required of an employee who is not "on call". The HSU agrees that such a distinction would create an incentive for more efficient management of the performance of work out of hours, and sets a fair and reasonable minimum standard for the performance of such work. Where an employee is not on-call and

thereby on notice as to the prospect of additional work out of hours, the disruption and disutility associated with a recall to perform work is likely to be greater.

8. As set out in the HSU's draft determination dated 15 February 2019, remote response work should be compensated at the overtime rate.

9. The HSU adopts the ASU Submissions at 3(f), (g) and (h), which address the operation of the employer's proposed clause, and the ASU's responses to the ABL Submissions at [5]. It endorses the principled approach to this issues set out at [7] of the ASU's Submissions.

Health Services Union

2 October 2019

Fair Work Commission
Four Yearly Review of Modern Awards
Social, Community, Home Care and Disability Services Industry Award
Matter No: AM2018/26

SUPPLEMENTARY SUBMISSIONS IN REPLY OF HEALTH SERVICES UNION

OVERVIEW

1. These submissions in reply are made by the Health Services Union (**HSU**) in response to:

   a) Reply Submission dated 12 July 2019 of Australian Business Lawyers and Advisors Pty Ltd (**ABL**) on behalf of Australian Business Industrial (**ABI**) the NSW Business Chamber (**NSWBC**), Aged & Community Services Australia (**ACSA**) and Leading Age Services Australia (**LASA**) (referred to herein as **the employers)** regarding the HSU's Claims (the outstanding matters identified in Attachment C to the directions issued on 13 May 2019) (**ABL Submission**);

   b) AIG Submission in Reply dated 13 July 2019 (**AIG Submission**);

   c) National Disability Services dated 12 July 2019 (**NDS Submission**);

   d) Business SA Submission in Reply dated 12 July 2019 (**Business SA Submission**);

   e) Australian Federation of Employers and Industries Submission dated 23 July 2019 (**AFEI Submission**);

   f) Reply Submission dated 13 September 2019 of **the employers** regarding the Unions' travel time claims (**ABL September Submission**);

g) Reply Submission dated 16 September 2019 of AIG regarding the Unions' travel time claims (**AIG September Submission**);

h) Reply Submission dated 16 September 2019 of NDS regarding the Unions' travel time claims (**NDS September Submission**);

i) Reply Submission dated 16 September 2019 of AFEI regarding the Unions' travel time claims (**AFEI September Submission**);

2. Save where something in the HSU's Submissions of 15 February 2019 is expressly disavowed, the HSU relies on its earlier submissions.

3. The HSU does not contest the FWC's *Legislative framework relevant to the Review* dated 12 April 2019, and adopts the analysis contained therein in these submissions.

The Social, Community, Home Care and Disability Services Industry

4. In Section 4 of the ABL Submission, ABL describes the "work arrangements" covered by the Award as falling into two categories: work that is stable, consistent and certain, and work that is *dynamic, variable and difficult to predict* due to client driven factors that cause the working arrangements to be subject to regular change.

5. The HSU does not accept the ABL's characterisation.

6. It is true that some of the work performed under the Award is work that may be performed at a single location and at regular times. It is also true that the services provided to clients by disability and home care workers are likely to be required at a range of locations over the course of any day or week, and that the timing and nature of that work required to be performed by an employer will be significantly determined by client demand.

7. However, it does not follow for those reasons that the *working arrangements* need be subject to regular change. Nor is it the case that employers are lacking in any power or means to manage the timing and the performance of the work they require in a way that makes sensible and efficient use of the time of employees. The evidence and submissions of ABL in this regard display a disturbing passivity in that regard.

8. At 4.13, ABL contends that *the nature of this work is also often characterised by short segments of work.* The HSU does not accept that description. The evidence shows that in order to deliver any service, a home care or disability worker will initially be required

to travel some distance in order to attend upon the client. They must then either travel on to the next appointment, or return from the appointment. All such travel is carried out for the purpose of performance of the employer's work and should be regarded and remunerated as such, as is the case for employees in other industries. Further, the period between directly "productive" tasks is also work, as in any other industry where a worker stands in readiness for the next task. It wouldn't be suggested that a retail worker should only be paid for the moments when they are receiving money from customers. ABL's contention seeks to redefine "work" as only that time when the worker is in direct contact with the client. Given the funding provided under the NDIS for travel, its definition doesn't even extend to the entire period during which the worker is generating income for the employer. When the direct client contact time, and associated travel and waiting time is considered, it is clear that the periods of work performed by employees are considerable, and easily sufficient to meet a minimum engagement.

9. The circumstances of home care and disability workers are at the centre of the present proceeding. The evidence from workers in the industry, and from experts whose reports have been filed by the unions, shows an expanding and underemployed workforce, rarely earning any more than Award minima, spending hours criss-crossing the catchment areas of their employer organisation to perform services for clients without being fairly compensated for the entire time they are required to devote to the performance of the work of their employers. The HSU's claims in respect of minimum engagement, broken shifts and travel allowance are, taken together, directed to avoiding the unfairness and exploitation which are made possible by the provisions of the Award as they currently stand.

10. So far as ABL points to the prices that employers may charge for such services being fixed by Government, the HSU relies on the *Further Statement of Mark Farthing* dated 16 September 2019 which details the recent significant increases to the prices which may be charged by organisations for NDIS funded services. Those price increases were effected in a 30 March 2019 announcement, and in the changes in the NDIA 2019 – 2020 Price Guide, and significantly outpaced wage increases.

11. So far as ABL points to the *significant financial pressure* on employers in the industry at 4.18, it does not substantiate that assertion in the evidence it has filed. The Commission could not make the finding urged on it at 4.19(f) of the ABL submission based on the evidence before it.

12. NDS also makes some observations about the nature of the industry. At [29] of its Submission, NDS refers to the personal preferences of clients regarding reallocation of their workers.

13. The FWC should not proceed in its consideration of this matter on the basis that in the utilisation of services under the NDIS clients have, at every point in their relationship with an organisation, an entitlement to be afforded their first preference as to the service they receive. The reality that preferred workers will have days off sick, or on leave is one with which clients are, not unreasonably, required to grapple. The vast bulk of appointments carried out by any organisation are carried out as scheduled; cancellations represent a small proportion of those appointments. It is not unreasonable for clients to have to deal with the occasional frustration of not having their preferred provider if a cancellation gives rise to a need to reshuffle workers.

14. The assertion at [37] of the NDS Submission as to the enhanced negotiating power of the individual client is unsupported by any evidence of client flight, or any evidence of organisations attempting to negotiate arrangements in a way that protects the interests of their workers.

15. In its Submission at page 33 and following, AIG deals with the NDIS, and the funding arrangements associated with that scheme. The HSU relies on the analysis contained in the *Further Statement of Mark Farthing* dated 16 September 2019 in respect of those funding arrangements.

ABL Submission - Section 5 – Summary of ABL Position

16. The ABL contends, at 5.2, that if the unions' claims are granted there will be a *significant deleterious impact on the viability of most businesses in the sector.*

17. That assertion is unsupported by cogent and reliable evidence. There is not a proper basis to urge such a finding on the Commission.

18. If made, the variations sought by the HSU will create an incentive for employers to review their approach to the rostering and scheduling of their services and their workers. The financial impact of the changes will depend, in any case, on the extent to which those the employer deploys management strategies to meet them.

19. The suggestion that the changes sought by the unions *would likely have a material adverse impact on the businesses' ability to deliver services to vulnerable members of the community* is unsupported by any evidence as to the financial position of the

organisations, from clients in receipt of services, or any cogent evidence as to the impossibility of managing work to meet the proposed changes. The Commission would reject this hyperbole.

20. So far as the ABL sets out its position at 5.9 and following, the HSU notes ABL implicitly concedes the necessity for minimum engagements for part-time employees at 5.9 and 5.10.

Minimum Engagements

21. Both AIG and ABL refer to the decision in the *Casual and Part-Time Employment Decision*[1]. Although it rejected the ACTU's universal claim in that case, the Full Bench made this observation about the purpose of minimum engagement periods, which is particularly apposite in the current matter (at [399]):

> *Minimum engagement periods in awards have developed in an ad hoc fashion rather than having any clear founding in a set of general principles. However their fundamental rationale has essentially been to ensure that the employee receives a sufficient amount of work, and income, for each attendance at the workplace to justify the expense and inconvenience associated with that attendance by way of transport time and cost, work clothing expenses, childcare expenses and the like. An employment arrangement may become exploitative if the income provided for the employee's labour is, because of very short engagement periods, rendered negligible by the time and cost required to attend the employment. Minimum engagement periods are also important in respect of the incentives for persons to enter the labour market to take advantage of casual and part-time employment opportunities (and thus engage the consideration in para (c) of the modern awards objective in s 134).*

22. The Full Bench set out evidence before it concerning work in the disability sector. In the case of Ms Potoi, the work involved the performance of a one and a half hour shift which involved the same amount of time again spent on travel, and in the case of Mr Quinn, the working of shifts between half an hour in length and 4 hours in length. The Full Bench characterised that evidence as showing the working of short shifts in the disability sector in a manner which *verged on being exploitative*[2].

23. The HSU has obtained, and filed in the present matter, the Witness Statement of Mr Scott Quinn which was admitted into evidence in those earlier proceedings. It has also obtained a Supplementary statement from him which updates his earlier statement.

[1] (2017) 269 IR 125
[2] At p 312 [406]

24. The observations of the Full Bench invite a consideration of the time and cost expended by employees for the performance of any particular shift of work, in order to weigh whether the income is rendered negligible. In the HSU's submission, to undertake that weighing process in the case of disability services and home care workers requires consideration of (at least) the following matters:

    a) the length of "shifts" offered;

    b) the capacity of employers to break shifts;

    c) the time and cost expended in travelling to attend shifts;

    d) whether such time and cost are remunerated and reimbursed;

    e) the "dead time" lost by employees as a consequence of broken shifts.

25. To the extent it is suggested, at 6.28 of the ABL Submission, that the Full Bench is bound by the conclusions reached by the Full Bench when the Award was made, that submission misstates the task now required of the Commission. The establishment of the 4 Yearly Reviews contemplated that the making of the Modern Award in 2010 was a starting point, rather than an end point.

26. The HSU also relies upon, in support of this claim, the evidence in the Statement of Steven Miller dated 28 June 2019. Mr Miller's statement, at [25] and following shows the peaks and troughs of demand for services during the course of weekdays and weekends, with identifiable and extended periods of consistent demand. The task of arranging work and shifts of a reasonable minimum length in those circumstances should not be beyond employers in this industry. The observation at [53] in the Statement of David Moody dated 12 July 2019[3], that NDIS participants receiving assistance with daily living require assistance of 2-3 hours, provides a basis for optimism that a 3 hr minimum engagement may be readily accommodated by employers.

27. The HSU notes the concession by ABL, at 6.43, that it is commonplace in the industry that employees are rostered to perform very short shifts. It rejects the contention thereafter, that such approach is the inevitable consequence of the nature of the services offered by employers.

[3] Filed by National Disability Services

28. The ABL's contention, at 6.45, that it is particularly challenging in regional, rural and remote areas to effectively *bundle* a number of engagements to produce a shift of sufficient length betrays an underlying assumption that the extensive travel to, from, and between such appointments is not regarded as forming a part of a worker's shift. Contrary to the ABL's submission, it is the fact that the performance of each shift of work involves such travel that makes a fair minimum engagement necessary.

29. At clause 6.48, ABL contends for a one-hour minimum engagement for home care employees. The HSU submits such a minimum engagement is exploitative, in keeping with the comments of the Full Bench in the Casuals and Part-Time Case. This is particularly the case where the Award would enable an employer to break a single hour shift. The two hour minimum engagements ABL otherwise contends for barely rise above the level of the verging on exploitative shift of Ms Potoi considered by the Full Bench.

30. Business SA appears to concede that there is a proper and principled basis for the introduction of a minimum engagement clause for part-time workers ([34]).

31. As with the ABL's submissions, the Business SA contention that the industry is one which of necessity requires short shifts (at [37]ff) is based on an assumption that travel to and from client appointments and waiting time between appointments is not work. Those assumptions are wrong as a matter of principle, and encourage an exploitative model of employment.

32. As to [47] of the Business SA Submission, the HSU repeats the observations it has made above about the significant increases to NDIS funding in 2019.

33. At [69] of its submission, AFEI bemoans the prospect of employer liability to pay for *"hours"* in which *no productive work is being performed.* As set out above, this submission is based on a fundamental misunderstanding or mischaracterisation of the nature of "work". Entitlement to wages is not conditioned on being "productive". Many types of employment involve workers having differing levels and periods of productivity over the course of a period of engagement. The submissions of the employer in this respect seek simply to define themselves out of the obligation to pay wages whilst having workers ready and available to perform the work they require.

34. At [113] AFEI repeats submissions it made in the Award Modernisation process. That submission referred to a single hypothetical example in a small community. The FWC would not centre that scenario in its approach to dealing with the matter before it. As

set out elsewhere herein, the evidence about peaks of demand at the start and end of the day make it apparent the HSU's claim for minimum engagements in each part of the broken shift one which is able to be accommodated.

35. To the extent the AFEI submission refers to the increased costs to providers as a consequence of allowing the union claims, that submission:

    a) does not appear to acknowledge the significant NDIS Price Guide increases in 2019-2020; and

    b) fails to credit employers with the capacity to adapt to changes in work conditions by reviewing their approaches to rostering and scheduling of appointments.

36. The issue of minimum engagements was considered by the Full Bench in the *Aged Care Decision* [2019] FWCFB 5078.

37. In that decision, the Full Bench said:

> *[182] In considering the merits of the claim, it is useful to look first at the rationale for minimum engagement provisions in modern awards.*
>
> *[183] The question of minimum engagement terms did not receive any systematic consideration during the award modernisation process which led to the current modern awards and largely preserved the predominant provisions concerning minimum engagements contained in pre-reform awards. As explained by the Full Bench in Re Victorian Employers' Chamber of Commerce and Industry:*
>
> > *'The Award Modernisation Full Bench of the Australian Industrial Relations Commission (AIRC) did not address the question of minimum engagements in any of its decisions and statements made in connection with the award modernisation process. This is because minimum engagements did not emerge as a significant issue during that process. Minimum periods of engagement have been a common feature of State and Federal awards for a very long period. The rationale for minimum periods of engagement is one of protecting employees from unfair prejudice or exploitation. Given the time and monetary cost typically involved in an employee getting to and from work, it has long been recognised that employees, especially casual employees, can be significantly prejudiced if a shift is truncated by the employer on short notice (as would otherwise be lawful in a typical casual engagement) or the employee can be pressured into accepting unviable short shifts in order to*

retain access to longer shifts. The inclusion of a minimum engagement period in a modern award invariably reflected the fact that such provisions were to be found in a sufficient proportion of the pre-reform awards and NAPSAs that are operated within the coverage of the modern award.' (emphasis added)

[184] Similar observations were made by the Full Bench in the Metals Casual Decision.

> *'the minimum income from a casual engagement determines whether or not people who rely on social security or who have children will accept the job. Travel costs, child care expenses erode savagely any earnings. Any reduction in the expected length of a daily engagement has a severe impact on an already disadvantaged employee, and most heavily so for intermittent casual workers. The difficulties in balancing the requirements of the social welfare Newstart program with an offer of casual work are often too great to make the job worth the extra trouble'*

[185] The Full Bench in the Casuals and Part-time Employment Decision, 137 observed that the rationale for minimum engagement periods in modern awards was as follows:

> *'to ensure that the employee receives a sufficient amount of work, and income, for each attendance at the workplace to justify the expense and inconvenience associated with that attendance by way of transport time and cost, work clothing expenses, childcare expenses and the like. An employment arrangement may become exploitative if the income provided for the employee's labour is, because of very short engagement periods, rendered negligible by the time and cost required to attend the employment. Minimum engagement periods are also important in respect of the incentives for persons to enter the labour market to take advantage of casual and part-time employment opportunities (and thus engage the consideration in paragraph (c) of the modern awards objective in s.134.' 138*

[186] The short point to be extracted from the decisions referred to is that minimum periods of engagement protect employees from exploitation by ensuring that they receive a minimum payment for each attendance at their workplace in order to justify the cost and inconvenience of each such attendance.

[187] The interpretation of clause 22.8 advanced by ABI and AFEI would allow a casual or part-time employee to be engaged to perform work on two or more occasions in a day and an engagement may be for less than an hour. Indeed there would be no minimum duration for an individual engagement provided the sum of the engagements (or broken shifts) on a particular day exceed 2 hours in total. It seems to us that such an outcome is antithetical to the purpose of a minimum engagement term, such as clause 22.7 in the Aged Care Award.

[188] We note that ABI (and AFEI) point to a number of what are said to be 'safeguards' in relation to the use of broken shift, namely:

> *1. Broken shifts can only be worked by casual and permanent part-time employees.*
>
> *2. A broken shift can only be worked where the employee agrees to work the broken shift.*
>
> *3. The breaks within a broken shift cannot total more than four hours.*
>
> *4. The span of hours of a broken shift cannot exceed 12 hours.*
>
> *5. Part-time employees have the certainty of their pattern of work having been agreed in advance (in writing), including the number of hours to be worked each week, the days of the week to be worked, and the starting and finishing times of each day.*
>
> *6. The existing minimum engagement provisions ensure that employees receive a minimum payment of two hours' pay when working a broken shift.*

[189] We are not persuaded these 'safeguards' are adequate and nor do we consider that in its current form, clause 22.8 is a fair and relevant safety net term. The fact that broken shifts can only be worked by 'mutual agreement' does not provide sufficient protection, particularly for casual employees.

[190] It is relevant to note that the Full Bench in the 2017 Casual and Part-time Employment decision considered (and rejected) an Ai Group proposal to vary the Fast Food Industry Award 2010 to allow an employer and a casual employee to agree on an engagement of less than the 3 hour minimum provided in clause 13.4 of that award. In rejecting the claim the Full Bench said:

> *'The actual award variation advanced by the Ai Group may be criticised in the same way as the NRA proposal was criticised by Vice President Watson in his 2010 decision – namely that it "does not address the balance that is required with award provisions of this type to provide reasonable safeguards for employees against unfair engagement practices". The general concept of casual employees agreeing to reduced minimum engagement periods is itself problematic, since the continued engagement of casuals at all is dependent upon them agreeing to the terms of each engagement (subject only to any applicable award obligations binding on the employer). Ai Group's proposed provision does not require any minimum engagement period to be agreed in substitution for the standard 3 hour period at all, meaning that it would facilitate the complete removal of minimum engagement periods and thus open the door to the exploitation of casual employees.'*

[191] Later in that decision, the Full Bench rejected the proposition that provisions which allow employees, voluntarily and at their initiative, to work additional hours at ordinary rates would represent a tangible benefit for employees, noting that:

> *'Where a casual is engaged on a daily basis, the employer has the capacity under any facilitative provision, to dictate the terms of engagement, so that any employee who did not volunteer in writing to work additional hours at ordinary time rates would not be engaged.' 141*

[192] Further, in the Modern Awards Review 2012 – Award Flexibility Decision the Full Bench rejected applications which sought to include minimum engagement periods within the scope of the model flexibility term:

> *'We are not persuaded that it is appropriate to include 'minimum engagement periods' within the scope of the model flexibility term. As we have noted these provisions relate to minimum wages and for many employees are an important aspect of the modern award safety net. As Vice President Watson observed in Secondary School Students case:*
>
> > *"There is a long history of minimum engagement periods for part time and casual employees providing protection for employees from employer expectations of working short periods where the cost and inconvenience of attending the workplace outweighs the benefits received from the engagement."*

Any variation to minimum engagement periods in modern awards should only be by application to vary the relevant modern award or by enterprise agreement. This will ensure that the variation is subject to appropriate scrutiny. It is not appropriate to permit such variations by IFAs, which are effectively self-executing. In our view, the inclusion of such terms within the scope of the model flexibility term would not be consistent with the modern awards objective.'

[193] To the extent that clause 22.8 permits casual and part-time employees to be engaged (and paid for) for a portion of a broken shift which is less than 2 hours it does not provide a fair safety net.

[194] In relation to the s.134 considerations:

- *the 'needs of the low paid' (s.134(1)(a)) weighs in favour of the proposed variation;*

- *the variation of the clause in the manner proposed by the HSU would not 'encourage collective bargaining', it follows that the consideration in s.134(1)(b) does not provide any support for the variation;*

- *as to ss.134(1)(d) and (f), we accept that the variation proposed by the HSU may have an adverse effect on business – it is likely to increase costs and reduce flexibility. But the extent of the adverse impact is not likely to be substantial as the material before us suggests that split shifts are relatively uncommon and the incidence of such shifts has declined over time; and*

- *the consideration in s.134(1)(da)(e)(g) and (h) are not relevant.*

[195] The modern awards objective is to 'ensure that modern awards, together with the NES, provide a fair and relevant minimum safety net of terms and conditions', taking into account the particular considerations identified in paragraphs 134(1)(a)–(h). We have taken into account those considerations, insofar as they are relevant to the matter before us, and have decided to vary the Aged Care Award in the manner proposed by the HSU.

Broken Shifts

38. The issues of broken shifts, minimum engagements and travel provisions are interconnected. As set out by the HSU here and elsewhere, the existing provisions are

ripe for exploitation, and many workers have experienced periods between client interaction treated as breaks between their shifts. This approach is enabled where there is no minimum engagement, and no limit on the number of breaks in a shift. It is particularly egregious where it affects employees who work on a part-time basis.

39. The claim by ABL, at 7.26, of a need to have employees *work a broken pattern of work across the course of a day to meet customer needs* is in essence a demand to have employees in harness for an extended day, being paid for but small parts of that day. Nothing in the ABL submission acknowledges the disutility resulting from that approach to rostering.

40. The HSU accepts that it is appropriate in this industry for full-time workers to work broken shifts by agreement. It accepts that its draft variation dated 15 February 2019 inadvertently excludes that possibility.

41. The HSU maintains, however, that part-time disability and home care workers should have no more than one break to their shift.

Travel Time and Travel Allowance

42. The HSU rejects the employers' view that the Award currently does and should permit that '*employees are not entitled to any payment in respect of the non-work time which falls between the portions of work-time in a broken shift*'.[4]

43. As we have stated above, the HSU rejects the assumptions inherent in the submissions of the employer parties that travel to, from and between client appointments, and that time between appointments is not work.

44. The HSU has read the submissions of United Voice (**UV**) of 3 October 2019, and adopts its response to the employer replies to the union parties' travel time claims.[5] The UV submission clearly sets out the inequities associated with treating travel as an allowance rather than as time worked.

45. A further inequity arising from dealing with travel purely as an allowance is the fact that such time does not count for the purpose of calculating the entitlement to overtime payment. The nature of work in the industry means that employees can, over a span of

[4] ABL September Submissions, [4.10]-[4.12], and [8.2]-[8.25].
[5] United Voice Further Submission in Reply dated 3 October 2019, [6]-[19].

many hours druring the course of a day, spend many hours devoted to the performance of the employer's work: travelling, attending appointments and waiting.[6]

46. If travel between clients were to be considered an allowance rather than time-worked, employees working long days with multiple clients would rarely be entitled to overtime, save for when working beyond the 12 hour span for a broken shift, notwithstanding that they devote many hours to the employer's business.

47. Finally, we note that AIG has criticised the 'workability' of the HSU's and other unions claims at paragraphs [49] to [66] of their September Submissions, but have filed no evidence in support of their arguments and have never identified in these proceedings which clients in the industry they in fact represent. AIG's failure to comprehend how 'reasonable travel time' might be assessed displays either disingenuousness or a lack of engagement in and knowledge of the sector. Employers must have some idea of the time it takes to travel between clients, else they could not roster their workers. Employers, just like everyone else with internet access, know how to use Google Maps.[7]

Telephone Allowance

48. The HSU's claim in this regard was conditioned upon an employee being required by their employer to use a mobile phone for work purposes.

49. In that event, it is difficult to see how it can be asserted that the employer should not bear the costs associated with such usage.

50. Business SA appears to concede the prima facie entitlement to recompense for telephone costs incurred for the purpose of work.

Overtime for Part-Time Employees

51. At [41], AFEI appear to contest the HSU Submission that the Award creates a structural incentive to underestimate the work required of part-time employees.

52. The HSU's submission to that effect is supported by the evidence of employer organisations filed on behalf of ABL. Several of those witnesses averred, in terms which are strikingly similar, as to the frequency with which part-time employees are offered work additional to their contracted hours.

[6] Supplementary Statement of Scott Quinn, dated 3 October 2019, [24]-[26], [30], Annexure A.
[7] See, eg, Quinn [10], [14]-[20].

Cancellation

53. At [29] of its Submission, NDS refers to the personal preferences of clients regarding reallocation of their workers.

54. The HSU opposes the extension of cancellation arrangements to disability workers. There is no warrant at all for any diminution of the conditions of this workforce.

55. As to [33] of the NDS Submission, it is significant that NDS does not identify the number or proportion of cancellations that occur between 2 and 7 days out from an appointment. In any event, it must be conceded that with such an amount of notice, the capacity of an employer to rearrange workers and schedules is significantly greater than cancellations with lesser notice.

Health Services Union

3 October 2019

Fair Work Commission
Four Yearly Review of Modern Awards
Social, Community, Home Care and Disability Services Industry Award
Matter No: AM2014/285 and AM2018/26

STATEMENT OF DR. FIONA MACDONALD

1. I am a Senior Research Fellow and an Australian Research Council DECRA (Discovery Early Career Research Award) Fellow in the School of Management, RMIT University.
2. I have worked as a researcher in academic, government and non-government roles since 1994. My research work over this period has largely centred on the changing nature of employment and the role of work in people's lives. A copy of my Curriculum Vitae is **attached as FM-1** to this statement.
3. Since 2014, when I commenced at the School of Management at RMIT University, my research has focussed on the work and employment arrangements of frontline disability support workers under the National Disability Insurance Scheme.
4. Since 2016 this research has been supported by an Australia Research Council grant.
5. I employ a range of qualitative and quantitative methodologies in my research including in-depth interviews, labour market and organisational case studies, and socio-legal analysis.
6. I am a member of the Executive Committee of the Association of Industrial Relations Academics of Australia & New Zealand, the ILO Regulating for Decent Work network and the International Carework network. I am a member of the editorial advisory board of the International Journal of Care and Caring.
7. **Attached as FM-2** to this statement is an article I co-authored, titled 'Wage theft, underpayment and unpaid work in marketised social care,' which was published in 2018 in *The Economic and Labour Relations Review*. The article reports on the findings of a recent research project undertaken by me and two colleagues about the paid and unpaid work time of disability support workers.

[redacted]

Dr Fiona Macdonald

15 February 2019

FM-1

Fiona Macdonald

My professional experience as a researcher commenced over 20 years ago and my research over this period has largely centred on the changing nature of employment and the role of work in people's lives. Since 2014 my research has focussed on work and employment arrangements of frontline disability support workers under the National Disability Insurance Scheme. Since 2016 this research has been supported by an Australia Research Council grant. I employ a range of qualitative and quantitative methodologies in my research including in-depth interviews, labour market and organisational case studies, and socio-legal analysis. I am a member of the Executive Committee of the Association of Industrial Relations Academics of Australia & New Zealand, the ILO Regulating for Decent Work network and the International Carework network. I am a member of the editorial advisory board of the International Journal of Care and Caring.

Qualifications

2012	PhD (Political Science), University of Queensland
2001	Master of Social Science (Social Policy), (awarded with distinction) RMIT University.
1991	Graduate Diploma in Counselling Psychology, RMIT University
1982	Bachelor of Behavioural Science (Psychology), Latrobe University.

Employment

2016-	*Senior Research Fellow & ARC DECRA Fellow,* School of Management, RMIT University
2015-2016	*Vice-Chancellor's Senior Research Fellow,* School of Management, RMIT University (four year appointment, deferred in July 2016 to take up ARC DECRA Fellowship.
2014-2015	*Research Fellow,* (project position) School of Management, RMIT University.
2012-2014	*Research Fellow, Gender Equality and Decent Work* (project position), Centre for Work + Life, University of South Australia.
2009-2012	*Panel Member*, Victorian State Services Authority Panel of Grievance Review and Workplace Investigations Officers and *Independent Chair*, Victorian Public Service Tripartite Work Review Panels (self-employed consultancy roles).
2007-2012	*Self-employed research consultant*
2007	*Research Associate (project contracts)*, School of Political Science, University of Queensland; Centre for Applied Social Research, RMIT University; and Centre for Citizenship and Human Rights, Deakin University.
2005-2006	*Senior Researcher and Organisational Consultant*, URCOT, Melbourne.
2001-2004	*Executive Director, Equity Research Centre Inc.* industry advisory body to Victorian Government on equity and diversity in vocational education and training.
1994-2001	*Research and Policy Projects Manager* (from 1998) and Officer, Future of Work Research Project, Social Action and Research Division, Brotherhood of St Laurence, Melbourne.
1987-1994	*Vocational counsellor* and sessional lecturer, Social Science, RMIT; secondments to Industry Liaison Officer, TAFE Industry Research Unit, and Research Officer, Equal Opportunity Unit.

Awards

2018	Research Excellence Award, School of Management, RMIT University
2017	Vice-Chancellor's Award for Research Impact – Early Career Researcher Award, RMIT University
2016	Early Career Researcher Research Excellence Award, College of Business, RMIT University

2015 2016-2019 Australian Research Council Discovery Early Career Researcher Award

2008 Vic Taylor Award for Best Paper awarded by the Association of Industrial Relations Academics of Australia and New Zealand (AIRAANZ) for Charlesworth, S and Macdonald, F. 'The Unpaid Parental Leave Standard: What Standard?' 21st Conference of AIRAANZ, Melbourne, 6-8 February.

Abstract
Marketised models of social care provision in Australia are placing pressures on service providers and driving changes in work organisation and employer practices, with potential to degrade social care jobs. While international experience of marketised social care has demonstrated the vulnerability of social care workers to wage theft and other violations of employment laws, Australia's relatively strong industrial relations safety net might be expected to be better able to protect these low-paid workers. Nevertheless, there is emerging evidence of negative impacts on the pay and entitlements of frontline workers in the expanding community support and homecare workforce. This study investigates the paid and unpaid work time of disability support workers under Australia's new National Disability Insurance Scheme. The research takes a novel approach combining analysis of working day diaries and qualitative interviews with employees to expose how jobs are being fragmented and work is being organised into periods of paid and unpaid time, leaving employees paid below their minimum entitlement. The article highlights the role of social care policy along with inadequate employment regulation.

Introduction

This article reports on research investigating underpayment of wages of low-paid social care workers under Australia's new National Disability Insurance Scheme (NDIS). As a

'cash-for-care' scheme, the NDIS individualises and marketises disability support and shifts the location of much care and support work from public organisational settings to more diverse settings, including private households, as well as introducing new demands for flexibility, for very short working hours and for travel between multiple work locations (Macdonald and Charlesworth, 2016). Similar pressures and arrangements in adult social care in the United Kingdom have seen social care workers become highly vulnerable to wages underpayment (Low Pay Commission, 2016).

This study explores working time arrangements and pay of disability support workers (DSWs) in the context of employment regulation and the new disability support arrangements. It addresses the following questions: what regulatory gaps contribute to any wages' underpayments and what roles (if any) do the design and management of the social care system (the NDIS) play in this?

Rubery et al. (2015) suggest a homecare worker's comment 'it's all about time' encapsulates 'the central importance of time in the management and employment arrangements in home care work' (p. 756). This phrase also encapsulates our findings that the tight control of time as a contested resource in disability support in the home and community underlies wage theft, underpayment and low pay. Underpayment of workers is made possible by various gaps in employment regulation, in addition to inadequate enforcement. While the regulatory deficiencies are not new, the changing industry structure under the new marketised social care arrangements may be exacerbating the issues.

Beginning with a short overview of the regulatory context for wages underpayment and minimum wage compliance in Australia, we then review relevant international literature on working time and wages in social care. We then outline the changing industry and regulatory context of disability support work in Australia. After outlining our method and framework for analysing paid and unpaid work, we present key findings from (1) analysis of disability support work 'working day' time diaries and (2) interviews with DSWs about their jobs and working time. We end with a reflection on the funding and regulatory frameworks that contribute to wages underpayment, and point to some possible responses.

Background

Wage theft, underpayment and employment regulation in Australia

Wage theft refers to the non-payment or underpayment of the full wages to which employees are legally entitled (Galvin, 2016: 325; Milkman et al., 2010; Vosko et al., 2017). Thus, wage theft is seen as arising from non-compliance with employment laws, and multiple types of wage theft reflect different kinds of violations. While violation of minimum wages regulation is the most 'blatant' type of wage theft (Wilson, 2011: 6), others include overtime violations, rest break violations, time 'off-the-clock' violations and illegal employer deductions (Milkman et al., 2010).

There has been little research into the extent of minimum wage non-compliance in Australia (Maconachie and Goodwin, 2010; Nelms et al., 2011). Historically, with wide workforce coverage, union recognition and union membership preference provisions, the centralised industrial arbitration system has been characterised by relative ease of

enforcement of standards, with trade unions playing a significant role (Johnstone et al., 2012: 27). In addition, a feature of the system has been a comparatively wide array of minimum employment standards contained in industry or occupation-based industrial awards including working time arrangements such as standard working times, minimum and maximum shifts, shift and overtime penalty payments, minimum call-back times and other rostering arrangements.

However, changes in the labour market and organisation of work and significant de-regulation and de-collectivisation of industrial relations (Quinlan and Sheldon, 2011) have seen more employment likely to be affected by 'gaps' in regulation. Unchecked non-compliance with employment laws resulting in wage theft can be seen as arising from a regulatory gap whereby evasion is made possible by limits in enforcement. Other forms of regulatory gaps have contributed to the growth of employment forms with inferior rights and benefits, including lower payment for comparable work, although there may not be any violation of employment laws. Taking the range of protections of terms and conditions for full-time permanent employees as a normative standard, regulatory gaps exist for most workers outside this form of employment. Different forms of regulatory gaps contribute to inferior employment. Special rules and exemptions in employment regulation establish some forms of employment with diminished conditions and benefits (e.g. casual employment), while limits in regulatory scope leave some workers, such as self-employed contractors, entirely outside all or most employment law (Pocock et al., 2004). An additional regulatory gap involves the absence of legal mechanisms for ascribing responsibility for pay and conditions to network lead organisations that, while not being the direct employer, control the way work is organised (Johnstone et al., 2012). All these types of regulatory gaps are relevant to the underpayment of social care workers' wages, including wage theft through non-compliance.

Employment regulation is one important element in the broader institutional context in which wage theft and underpayment occur. Other social institutions also have significant influence. In the next section, we review some of the international evidence relating to working time in social care. This review highlights that employer practices leading to underpayments (including wage theft) are also strongly shaped by gendered norms of unpaid care work and the design of public social care systems.

Social care work, working time and underpayment of wages

International comparative research has shown there are real differences in social care systems in developed economies in regard to outcomes for social care workers (Simonazzi, 2009). However, in general, workers are low-paid and have poor working conditions (Cristiano et al., 2016; Razavi and Staab, 2010). In the context of pressures to cut care costs, there is also convergence between care systems, to more home-based care, private provision and cash transfers for care recipients. From the developing international literature on working time and pay in social care we draw three insights especially relevant to our Australian study. First, analysis of the organisation of work shows work time has been excised from paid time, embedding unpaid time in home-based care work (Boivin, 2016; Hayes, 2017; McCann, 2016). Second, the gendered nature of care work and strong norms of unpaid time combine with employer strategies and worker resistance to contribute to

overwork and high levels of unpaid work (Baines et al., 2017; Hayes, 2017; Palmer and Eveline, 2012). Third, public authorities and funding bodies maintain significant control over the organisation of work and over care workers' pay and conditions, using time as the main control mechanism (Atkinson and Crozier, 2016; Boivin, 2016; Rubery et al., 2015).

Of particular relevance is the UK experience, as social care systems across Britain share many features with Australia's developing individualised and marketised disability support system (Macdonald and Charlesworth, 2016). Social care workers have been identified as at greater risk than other UK workers of not receiving the National Minimum Wage (NMW) (Low Pay Commission, 2016: xxvii), and it has been estimated that about half of social care companies have not met their minimum wage obligations (HM Revenue and Customs, 2013). Homecare workers – who provide care and support to frail aged and people with disability in private homes and the community – are particularly vulnerable to underpayment with one estimate that 60% of such workers are underpaid (Bessa et al., 2013: 27–28).

In particular, the social care workforce experience in England highlights how, by paying workers for only some of the time they work, 'nominal' wages may be above the statutory minimum wage but 'effective' wages can be much lower (Koehler, 2014: 5). In England, homecare workers have typically been paid only for contact time with care recipients and have not been paid for much of the work they perform, including the time they travel between private residences where they provide care (Hayes, 2017: 135–138; Rubery et al., 2015). This has been considered to be wage theft (Hayes, 2014) and recent legal challenges to the practice have strengthened regulation specifying that travel between work assignments must be paid (United Kingdom Government, 2017).

Similarly, until recently, homecare and DSWs in New Zealand were not paid for time spent travelling between 'clients', with Briar et al. (2014) arguing this brought the employees' hourly wages below the national minimum wage. Following a long-running campaign and a legal case pursued by the Public Service Association (PSA), a sector-wide arrangement for payment of travel time has now been introduced (New Zealand Parliament, 2015). In Europe, recent legal cases under the European Working Time Directive have also challenged the non-payment of homecare workers' time spent travelling between home visits (McCann, 2016).

Despite some ambiguity about travel as 'work' (McCann, 2016), much other unpaid overtime undertaken by social care workers is undoubtedly work (comprising face-to-face client care and support, administration and communication). Non-payment of work time is underpinned by unfair job design with extremely tight specification of time and tasks and no provision at all for some aspects or for any variability in the work (Hayes, 2017; Moore and Hayes, 2017: 103). In addition, work scheduling techniques that 'drain waged-time from the working day' and the devolution to workers of the risks of variable client demand result in fragmented, often varying and unpredictable work schedules: short periods of paid time (invariably face-to-face contact time with care recipients) are interspersed with other also fragmented, variable and unpredictable periods of unpaid 'non-work' time (McCann, 2016: 44–45; Rubery et al., 2015). So, workers have long work days for little recompense, contributing to low pay. Gaps of unpaid time in the day may not be work but neither are they available to the worker as personal time (Boivin, 2016: 301).

Non-payment of social care work is supported by the gendered legacy of care work as women's work (Hayes, 2017; Palmer and Eveline, 2012). With care work continuing to

be mainly performed unpaid by women in the family, it is often regarded as performed for altruistic reasons and as unskilled and not deserving of decent pay. These norms have a powerful role in social care, influencing employer strategies and also workers' preparedness to perform unpaid work. Furthermore, much social care work is performed in not-for-profit agencies that have long traditions and strong norms of volunteering that contribute to pressures on workers (Baines et al., 2017).

A final insight from the international literature concerns the role funding models and commissioning practices play in determining care workers' pay and conditions. The UK and Canadian studies have identified the use of time as a control mechanism by public funding and commissioning bodies (Atkinson and Crozier, 2016; Boivin, 2016; Rubery et al., 2015). These bodies have no direct responsibility for the employment of care workers but nevertheless determine many aspects of care provision, including the organisation of work. They tightly specify 'care quality' and work on the basis of time and tasks, leaving employers with little scope in relation to workforce strategy. They determine the duration and scheduling of work and, through tight hourly based funding, they also determine pay.

The multiple factors underpinning the underpayment of homecare workers, including marketised, poorly funded care systems which build on a gendered legacy of care work as non-work, are now more visible in the Australian context of disability support work.

Social care, the NDIS, working time and pay in Australia

The Australian care workforce is predominantly female and the work of frontline social care workers is low-paid (Martin and Healy, 2010). Some 70,000 people were employed in specialist disability support services before the NDIS (Martin and Healy, 2010: 109) and the effective full-time disability support workforce is predicted to more than double by 2019–2020 (Buckmaster and Dunkley, 2017). In 2017, this workforce comprised 43% permanent part-time, 41% casual and only 12% permanent full-time employees (National Disability Services (NDS), 2017: 4).

The gendered undervaluation of social care work is reflected in the historical development of working conditions standards for social care workers in Australia (Charlesworth, 2012). The growth of the paid workforce was accompanied by a long struggle for industrial recognition, and it was not until 1990s that most social care workers gained industrial award coverage, providing them with minimum wage rates and employment conditions that were already available to 'over 90% of the Australian workforce' (Briggs et al., 2007: 498). Recently, some recognition of the gendered undervaluation of care work has been achieved with the success of an equal pay case acknowledging this undervaluation (Macdonald and Charlesworth, 2013).

In comparison to the UK, employees in Australia might be expected to be protected by this country's much more comprehensive set of minimum standards for pay and conditions. However, as Charlesworth and Heron (2012) have argued – specifically drawing on the case of social care work – inferior conditions are established for 'non-standard' part-time and casual employees in both the statutory National Employment Standards and in industrial awards, and this regulatory gap has a gendered impact due to women's concentration in these forms of employment. These authors document a range of inferior working time standards for employees covered by the Social Community Home Care and Disability

Support (SCHADS) award compared to employees covered by the Manufacturing Award. Such regulatory gaps include the absence of minimum engagement periods for part-time employees and of provisions for notice of changes to rostered work time and silence on the question of pay for time spent travelling between work assignments (Charlesworth and Heron, 2012). Based on overseas experience, it could be expected that these regulatory gaps are now more significant to the working conditions of care workers under the NDIS than under previous block-funding contracts for disability services.

The publicly funded disability support system in Australia has undergone significant reform with a national system, the NDIS, replacing multiple piecemeal services provided by states and territories. Services are now allocated and funded on an individual basis and provided through the market. Traditional service providers are now competing with new providers, including private for profits. A national agency, the NDIS, manages the market, assessing eligibility, determining individual support packages, setting prices and funding supports. Funding for the personal support provided by DSWs is determined on the basis of an hourly price, varied in some circumstances. Recent study suggests this fee has been set too low to enable the minimum SCHADS Award conditions to be met for DSWs (Cortis et al., 2017). The study also found that the pricing model did not reflect existing employees' classification levels and provided inadequate allowance for training, workers' time not spent providing face-to-face support (3 minutes an hour), travel between clients (providers can include a 20-minute journey but without any adjustment for support to be provided), and supervision (both levels and workloads). These assessments are supported by findings of an employer survey in which two-thirds of respondents disagreed with the statement 'NDIS prices enable us to meet our industrial obligations' (Cortis and Blaxland, 2017: 3).

Here, we report on a qualitative case study of DSWs' paid and unpaid work time. Our findings shed light on the ways in which social care work may be organised under the various pressures and within the regulatory context outlined above and on some of the impacts this can have on employees and their pay.

Method

Qualitative research combined collection of data from 'working day' diaries and semi-structured interviews with DSWs employed under the new NDIS arrangements. The purpose of collecting diary data was to explore working time arrangements and any unpaid work associated with DSWs' jobs. Interviews explored employees' experiences and views of their jobs, working time arrangements and pay.

Participants were recruited through advertisements in newspapers and job websites and through snowballing. We interviewed 22 employees providing home and community-based support services to people with disability. This article reports on analyses of interviews and working day diaries for 10 DSWs: a total of 20 interviews and 30 self-completed diaries. The 10 women all provided support and care under the NDIS. They were employed by 10 different service providers: four for-profit, five not-for-profit and one government provider. All worked in the same region that was one of the first NDIS implementation sites. At the time of the fieldwork in late 2016, the NDIS had been in place in the region for 3 years. The other 12 participants who are not reported on in this article were not providing NDIS services.

The 10 DSWs cannot be seen as representative of all DSWs working under the NDIS. However, this study can provide valuable insights into some of the ways in which work

is being organised under the NDIS and impacts on employees. Despite the small sample size, our interviews were approaching saturation (Morse, 1995), with issues raised in interviews highly consistent across the 10 participants. While there was considerable dissimilarity in paid and unpaid work patterns recorded in diaries, common issues and themes emerged from all 10 workers' diaries. The issues are also similar to those identified in recent surveys of DSWs and providers examining NDIS workforce issues (Cortis et al., 2017; NDS, 2016). Nevertheless, the data we present is indicative only and our findings warrant further investigation through a larger study.

Each DSW participated in two individual face-to-face semi-structured interviews with one of the researchers. In the first interview, each participant was asked about what her job/s involved, the support she provided, working time arrangements, rates of pay and likes and dislikes. At the end of the interview, the participant was given a paper 'diary' on which she was asked to record time, duration and a brief description of each work-related activity and 'breaks' for the next three work days. At the second interview (1–4 weeks later), the researcher went through the diary with the participant seeking additional details and views of the 'diarised' time use. Informed consent in writing was obtained from all participants. Participants were given retail vouchers in recognition of their time and in lieu of payment for any expenses incurred.

Analytic framework

To identify and quantify any apparent underpayment of employees' work time, we categorised time recorded in the diaries as follows:

a. Paid work time.
b. Unpaid overtime comprising: *support work and administrative work* (paperwork, communications and meetings with supervisors, support recipients and families).
c. Unpaid travel directly between support recipients (for a single employer).
d. *Other unpaid time in the work day* comprising: unpaid travel between the employee's home and work during and at the beginning and end of the work day; and unpaid 'breaks' between work-related activities.

We also recorded the *length of the work day* (e), defined as the duration of time from when the worker first left home in the morning until she returned home from her last shift for the day.

On the basis of our literature review, we considered that, on the face of it, time spent on (b) unpaid overtime and (c) unpaid travel directly between support recipients should undoubtedly be paid work time. In this article, we focus on these categories to investigate underpayment of wages for the DSWs. It is much more difficult to ascertain the extent of any wrongful underpayment for time in category (d) and, as it would require considerably more space to do so, we have largely excluded this time from our analysis. This time is, nevertheless, critical to the structuring of employees' work days and pay as workers are often expected to travel long distances from home for very short shifts and can have their work scheduled so that they experience long periods of 'dead' time between shifts.

Here, we have space to provide detail of this time only where it sheds light on the overall organisation and time structure of the work.

Findings

Overview of employees' work and pay

In total, 9 of the 10 DSWs were multiple job holders: five worked in two or three different DSW jobs. Other jobs included aged care and residential support. The main reason women gave for holding multiple jobs was that their main job provided insufficient income. In their main job, seven women were permanent part-time and three were casual employees. Part-time employees had contracts specifying minimum hours, although these minimums were as low as 2 hours a fortnight. All employees had highly variable daily and weekly hours and all were regularly 'expected' to do additional work, often at very short notice. Part-time employees' hourly rates ranged from AUD19.80 to AUD25 and casuals' from AUD25 to AUD29, rates consistent with employment at or just above the relevant classifications in the SCHADS Award. Nine DSWs said they were paid penalty rates for weekend and evening work. The 10th said her employer told her she was paid penalties only when they were included in her clients' NDIS support plans.

Only two DSWs (both employees of the same long-established and large service provider) were paid for time spent travelling between clients. However, seven DSWs (including those two), received a per-kilometre reimbursement for using their own cars when travelling between clients. Notably, the industrial award specifies employees must receive this reimbursement 'where required and authorised by their employer to use their motor vehicle *in the course of their duties*' (our emphasis) (SCHADS Award 2010:: cl 20.5(a)). All DSWs were reimbursed for using their cars to transport clients, as long as the distance was within the kilometre range specified in the client's NDIS funding package.

Employees' paid work time was primarily spent in direct contact with clients, providing in-home assistance, personal care and/or support for community and social participation. All 10 workers said they enjoyed or even loved many aspects of the work; they valued making a difference in people's lives and enjoyed spending time with clients. However, most were unhappy with their pay and conditions and several were seeking other employment. The work aspect identified as a serious problem by all 10 workers was the way their working time was structured. Many frequently worked long days, 6 or even 7 days a week to try to earn an adequate income; yet many spoke of their difficulties earning enough to pay their bills. The women's jobs often left them exhausted and with little time for friends and families.

The working day: The time diaries

The working day diaries documented a total of 30 working days (comprising 3 diarised days for each of the 10 DSWs). They reveal four important aspects of DSWs' working days.

First, the diaries show that the DSWs' days were typically made up of several relatively short paid work 'shifts' spent with support recipients, interspersed with often long periods of unpaid time. Over the 30 days, the 10 DSWs worked between one and five

separate shifts per day. The shortest recorded shifts of paid work were around 30 minutes and the longest was over 10 hours. Most paid work periods were 2 hours or less. Second, the DSWs' working days (from first departure from home for work to last arrival home from work) were long. Two-thirds of the 30 diarised days were 10 hours or longer. Third, though days were often very long, the proportion of the total working day that was paid work was often small. On 17 of the 30 work days, employees were paid for 5 or fewer hours' work in the context of a long span of working hours. As an example, one day in DSW9's diary showed that she left home at 8:45 am and finished her day 13.5 hours later, at 10:15 pm, having completed four shifts and earned only 5 hours' pay. This pattern of paid work was not uncommon: the diaries showed that for each worker, on average over their 3 working days, paid work time was between 27% and 73% of the working day (Table 1). Fourth, the diaries showed very substantial periods of the working day consumed by unpaid activities, structured and often occupied by work.

In the presentation of findings below our focus is on the unpaid work time employees spend travelling between clients and undertaking support and administrative work, time that apparently should be paid work time. However, the organisation of disability support work often renders unusable as 'free' or 'personal' time much other time in a worker's day. For example, workers spent time travelling back and forth from home to work in breaks between periods of paid work, and they often found themselves too far from home to make it worthwhile returning so they simply waited somewhere near their next client's home.

Turning to the unpaid work that clearly directly contributes to underpayment, all 10 DSWs undertook unpaid work either travelling between clients or unpaid overtime (administration and face-to-face support), or both, over the 3 diarised days. For individual workers, the total amount of such unpaid work undertaken over the 3 days ranged from 22 minutes to over 6 and a quarter hours. For some DSWs, unpaid work time was equivalent to a third or more of paid work time in a single day and comprised up to 25% of the duration of the working day (Table 1). If all travel between clients and overtime had been paid, these employees would have received between 2% and 27% more pay than they actually received for the 3 days. In the discussion that follows, this unpaid work and the factors driving it are examined in detail.

Unpaid work: Travel between clients

Travel to clients' homes is an essential part of home and community-based disability support work. The amount of unpaid travel directly between clients varied considerably among the 10 employees on the 3 diarised days. The two women who were paid for the time they spent travelling directly between clients had paid travel time in their enterprise agreement with the same long-standing service provider. Our interviewees informed us, and it was later confirmed, that this provider had ceased providing disability support services because they could not afford to do so under the NDIS. For other DSWs unpaid travel between clients was equivalent to between 1% and 15% of the employee's paid time over the 3 days, and as much as 25% in a single day. One DSW spent an hour and a half travelling directly between clients in a single day. A total of 15 of the diarised days showed no unpaid travel directly between clients, but this was often because employees had large unpaid gaps between paid work periods and went home before travelling to the next client.

DSW: disability support worker.
[w]Times are reported in hours and minutes.
[x]DSW employed by more than one disability support provider.
[y]Administration time adjusted as one employer paid for 30 minutes a week.
[z]DSW paid for travel between clients by one employer.

Most interviewees raised the issue of unpaid travel time as a major shortcoming of the job, particularly when paid work periods were short and the ratio of unpaid to paid working time was high. Women's gave a variety of explanations for undertaking shifts that involved at lot of unpaid travel and little paid work. For some it was a sense of responsibility to clients, a manager or both. Fear of jeopardising further work opportunities was often cited as a strong motivator for not refusing shifts. One DSW who had been in her job under 6 months was very conscious of the impact of travel time on her effective pay rate and also found the driving stressful:

> … but a big part, as you know, is driving for the job. So I think at the end of the day I'm so knackered, so tired because I'm thinking, I've just been stressed all day worrying about the traffic, whether I'm going to have a prang, just trying to get to these places on time. All for what? For say 3 hours' work. (DSW2)

Yet this employee was unwilling to complain about her pay and conditions as it had been difficult for her to find work. This sense of vulnerability may have been well-placed: another DSW, who had consistently refused to take certain poor shifts, believed she had been punished by having work taken away. By comparison, a very experienced worker reported resisting or refusing shifts where the ratio of paid to unpaid work was too low:

> I don't do any less than an hour. … [Employer B] don't do less than an hour. [Employer A] try to get you to do half hour ones like for medication runs or things like that but, no to me it's not worth it especially when you have to drive like half an hour there, get paid half an hour and a half an hour back and you don't get paid for travelling. (DSW1)

However, this DSW spent nearly 2 hours travelling directly between clients over the 3 days, unpaid and without a car allowance.

Unpaid work: Overtime providing support and undertaking administration

A second type of unpaid work was the additional time DSWs spent providing support to clients and undertaking administrative tasks. Five of the ten employees accrued 50 minutes or more of such unpaid work over the 3 days. For four workers, this was equivalent to 10% or more of the time they were paid for work.

This form of unpaid work appeared endemic. Six of the ten employees provided unpaid support on 29 occasions over the 30 recorded days. Though often only for short periods this unpaid work added up to between 15 and 50 minutes over the three days. Employees' fragmented work schedules meant that this additional work was often absorbed into unpaid time between scheduled support for clients – rendering it invisible to the employer. Contributors to unpaid support included unexpected events (e.g. client illness), unpredictable behaviours, client requests for extra supports; new/unfamiliar clients; family carers returning home late, and mismatches between client needs and funded supports, as described here:

> Sometimes when the support team goes out to a client's home or interviews them, [or] interview them over the phone, they may think 'Oh this is only going to take half an hour' but they haven't actually done it [the work]so they might guestimate that it's half an hour where it's a bit longer. [DSW4]

Administration work was a further significant component of unpaid overtime. Eight of the ten employees completed multiple, often small, amounts of unpaid overtime every day. The range of unpaid administrative tasks included: completing client notes and incident reports, communicating with supervisors about client needs, organising rosters and extra shifts and completing travel forms and timesheets. Most tasks were central to client care and/or the organisation of work. While one organisation paid employees 30 minutes a week for administration, DSWs were not otherwise allocated paid time for these tasks which often consumed considerable amounts of time and could be highly disruptive to personal time. One employee, who had many serious concerns about her clients, spent nearly 4 and a half hours over the 3 days writing up client notes, usually very late at night. This unpaid administration was equivalent to almost 20% of her paid work time. Another seven employees undertook between 10 minutes and just under 2 hours of unpaid administration over the 3 days. Two employees did no unpaid administration work at all.

DSWs gave two main reasons for undertaking unpaid work. Many workers did so out of a personal commitment to providing good quality, and usually essential, care. This included one employee who said she and colleagues arranged staff meetings in unpaid time to induct new staff and discuss clients' support needs. Most employees linked their unpaid overtime to job insecurity and some reported responding to pressure to complete additional unpaid tasks at clients' request because they feared losing shifts if a client requested a different support worker.

In theory employees could claim pay for some of their unpaid overtime while in practice it was often difficult or impractical to do so. One employee commented: 'I mean I guess if we specifically rang our boss and we're like "hey, this ran 15 minutes over, I'm going to put it on my timesheet," and they knew, then we would. But if it happens every single day, I don't think that many of us really ring her every single day. And she's very hard to contact as well' [DSW10]. Nevertheless, employees sometimes accepted responsibility for not claiming time:

> I: Do you get paid for that extra ten minutes, when (the family carer's) late?
>
> P: No. Well, that's my fault; I'm not going to ring something like that in.
>
> I: No. When would you ring it in? How many minutes late would they have to be for you to call in?
>
> P: Half an hour, twenty minutes, half an hour, it depends. This is a nice lady, she doesn't mean to be home [late]. [DSW6]

In some cases, explicit organisational arrangements required employees to absorb unpaid work without remuneration. Further, employees articulated it was in their best interests to undertake this work in order to have better outcomes for clients. For example, one employee (DSW5) explained that it was in her position description to arrive at work 10 minutes before the commencement of her paid work. While she considered this 'a nuisance' it also enabled her to talk with the client's family carer and get any issues 'sorted'.

Finally, workers' sense of insecurity and lack of support in challenging their working conditions was often evident in their explanations for undertaking unpaid work. One employee feared losing shifts if she 'rock[ed] the boat' (DSW2), another said she was afraid of 'making ripples' and risking confrontation (DSW5), and others reported they

had been 'punished' with removal of shifts for attempting to challenge an employer (DSW1) and for refusing to take poor shifts (DSW8). In contrast the two employees of the large long-established and highly unionised service provider reported numerous instances of challenging management to improve conditions for workers.

The financial cost to employees of the unpaid work of travel between clients and overtime was significant, even for those who undertook relatively little unpaid work. For five of the ten employees, 2%–6% of their work over the 3 days was unpaid. On the basis of the standard hourly rate each DSW was paid (i.e. disregarding any penalty rates), we estimate those five employees were underpaid by between AUD8.84 and AUD30.42 over the 3 days. The other five DSWs were not paid for 12% or more of their work time, including one who was not paid for 21%. That employee, who had both the highest number and proportion of unpaid work hours, was underpaid by around AUD180 over 3 days. The remaining four employees were underpaid by between AUD24.75 and AUD92.08 over 3 days.

Discussion and conclusion

Our case study findings demonstrate some of the ways in which disability support work is being organised under NDIS implementation, leaving employees underpaid for significant amounts of their working time. While it is not possible to generalise from the experiences of this small sample it is worth noting that underpayment for travel and overtime was experienced by employees of nine of the ten different employers in this study. Further, we argue that the significance of this study, beyond mapping the dimensions of wage theft and underpayment for a small group of workers, is its analysis of how the funding and regulatory environments facilitate systemic non-payment of working time for homecare workers – an analysis which is broadly applicable to the many workers employed in the same context.

In part, underpayment of the DSWs was rendered invisible by the gendered norms of care work. The findings of this study echo those of Hayes (2017) that in the UK 'homecare workers who wish to provide care in a way which is compatible with self-respect must do so on an unpaid basis' (p. 127). The underpayment of wages was hidden and ambiguous, owing to the regulatory gaps which supported it. Non-payment for travel time was apparently enabled by the absence of a specific entitlement in the industrial award, while the absence of a minimum engagement period for part-time employees saw work periods reduced to as little as 20 minutes. Employers appear to have actively exploited the lack of clear minimum standards: paying vehicle allowances for travel between assignments suggests acceptance of this activity as work – while not paying wages for this time.

Inferior benefits and conditions for social care workers were established in Australian employment regulation long before the introduction of the NDIS. However, our findings support the view that the NDIS is further institutionalising employment practices that produce wages underpayment. Notably, in the context of identified under-pricing of personal support services under the NDIS, the only employees in our study who were paid for travel time lost work as their employer's disability services provision was deemed not viable under the new funding model. Also notably, in this workplace, employees had gained their superior benefits through collective bargaining, while union organisation and representation were less apparent for other employees in our study.

Addressing deficiencies in employment minimum standards is one strategy for resolving some of the problems of underpayment for social care workers. Embedding gender equality objectives in award review processes is potentially a way of achieving this (Macdonald and Charlesworth, 2013). More fundamentally, addressing underpayment of wages of social care workers is likely to require acknowledgement of the limitations of regulation fashioned around the normative standard of full-time permanent employment and the binary employment relationship. In this regard there is a variety of innovative regulatory responses that target network lead or top of supply chain organisations, including in Australia's textile, clothing and footwear industry (Johnstone et al., 2012). Safeguarding and quality regulation under the NDIS could be framed to ensure disability workers are paid fairly and all participants in the supply chain take responsibility, as was previously done in the road transport sector (Johnstone et al., 2015). The fact that the government is effectively the top of the supply chain body in publicly funded social care systems such as the NDIS highlights the need for embedding accountability for labour standards in public policy more generally.

Author biographies

Fiona Macdonald is Senior Research Fellow in the School of Management and Centre for People, Organisations and Work (CPOW) at RMIT University. Her research is investigating workforce challenges of marketised social care systems, through an examination of the organisation of work and changes to disability support workers' jobs and employment arrangements under Australia's NDIS, in international comparison.

Eleanor Bentham is a researcher in the School of Management and CPOW at RMIT University. She has 10 years' experience researching disadvantage in labour markets and education, and has spent the past 2 years investigating the impact of the NDIS on disability support work.

Jenny Malone is a researcher in the School of Management and CPOW at RMIT University. She is researching dimensions of care work, including the ways in which gender, migration and the organisation and regulation of care work intersect to shape working conditions.

Fair Work Commission

Four Yearly Review of Modern Awards

Social, Community, Home Care and Disability Services Industry Award

Matter No: AM2014/285 and AM2018/26

STATEMENT OF MARK FARTHING

1. I am employed as a Senior Policy Advisor for the Health Services Union (**HSU**) Victoria No. 2 Branch, also known as the Health and Community Services Union (**HACSU Victoria**).
2. I have been employed with HACSU Victoria since March 2016.
3. I have substantial research experience in the health and community services sector, with particular expertise in disability services and the National Disability Insurance Scheme (NDIS), as well as more broadly in industrial and workforce research and policy.
4. Between 2013 to 2016 I was employed as the Senior National Project Officer in the Health Services Union National Office.
5. Prior to that I worked as a Senior Project Officer – Research for Service Skills Australia, which involved producing research for the purposes of advising the Commonwealth Minister for Industry and the Australian Workforce and Productivity Agency. I also worked as a Junior Policy Associate for the China Studies Centre at the University of Sydney.
6. I hold a Bachelor of Arts with First Class Honours in History and Politics.
7. In my current role I deal with Victorian employers providing disability support services. These employers are largely not-for-profit organisations, with one very large public-sector employer (with over 6,500 employees), the Victorian Department of Health and Human Services (**DHHS**). I have compiled a table of the employers in the non-government, not-for-profit disability support services sector, with which the union has dealings on behalf of members appears below. I have had the most in-depth

DPV Health Ltd	DPV Health	Disability services for adults and children with disabilities, including supported accommodation, community participation, in-home support, allied health, day programs, respite and support coordination.	Victoria (Outer Northern Metro Melbourne)

8. Most of the above providers operate under enterprise agreements which were made prior to the introduction of modern awards in 2010, and which are based on the pre-modern *Residential and Support Services (Victoria) Award* 1999. The pay rates in these agreements broadly align with the *Social, Community, Home Care and Disability Services Industry Award* (**the Award**) Schedule B (SACS) classifications, ranging from Level 1 to Level 4 of the Schedule.

Wage rates for disability support workers

9. Based on my experience in bargaining in this sector in Victoria, wage increases in enterprise agreements are always the same as the Award, or phrased as "3% or the minimum award increase if greater", or words to that effect.

10. The only enterprise agreement I have come across in this sector with higher wages than the award is the public sector one with the DHHS.

11. The ERO has largely precluded any above award increases as wages have been going up by about 5% a year with the ERO in place.

SCHCDSI Award and disability workers

12. The vast majority of HSU members employed in the disability support sector in Victoria are "social and community services sector" (**SACS**) employees as defined in the Award.
13. With the exception of employees employed by some large public-sector employers, almost all disability support workers are paid minimum Award rates.
14. The introduction of the National Disability Insurance Scheme (NDIS) has further entrenched minimum Award rates of pay as the standard for wages in the sector as employers cannot charge participants more than the National Disability Insurance Agency (NDIA) price-cap, which is calculated on the basis of Award wage rate assumptions. This cap, coupled with the unique characteristics of the disability sector—a sector almost entirely reliant on government funding with minimal or limited co-contributions/co-payments by the service recipients—largely precludes bargaining above Award wage outcomes.

15. While bargaining does occur in the sector, the focus of bargaining is predominantly on non-monetary items such as consultation, hours of work, rostering and training.
16. Since 2012, the Equal Remuneration Order has substantially lifted Award rates of pay, however, with the final ERO payment due on 1 December 2019, the disability sector workforce will again be reliant on minimum wage case decisions to secure wage increases.

Minimum Engagement under SACS and Home Care classifications

17. Clause 10.4(c) of the Award (Exposure Draft – clause 11.3) provides for minimum shift engagements for casual employees. This provides for three hours for casual SACS employees who are not undertaking disability services work, one hour for casual home care employees, and two hours for all other employees, including disability support workers.

18. This distinction between SACS and home care casual employees creates a perverse incentive to misclassify Schedule B workers as Schedule E workers. It creates additional flexibility for employers in the rostering and scheduling of work if they can characterise workers as falling under the Home Care classifications in Schedule E of the Award.

National Disability Insurance Scheme (NDIS)

19. The National Disability Insurance Agency (NDIA) caps the price that providers can charge NDIS participants for particular service types.

20. The current NDIS Price Guide for NSW, QLD, VIC and TAS (published on 1 February 2019 and applying to 30 June 2019) has been filed by the HSU along with its material in this matter

21. Below is a table I have created which provides a summary of the elements of the NDIS capped price for 1-hour of standard needs, weekday support, with a supervision ratio of 1:15. The first column of the table describes what data is contained in the second, third and fourth columns. The second column uses the SACS (Schedule B) 2.3 hourly wage rate as at 1 December 2018 as the basis of calculating labour and on-costs. The third column uses the Home Care (Schedule E) 3.1 hourly wage rate as at 1 December 2018 as the basis of calculating labour and on-costs. The fourth column provides some further details on the assumptions used in different rows of the table.

	SACS 2.3	HC 3.1	Notes on Assumptions
Hourly Rate (1 December 2018)	$ 27.61	$ 22.04	*SACS 2.3 is level agreed by the NDIA as forming the basis of the capped unit price. Homecare 3.1 is the closest equivalent to the skill level and duties of the SACS 2.3 classification.*
Annual Leave	$ 2.12	$ 1.69	*4-weeks of annual leave.*
Leave Loading	$ 0.37	$ 0.30	*17.5% leave loading on annual leave.*
Personal Leave	$ 1.06	$ 0.85	*10 days of personal leave per annum and all 10 days are taken. This is assumed by the NDIA.*
Long Service Leave	$ 0.08	$ 0.07	*NDIA assumes 8.67 weeks of long service leave after 10-years and*
Superannuation	$ 2.62	$ 2.09	*9.5% superannuation guarantee*
Workcover	$ 1.22	$ 0.98	*NDIA assumption is 4% (based on NSW industry average)*
Payroll Tax	$ 1.48	$ 1.18	*Victorian Payroll Tax rate (metropolitan employers)*
Total Labour Cost	$ 36.58	$ 29.20	
NDIS Price Cap	$ 48.14	$ 48.14	
Total Labour Cost	$ 36.58	$ 29.20	
Supervision 1:15	$ 2.68	$ 2.28	*Calculations are based on classification levels SACS 3.3 and HC 5.1. The total labour costs are then divided by 15 to create the supervisory span of 1:15 FTE*
Remaining (Overhead and Margin)	$ 8.88	$ 16.66	
Overhead and Margin as % Price Cap	18.4%	34.6%	

NDIS Price Increases

22. At least once per year the NDIA increases price caps to account for wage growth and/or general inflation. For the 2018-19 financial year the NDIA adjusted prices used for attendant care supports to take into account the 1 July 2018 3.5% minimum wage increase and the ERO adjustment from 1 December 2017, calculated by the NDIA as 2.27%, plus CPI of 1.9%. For attendant care supports, this equated to an increase of 5.14%. This can be seen in the NDIS 2018-2019 Price Guide Update Summary, which has been filed by the HSU along with its material in this matter.

Client Cancellation

23. The current NDIS Price Guide for NSW, QLD, VIC and TAS (published on 1 February 2019 and applying to 30 June 2019) sets rules around how much and how frequently a provider can charge an NDIS participant for a short-notice cancellation.

24. The NDIA defines a short-notice cancellation as, "after 3pm the day before the service." (see Price Guide, p. 18)

25. Providers can charge a participant a fee of up to 90% of the agreed price of a short-notice cancellation for personal care and community access supports.

26. This fee can be charged up to 12 times per year without pre-authorisation from the NDIA. A provider may still be able to charge cancellation fees in excess of 12 times per year, however the NDIA will require the provider to demonstrate they are taking active steps to manage cancellations.

24 hour shifts

27. In my experience the 24 hour clause is not used by employers. Based on my discussions with employees and employers in the sector and officers of the HSU, employers are not requiring employees to work 24 hour shifts.

28. In terms of work value, the compensation provided for by the clause does not represent the value of the work. The worker is not compensated for the entire period of time they are required to be present at the workplace, nor are they compensated for the inconvenience and unsociability of working extended hours under fatigue away from their homes and families. When you compare the compensation paid to what a worker would be entitled to under the alternative provisions in the award, such as overtime, shift penalties and sleepover allowance, it is substantially less.

29. In-home respite is not a discrete line item in the NDIS price guide. Instead, NDIS participants are able to use a range of line items in the price guide to engage a support worker to deliver in-home respite such as "assistance with self-care activities – daytime, evening, Saturday, Sunday and Public Holiday" and "Assistance with self-care – Night-Time Sleepover and Active Overnight." These line items allow the delivery of in-home respite over a 24-hour period, with support workers being paid using a combination of ordinary time earnings, shift allowances and the sleepover allowance.

Fair Work Commission

Four Yearly Review of Modern Awards

Social, Community, Home Care and Disability Services Industry Award

Matter No: AM2014/285 and AM2018/26

STATEMENT OF WILLIAM ELRICK

1. I am employed as an Area Organiser for the Health Services Union (**HSU**) Victoria No. 2 Branch, also known as the Health and Community Services Union (**HACSU Victoria**).

2. I have been employed with HACSU Victoria since March 2016. My previous roles at HACSU Victoria have included Project Organiser, HACSU Assist Organiser and Administrative Assistant.

3. HACSU Victoria primarily deals with members and employers working in the Social and Community Services (**SACS**) sector, as defined in clause 3 of the *Social, Community, Home Care and Disability Services Industry Award* (**the Award**). A far smaller number of our members are classified under the Home Care sector, as defined in clause 3 of the Award.

4. As an Area Organiser I am regularly required to visit worksites and engage with members about issues they are experiencing at work. I also often represent members during disciplinary matters and prosecute disputes through the Fair Work Commission. As a HACSU Assist Organiser I regularly received industrial based calls and emails from members seeking advice. My roles have required an in-depth understanding of the Award and being able to interpret and apply the Award to issues members are dealing with at their workplaces.

5. Prior to working for HACSU Victoria, I held a number of roles in the SACS sector.

6. Between 2012 to 2016 I was employed as a Disability Development and Support Officer for the Department of Health and Human Services. This role involved supporting clients with their activities of daily living, such as personal care, transport, assistance with eating and drinking, community outings, regular grocery shopping and

Filed on behalf of	**HEALTH SERVICES UNION**
Address	Suite 46, Level 1, 255 Drummond Street, CARLTON VIC 3053
Tel	03 8579 6328
Email	rachell@hsu.net.au, Rachel Liebhaber, National Industrial Officer

other community-based activities. In this position I was responsible for development and completion of individual care plans, which involved engagement with community stakeholders and family members.

7. Between 2009 to 2011 I was employed as a Personal Support Worker for Karingal Support Services. This role involved providing complex care to adults with severe physical disabilities in relation to all aspects of daily living activities. Shifts varied between one to two-hour home visits, and seven to nine-hour respite days assisting clients while family members worked or were otherwise absent. I also undertook active night shifts, where I assisted clients overnight whilst family members slept. I often assisted clients over mealtime; this involved preparing meals for clients and general household duties. I was also trained and competent in feeding clients through PEG (percutaneous endoscopic gastrostomy) tubes. Many of my shifts involved primary care for clients whilst they were undertaking social and community activities. I was responsible for their care and transport in varied situations such as shopping, going out for meals, attending movies and other activities as requested.
8. Between 2009 to 2010 I was employed as a Respite Support Worker for Gateways Support Services Geelong. In this role I was often responsible for transporting clients within the Geelong area, such as driving primary school age clients from school to home. I would frequently be involved in providing respite for families with young members who are mentally disabled. This would involve transporting and caring for the clients during recreational activities such as swimming, visits to parks and walks on beaches as requested. My duties included all aspects of clients' personal care such as hygiene, toileting and feeding plus dealing with physical aids such as wheelchairs. I was responsible for communicating with families and my supervisors as to the care provided during my shifts and the clients' responses and needs.

Coverage of members under SCHCDS Award

9. The majority of the members I have supported in my role at HACSU Victoria are classified under the SACS stream of the SCHCDS Award.
10. It is not always a straightforward task to advise about the appropriate classification for a particular worker, often because organisations engage in activities which overlap classification boundaries. For example, in one instance I received a referral from our HACSU Assist member advice line, about a member who was unsure of their classification in a role which mainly involved working in a client's home.
11. I spoke with the member, who detailed their role as largely involving cleaning and who worked for an organisation that was largely staffed by former council workers. To the

best of my recollection, neither the employment contract nor payslips correctly referred to their classification.

12. I advised that she was indeed a Home Care employee, as defined in clause 3, as she didn't undertake any plan driven support work and mostly undertook domestic duties.

13. There were rare occasions where the member took the client out to do shopping, which would in my view be SACS work. However, the member was concerned about the requirement to perform those duties and sought advice about approaching the employer to stop those duties.

14. The majority of employers I deal with in the SACS sector are medium to large, not-for-profit disability service providers.

15. I have never dealt with a small business (according to the *Fair Work Act* definition). I do not think it would be economical to operate a disability service with less than 15 employees.

16. The providers I regularly organise within include: Yooralla, Scope, The Tipping Foundation, Jewish Care, Focus, Statewide Autistic Services, Autism Spectrum – Aspect, Connect GV, PALS, Melba, Life Without Barriers, Villa Maria, GenU and Melbourne City Mission (MCM).

17. With the exception of disability support workers in public sector roles, the vast majority of disability support workers are paid award wages only. Bargaining in the sector isn't common. However, many workers are on enterprise agreements that have long expired and were developed during the "Work Choices" period. When new enterprise agreements are negotiated, wages are almost always in line with the rates in the Award. The HSU has been successful in bargaining with a couple of organisations for a term providing for the greater of a 2.5% increase or the annual minimum wage increase. Thus far, the minimum wage increase has always been greater.

Minimum Engagement

18. Some of the most common issues of concern for workers we deal with who are covered by the Award are around rostering issues and lengths of shift.

19. Because there is no minimum engagement for part-time and full-time employees under the Award, the HSU sees a lot of cases of 0-hour contracts and 30-minute shifts. The shortest shift I've heard of is 15 minutes, although in that case the worker was paid for 45 minutes. In that particular workplace the employer would often pay a rate of 45 minutes or 30 minutes for a short shift. Some of the larger employers have a minimum two hour engagement policy, but this is not always adhered to.

Broken shifts

20. Broken shifts are very common in this sector.

21. Some workers enjoy working broken shifts, as they provide them with the ability to undertake personal tasks during the breaks.

22. However, many workers strongly dislike them. This is especially the case for workers living some distance from work, as the transportation to and from home becomes very tedious.

23. In group homes workers will often do a morning and afternoon shift, such as 7am – 10am and then 3pm – 10pm. In-home support workers generally have a more fragmented working pattern and may be required to do several shifts in a day. For example, rosters of 7am - 9am, 11am - 1pm, and then 5pm – 7pm are common. These shifts are normally for the purposes of providing meal assistance and personal care to clients.

Sleepovers

24. As a disability support worker, I would regularly be rostered to work sleepovers. There are many pros and cons to sleepovers, the biggest positive is for the client who is able to be supported overnight in a manner that supports less restrictive practice. As a worker, considering most sleepovers have several hours of work either side, sleepovers provide an opportunity to work significant hours in one stint, allowing more days off work. Sleepovers also allow for reduced travel time in between shifts, this is particularly advantageous if the worker regularly has short shifts.

25. Nonetheless, sleepovers can have an impact on a worker's wellbeing, productivity, and employment satisfaction. Firstly, my colleagues and I use to always say you'd "have to sleep with one eye open", this was due to the perceived risk that incidents could happen overnight. When working with clients who are suffering medical issues it is only natural that many workers will have anxiety or concerns and will be alert to the point where they are unable to get a regular night's sleep. There are other issues that can occur overnight that result in workers irregular night's sleep, such as, some clients can soil themselves over night and not be able to communicate this to the sleeping worker. Sleeping through a client who has soiled themselves can cause health impacts for client and take up time during the morning routine to assist in cleaning the client.

26. The allowance for sleepovers and the disturbance clause don't sufficiently remunerate for the work done overnight. The SCHADS rate of $47.04 works out to be $5.88 an hour, while I understand that it is an allowance and not an hourly rate, a sleepover is

still 8 hours away from your own home and loved ones. It isn't uncommon to be woken up overnight whilst on sleepover for reasons that most workers wouldn't claim for remuneration, such as, a client getting up to use the toilet and slamming doors, clients who knock on the door for no reason, and various other matters that don't require direct support. All the aforementioned can result in the worker being too tired to pick up additional shifts the next evening, or having to sleep through the day when they return home.

27. Lastly, the sleepover arrangements in many workplaces aren't conducive to a good sleep. For a period while I was undertaking sleepovers where bed was located in the office. The head of the bed was coming out of the cupboard that had the doors removed, the office had hums from the computer and fax, along with a bright light from the handset of the house phone. I have had reports from other members who have had to sleepover with the sleepover door open, having to deal with uncomfortable beds, and various other issues that result in poor sleep.

24 hour care

28. I am unaware of any workers being rostered for 24-hour shifts or being paid under the 24 hour care provision in the Award.

29. I have myself worked more than 24 hours straight when I was working in the industry. I am also aware of other workers who have worked such hours, usually including a sleepover as per the award clause, however, this is normally not a rostered 24 hour shift, but overtime which is required due to an emergency. For example, an employee may be about to finish a 12-hour shift after 8-hour sleepover, but the client is suddenly required to be rushed to hospital. In that case the employee may be required to go to hospital with a client and isn't able to leave. I've never come across an employee who has been engaged according to this clause.

Telephone allowances

30. Generally speaking, most workers will only use their personal phone for the purposes of being contacted for shifts, and not during work.

31. However, there is a growing trend amongst employers in the industry to have 'bring your own device' practices or policies that require employees to complete notes and other work-related duties using on-line apps on their personal phones. This is a problem because it isn't uncommon for workers in this sector not to have "smart" phones.

32. HACSU Victoria has recently prosecuted a dispute in the Fair Work Commission about the employer PALS ('Providing All Living Supports') requiring employees to use their personal phone for work duties. The employer had intended to compensate their employees with just $5 per month, without any extra money for those who needed to upgrade their phones to a smart phone.

33. Part of supporting people with disabilities requires research for social activities, making reservations, and sending emails to stakeholders. In group home settings, many houses only have one computer that is primarily for the group home managers. Some employers such as Scope do not let their workers access the computer at all. As computers are often inaccessible, many workers will use their personal phones to carry out the necessary research and communications.

Travel

34. Our members working in in-home support and day services are required to do a great deal of driving in their own vehicles between shifts and worksites.

35. In group homes, many worksites will have a van for transporting clients. However, some employers have suggested to me that they won't be keeping those vans in the future.

36. Where an employee is required to use their vehicle for work, they will often be required to have comprehensive business insurance. This can come at a large cost for workers and they generally aren't compensated for the added insurance costs by the employer.

37. There is also the problem for employees working with clients with behaviors of concern that their vehicle may be damaged.

Clothing

38. When supporting a person with a disability it is best to be dressed casually as it creates less barriers between the client and support worker, and makes clients feel comfortable and at ease, it assists in avoiding unwanted attention in the public. inclusion. I'm only aware of a few disability services employers who require uniforms to be worn.

39. Uniforms are common in the home care services which undertake a cleaning heavy practice.

40. For employees in disability services in the SACS sector, a damaged clothing allowance is more appropriate than a uniform allowance.

41. Clients with behaviors of concern will often damage clothing to the point they need replacing.

42. There are other ways a worker's clothing also suffers greater wear and tear in the course of work. If you are cleaning you may spill or splash cleaning products on your clothes which causes fading and a breakdown of the clothing. In services that require medical supports, a worker will often want to have two separate wardrobes, one for work and one for personal. Work clothes will often be looser fitting for ease during manual handling, and washed more regularly due to close proximity with bodily fluids.

43. Some employees will have extra pairs of shoes that they use while showering clients. The additional pair of shoes are just a pair that can get wet and be dried out over the shift, to avoid having to wear wet shoes all days.

44. Many worksites will provide surgical booties although these aren't always effective of stopping water from a shower.

First aid allowances

45. The cost of renewing first aid qualifications is something that is often raised by members as an issue. First Aid and CPR are essential to work in disability services. Without a first-aid certificate, an employee can't work this sector. Costs vary depending on the training provider, but, for example, St John Ambulance Australia charges $159 for a one-day refresher course for those who hold a current first aid certificate less than 2 years old, and $75 for a CPR course.

Fair Work Commission
Four Yearly Review of Modern Awards
Social, Community, Home Care and Disability Services Industry Award
Matter No: AM2014/285 and AM2018/26

STATEMENT OF ROBERT SHEEHY

1. I am employed as the Manager Aged Care and Disabilities at the Health Services Union NSW/ACT/QLD Branch (**HSU NSW Branch**). I have been in this role since November 2015.

2. In my current role I manage a team of 8 organisers, develop and manage campaigns and provide strategic direction within the HSU NSW Branch in relation to Aged Care.

3. In my role I deal with members and employers covered by the *Social, Community, Home Care and Disability Services Industry Award* (**the Award**) in the Home Care sector. The Home Care sector classifications are contained Schedule E of the Award.

4. Most of the organisations I deal with are not-for-profit organisations, and include both larger home care provides (for example, Uniting), and smaller or medium sized not-for-profits.

5. Our members in the home care industry are predominantly carers working with clients in aged care or dementia care, but can also include schedulers, coordinators, maintenance workers, assessors, leisure and lifestyle workers, administrative assistants, health professionals and some support services (for example, workers with cleaning or gardening roles).

6. Some of the most common issues of concern arising from the Award for our members are around shifts and rostering, particularly: compensation for travel time; minimum engagements; broken shifts; client cancellations; low hour contracts; and unpaid work.

Split Shifts and Travel Time

7. Broken shifts are a very common occurrence in the home care sector. It is very common to have at least one split to the shift during the course of the work day, but I

Filed on behalf of	**HEALTH SERVICES UNION**
Address	Suite 46, Level 1, 255 Drummond Street, CARLTON VIC 3053
Tel	03 8579 6328
Email	rachell@hsu.net.au, Rachel Liebhaber, National Industrial Officer

know of instances where workers have had two splits to their shifts in a day. That is, the workers have had 3 separate periods of work during the course of the day, with breaks between each period.

8. The periods of work often occur with the same client, with the member providing assistance at different times of the day. I am aware of one member who was rostered to work three separate periods of one or one and a half hours over the course of a day with the same client.
9. The inconvenience and inequity associated with working such patterns is compounded by the requirement for workers to travel, sometimes long distances, to the work location which is the client's residence. I am aware of cases where members are required to travel up to 50 kilometres to the client's home before they are regarded as commencing their shift of work. From my discussions with members, employers are scheduling the work at the most distant locations for the first and/or final appointment of the day, minimising the extent to which the time taken to travel to, from and between client homes counts as paid work.

24 hour care

10. I am not aware of any workers being engaged to provide 24-hour care in a person's home, as contemplated in clause 25.8 of the Award. As far as I am aware this clause is not used by employers in the aged care sector.

Telephone allowance

11. It is very common amongst our members working in home care to be required to have a mobile or smart phone, to be able to be contactable out of hours and when they are on the job, to log in to rostering or work allocation schedules, for use in writing reports on their clients, or to otherwise carry out their work functions.
12. Nearly all our home care worker members either have been provided with a phone or are required to have their own phone. A smart phone in particular is required and is required because rosters, change in rosters and all work related communication is done through the phone, including email and texts, often utilizing an app.
13. Many of the aged care employers are now providing phones to employees. But there are still some who don't, yet require employees to have a smart phone to communicate and log onto their company's app.

Clothing

14. Some employers in the industry do not provide any, or sufficient uniforms to their employees working in home care. For example, some employers will insist on a dress

code which is practically a uniform (for example, black pants, black shoes, white shirt), but will neither provide these clothes nor reimburse workers for them.

15. Other employers will provide only one t-shirt a year. This is not adequate when the nature of the work home carers do means that clothes become damaged, dirty or worn quickly.
16. Workers in the industry are performing all types of personal care – getting people dressed, showering, preparing food, feeding clients and dealing with bodily fluids. I've had members talk to me about being asked to pick up dog faeces and clean up after pets.

First aid certificate renewal

17. The cost of renewing first aid certificates is an issue commonly raised with me and my organisers by members.
18. It is commonly required of our members in aged care to have a first aid certificate, and then to maintain the certification with regular, updated training. Some enterprise agreements stipulate that the company will pay for it, but often not.
19. For aged care workers who are low paid, the costs of obtaining and maintaining a first aid certificate is a significant amount of money

Employers altering rosters to avoid public holiday entitlements

20. Our branch has run a number of disputes for members where employers have altered rosters to avoid paying employees public holiday entitlements.
21. It's not uncommon for employers to change the roster shortly before a public holiday, with the consequence that the employee is not paid for that day. For example, an employee may work every Monday but will be taken off that Monday for the two week period where the public holiday falls. Often employers will cite client cancellation as the reason for changing an employee's roster.

ROBERT SHEEHY

27/2/19

Fair Work Commission
Four Yearly Review of Modern Awards
Social, Community, Home Care and Disability Services Industry Award
Matter No: AM2014/285 and AM2018/26

STATEMENT OF CHRISTOPHER FRIEND

1. I am employed as a Bargaining Officer for the Health Services Union NSW Branch (**HSU NSW**). I have been working in this role for 1 year. Prior to this role, I was an Organiser with the HSU NSW Branch for approximately 1 year, and prior to that I was employed by the Australian Services Union for approximately 8 years, representing members in the social and community sector, state government utilities and local government.
2. The HSU NSW represents members in NSW, ACT and Queensland.
3. My primary role is representing the HSU NSW in enterprise agreement negotiations with employers in the aged care sector, under the *Fair Work Act* 2009 (**the Act**). Within that sector are employees in the home care sector, who fall within the classifications in Schedule E of the *Social, Community, Home Care and Disability Services Industry Award 2010* (**the Award**), or within equivalent classifications in an enterprise agreement underpinned by the Award.
4. In NSW and the ACT, the HSU is covered by 234 enterprise agreements made under the *Fair Work Act* 2009 with various employers in the aged care sector. Of these agreements, 190 have coverage of home care worker roles.
5. Save in respect of the Award provision requiring that part-time employees be given a regular pattern of work at the time of engagement, the terms and conditions as contained in the Award are seldom varied significantly in enterprise agreements.
6. As a consequence, many of the industrial issues that arise for HSU members in home care roles involve the interpretation and application of terms and conditions of the Award, whether because the Award applies directly to them, or because a corresponding provision in an enterprise agreement in the same or similar terms has application.
7. Based on my work and discussions with HSU delegates and members, the primary industrial issues affecting members in home care are:

Filed on behalf of	**HEALTH SERVICES UNION**
Address	Suite 46, Level 1, 255 Drummond Street, CARLTON VIC 3053
Tel	03 8579 6328
Email	rachell@hsu.net.au, Rachel Liebhaber, National Industrial Officer

a. inconsistent and precarious rostering, leading to insecure employment;
b. extremely low, or non-existent, minimum engagements;
c. a prevalence of broken shifts, with little or no compensation; and,
d. high levels of unpaid work-related travel.

Rosters

8. Employers in the home care sector overwhelmingly engage part-time employees. Amongst the material filed by the HSU in these proceedings is an Australian Government Department of Health Publication entitled "The Aged Care Workforce, 2016". That report shows that some 79% of employees in the aged care home care workforce are part-time, 5.3% are full-time and 15.3% are casual.
9. HSU members report being offered employment contracts with very low minimum hours, such as 15 hours per fortnight. Commonly, the minimum number of hours is about 20 hours per fortnight.
10. The rostering practices in many organisations leave staff vulnerable and open to exploitation.
11. In my experience, the requirement for a regular pattern of work hours for part-time employees in clause 10.3 (c) of the Award is one which is rarely observed.
12. Some of the employers in the home care sector may not have an enterprise agreement, and therefore rely on the Award as their primary industrial instrument.
13. Of the 190 enterprise agreements that the HSU is covered by, which contain provisions for staff to be employed in home care roles, none of the agreements contain specific provisions that guarantee a particular pattern of shifts, in the manner provided in clause 10.3(c) the Award.
14. Where enterprise agreements are in operation in the sector, the Award requirement is often diluted. Most commonly enterprise agreements in the sector contain a provision in the following (or similar) terms:

    'Before commencing part-time employment, the Employer and the Employee will agree in writing on the minimum number of hours to be worked and the rostering arrangements which will apply to those hours.'

15. Where such terms apply, in practice, they mean that prior to employment, a prospective employee is required to identify the days and times they are available to work, and are then rostered within those periods. New employees are not well-placed to demand limitations on the hours in which they are rostered.
16. Members report that changing or reducing their availability is viewed negatively by management and many say that they are fearful of repercussions were this to occur.

17. When I have raised this issue during enterprise agreement negotiations, employers have responded that it is often too difficult to accommodate changes to an employee's availability.
18. One employer has told me in enterprise bargaining negotiations that if an employee requests to change their availability, they reserve the right to refuse the request, potentially leading to termination as a result.
19. Alternatively if an employee requests to reduce their availability, they can expect the minimum hours in their contract of employment to be reduced, proportionally with the reduction in their availability.
20. Most HSU members work additional hours, in excess of their minimum number of contract hours.
21. Classifying work as 'additional hours', rather than regularly rostered hours, means that Award provisions such as consultation about roster changes (8.2) or notice about roster changes (25.5 (d)) do not apply.
22. Staff who have extremely low guaranteed hours per week are in a weak negotiating position to refuse the hours or to request changes to any additional hours offered.
23. Many members report feeling pressured to accept additional hours, even if the hours offered do not suit the staff member.
24. Members commonly say that if they do not accept additional hours that are offered, they will not be offered additional hours in the future.
25. One member said that when she declined to work additional hours, she was told that she would be rostered on the hours anyway and that she would now need to apply for annual leave if she did not want to work them.
26. Many staff rely on working 'additional hours' and could not survive on the extremely low minimum contracted hours, so are forced to accept whatever additional hours are offered.
27. This gives the employer little incentive to avoid short-notice roster changes and provides them with a group of staff that are willing to accept almost any shift that is offered to them.
28. By providing employment contracts with extremely low minimum hours, employers maximise their flexibility, minimise their liability and create a significant power imbalance by giving employees very little job security.
29. For staff members who do have regularly rostered shifts, they may still be changed at very short notice.
30. Changes are often caused by clients cancelling, or altering, their visits.
31. The Award provision regarding client cancellation (25.5 (f)) is replicated in most enterprise agreements.

32. This provision enables employers to change any upcoming shifts, up to 5pm on the day before a shift, if the client cancels or requests a change in time.
33. That means that employees, who may have been scheduled to work a morning shift close to their home, can be redirected to work an afternoon shift far away from their home, with less than 24 hours of notice.
34. Worse still, in the case of employees who are rostered to work 'additional hours' which are then subject to client cancellation, there is simply no obligation on the employer to provide alternate work and fulfil the shift that has been rostered.
35. So employees working high numbers of 'additional hours' are subject to far more precarious employment when it comes to client cancellation.
36. Our members also report changes to the roster on the day of shifts being worked, without any notice or consultation.
37. Most enterprise agreements make a provision similar to the Award condition 25.5 (d) (ii) that says:

    (ii) However, a roster may be altered at any time to enable the service of the organisation to be carried on where another employee is absent from duty on account of illness, or in an emergency.

38. In the case of home care employees, what constitutes an 'emergency' is often given a very wide interpretation by an employer.
39. Our members report that it is not uncommon for a roster to be changed on the same day, in some cases while en route to a client visit, and this being deemed an 'emergency' change by the employer.
40. Our members are then directed to change their shift pattern for the day, with no regard for any other plans or responsibilities the employee may have made, based on the scheduled roster.
41. If the member complains or refuses to work the altered shift, but the change is within the employees originally agreed 'availability roster', members report being told that they will not be paid as they are refusing work.
42. The cumulative effect of rostering patterns that change from cycle to cycle, along with frequent, short-notice changes within a cycle, is a highly destabilised workforce that is vulnerable to exploitation.

Minimum engagements

43. While casual home care employees have a 1 hour minimum engagement under the *Social, Community, Home Care and Disability Services Industry Award 2010*, there is

no such minimum engagement for part-time home care employees who make up the overwhelming majority of care staff in the home care industry.

44. Given the above issues with rostering, part-time employees are open to exploitation in the form of extremely small minimum engagements.
45. There is no provision in the Award that prevents a minimum engagement for a part-time home care employee of less than 1 hour, for example 30 minutes or even 15 minutes.
46. Some enterprise agreements do provide a minimum number of hours per shift.
47. However, some employers take the view that a shift may be made up of any number of 'engagements' (i.e. the periods of work) within that shift. For example, the employee could be 'engaged' to work for 30 minutes, then be on the 'break' part of a broken shift for 3 hours, before commencing another 30 minute 'engagement' of work, to complete a 1 hour shift for the day.
48. By having no minimum engagement for part-time employees – in terms of 'total hours per shift' or 'per work period within a broken shift' - the Award effectively provides no limit on the ways work could be divided in any given period, except for limiting such period to 12 hours.

Broken Shifts

49. Broken shifts are commonplace within the home care sector in New South Wales.
50. Issues related to broken shifts are one of the most regularly raised problems from union members.
51. The Award does not provide strong protection for an employee to refuse a broken shift, when directed to work by their employer.
52. The Award provides no compensation to an employee for the inconvenience of working a broken shift. A shift of two hours performed over two hours is compensated the same as a shift of two hours performed over a span of eight hours.
53. The Award does not regulate the length of 'break' between periods of work, except indirectly by the span of 12 hours or limit the number of 'breaks' in a broken shift.
54. Members commonly report having 1 or 2 hour breaks within broken shifts, which do not give them sufficient time to undertake other constructive activities in between periods of work, particularly when travel between clients is factored in.
55. Members also regularly report having to wait in their car or a public space, for their next period of work to commence.
56. Members in regional areas often report that the distance between home and their clients makes it unfeasible to return home between periods of work and have a proper

break (eat a meal for example) and then return to the next client engagement, making the broken shift inefficient for them.

57. Some members have reported having a high number of 'breaks' in any one shift, for example up to four or five breaks, in between short periods of work in worst cases.
58. Members have reported to me that they are effectively tied up for full days performing work or waiting to attend their next client, but only being compensated for a portion of their work due to multiple 'breaks' on their broken shift.
59. Many employers do not pay travel costs for travel at the start or finish of a shift. The effect of that approach is compounded where the shift is broken – the employee gets no compensation for the drive on to the next client engagement undertaken during the break in the shift.

Work related travel

60. At clause 20.5, the *Social, Community, Home Care and Disability Services Industry Award* provides that:

    (a) Where an employee is required and authorised by their employer to use their motor vehicle in the course of their duties, the employee is entitled to be reimbursed at the rate of $0.78 per kilometre.
61. Most home care employees in New South Wales do not work from the employer's business, but move between their own home and the clients' homes in the course of their work.
62. Most home care employees in New South Wales are not provided with a company vehicle to undertake their duties, but are required by their employer to use their own vehicle in the course of their duties, in order meet the requirements set by their employer.
63. A vehicle is necessary to perform home care work to carry necessary equipment and supplies, and to take clients on trips and outings.
64. Employees could not fulfil their role adequately without using their personal vehicle to undertake their duties and most employers structure the rosters of home care employees on the assumption that the worker will drive their own vehicle from client to client.
65. Our members regularly travel significant distances in order to meet the requirements of role.
66. In regional areas, this can include regular travel of 30km-40km, in order to make a single home care visit to a client.

67. Some members report being asked to in excess of 70km in order to make a home care visit.
68. While our members are ordinarily paid for travel between consecutive clients, they usually receive no allowance to use their vehicle in order to get to or from a client, if it is their first or last client of the day.
69. In some cases, it may be their only client for the day.
70. Further, it is commonplace for employers not to pay any kilometre allowance when an employee is travelling on a broken shift.
71. This means that home care employees may be required use their vehicle to service a client, then break for several hours, before commencing a visit another client, without receiving any kilometre allowance for the use of their private vehicle to undertake any of that work.
72. Some enterprise agreements go further than the Award to explicitly prohibit any payment for travel, in either circumstance.
73. Our members do not have a regular place of work, do not work a regular pattern of work and required their employer to use their own private vehicle to undertake their work.
74. As a result, our members report significant financial disadvantage due to this allowance not being paid for all work-related travel, including to and from all clients and while traveling on a broken shift.

CHRISTOPHER FRIEND

15 February 2019

Fair Work Commission
Four Yearly Review of Modern Awards
Social, Community, Home Care and Disability Services Industry Award
Matter No: AM2014/285 and AM2018/26

STATEMENT OF PAMELA WILCOCK

1. I am employed as a Community Care worker for Hammond Care. I have been working in this role for three years. I cover the central coast of NSW.
2. I am a member of the Health Services Union NSW, ACT and QLD Branch. I am the union delegate at my workplace.
3. I am covered by the *HammondCare HammondAtHome Care Worker Enterprise Agreement* 2015.
4. I am a permanent part-time employee. I am contracted for 40 hours per fortnight, but can average over 50 hours per fortnight. These can be worked in my available hours, which are
5. Saturday, Sunday and Monday are my busiest days. On Saturday and Sunday, I generally see up to 4 to 5 clients in the morning between 8am to 1pm. Then I usually will have a break for 2 or 3 hours. In the afternoon, I will generally have 2 to 3 clients, sometimes 4 clients. This is generally in a period of between one and a half of three hours.
6. On Monday I generally work about 8 and a half hours between about 9am until about 5:30pm, and see on average about 4 clients.
7. Tuesday and Wednesday are generally my short days. On a Tuesday, I usually work between 10:30am and 4:00pm, with a break of about 10-20 minutes in between. Wednesdays I tend to only see two clients, one for a half hour and one three hour.
8. My role involves helping out clients with personal care including showers, toileting, applying creams. We are allowed to dispense medication if it is from a Webster pack. When we do, we have to check the medication and document what the client has taken. If the client declines to take the medication, we have to report that straight away to the manager. If they have antibiotics in a separate packet, for example, we're only allowed to

prompt them to take it themselves. I regularly take clients to appointments, shopping, or sometimes they just want to go for a drive.

9. My role sometimes involves respite care. With respite care your role is to be there with the client so that their family member can have time off and assist the client with any needs their carer would normally assist with. In my time with the company, I have worked five-hour long visits for clients needing respite care.

10. Showering clients can be very difficult. I often tell people to think about their own bathrooms and how they're set out. We're trying to assist people in and out of showers often in a tight space. Our client's bathrooms aren't like those in a nursing home where you have a lot of room to manoeuvre, equipment and extra staff at hand. It's also where a lot of injuries can happen if a client falls in the bathroom. We could become trapped in a bathroom if a client falls in front of the door. A small number of clients will have lifting equipment to help them in and out of their bed, chairs and into the shower. But the vast majority of clients don't have such equipment in their homes.

11. Sometimes clients cancel appointments with short notice because they have to go to hospital or for some other reason, and this can mean I don't make my 40 hours per fortnight minimum hours, as per my contract. When this happens I have to make up my hours at another time that fortnight. I generally make up my hours at one of Hammond Care's respite cottages or facilities. I have also seen other care workers in the head office doing administrative or filing work as part of their make up hours .

Cleaning

12. My role involves a lot of cleaning. We also make our clients' beds, and sometimes they request us to make up other beds in the house as well.

13. When cleaning we have to use whatever cleaning products the client has in their home. We usually end up using harsh chemicals like bleach. Using those products can ruin our clothes. Hammond Care does provide us with protective clothing and gloves.

14. We also have to often have to clean bodily fluids or urine. Often we're not dealing just with clients but with their pets as well, and I've had to clean urine and faeces from a dog that the client isn't able to care for.

Travel

15. The main concern for myself, and my fellow care workers (as best I can understand as the union delegate) is the travel we are required to do in the course of our work. We don't go to the same workplace day to day, rather, each work day we can go to the homes of a number of different clients. This can involve driving long distances.

16. We cannot plan our days much in advance as the schedule can be changed at any time up to the start of the shift, and sometimes even during the shift.

17. Our vehicles are our tools of trade. You cannot be a community care worker if you do not have a car. We need our cars to meet the schedules set by the employer, and also to carry out our duties when we need to take a client to an appointment or for a drive. We often have to put clients' wheelchairs and walkers in the cars and that can be difficult at times. When clients have misplaced their disabled parking permits, we can have difficulty finding parking and manoeuvring clients safely in and out of the car. The amount of driving required is such that it forms a large part of the working day. Some workers are available for shifts between 6am-9pm. Combined with the burden of driving, that length of work day can leave workers very fatigued.

18. A few workers have had accidents in their cars. But costs such as vehicle insurance and excess payments have to be covered by us. All these added costs weigh on our wages.

Phone use

19. We are given a phone by the company. That is common these days because we rely on our phone for work. We our phones for emails for work purposes, risk plans, amongst other things.

20. Our work schedule is issued through an app on the phone and it can be changed by management as required. It is common for our shift times and the location of our work to be changed at very short notice, including on the day of our work.

Rostering

21. I am a permanent part-time employee. But, while we are meant to have a roster fortnightly in advance, our roster is often changed at short notice based on the hours we've said we would be available.

22. My availability is from 8am to 6pm Saturday, Sunday, Monday and Wednesday. On Tuesdays my availability is from 9am to 4pm. This means that I can be rostered to work a minimum of 40 hours a fortnight during these available hours. My roster can be changed at short notice. On one occasion, I finished a client and had no other clients rostered on for the day, so I logged off from the app and went home. Then I got a call asking me to log back into the app and do another client visit.

23. This means employees are virtually on call for lengthy periods with no allowance. Employees are often asked to do a shift at short notice and expected to do so during the period of their "availability".

24. What this means is that it is difficult to make other plans or to leave the area during those “availability” periods. If you do so and then are not in a position to take a shift at short notice, that is frowned upon.

25. I’ve spoken to a lot of community care workers working for different employers, and from my understanding all of them work according to a similar system. That is, if you say you’re available between 8am to 6pm, you have to be available then. Your roster might have you finish at 3pm, but if the employer then calls you and asks you to do another shift at 4pm, you have to work, because you said you were available until 6pm.

Public holidays

26. Our employer offers us to sign a form to say if we do not want to be rostered to work on a public holiday. If we sign this form, we then don’t get paid for the public holiday. If we don’t sign the form, and say we’re available to work the public holiday, then we have to be available to work it, though we may not know whether we’re rostered on until the last minute.

27. The problem is that we never know whether we are working a public holiday or not until two days beforehand, or sometimes at even shorter notice. Your roster on the mobile phone app can can show that you don’t have any clients, but this can change at the last minute. It means you can’t plan anything. You can’t leave the local area in case your roster changes. If we complain about being rostered on a public holiday at short notice we’re told ‘but you said you were available to work’. This is also a problem in general, not just on public holidays.

28. We had a big discussion about this during bargaining for our enterprise agreement.

15 February 2019

Fair Work Commission

Four Yearly Review of Modern Awards

Social, Community, Home Care and Disability Services Industry Award

Matter No: AM2014/285 and AM2018/26

STATEMENT OF HEATHER WADDELL

1. I am employed as a Community Care worker for Hammond Care in the Shoalhaven area of New South Wales. I have been working in this industry for over 10 years.

2. I work mainly in aged care and with dementia patients. Most of the clients I provide care for are frail or aged, some clients are younger people with early onset dementia.

3. Hammond Care train their workers and are committed to looking after people in need of care. I enjoy my role as a care worker and gain satisfaction from knowing that I have made a difference to peoples' lives by assisting them to remain at home for as long as possible.

4. As a Community Care worker, my role involves assisting clients with all their daily activities of living, including socialisation and personal care and home maintenance This includes showering, dressing, administering medication from their Webster packs, house cleaning and cooking shopping and caring for their pets, leisure activities and community engagement.

5. I am a member of the Health Services Union. I am on the Aged Care Committee for the NSW/ACT/QLD Branch.

6. I am covered by the *HammondCare HammondAtHome Care Worker Enterprise Agreement* 2015. We have recently negotiated a new Enterprise Agreement for 2018 that is in the process of being ratified.

7. I am a permanent part-time employee. I am engaged to work a minimum of 20 hours per week, 40 hours per fortnight. According to our enterprise agreement, this 20 hours can be rostered any time within my available hours that I provided to my employer. My availability is from 7am to 7pm, 5 days a week. I don't work on Fridays or Wednesdays.

8. I am not always rostered on for my full 20 hours, in which case I have to make up hours in the following week.

9. As a Community Care worker I am required to supply my own registered, insured and clean vehicle to attend to clients as directed and transport them as necessary along with their wheelchairs or walkers on their various outings

Travel

10. The regional head office of Hammond Care in the Shoalhaven district is in Nowra. We have 3 teams, North team and South team and Ulladulla team I live about 32 kilometres south of the head office. I am part of the "South" team. We cover an area that stretches approx 100kms plus. We are sometimes rostered to cover clients in the North Team, and regularly the Ulladulla team's clients.

11. I sometimes have to travel long distances to visit clients. For example, I visit clients in Ulladulla, which is approximately 50 kilometres south of where I live. The furthest south I personally have travelled is to Kiola / Bawley Point (80km). The furthest North is Gerringong (63km). The furthest west is Kangaroo Valley and Budgong (54km) (which in my opinion you need a 4 wheel drive to get in and out of.) I have worked days where I have travelled 250 km in a day for 4 or 5 hours of paid work. I have been required to travel 50 kilometres to my first client, perhaps attend other clients in the area, then have a long break after having only performed a few hours of work, attend to other clients then travel 50km home.

12. On days like that, I would have to weigh up whether I should wait for hours in my car to save money on travel, or drive home during my breaks. Even though going home involves a long drive it is often the case that there is very little else useful I can do with my time in the areas around client homes. Driving 50 kilometres back home and then back out for the next part of your shift doesn't work out to be economical. But the other option is to be away from home for 13 hours for only 4 or 5 hours work which is emotionally uneconomical.

13. The employer doesn't pay for travel to the first client in a shift or back home from the last client, or travel time and kilometres in a broken shift. For home carers like me this can mean travel of great distances without being paid for the time spent undertaking that travel. We can ask our manager to get paid for kilometres or the time. But we have to make the request in advance, and it's only given at the manager's discretion and if our shift is less than 3 hours. I work on weekends – so late on Friday afternoon my roster can change and I'm travelling up to Ulladulla next day so I can't get prior approval before I go.

14. Driving such long distances in the country and driving home involves the risk of accidents. I've had incidents where I've run out of fuel while on the highway, and I've had to walk back up the highway up the hill to get reception on my phone to call someone to help me. I've hit three kangaroos in my time, and at least one was while driving for work. On that occasion, a kangaroo jumped on my car while I was driving between clients. I had to call for a tow truck and Native Wildlife Rescue to put the animal out of its misery and my partner to allow me to drive to next client whilst he waited for the other agencies to come. That

made me late for my client and distressed. Another occasion, coming home from a client, in Ulladulla, my back tyre blew on a bend at Jerrawangala and I came off the highway and into the ditch on the other side of the road. I went careering across the highway. Luckily no one was coming in the other direction. I had to phone for my partner to come and assist me.

Rosters

15. The clients we are rostered to visit can change at short notice. We have to check after 5pm the night before to see where we're rostered on the next day. The after hours schedulers may phone you between 5pm and 9pm and then again from 6am to change your roster.

16. I have found myself rostered 50 kilometres away at short notice and had no fuel in my car. I have then had to scramble to find money just for the fuel to get there.

17. In December 2018 I didn't RSVP for our work Christmas party on a Saturday, because I was rostered to work. On Friday my roster was changed. I would have been able to attend the Christmas party after all, but it was too late to change my RSVP. It's very difficult to make plans when your roster changes like that.

18. Sometimes the roster will change instantly due to emergencies. Normally, if you decline a job during a time you said you were available, the company will reduce your hours for that fortnight and you end up losing pay.

19. I've had my roster changed at the last minute when I've been rostered to work on public holiday. For example, I said I would be available to work on the Australia Day public holiday, but I didn't have anything on my roster. Then, in the late afternoon the day before, I saw I had two clients added to my roster, a total of one and half hours work. Both of these were clients I'd never worked with before, and one client needed their stoma bag changed.

20. It is hard to plan a holiday or break if you don't know whether or not you will working on a public holiday until shortly before.

Minimum Engagement and Broken Shifts

21. The minimum client visit at Hammond Care is half an hour. Often we are rostered on back to back, one client to the next, because each client visit is short.

22. The shortest shift I've worked is half an hour. A lot of the shifts we get are just half an hour.

23. Work is usually rostered around client meal times, so shifts tend to be around morning, lunch and evening. Generally shifts are broken with breaks in between those times being paid at $21 flat.

24. In our most recent Enterprise Agreement, we negotiated for a two hour minimum engagement. Previously we had a one hour minimum engagement.

25. But with broken shifts, the employer takes the minimum to mean two hours per day, not 2 hours per shift

Overtime

26. While shifts are usually short ones, there have been times I've worked much longer days.

27. On one occasion I recall working a nine hour straight shift. I drove to a client in Ulladulla and was there from 7am to 4pm, and was with the client the whole time.

28. I had no time to take a lunch or tea break, just to quickly eat the lunch I brought whilst caring for the individual.

29. There was no overtime paid on this shift because it was within my available hours and the shift wasn't over 10 hours.

30. I have been paid overtime when I've worked past 7pm, that is, over my available hours or over the 10 hours.

Telephones

31. The company supply us with a phone. We clock on and off with each client with an app on our phone. There are no hard copy paper rosters. We work on our own so our phone is our only contact with our employer, supervisor or other colleagues. We're asked to have our phone on our person at all times (though this can be difficult, for example, in wet areas while showering clients). Using the phone for emails, photos and apps is essential. I use the camera on the phone to take photos of client's wounds, which I send to my manager who is a clinical nurse, who will then advise how to dress it. We take pictures of our clients when they're out having a nice time on a social visit, and are added to their file for their families. We also take photos of clients to have on our records for our paperwork

32. My employer's primary form of contact is via an app. It is used for rostering, emails, communication with schedulers etc. Every night after our last client, or at 5:30pm, we have to log out of the app, then log back in to see what you're doing for the next day.

Clothing

33. We don't get uniforms at our work so we have to wear our own clothes. These get damaged and worn out very quickly with the kind of work we do. With cleaning we have to use the cleaning products the client wants us to use or has available. Often this is harsh chemicals like bleach that can splash and ruin our clothes. Clothing can also get spoiled with bodily fluids.

34. Hammond Care does provide single use aprons and goggles that we can use, for example when dealing with bodily fluids. These are kept at head office and we'd need to drive to head office before our shift to pick them up if we are rostered to them. I don't do this because the head office is usually in the opposite direction of my clients, and it doesn't work out economically to make that trip

Fair Work Commission

Four Yearly Review of Modern Awards

Social, Community, Home Care and Disability Services Industry Award

Matter No: AM2014/285 and AM2018/26

STATEMENT OF THELMA THAMES

Introduction

1. I am employed as a support worker by Uniting, which is an Aged Care provider based in NSW and the ACT. The company was previously called Uniting Care, but rebranded a few years ago. I am covered by the Uniting Aged Care Enterprise Agreement (NSW) 2017.
2. I have been working for the company for some 13 years. I started working with the company in 2006 as an enrolled nurse. Since 2009 I have been working in my current role in community care. I am the union delegate for our workplace.
3. My role involves assisting clients in aged care. A lot of my clients are in their 90s. Other are in their 70s or 80s. One of my clients is younger, in their 60s, but they have a medical problem which makes them less mobile.
4. The title of my role has changed over the years from 'carer' or 'care worker' to 'support worker'. The roles are very similar but the main difference is that being a care worker involves mainly personal care. That is, for example, showering clients, getting them in and out of bed, and assisting with medication. As a support worker we have a much broader duty statement.
5. The service is based on what the client's package allows for in their care plan. This may include:
    - personal care, which includes assisting with showering and toileting, for example
    - meal preparation
    - medication assistance
    - transportation to appointments, or errands such as the bank or hairdresser.

Filed on behalf of	**HEALTH SERVICES UNION**
Address	Suite 46, Level 1, 255 Drummond Street, CARLTON VIC 3053
Tel	03 8579 6328
Email	rachell@hsu.net.au, Rachel Liebhaber, National Industrial Officer

- domestic assistance, for example making beds, vacuuming and mopping floors, cleaning the toilet and bathroom, laundry, shopping for groceries and discarding old food in the fridge (after asking the client)
- social support, such as taking a client out for lunch or coffee, or another activity to give respite for themselves and their family

6. A lot of my work now is domestic assistance. The employer tells us this is because clients now get more choice in their aged care packages and these are the tasks the clients want us to do. I find domestic assistance to be more physically demanding, wearing on the body and tiring than personal care. A few years ago, the domestic assistance shifts would be limited to 3 a week. Now we usually have 3 domestic assistance shifts a day.
7. Our shifts are broken up into 'microshifts' according to the client's care plan. For example, a one hour shift might be broken up into two microshifts, which could include 9 to 9:30, meal preparation, and from 9:30 to 10:00 domestic assistance. In a lot of cases, the entire shift is dedicated to domestic assistance, as per the client request. Another might be a three hour shift, and the microshifts will include personal care, medication assistance, meal preparation, domestic assistance and social support.
8. It also depends on the individual carer. For example, my clients know I can cook, so in my case, meal preparation means I will make them poached eggs, for example.

Rostering and hours of work

9. I am a permanent part-time employees, and contracted to work a minimum of 20 hours a week. I work these hours over four days per week. I'd like to have more hours. I'm not close to retiring and 20 hours a week is a semi-retired wage. Most weeks I work more than 20 hours a week, taking into account meetings and travel time.
10. On Mondays and Tuesdays I work full days, sometimes with a break for an hour. Wednesdays and Thursdays are usually short days.
11. The roster is very fluid, it can go up and down. You can access the roster in the company portal online two weeks in advance, and see the previous two weeks, but your shifts can be cancelled at any time. A client can cancel in less than 24 hours. I've been on the way to a job and the client has cancelled, and suddenly your four hour day is now two hours.
12. In the past, I have had some half hour shifts. I haven't had one in a while, but some employees do get these. Usually these are at the end of a day to help a client with meal preparation or their medications.

Travel and arrangement of work

13. Generally, breaks between clients longer than 10 minutes are called 'gaps' and are unpaid. Breaks an hour or longer are called broken shifts. We get an allowance of $10.74 for each broken shift.

14. The amount of travel I do varies. Some days I drive 50km in a day, other days 30km, some days it is only 10km. I work in the Sydney metropolitan area, so Sydney traffic can be a problem and cause delays.

15. When I have a gap or broken shift, I usually sit and wait in my car for my next client. Sometimes, if I have the time and I'm close to home, I will go home in this break. But often I will be waiting for an hour in my car for the next client, sometimes longer. The $10.74 we receive for a broken shift isn't much compensation when you have to sit in your car twiddling your thumbs for an hour and a half. It's been extremely hot in Sydney over summer, so sitting in your car can be very uncomfortable.

16. We don't get paid any travel time or a travel allowance for travelling to our first client in morning, and from the last client at the end of the day. We regularly have to travel 12 -15 kms to our first clients. Because we don't have the same place of work day to day this distance can be fluid. The company often roster the furthest away client on either end of our shifts, because they're not paying for travel. Traffic-wise, this can be difficult, especially in peak hour.

17. When I started working for my employer, we had two teams – east Sydney and west Sydney. I live in the East and requested to work in the East. But recently this has changed. I now cover what my employer calls 'Sydney Central', which means I work further out.

18. I live in Bondi, but am currently staying in Maroubra. I have been rostered to see clients in Camperdown, Lilyfield, Newtown, Balmain, Petersham, Dover Heights and Rose Bay.

19. As the union delegate I sometimes get calls from other employees, who'll call me to complain that they've been rostered to travel from the eastern suburbs where they love to South Strathfield, Beverly Hills and Bellfield to see clients.

Overtime

20. Occasionally, where necessary, my employer will extend my hours on a temporary basis. I may be required to work from 9am to 5pm, instead of 9am to 4pm on one day, for example. When this occurs, I do not receive overtime rates. We are only paid ordinary rates for the hours we work over and above our rostered or available hours.

21. One week earlier this year I worked an extra day, on Sunday, which I don't usually work. The client requested that someone be there the whole day, from 10am – 6:30pm. Last year there was another day I ended up working a whole extra day on Friday, which wasn't my usual day either. I didn't receive overtime for working these extra days either.

Telephones

22. My employer provides us all with a smart phone. We are required to use the online portal, called 'Care Link mobile', as our timesheet. For example, you use it to put in the time you start and finish with a client, and then you get the client to sign at the end of the service, before you log off. We also use something called 'Care Link portal' to access our rosters.

First aid

23. I hold a first aid certification. My employer pays for us to do the training through Red Cross. First aid is essential for employees doing the work we do. I used to be an enrolled nurse so have some nursing experience. That training comes in handy when working with our clients.

THELMA THAMES

19 February 2019

Fair Work Commission

Four Yearly Review of Modern Awards

Social, Community, Home Care and Disability Services Industry Award

Matter No: AM2014/285 and AM2018/26

STATEMENT OF BERNIE LOBERT

1. I am a disability support worker employed in that role on a casual basis by three different organisations:
    a. **Morcare Services** which is a company based in Wantirna South in Eastern Melbourne. The people I support are Transport Accident Commission (**TAC**) clients who have acquired brain injuries.
    b. **EACH** is a company limited by guarantee. The people I support have intellectual disabilities.
    c. **Possability** is a company limited by guarantee which is based in Tasmania but has recently branched into Victoria and now manage a number of TAC funded facilities. I work doing one-on-one community access.
2. I started working as a disability support worker in June 2012. Before that I was a Community Development Officer at a local council. I was made redundant in my 50s, so I moved into this sector, and then I realised that I really liked the work.
3. Initially what I liked about the work was the people and making a difference in peoples' lives. Now I also like that you don't have to take the work home with you, and that working one on one, you're only responsible to the person you're working with.
4. I am employed under the *Social, Community, Home Care and Disability Services Award* (**the Award**) for Morcare and Possability. EACH has an old 2009 Enterprise Bargaining Agreement, which is still current, but our pay and all of our conditions now come from the Award. Employees have been paid most of the conditions under the Award since 2016 because the Award rates were higher than the EBA. At the end of

Filed on behalf of	**HEALTH SERVICES UNION**
Address	Suite 46, Level 1, 255 Drummond Street, CARLTON VIC 3053
Tel	03 8579 6328
Email	rachell@hsu.net.au, Rachel Liebhaber, National Industrial Officer

last year, EACH introduced casual loading, a first aid allowance and increased mileage rates. EACH has told employees that it wants to terminate the old EBA.

5. I work mainly in the East and South East of Melbourne. My furthest clients are in Frankston in one direction, and in Lilydale in the other direction. I work in suburbs including Glen Waverly, Ferntree Gully and Bayswater.
6. Including the time it takes me to travel home and back each day, and the driving I do with my clients, I end up travelling about 1000km a week. I keep a log of all the travel I do on my phone.
7. I mainly work in one-on-one community access; that is, supporting the client to participate in their community in the ways they decide they want to.
8. Activities I do with my clients include:
    a. Driving clients to programs organised by the disability service provider, such as cooking or woodwork programs;
    b. Taking clients on outings for coffees, to the movies, shopping, the gym, or other activities;
    c. Taking clients to medical appointments with their doctors, or with podiatrists, physiotherapists and hydrotherapy sessions.
9. The activities you do will change depending on the client. For example, one of my client likes to go shopping, so I will do a lot of driving with them to different shops across different suburbs, sometimes travelling 50km or 60km in a day.

Hours of work and travel

10. I work Monday to Friday and every second weekend.
11. My shifts are generally between 5 hours and 7 and a half hours in length.
12. My first employer was Melba Support Services. I was engaged as a casual employee, and completed my training with them. But wasn't given any shifts for about 3 months after I started. So I started looking elsewhere.
13. When I started out in the industry I generally worked shorter shifts. I did two hour shifts and some one hour shifts. At that time I was desperate to get into work and took whatever shifts I could take. My very first shift was a two hour shift in Carnegie. This was a good 45 minutes from where I live in Belgrave South. I spent 45 mins driving there and back.
14. After a few years I refused to do anything below 3 hours, as it's really not worth it. Whether you work 1, 3 or 7 hours, you still have to get ready for work, shower, get dressed, travel to your client, travel back home, and pay for fuel.
15. I prefer to work longer shifts because I didn't get paid for the time spent travelling between clients for my shorter shifts. I used to have a client in Ferntree Gully and

then another in Burwood East, so I could claim a per-kilometre allowance for the distance travelled between them (approximately 12 or 13km) but not for the approximately 20 minutes I spent driving from the first client to the next.

16. If you use your own car as a disability support worker, you're also required to have comprehensive car insurance.
17. I work for three different employers because I work casually, and I feel I need to spread the risk, given the work can be unpredictable and insecure. In the past I have had regular hours of work dealing with the same client or clients for years, and have those hours change suddenly because there are changes with the client's situation or in the organisation. For example, one client I worked for passed away, in another instance one moved into a facility. To spread the risk I worth for 3 different employers.

Telephones

18. My employers don't provide their employees with a phone, but we are expected to have a phone for the work we do. One company I used to work for, Melba Support Services, used an internet portal and they required employees to sign on and off for every shift using that portal within a half hour of the start or finish time. Because of this time limit, you couldn't do this from home; you needed to use a phone.
19. One company uses text messages to notify all employees when a shift is available. They'll regularly send out message to all employees with the date, time, suburb and shift length, for example, 1 February, 9am to 11am, Wantirna, and if you want that shift you click on the link to confirm your availability.
20. I'll also use my phone during the course of my work. I may need to call the ambulance if the client has a medical emergency, call doctors or podiatrists on behalf of the client, use the calendar to keep track of appointments, or look up movie times or other information during the course of working with clients. I may need to call my coordinator at times. For example, I've had to call my coordinator when I received a call from an Occupational Therapist about changing the gym hours for the person I support. On another occasion I had to call the after-hours coordinator when a person I supported had a fall, and I'd had to call the ambulance. I also use my phone to keep a log of my hours and the kilometres I drive. One of my clients also gets a monthly allowance from his provider, so I use my phone to keep track of how much we spend each visit.

Shift length and overtime

21. Most of my shifts are between five and seven and a half hours long. I don't generally work shifts that are any longer than that. It can be difficult working one on one with someone with a disability for 7 hours or more. Because the work is one on one, you can't have a break, you can't get away and you can't switch off.

First aid renewal

22. As a disability support worker you are required to have a current first aid certification, otherwise you can't get work. You need a CPR update every year and a new first aid certificate every three years. It costs approximately $100 for the first aid training once every three years, and $60 for the CPR training once a year. That works out to a cost to the employee of roughly $90 dollars a year.

BERNIE LOBERT

15 February 2019

Fair Work Commission
Four Yearly Review of Modern Awards
Social, Community, Home Care and Disability Services Industry Award
Matter No: AM2014/285 and AM2018/26

STATEMENT OF JAMES EDDINGTON

1. I have worked as the Legal and Industrial Officer at HACSU, Tasmania Branch since October 2010. In that role I am responsible, amongst other things, for bargaining for enterprise agreements, reviewing enterprise agreements, filing associated documentation with the FWC and representing members that have disputes with employers.

2. As our branch has members in the social and community and home care sectors, my work in respect of those two streams in the *Social, Community Home Care and Disability Services Industry Award* (**the Award**) represents a significant portion of my work. I was involved in the negotiation of a 2011 Tasmanian multi-employer agreement in the disability services sector and have played a significant role in negotiating enterprise agreements for homecare, disability services and community service employers in Tasmania.

Overview of Industry

3. The Social, Community, Home Care and Disability Services (**SCHCDS**) Industry in Tasmania consists of three broad sectors:

    a. Disability Sector, which consists of about 22 employers employing about 2,950 employees.

    b. The Home Care Sector, which consists of about 15 employers employing about 2,000 employees.

    c. The Social and Community Sector, which consists of about 130 employers employing about 3,000 employees.

Disability Sector

4. There are approximately 22 providers of disability services in Tasmania. There are about 5 large employers with more than 200 employees; 6 medium sized with 100 – 200 employees; and 11 smaller employers (fewer than 100 employees).
5. Across the sector, the staff of disability support providers consists predominantly of disability support workers (**DSWs**). Although the employment profile changes from service to service, DSWs make up in excess of 90% of the workforce (including team leaders, managers and co-ordinators). Administrative or clerical employees make up around 5% of the industry. In addition to those two categories of employment other employees in disability service organisations consist of:
    a. senior management,
    b. in some of the larger services, maintenance, groundskeeping, domestic and service staff;
    c. in some of the larger, facility based services, nurses and medical staff.
6. The 5 largest employers of disability support workers, and the approximate numbers of such workers they employ, are:
    a. Anglicare – 250 DSWs
    b. Possability – 422 DSWs
    c. St. Giles – 218 DSWs
    d. Liviende Veranto – 194 DSWs
    e. Mosaic – 250 DSWs
    f. Life Without Barriers – 175 DSWs
7. I have gleaned the numbers of DSWs employed by the organisations from organising in the sector, F17 forms lodged at the Fair Work Commission and other published materials.

Home Care Sector

8. There are 6 major home care providers in Tasmania who provide services utilising funding through the Home and Community Care (**HACC**) and Commonwealth Home Support Programme (**CHSP**) funding programs. They, and their approximate number of home care workers are:
    a. Anglicare – 200 home carers
    b. Community Based Support – 300 home carers

c. Independent Health Care Service – 300 home carers

d. Integrated Living – 300 home carers

e. Family Based Care North West – 122 home carers

f. South East Community Care – 75 home carers

9. Again, as with the disability services industry described above, I have gleaned the numbers of home carers employed by the organisations from organising in the sector, F17 forms lodged at the Fair Work Commission and other published materials.

Community Services Industry

10. The community services industry is vast in its breadth. There are approximately 130 different community organisations in Tasmania performing a wide range of community services. Broadly the community services provided by each are designed to assist the social inclusion, safety, wellbeing and health of recipients. Organisations include those that provide for:

a. Mental health (eg. Richmond Fellowship Trust;);

b. Physical wellbeing and health (eg. Arthritis Tasmania);

c. Shelters and protection from violence and assault (eg. Launceston Women's Shelter);

d. Housing and homeless support (eg. Colony 47);

e. Community houses (eg. Derwent Valley Community Houses);

f. Drug and alcohol counselling and education (eg. Holyoake Tasmania);

g. Family and relationship support (eg. Family Relationship Centre);

h. Legal support (eg. Women's legal service);

i. Work and training (eg. Work Solutions Australia);

j. Charity (eg. St. Vincent de Paul);

k. Aboriginal assistance and support (eg. SETAC Primary Health Care & Wellbeing).

11. The largest providers of community services in Tasmania are Anglicare, with approximately 275 community service (as distinct from disability and home care workers and excluding administration and home care staff) employees; and Catholic Care which has 300 support workers providing child and family assistance and housing.

12. Other large providers include:

l. Richmond Fellowship Trust – 80 support workers working in group homes for residents requiring mental health support;

m. Colony 47 – 104 support workers providing housing and homeless support, mental health services, and education and employment services;

n. Mission Australia – 69 support workers assisting in homelessness, alcohol and drug counselling, mental health and employment, skills and training, youth services and family and children services.

13. The majority of community service providers in Tasmania are small (between – 10-40 staff). For instance, The Link Youth Health Service has 22 support workers and 4 administration staff. EACH, which provides counselling and family violence services and a children's contact service has 10 staff made up of 7 support workers and 3 administration staff.

14. Increasingly Award employers have shown a desire to employ both home care and disability services staff. In negotiating enterprise agreements, organisations that traditionally only operated in home care have sought to expand into disability services. Similarly, employers that have historically only provided disability services have now sought to expand into home care. Almost every aged care provider in Tasmania has sought to expand their service from a facility-based service to a home care service. An example of employers proposing that one employee may have multiple functions based on different Award classification descriptors is the negotiation of the *Liviende Veranto Enterprise Agreement* 2016 [2016] FWCA 4686. This employer historically has only been a disability service provider. They sought to branch into home care. The parties included in the enterprise agreement Cl. 13.6, a clause that allowed employees to be employed in multiple positions (ie. as both a disability support worker and home care worker) provided the employee voluntarily applied for a second role and the total ordinary hours would be an average of 38 per week over two weeks. Similarly, in negotiating the recently approved *South Eastern Community Care Community and Disability Support Workers Enterprise Agreement* 2018 [2018] FWCA 7646, the employer, an organisation that traditionally only provided home care services sought for a change of scope and classifications to include disability support work.

Rates of pay

15. The very large majority of disability service providers in Tasmania pay staff at Award rates only. When we negotiate enterprise agreements in the sector wage rates are almost universally at Award rates including the rates determined in the Equal Remuneration Order.

16. Negotiated home care rates in EBAs (because the ERO has not applied to home carers) may be slightly higher than the Award (approximately 2% higher).

17. Social and Community sector wages rates (other disability services) are commonly at Award rates but may be above Award for occupations requiring higher qualifications.

18. There are 22 disability services and 6 home care organisations in Tasmania that are covered by enterprise agreements and for which we bargain replacement agreements.

19. There are 6 larger employers (eg. Anglicare, Richmond Fellowship Trust, Colony 47) providing community services that have enterprise agreements and that we bargain for. As that sector has approximately 130 small employers it is difficult to bargain effectively across the sector.

Scheduling of work, minimum engagement and broken shifts

20. The most common issue of concern for employees in the home care sector is the scheduling of work and length of minimum engagement. In Tasmania home care employers have taken the approach that travel to any engagements beyond one hour apart is not travel 'in the course of duties'. This means employees must bear the cost of travelling from one client to another if there is a break of more than one hour between engagements. It is reported to me by members that there are often breaks of more than 1 hour between engagements or that engagements that are significant distance from an employee's home are rostered as the first engagement.

21. Often home carers in Tasmanian are required to travel significant distances to work for clients. I am aware of employees having to travel between 30 and 50 kilometres to client homes. If an employee has to pay for their own travel to attend to clients for work and then only have an engagement of 1 hour (or, in the case of part-time employees 15 minutes or 30 minutes) it is uneconomical to work. That is, the cost of travel to and from the client may exceed or be approximately the same as wages received for the hour of work performed. Members have informed me that they tolerate such economic inequity because they feel a sense of duty and obligation to their clients and that if they refuse such shifts they will no longer get any work at all.

22. There is no minimum engagement for part-time employees pursuant to the Award. I am aware of employees being asked to work shift lengths as little as 15 minutes. Commonly engagements are 1 hour, which is the current minimum engagement for casual employees.

23. Broken shifts are relatively common in both home care and disability services in Tasmania. Historically, pursuant to the state Tasmanian Disability Service Providers Award,

employees were paid an allowance when required to work a broken shift. This allowance partly ameliorated the inconvenience and expense associated with having a break between shifts.

Experiences of HSU members

24. The home care industry is a difficult one to organise, because employees don't have a workplace as such. As a union official, I can't just call a member meeting at a workplace to ascertain views on various issues because there is no common workplace. Whilst home care organisations often do have an office, home carers themselves do not often frequent it. Organising in this sector usually involves a lot of individual conversations.

25. In the course of preparing this statement, I spoke to a number of our members working in home care or disability support work about the conditions of their employment. These employees did not wish to reveal their names or the names of their employers, as they were fearful that their employment would be adversely affected, such as by having their hours reduced by their employers. Most employees in this sector in Tasmania are underemployed, and are always seeking extra shifts to make ends meet. They therefore feel constrained about speaking out about their employers.

26. Because of this, I have provided de-identified information about these members and employers below. I refer to the employees as Employee A, B, C, D, E and F. I refer to the Employers as Employer X and Y. This information is based on conversations I had with our members, and the notes I took from these conversations.

Employee A

27. A works as a home carer for Employer X. The applicable instrument is the Award. A is employed at Home Care level 3.2 of the Award and paid at the rate applicable to that level (that is, $22.70 per hour). A has worked for employer X for 14 months and is a permanent part-time employees. A works 30 hours per week.

28. Like most employers in the sector, the employer is funded for home care services through either the Commonwealth Home Support Program (CHSP), the Tasmanian Home and Community Care program (HACC) or through Home Care Packages (HCP). The HACC program provides funding for home and community care services that support persons who are under 65 years or Aboriginal and Torres Strait Islander people aged less than 50 years of age living with disabling conditions. HACC services are targeted towards people who need assistance for independent living. The Commonwealth (CHSP) program provides funding for persons over the age of 65, or Aboriginal and Torres Strait Islander people that are 50 years or older.

29. Despite the Award (Cl. 25.5) requiring that a roster will be posted at least two weeks before the commencement of the roster period, employer X posts rosters 3 days before the roster period commences. I am aware that this Award clause is commonly breached by home care employers in Tasmania.

30. Employer X at times rosters sizeable breaks between seeing clients. They have determined that any break of greater than one hour between clients means that the travel between clients is not in the 'course of duties.' This means that an employee is responsible for their own travel costs, subject to the radius limit described below) when travelling between clients if the break between those visits is more than 1 hour.

31. In late 2018, every Wednesday, A worked the following work day:

    a. Leave home in Legana at 7.20am to beat school traffic for first client at Youngtown. Travel of 22 km. A is responsible for her travel costs for this leg. The work at Youngtown was for 1 hour.

    b. A then left Youngtown to go to next client at Newnham. The time between the work at Youngtown and Newnham was one hour. The distance travelled was 15 km. The employer paid the cost of travel (.78c per kilometre) as the break between shifts was one hour or less). A would, however, sit in her car on the side of the road waiting for her work at Newnham to commence. The work at Newnham was also 1 hour in length.

    c. A then left Newnham to drive to her next client at Beauty Point. The distance between Newnham and Beauty Point is 51km. The break between these work engagements was 1.5 hours. The work at Beauty Point is 2 hours in length. As the break between the Newnham work and Beauty Point work is 1.5 hours (beyond 1 hour) the travel in between is not considered in the 'course of duties'. As such A had to pay for their own travel although X have a policy that an employee is only responsible for the first 25 km (if rostering is done in Tasmania) or 30 km of travel (if rostering is done in Melbourne). That is, a 51 km trip will see the employee pay 30km and X will pay travel (ie. the Award travel allowance of .78 pe kilometre for 21 km.

    d. After finishing the two hours of work at Beauty Point A then drove home to Legana (36 km). This travel is not in the 'course of duties' and thus A is responsible for the first 25 km of travel (if rostering is done in Hobart) or 30km (if rostering is done in Melbourne).

32. In summary, on Wednesdays in 2018, A left home for her first client at 7.20am and returned home from her last client at approximately 3.30pm: Approximately 8 hours. In that time, she was paid for 2 x 1 hour shifts ($22.70 per hour) and 1 x 2 hour shift; ie. a total of 4 hours work. She travelled 124km. Of that, she was responsible for 88km of travel and the employer paid her (at the Award rate of .78km) for 36km.

33. A informs me that there has been one improvement in the rostering in 2019 in that a half hour unpaid meal break can be allocated in the day. If X requests that meal break to be allocated between her Newnham and Beauty Point work the break between those work engagements is reduced to an hour and therefore the employer will pay the cost of travel between the Newnham and Beauty Point engagements. She indicates that the unpaid meal break is normally scheduled at the end of the day so she has to have it changed to best accommodate her work schedule.

34. In the past, A has worked a similar shift requiring that A travel between a client in Youngtown and a client in Deloraine (again 50 km apart). The shift was for two hours. The payment of travel arrangements was the same as above. That is, A had to pay for 30km of the 50km travel.

35. Recently, A has been asked to work a shift that finishes at 12.15pm in Newnham in Northern Tasmania. A is then rostered to work for 15 minutes at 4.15pm in Mowbray. Newnham to Mowbray is 6km. Because the break between engagements was more than one hour she has to meet the travel cost to work the 15 minute engagement. A has the choice of driving 30 km each way (60km round trip) to get home from the 12.15pm Newnham engagement. This means A either travels 60km at her own expense for a 15 minute client visit or sits around after 12.15pm in the car until the 4.15pm job starts.

Employee B

36. Employee B also works as a home carer for X. B is a casual. The applicable instrument is the Award. B is employed at level 3 of the Award. B has worked for employer X for 2.5 years and is a casual employee.

37. B has been rostered on for one hour shifts by X. In December 2018, B was asked to work a one hour engagement in Westbury, which involves travelling from Perth. The time between engagements is beyond one hour, so the employee is responsible for their own travel costs for the first 25 or 30km one way. The round trip is 78km. Therefore, the employee will pay for 50km of travel and the business will pay for 28km. The travel cost is $39 based on a travel allowance of 78c per kilometre. It is understood the travel allowance rate takes into account factors such as the cost of fuel, wear and tear, depreciation of vehicle and higher insurance costs. B is not paid for the time spent travelling. Effectively,

B loses money to work the one hour engagement. B indicated that it is very difficult to refuse shifts because refusing shifts will result in not being rostered for other shifts.

38. In the weeks preceding the making of this statement B obtained some other part-time work and is thus in a position to refuse shifts which require uneconomic travel; ie. the cost of travel is the same or greater than the cost of remuneration for the work performed.

Employee C

39. Employee C is a permanent part-time home carer in Northern Tasmania and works for Employer Y. C has worked for Y for 15 years. Approximately half of the workforce are covered by an old Enterprise Bargaining Agreement (EBA) - the Family Based Care Association (Northern Region) Inc. Direct Care Worker Employee Collective Agreement 2009-2012 - that has never been terminated. Newer employees are covered by the SCHCDS Award.

40. C is covered by the old EBA. C is rostered to work shifts of half an hour in duration. The Award has no minimum engagement for part-time home carers.

41. The old EBA provides that employees are entitled to claim 60 cents per kilometre where kilometres are incurred for work purposes; and also claim 60 cents per kilometre for all kilometres beyond 15 km to and from the first and last client per day (ie. the employee is responsible for the first 15 kilometres).

42. C has a job on Saturdays that C effectively performs for little remuneration. C travels from Prospect to Hillwood (a distance of 37km) to work with a client for one hour. C must meet the first 15 km of the travel costs each way, meaning C is only compensated for 44 kilometres of 74 kilometres travelled. C is paid at $27.35 per hour.

43. C retains the client as C does not want to let the client down.

Employee D

44. D works as a permanent part-time employee for Employer Y. D is covered by the Award. They are contracted to work 40 hours a fortnight.

45. D lives in Scottsdale, and was asked to work a one-hour shift in Labrinya (36km away) as their first client. Y asks employees to pay for the first 35km of travel unless the travel is between jobs. If the time between jobs is more than 1 hour then travel will no longer be in ‘course of duties’ and the employee will have to be responsible for the first 35 km of travel.

46. In another instance, D was asked to work a 1.5 hour shift in Bridport, which is 25 kilometres away. This would mean that D has to bear the cost of the travel.

Employee E

47. E works for Employer X and is covered by the old EBA described above.

48. E is a permanent part-time employee.

49. Like employee C above, E is rostered to work on half hour shifts.

50. E has been required to work a shift involving travel from Deddington to Norwood in Northern Tasmania (approximately 38km) for a half hour shift with one client, than travel from Norwood to Perth (approximately 16km) for another half hour shift, then from Perth to Kingsmeadows (approx. 14km).

24 hour care

51. To my knowledge, the 24 hour care provision in the Award is not frequently used in Tasmania. I am aware of one employer that includes the Award 24 hour care provision as a term in their enterprise agreement (*Community Based Support Enterprise Agreement 2014* [2014] FWCA 8298).

52. The 24 hour care clause became an issue in bargaining when the FWC sought that employers include the clause in enterprise agreements by way of undertaking at the approval stage of the *South Eastern Community Care Community and Disability and Support Workers Enterprise Agreement* 2018 (AG2018/2506) and at the approval stage of the variation to the *Liviende Veranto Enterprise Agreement* 2016 (AG2018/3439).

53. The HSU made submissions to the FWC that a 24 hour clause should not be included in the above EBAs by way of undertaking because, in both cases, the parties had negotiated a maximum hours for a shift or day clause and time worked in excess of those hours was to be paid as overtime. This resulted in a far more beneficial arrangement for employees than an arrangement whereby they may be available for 24 hours (perhaps in its entirety at work) and only paid at 155% for 8 hours. A 24 hour clause is not financially more beneficial for employees, and the inclusion of such a clause subsequent to an Agreement being made would represent a substantial detrimental change to the Agreement negotiated. The FWC ultimately accepted the HSU's submissions and did not proceed with its initial request to the employers to provide undertakings regarding the 24 hour clause.

54. 24 hour care shifts are strongly opposed by our membership. They result in an overall paltry rate of pay given the employee may be at work and unable to engage in other pursuits or perform other responsibilities, such as family responsibilities for 24 hours. The Award 24 hour care clause is uncertain and ambiguous because:

    a. it is not clear as to what is meant by *'be available for duty in a client's home'*. The HSU's interpretation is that to be available for duty may not mean actually being

present in the client's home but being *'available'* to be. This position is supported by 25.8(b) which states an employee *'will normally have an opportunity to sleep during a 24 hour care shift and, where appropriate, a bed in a private room will be provided'*. Given that an employee would be expected to sleep at some stage in a 24 hour period the absence of compulsion to provide a bed suggests the *'availability for duty'* does not necessarily mean *'present for duty'*;

b. pursuant to the 24 hour shift clause an employee is required *'to provide no more than 8 hours of care'*. The issues of how the 8 hours care are to be recorded and the activities that constitute 'care' are contentious. In circumstances of 24 hour care, the maintenance of an accurate record of "caring" time is likely to be difficult. A question also arises as to the pay arrangements if the 8 hours of 'care' have been provided and the employee is then asked to do further care tasks? If an employee is present over a 24 hour care shift it appears unlikely they will reasonably be able to refuse to provide care if they have already provided 8 hours care.

Telephone Allowance

55. I am aware employees in the SCHCDS sector require a telephone to be contactable regarding direction to work shifts or fill shortfalls due to alterations in the roster. In home care particularly there is high degree of fluidity regarding employees being or making themselves available for certain shifts and thus are very regularly contacted on their personal phone in their own time by their employer. If there is an issue with certain clients employers will also contact employees on their personal phone in their personal time.

Overtime

56. There is an inconsistency in the overtime provision of the Award in that part-time employees are only paid overtime after 10 hours worked in a day yet full-time employees are paid overtime for work in excess of 8 hours per day (rostered ordinary hours). Cl. 25.1 provides that the maximum ordinary hours of work for a shift shall not exceed 8 hours (this applies to all employees including full-time and part-time employees). By agreement, the ordinary hours may be worked up to 10 hours per shift. If a part-time employee is directed to work in excess of the stipulated maximum hours per shift (8) then they will not be paid overtime for doing so (until they work in excess of 10). There should be alignment between the maximum hours per shift and overtime provision.

First aid allowance

57. The First Aid Allowance (cl. 20.4), as currently drafted, has no practical application for home care employees. Home care employees in Tasmania work on their own almost exclusively. They travel from client to client doing tasks such as performing respite care, personal care and domestic duties. Employers in Tasmania mandatorily require home carers to hold a first aid certificate if they provide personal care (as opposed to just domestic services) to clients. However, given home carers do not commonly work with fellow employees they will not be required by their employer *'to be responsible for the provision of first aid to employees employed by the employer.'* They may be required by their employer, however, to provide first aid at their workplace (which is clients' homes). In that event, however, they will not, unlike disability support workers and SACS workers with the same requirement, be entitled to the allowance.

Fair Work Commission
Four Yearly Review of Modern Awards
Social, Community, Home Care and Disability Services Industry Award
Matter No: AM2018/26

FURTHER STATEMENT OF MARK FARTHING

1. I am employed as the National Campaigns and Projects Officer at the Health Services Union (**HSU)**. I have been employed in this position since September 2019.
2. I was previously employed as a Senior Policy Advisor for the Health Services Union (**HSU**) Victoria No. 2 Branch, also known as the Health and Community Services Union (**HACSU Victoria**) from March 2016 until September 2019.
3. I have substantial research experience in the health and community services sector, with particular expertise in disability services and the National Disability Insurance Scheme (NDIS), as well as more broadly in industrial and workforce research and policy.
4. Between 2013 to 2016 I was employed as the Senior National Project Officer in the Health Services Union National Office.
5. My work background is set out further in my previous witness statement dated 15 February 2019.

Overview of Changes to NDIS Price Guide

6. The National Disability Insurance Agency (NDIA) is responsible for setting price limits and policies relating to the delivery of NDIS-funded supports.
7. This function of the NDIA is achieved through the production of a document known as the “Price Guide”.
8. Price Guides typically operate for a full financial year (1 July to 30 June).
9. At least once per year, usually just prior to the end of the financial year, the NDIA revises the Price Guide to account for wage rises and general inflation. However, in some years more substantial variations to prices are implemented, either at that time or otherwise

because of Commonwealth Government policy decisions and/or at the behest of the NDIA Board.

10. In the 2019-20 Price Guide, which came into operation on 1 July 2019 and is in operation as at the time of the making this statement, significant changes were made to several price categories and policies. In summary these were:

    a. General price increases and significant above-inflation increases for therapists and attendant care and community participation supports. For example, the price for attendant care and community participation supports delivered during the daytime on a weekday to a standard needs participant was increased from the previous financial year by 9.78% (or 18.01% when the TTP Payment is taken into account). The rates were as follows:

       Assistance With Self-Care Activities – Standard – Weekday Daytime (Level 1) [01_011_0107_1_1]

       2018-19 = $48.14

       2019-20 = $52.85/$56.81 TTP

    b. The introduction of a Temporary Transformation Payment (TTP), which is a conditional loading calculated at 7.5% of Level 1 (standard needs) prices, but applicable in respect of Level 2 and Level 3 supports as well. The TTP will reduce each subsequent year by 1.5%. Providers can claim the higher TTP prices as long as they publish their service prices, list and keep up-to-date their business contact details in the NDIA's "Provider Finder" and participate in an annual NDIA-approved market benchmarking survey.

    c. A doubling of the remote and very remote loadings from 20% to 40%, and from 25% to 50%, respectively, of the price of the scheduled attendance. The rates for attendant care and community participation supports delivered during the daytime on a weekday to a standard needs participant are as follows:

       Assistance With Self-Care Activities – Standard – Weekday Daytime (Level 1) [01_011_0107_1_1]

       Metro = $52.85/$56.81 TTP

       Regional = $73.99/$79.53 TTP

       Rural = $79.28/$85.22 TTP

    d. Increases to the length of time that providers can claim for the time spent travelling to participants from 20 to 30 minutes within city areas, and from 45 to 60 minutes in regional areas.

e. Clearer rules around charging for non face-to-face time, with the NDIA stipulating that these activities are billable if they are part of delivering a disability support item to a participant such as writing a report about the participant's progress (rather than a general activity such as staff rostering).

f. A revised cancellation policy which abolishes the limit on the number of cancellations or "no shows" that be charged per year (see section below for more detail on client cancellation policy changes)

Response to AiG Submission

11. In paragraph 76 of its submissions dated 13 July 2019, the AiG suggests that the only increase applied in the 2019-20 Price Guide was the 4.5% increase relating to the Commission's Annual Wage Review decision and the operation of the Equal Remuneration Order. This overlooks the increases announced by the Commonwealth Government on 30 March 2019, the key elements of which I refer to in paragraph 10 above, and which were incorporated into the 2019-20 Price Guide in addition to the 4.5% increase.

12. In paragraph 77 of its submission the AiG suggests that *"the information published by the NDIA to date does not suggest that the assumptions underpinning the pricing arrangements have been changed or that any additional funding has been released to address broader concerns previously expressed by employers about the inadequacy of the funding to cover the various costs associated with providing the relevant services, including labour costs."*

13. While the NDIA has not released materials explicitly identifying the methodology underpinning price limits for supports in the 2019-20 Price Guide, it does not necessarily follow that prior published pricing methodologies and assumptions are still correct, for the reasons I set out below.

14. In section 5.3 of its submission, the AiG refers to the NDIA's "Reasonable Cost Model" (**RCM**) and the report published by the University of NSW in June 2017 titled *"Reasonable, necessary and valued: pricing disability services for quality support and decent jobs".* (**UNSW Report**)

15. The HSU along with the ASU and United Voice commissioned this report. I was intimately involved in working with the research team during the production of this report and was identified as such in the acknowledgements section prefacing the report, and am in a position to comment on the parameters of that research.

16. The UNSW report examined NDIS prices as they were in the NDIA's 2016-17 Price Guide, with the focus of analysis on the "base hourly rate" for standard needs, weekday, daytime support at $42.79 per hour, specifically the support item: *Assistance With Self-Care Activities - Standard - Weekday Daytime*

17. In the 2019-20 Price Guide the price limit for *Assistance With Self-Care Activities - Standard - Weekday Daytime* is $52.85 ($56.81 with the Temporary Transformation Payment (**TTP**) loading). This represents a 23.51% increase (32.76% with the TTP) compared with the 2016-17 price limit.

18. The 2016-17 rate for a SACS 2.3 worker was $24.70 per hour, whilst the current (2019-20) rate for the same worker is $28.44. This represents a 15.14% increase over the same period. These wage rates are inclusive of the ERO component.

19. The NDIS price item has increased at a rate which is substantially greater than the increase in wages for the average level disability support worker. The price limits in the 2019-20 Price Guide therefore do not reflect the assumptions that were contained in the NDIA's original RCM, which was the focus of the UNSW report.

20. The AiG's claim in Paragraph 151 that *"there is nothing to suggest that the fundamental problems identified in the UNSW Report with the RCM will be alleviated by the funding increases"* appears to disregard the fact that the price increases and additional payments set out above well and truly outstrip wage growth, provide some significant new bases of entitlement to payment and presupposes that the assumptions contained in the RCM are still built into the price structure.

21. The UNSW report also critiqued a number of NDIA policies contained within the 2016-17 Price Guide which have subsequently been addressed in the 2019-20 Price Guide. These include:

    a. Increasing the intensity loading for more complex participants, from two levels (standard and high-intensity) in 2016-17, to three levels Level 1 (standard), Level 2 (high intensity/complex) and Level 3 (higher intensity/more complex) supports in 2019-20;

    b. A doubling of the remote and very remote loadings from 20% to 40%, and from 25% to 50% respectively of the price of the scheduled attendance.

    c. Updates to the length of time that providers can claim for the time spent travelling to each participant to 30 minutes within city areas and 60 minutes in regional areas. This is an increase from 20 and 45 minutes, respectively.

d. Clearer rules around charging for non face-to-face time, with the NDIA stipulating that these activities are billable if they are part of delivering a disability support item to a participant such as writing a report about the participant's progress (rather than a general activity such as staff rostering).

e. A revised cancellation policy which abolishes the limit on the number of cancellations or "no shows" that be charged per year (see section below for more detail on client cancellation policy changes)

22. In summary, the AiG submission relies heavily on the UNSW report, which is predicated on an analysis of NDIS prices in the 2016-17 Price Guide. In light of the significant changes to both price limits and pricing policies contained in the 2019-20 Price Guide, much of the analysis in the UNSW report is no longer relevant.

Client Cancellation

23. The NDIA has significantly revised its cancellation rules in recent Price Guides.

24. In the 2015-16, 2016-17, 2017-18 Price Guides, the NDIA allowed providers to charge a participant the full amount of a scheduled personal care or community support up to 8 times per year when there was a short-notice cancellation or a "no show" by a participant. A short-notice cancellation was defined as such if the participant advised the provider after 3pm the day before the scheduled service.

25. In the 2018-19 Price Guide, the NDIA revised its cancellation rules which increased the number of times a provider could charge a participant for a short-notice cancellation or "no show" from 8 to 12 times per year, however, it reduced the amount that a provider could charge from 100% of the cost of the scheduled personal care or community support to 90%.

26. The 2018-19 Price Guide did not set 12 cancellations per year as a hard limit, instead specifying that "beyond this threshold, the NDIA will require the provider to demonstrate they are taking steps to actively manage cancellations."

27. In the 2019-20 Price Guide, which came into operation on 1 July 2019 and is in operation as at the time of the making this statement, the NDIA revised its cancellation rules again.

28. The revised cancellation rules provide for the following:

a. A provider can charge an NDIS participant for a "short-notice" cancellation up to 90% of the fee associated with the scheduled activity/service.

b. A "short-notice" cancellation is defined as such if the participant:

i. does not show up for a scheduled support within a reasonable time, or is not present at the agreed place and within a reasonable time when the provider is travelling to deliver the support (i.e. a "no-show"); or

ii. has given less than 2 clear business days' notice for a support that meets both of the following conditions:

- the support is less than 8 hours continuous duration; AND
- the agreed total price for the support is less than $1,000; or

iii. has given less than 5 clear business days' notice for any other support.

c. There is no limit on the number of short notice cancellations (or no shows) that a provider can claim in respect of a participant.

29. By way of example, a participant who had booked 2-hours of standard-needs community access between 9am to 11am on a Thursday at a cost of $125.38 who cancelled any time after 9am on the Tuesday prior could be charged $112.84 by their provider. Whereas a participant who had booked a full-day stay at a respite facility on a Thursday to receive 1:1 supports at a cost of $1,546.39 who cancelled anytime after 9am Friday the prior week could be charged $1,391.75.

30. In summary, the 2019-20 Price Guide provides significantly more flexibility and certainty to providers by abolishing the limit on the number of cancellations that may be charged per year and extending the definition of a "short notice" cancellation from 3pm the day before the scheduled service to less than 2 clear business days before the scheduled support.

31. The claims made by ABI in paragraphs 5.12 and 5.13 are therefore no longer correct in light of the 2019-20 Price Guide.

32. The revised cancellation rules in the 2019-20 Price Guide provide a significantly expanded capacity for service providers to recoup the costs of service cancellations.

Statement of Scott Quinn

I, Scott Graeme Quinn, Disability Support Worker at Community Based Support, of [redacted] Tasmania say:

1. I am a member of the Health Services Union, Tasmania Branch, and a delegate of the Union within my workplace.

2. Where I refer to a conversation in this statement and I cannot remember the exact words used, I have stated my best memory of the words spoken, or the effect of what was said.

Personal Details

3. I was born on 17 January 1970.

4. I am married.

5. My wife and I care for our two infant children aged 18 months and 1 month.

Work History

6. I have worked in disability services/aged care since about July 2006.

7. I have Certificate III in disability and a Certificate IV in Home and Community Care

8. I have worked at Community based Support Tasmania (CBS) since entering this sector in 2006.

9. Before working at CBS I was on a disability Support Pension, due to an earlier workplace injury where I had a severely injured knee.

10. Before surviving on a disability Support Pension I worked at Bennetts Patroleum in a fuel supply role, servicing homes and business and machinery; I fell from a ladder at work, which originally was a workers compensation claim after smashing my knee.

Current Work

11. In approximately July 2006, I commenced work with Community Based Support (CBS) as a part time employee, this was under an Australian Workplace Agreement (AWA). I worked between 120 and 130 hours per fortnight at that time.

12. There was a 15% loading, only applicable to hours worked outside of 6am to 10pm; this loading also applied from 10pm Friday until 6am Monday.

13. In 2010 my employment conditions were greatly improved with the introduction of the modern Awards. This facilitated the Negotiated Enterprise Agreement at CBS.

14. I am employed under (Community Based Support Inc (AG2014/9677)) COMMUNITY BASED SUPPORT ENTERPRISE AGREEMENT 2014. This is predominantly based on the Social, Community, Home Care and Disability Services Industry Award 2010 (SCHADS). I am classified under the Agreement as a LVL 2B Grade 2; this is the effective equivalent as a Home Care Employee LVL 3 PP2, under the SCHADS Award.

15. I currently work an average of 37 to 40 hours worked per week; but I am only contracted for 60 hours per fortnight.

16. I work varying hours over a seven day period, including early morning starts and later night finishes.

17. I work a few night shifts as part of 'patient sitting' with patients in hospital.

18. Normally I have every Thursday off and every second weekend off. Occasionally I am asked to work on those days.

19. I have no permanent clients, although I do often see the same people for their personal care needs.

20. My shifts (appointments between 30 minutes and 4 hours) can vary from day to day or hour to hour.

21. We have moved to 'smart phone' rostering; in general terms we get 6 days advance notice of shifts. We are entitled to 7 days' notice.

22. Our shifts can be changed with very little notice.

23. Notice for changes is normally given via text message but sometimes you get no notice and your duty has changed when you check your shifts (appointments) in your phone.

24. Travel time between shifts is normally given and shifts can have a "Time Band" applied so it isn't time critical to attend that shift exactly as scheduled.

25. Some "time bands" are short others are larger; it's client dependent.

26. I work Public Holidays as well.

27. A typical day of shifts are 12pm-1pm, 3pm-5pm, 5:30pm-6:30pm and 8pm-9pm. So over a 9 hour period I work 5 hours, plus travel time between clients, usually 10 to 15 minutes each. In this example it would be approximately 40 minutes travel.

28. I receive travel and time from each location to the next; but for example in the 1pm to 3pm window I would likely return home, but not be compensated for the petrol or time between clients and my home; just the distance and time between clients.

29. I would travel to and from work approximately 30 times a week, as the gaps between duties are staggered as such to have normally 2 to 3 occasions per working day where I would return home between shifts.

30. If the clients are close together, physically, I can lose a lot of my own petrol etc returning home, especially if that travel time from the client to home is large.

31. Attached and marked **Annexure A** are copies of my diary entries about my rosters for the period 1 July 2014 to 31 August 2014.

32. Attached and marked **Annexure B** are copies of my diary entries about my rosters for the period 1 July 2015 to 2 September 2015.

The Impact of Short Shifts

33. When shifts are cancelled then the employer will normally give us additional work within the same pay period.

34. Our agreement states as per the *Social, Home Care and Disability Services Industry Award* [SCHCDS] Award that it could be the following fortnight too;

however the employer has no easy way of tracking this so it's impracticable and not common practice for hours to flow from one pay period to the next.

35. Most Part Time employees work above their minimum contracted hours, so normally lost hours are absorbed into the hours otherwise allocated as additional hours.

36. Variations occur all the time day to day, hour by hour. It becomes difficult to make plans or appointments when you working on a given day.

37. I have a good relationship with the rostering department and only occasionally have it been stated that I have refused a shift because I was unable to attend due to appointments otherwise booked when I wasn't working.

38. I am aware of other employees who don't have this good relationship so lose out on pay for not being available when they have been assigned alternate work on a day with little to no notice.

39. There is no minimum client engagement or shift length for Part Time or Full Time staff.

40. If a shift is cancelled in the middle of other duties it can become problematic and expensive as you lose travel time, and sometimes have no real alternative other than to return home for long periods where you would normally have expected to work continuously.

41. We receive a split shift allowance where the break between duties in excess of 1 hour after travel time; this is a single payment of $7.50 per break. As per paragraph 27 I would have received 2 split shift payment on that day. This normally covers the petrol expenses for returning home and back to a client.

42. I understand that under the current SCHCDS Award the split shift payment is not provided for, the impact of this would make working multiple short shifts on a given day untenable.

43. The biggest problem with working short shifts is the length of time it takes on a given day to work a 'full days work'. For example on 5/7/14 I started work at 7:30am and worked through until just after midnight (12:03am). I had no splits that

day and only accrued 9 hours and 53 minutes work but I didn't finish work until 16 hours after beginning my working day.

44. I have an arrangement with CBS to take 3 months off every year where I work at another job, making Christmas Cakes. This supplements my income greatly as I work significant hours in those 3 months; whilst it is hard physical work, I get paid for all the hours I spend at work.

Income and Expenses

45. Attached and marked **Annexure C** are copies of my pay slips for the period 24 June 2013 to 21 June 2015.

46. In an average week I earn $1900 Net. About 30% of my weekly take home pay comes from penalty rates.

47. My wife is currently on Paid Parental Leave.

48. The average weekly expenses of my household are approximately $850, comprised of:

Rent/mortgage payments:	$300
Household bills (utilities, telephone, internet):	$150
Groceries:	$150
Transport (petrol, tickets):	$160
Other household expenses (health, school, etc):	$90
Total:	$850

Impact of working definite hours

49. I rarely under take social activities on days of work, it is difficult to rely on having a set time on or off. However there are usually time to undertake personal appointments between work engagements.

50. Compared to my previous work, where I permanently worked 7am to 3pm 5 days per week; this type of work is more difficult to manage overall.

51. My petrol expenses are higher than my previous jobs because of all the travel to and from home, however costs are relatively neutral as my split shift payments can cover the majority of this extra cost.

Fair Work Commission

Four Yearly Review of Modern Awards

Social, Community, Home Care and Disability Services Industry Award

Matter No: AM2018/26

SUPPLEMENTARY STATEMENT OF SCOTT QUINN

1. I made a Statement in the casual and part-time employment four yearly review matter (matter numbers AM2014/196 and AM2014/197) dated 16 December 2015.

2. This is a supplementary statement to that earlier statement.

Current work

3. I am a member of the Health Services Union, Tasmania Branch, and a delegate of the Union within my workplace.

4. I have worked in disability services/ aged care since about July 2006.

5. I have a Certificate III in Individual Support (Disability) and a Certificate IV in Home and Community Care.

6. I have worked for Community Based Support Inc, known as Community Based Support Tasmania (**CBS**) since entering this sector in 2006.

7. I am employed under the *Community Based Support Enterprise Agreement* 2018 (AG2019/602) (**the Agreement**). This is predominantly based on the Social, Community, Home Care and Disability Services Industry Award 2010 (**the Award**). I am classified under the Agreement as a Level 2B Grade 2; this is the effective equivalent as a Home Care Employee Level 3 Pay Point 2, under the Award.

8. I am only contracted to work 60 hours per fortnight, but I usually work an average of 37 – 40 hours per week, sometimes more.

9. My work involves attending to clients of CBS in their homes or at other locations to assist them with anything from assisting clients with showering, preparing meals, social support such as taking them to do shopping, domestic assistance such as changing the bed, mopping and laundry, or social support, such as taking them out to a concert.

If they have mobility issues we might help get the client into bed or out of bed. Generally the role is assisting clients to do what they can't do for themselves in their every day lives.

10. On a work day, my schedule is as follows:

    a. Leaving my home in Glenorchy, which is about 10km from Hobart, and driving to the home of my first client. Occasionally I will call into the office in Hobart on the way past if there is something I need to pick up, but normally I will go straight to my first client.

    b. My work locations vary between 1 and 20 kilometres from my home. Normally I see clients anywhere between Taroona in the South (approximately 20km from home) Bridgewater in the North (approximately 15km from home). On the odd occasion I will travel further than 20 kilometres. Travel to for my first appointment varies between 5 minutes and 45 minutes;

    c. I am not paid travel time or a kilometre allowance for the travel to my first appointment;

    d. My first appointment usually lasts for a minimum of one hour;

    e. At the end of my first appointment, I will then either drive back home for a short gap, or drive on to my next appointment;

    f. Unless the time between the end of the appointment and the start of the next appointment coincides with the Google Maps estimate of time taken to travel between the two locations, my shift will break, and I will have unpaid time prior to the next appointment. That period can be between 5 minutes and 5 hours, but normally my breaks are not longer than 2 hours. I set out below how the Google Maps arrangement operates;

    g. I continue with that process each day until my final appointment;

    h. My return trip home from my final appointment is not paid.

11. Attached and marked **Annexure A** to this statement are copies of my diary entries which show my rosters from 3 June 2019 to 8 September 2019.

12. There is a typo on the first page of Annexure A. The first date listed reads '3-6-18'. It should read '3-6-19'.

13. In my diary I have recorded the times of my shifts and breaks. For most days I have calculated the hours worked (not including breaks or travel time) and added them up on the side. Where I have recorded kilometres these indicate the kilometres I drove

with clients or for clients, for example taking them to the shops or doing other errands for them. I have marked as 'split' where the split shift allowance is payable for a break. Where I have written 'SNC' this indicates the shift was a short-notice cancellation.

Broken shifts and travel time

14. CBS pays for travel time and a travel allowance per kilometre. CBS calculates travel time using Google Maps.

15. For example, in the second entry in my diary, dated 4 June 2019, I have a 15 minute gap between my first and second client, and my second and third client, and a 45 minute gap between my third and fourth client. I am not paid for all this time, only the time it takes to travel between clients according to Google Maps. So, if CBS have calculated on Google Maps that it only takes 10 minutes to travel between those clients, that extra 5 or 35 minutes is unpaid, it is dead time.

16. As far as I understand it, CBS calculates travel time by putting in the address of the first client in, for example, Moonah, and the second client in, for example, Newtown. Google Maps will display the best route and the time and kilometres between the locations, and the company will use that to calculate the travel time and kilometre allowance we are paid.

17. We are not told in advance how much travel time is allowed between clients. The rosters do not always reflect the amount of time needed to travel between clients. When this happens I try and manoeuvre my client appointments around to make the roster work and will let my clients know.

18. Sometimes it might take you longer to travel between clients than what Google Maps says, if there are road works, for example. When this happens, you need to ring up work and let them know that travel took longer because of road works, or whatever the reason. They make a note that you rang in and that you should be paid 45 minutes instead of 25 minutes, for example.

19. As per the Agreement, I receive a split shift allowance of $7.50 per break, where the break between duties is in excess of one hour after travel time into account.

20. If the break is one hour, but including travel time, then the split shift allowance is not paid. For example, my roster on 12 July 2019 has a one hour break between my first and second clients. I would be paid the time it takes to travel between these clients, according to Google Maps, and the kilometre allowance, but no split shift allowance for that day. In that case, my first two client appointments were each around 10 minutes drive from my home. In the hour gap between the first two appointments I

travelled 10 minutes home, and had about 25 minutes at home, before having to leave to travel to the next client.

21. During breaks like these, if the kids are home, I might muck around with them. I am working on renovations on my home, which I can sometimes do on my breaks, but 25 minutes isn't long enough to start a task. Often I will just sit down and do nothing.

22. My third client appointment was in Taroona, which is about 20 kilometres and about a half hour drive from my home, so I most of that time in my roster would have been spent travelling to and from that client.

23. I have marked in my diary 'split' for the breaks between clients for which I am paid the split shift allowance.

24. For example, on 17 July 2019, I worked from 8am-9am, 11am-12pm, 2pm to 5pm and 6:30pm to 7:30pm. So over an 11.5 hour day I worked 6 hours, with two breaks of two hours and one break of 1.5 hours. I received the split shift allowance for the three breaks. I also receive travel time for the time it takes to travel from one client to the next, according to Google Maps.

25. In that case, I travelled about 2 kilometres from my home to my first client in Glenorchy, then home for my first break, then roughly 7 kilometres or 15 minutes to my second client in North Hobart, then home for my second break, then about 6 kilometres or 15 minutes to my third client in Lenah Valley, then home for my third break, then about 2 kilometres or 5 minutes to my final client in Derwent Park, then home.

26. In total I spent approximately 34 kilometres and one hour 20 minutes travelling back and forth between clients and my home that day. However I was only paid for 14 kilometres and 30 minutes for the travel time between clients.

27. If I have a split shift but am not required to travel, then I am not paid any travel time or kilometres for that client. For example, I have one client out in Berriedale whom I see for a 12pm-1pm lunch shift, and then a 3pm-5pm tea shift. The time between 1pm and 3pm is a split shift. Berriedale from home is about 5 to 6 kilometres and a 10 minute drive from home. There's never anything I need to do out in Berriedale so I just go back home during that time. I am paid the $7.50 split shift allowance for this time, but no more, even though practically there is nothing else for me to do but to drive home and drive back in that time.

28. Where I have a split shift or dead time in my roster, I usually return home. If it's not practical for me to return home I might go to the client early to see if I can start earlier.

29. Travelling between clients and home all the time can get costly, as I am not compensated for all of the kilometres I have to travel or for time spent travelling between clients and my home where there is a long break between appointments, only the distance and time between clients. But there is usually little else useful I can do with that time.

Overtime

30. I am often required to work overtime. For example, in the first entry in Annexure A dated 3 June 2019, I worked a total of 9.75 hours with clients. But I did an additional 1 hour and 30 minutes travel time between clients that day, as my client Scott lives in Taroona, which is about a half hour drive each way from the clients on either side. So I was paid for eleven hours of work, with one hour and a quarter at overtime, in that example.

Shift changes and cancellations

31. Our shifts can be changed with very little notice.

32. Notice for when your roster has been changed or a shift added is normally given via an alert in your phone. But sometimes you get no notice and you just find out your duty has changed when you check your roster.

33. For example, although I see a fairly regular set of clients, I have checked my phone in the morning and noticed that I have two extras rostered in there.

34. If a shift is cancelled in the middle of other duties it can become problematic and expensive as although I am paid for the appointment, I am not paid for the kilometres and travel time connected with the appointment. If the cancellation opens up a big gap in time, I will have no real alternative other than to return home, which involves incurring the extra petrol costs of returning home and then travelling out again for the next client. An example of this is on 19 August 2019 in my roster. I had a short notice cancellation from 11am – 12:30pm, which left a gap in my roster between 10:30am and 12:45pm, during which I wasn't entitled to any compensation for travel, even though there would have been nothing for me to do but travel home and back.

35. We generally need to carry our phones with us because rosters or other circumstances may change at short notice. On one occasion I arrived at a client's home in North Hobart for a shift, only to find out he had moved to Claremont. I checked my roster again but his address hadn't been changed on the system. I had to call up the office to find the new address.

Contents

List of Figures

Executive Summary

This report analyses information from almost 1,500 disability service workers. It explores their characteristics and perceptions of their working conditions; their experiences of working under the National Disability Insurance Scheme (NDIS); and their concerns about the implementation of the Scheme and its impact on their working lives.

Characteristics of respondents

- 74.1% of respondents were women.
    - Among those working in allied health and in-home care settings, there were higher proportions of women (over 80%). In employment, mental health, and residential/ group home settings, the proportions of women were lower (around 70%).
- Respondents had extensive experience in disability services: a quarter (22.5%) had more than 20 years of experience in the industry.
- 28.5% of respondents supervised other staff in their current role, while about the same number (27.3%) did so sometimes.

Working under the NDIS

- A little over half of respondents (54.7%) were working in an NDIS rollout area or with participants of the NDIS, while 35.8% said they were not, and 9.5% were unsure.
    - Workers in allied health, case management, day settings and in-home care were more likely to report working under the NDIS, while those in mental health, employment and residential/group home settings were least likely.

Impact of the NDIS on participants and families

- Few workers perceive the NDIS to be having a positive impact on participants or their families
    - 24.6% agreed that the NDIS was positive for the participants they work with
    - A minority (14.6%) agreed that families of participants were happy with the scheme, and
    - 15.7% agreed that the NDIS is better than the previous system.

Impact of the NDIS on working life

- Comparisons of respondents working under the NDIS and those who were not shows:
    - Lower proportions of very experienced employees were working under the NDIS, while proportions of staff new to the industry were higher.
    - Among those working under the NDIS, a higher proportion of employees are working for more than one disability service provider.
    - Those working under the NDIS were no more likely to be satisfied with their pay: across all contexts only a minority of respondents were happy with the pay they receive.
- High proportions of staff reported challenges to working under the NDIS:
    - 55.9% reported that they did not have enough time to do their work under the NDIS

- 72.2% were worried about the future of their job
- 52.6% disagreed that the NDIS has been a positive change for them as a worker.

Supervision and the NDIS

- Supervisors working under the NDIS reported supervising higher numbers of staff than others, which made it difficult to provide proper supervision:
  - 20.0% of those in supervisory roles[1] and who were working under the NDIS were supervising more than 14 staff, compared with only 12.0% of supervisors not working under the NDIS.
  - The proportion of supervisors who agreed that they can't provide proper supervision because of lack of time or too many staff rises with the number of supervisees, indicating a major risk for the Scheme.

General comments from disability workers

Among comments from disability workers, the most common concerns were about the adequacy of resources being provided to people with disability under the NDIS, and the impact of the Scheme on the quality of services people with disability would receive. Many explained the frustrations experienced by people with disability and their families, including delayed, inequitable and impersonal planning processes, resulting in inadequate support plans for participants.

Respondents also made a range of comments about how the NDIS was impacting on their working lives. Many linked risks to quality and safety to the use of casual and agency staff, and untrained staff entering the sector. Others expressed concerns about pay and conditions, including coverage of costs of private vehicle use, loss of penalty rates, subcontracting, short shifts, payment for travel time, and roster changes which could result in fewer hours. Respondents also noted that the NDIS was placing pressure on their employment classifications and pay rates, and some raised concerns their work was misclassified. Related, workers' comments attest to their high levels of stress, with many reporting unsustainable workloads and time pressure (including unpaid work) and poor job security, corroborating the other survey findings.

[1] Excluding those who only sometimes supervised staff.

1. Introduction

This report provides insight into the characteristics and experiences of almost 1,500 survey respondents who were working in disability services in early 2017. The survey was designed and administered by the main unions representing workers in the disability services industry, the Health Services Union, Australian Services Union, and United Voice, to help understand disability workers':

- characteristics and perceptions of their working conditions;
- experiences of working under the National Disability Insurance Scheme (NDIS); and
- their concerns about the implementation of the Scheme and its impact on their working lives.

The survey questions asked about respondents' demographic characteristics and how long they had worked in disability services, the settings in which they provided disability services (respondents could select more than one), their perceptions of their pay, their intention to leave or remain in the disability sector and reasons for this. It also asked whether they were a supervisor and if so, explored the characteristics of supervisory roles, including supervisory workloads. Those who were working in an NDIS area or with participants of the NDIS were asked a series of questions about their experience of working under the Scheme, to capture perceptions of time pressure, job security, and the overall impact of the NDIS on clients and their families. Respondents were also given the opportunity to provide open ended comments about working in disability, and any concerns they had about their work in the industry or under the NDIS.

The survey was distributed online via the networks of the three unions, primarily in the Eastern States. As such it is a non-probability based 'opt-in' sample, selected purposively to enable a focus on members of the unions commissioning the survey and to enable insight into experiences of providing disability services in different contexts, and differences among different groups of workers. A particular aim was to explore the impact of working under the NDIS, and to this end, comparison is made between respondents working under the Scheme and those which were not.

As a purposive sample, it may not be perfectly representative of all disability workers in Australia. As the survey was distributed through union networks, workers who are newer to the industry (and less likely to be union members) are under-represented. Further, responses from the Northern Territory and South Australia were not sought. However, while the sample is skewed to older, more experienced workers in the eastern states and should not be considered representative of the whole disability workforce, it does provide important insights into the experiences of working in disability, and differences for workers in different circumstances and settings. To this end, the analysis focused on comparing workers in different circumstances, with cross tabulations used to provide detailed breakdowns of respondents.

2. About respondents

2.1 Gender

Of the 1,477 survey respondents who provided their gender, 1,094 (74.2%) were female. This varied slightly across disability settings, as shown in Figure 2.1. Allied health was most strongly female dominated (87.1%), while mental health, residential, and employment services had proportionally fewer women (around 70%). The gender composition of the sample also differed slightly across the age groups. The largest group of men and women were aged 45 and 54, with this group comprising a third of all respondents (see Figure 2.2). In terms of differences in the age distribution of men and women, a relatively high proportion of men were aged 35 to 44, while a lower proportion of men were aged 45 to 54. Figures were similar across other age ranges.

Figure 2.1 Proportion of respondents in each disability setting who were women

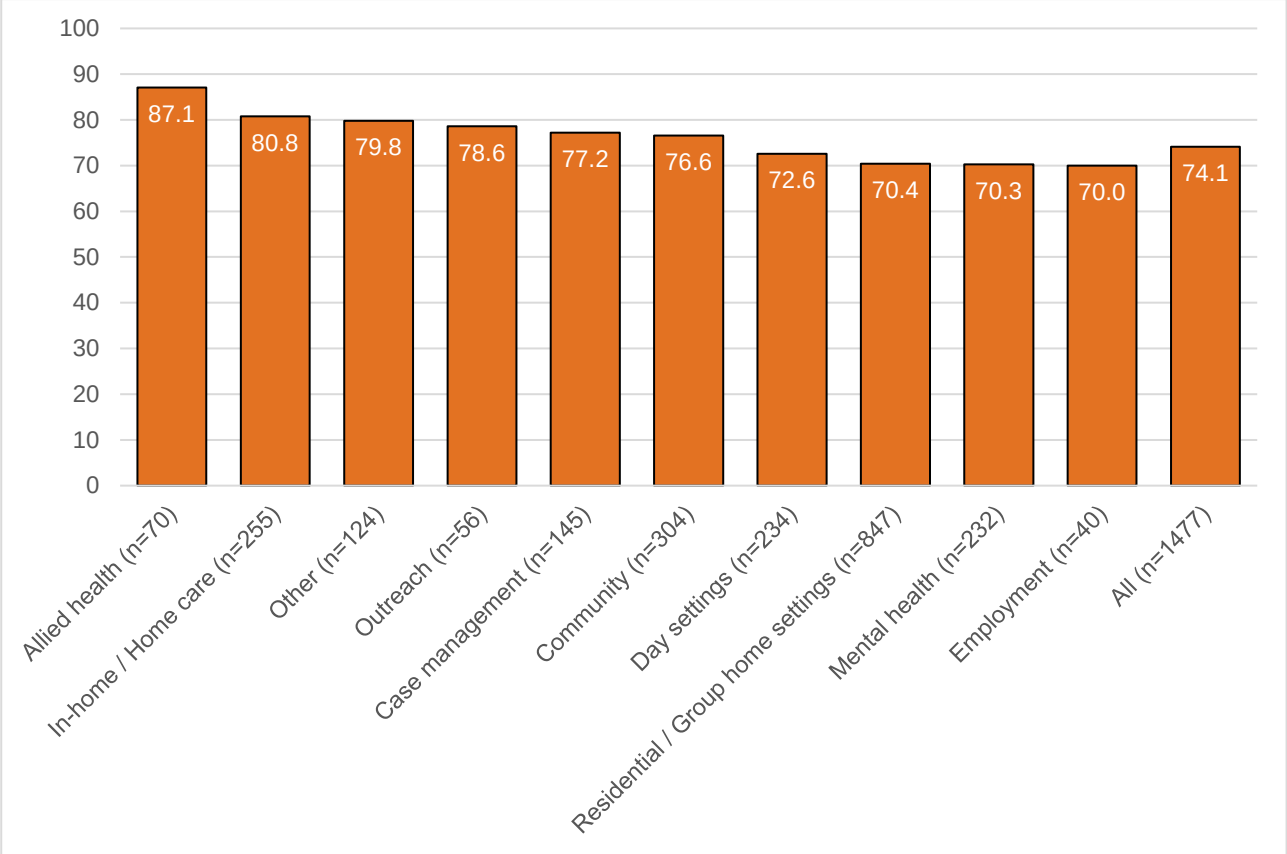

Figure 2.2 Proportion of men and women in each age category (%)

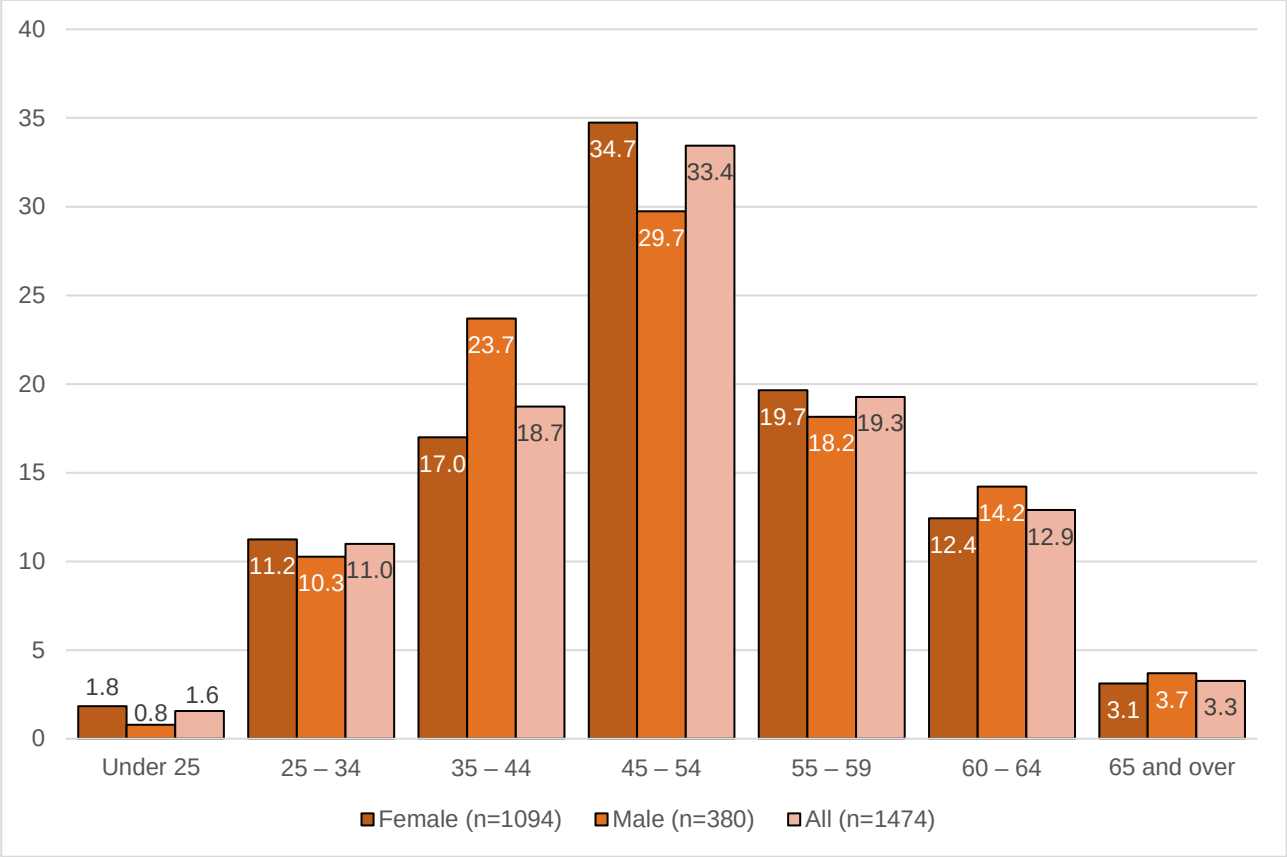


2.2 Experience in disability services

Many respondents were highly experienced in disability services. Almost a quarter (22.5%) had more than 20 years of experience providing disability services, and a further 13.8% had between 16 and 20 years of experience (see Figure 2.3). More than half (54.1%) had more than ten years of experience. Only a minority were new to the sector, with 2.0% having less than 1 year experience and 5.2% having between 1 and 2 years of experience. Although the age distribution of men and women differed slightly, there was little difference in the length of experience of men and women respondents, as shown in Figure 2.3.

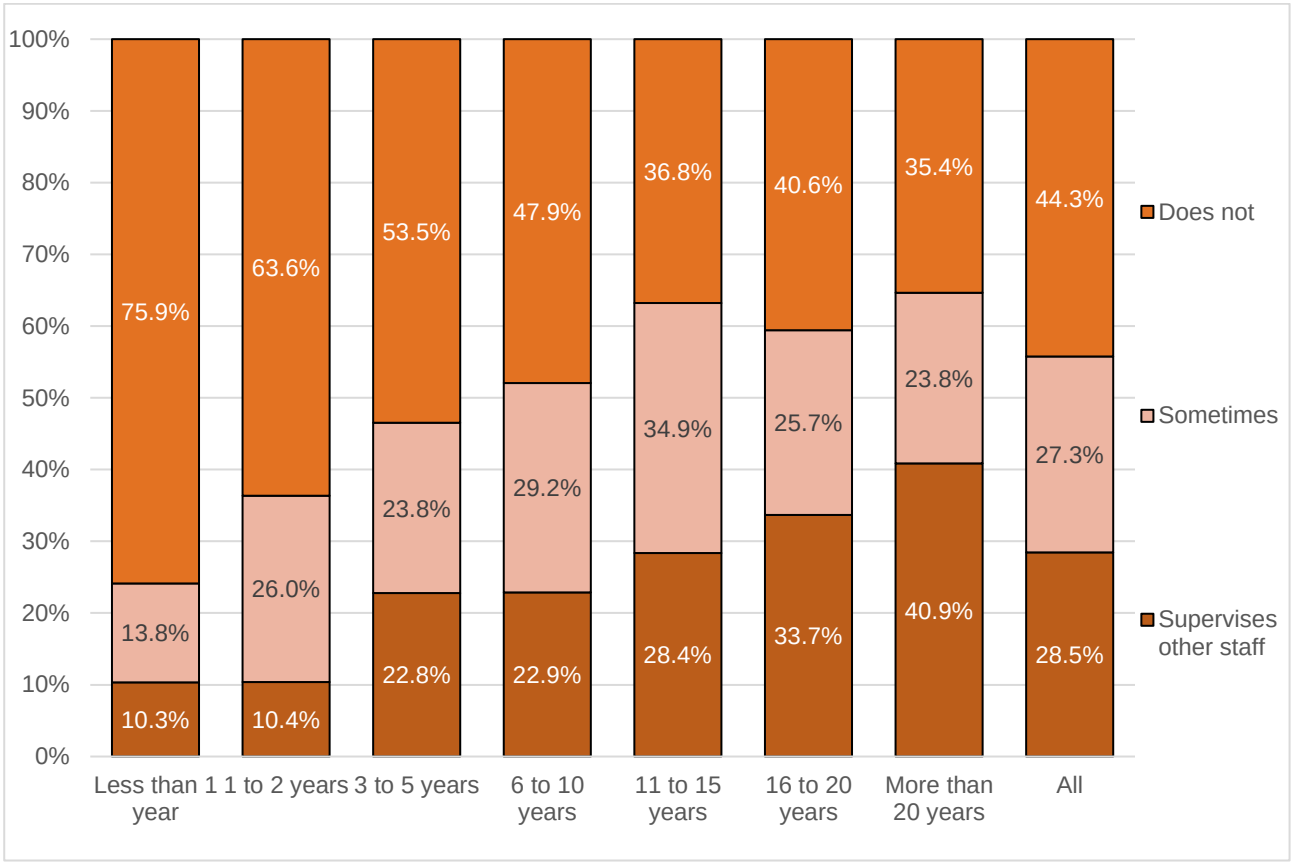
Figure 2.3 Men's and women's experience of working in disability services

	Less than 1 year		1 – 2 years		3 – 5 years		6 – 10 years		11 – 15 years		16 – 20 years		Over 20 years		All	
	n	%	n	%	n	%	n	%	n	%	n	%	n	%	n	%
Male	5	1.3	27	7.1	46	12.0	99	25.9	65	17.0	56	14.7	84	22.0	382	100.0
Female	25	2.3	50	4.6	156	14.3	269	24.6	198	18.1	148	13.5	248	22.7	1094	100.0
All	**30**	**2.0**	**77**	**5.2**	**202**	**13.7**	**368**	**24.9**	**263**	**17.8**	**204**	**13.8**	**332**	**22.5**	**1476**	**100.0**

2.3 Supervisory responsibilities

Figure 2.4 shows that 28.5% of respondents supervised other staff in their current role, while about the same number (27.3%) said they did so sometimes. As would be expected, the proportion of staff supervising others was higher for those with longer experience in the disability services sector: 40.9% of those with more than 20 years of experience were supervisors, compared with around 10% of those with less than 2 years of experience.

Figure 2.4 Proportion of staff which supervised staff in their current role, by length of time working in disability services (n=1,462)



2.4 Residence and NDIS involvement

Most respondents resided in the eastern states, reflecting the networks through which the survey was distributed. Around 2 in 5 respondents (40.7%) resided in Victoria, 37.2% resided in NSW/ACT[2], and 11.8% resided in Tasmania.

Overall, a little over half (54.7%) were working in an NDIS rollout area or with participants of the NDIS, while 35.8% said they did not, and 9.5% were unsure (see Figure 2.5). This differed across the jurisdictions, with relatively high proportions of respondents (more than two thirds) working under the NDIS in NSW/ACT and Tasmania.

[2] A small number (8) were from the ACT, and these are combined with NSW for the purposes of analysis.

Figure 2.5 Respondents from each jurisdiction by whether or not they were working in an NDIS rollout area or with participants of the NDIS

	NDIS		Not NDIS		Not sure		Total	% of total
	n	%	n	%	n	%	n	%
NSW/ACT	356	68.5	121	23.3	43	8.3	520	37.2
QLD	26	37.1	39	55.7	5	7.1	70	5.0
TAS	112	67.9	42	25.5	11	6.7	165	11.8
VIC	224	39.4	277	48.8	67	11.8	568	40.7
WA	45	61.6%	21	28.8%	7	9.6%	73	5.2
Total	**763**	**54.7%**	**500**	**35.8%**	**133**	**9.5%**	**1396**	**100.0%**

2.5 Experience in disability by NDIS involvement

As shown above, over half of respondents were working under the NDIS (54.7%). However, slightly lower proportions of those working under the NDIS had lengthy experience in disability services. As shown in Figure 2.6, among those working under the NDIS, 21.4% of respondents had more than 20 years of experience compared with 26.2% of those not working under the NDIS. Relatively high proportions of those working under the NDIS had 2 years of experience: 8.7% of those working under the NDIS were in this category compared with 4.2% of those not working under NDIS.

The difference between levels of experience of respondents working under the NDIS and others is more apparent for non-supervisor staff (see Figure 2.7). Among staff working under the NDIS, 41.8% of non-supervisory staff had over 10 years of experience and 13.8% had less than 2 years of experience. For those not working under the NDIS the equivalent figures were 53.2% and 5.1% respectively.

Figure 2.6 Number of years worked in the disability sector, by NDIS involvement, supervisors and non-supervisors, n=1,462

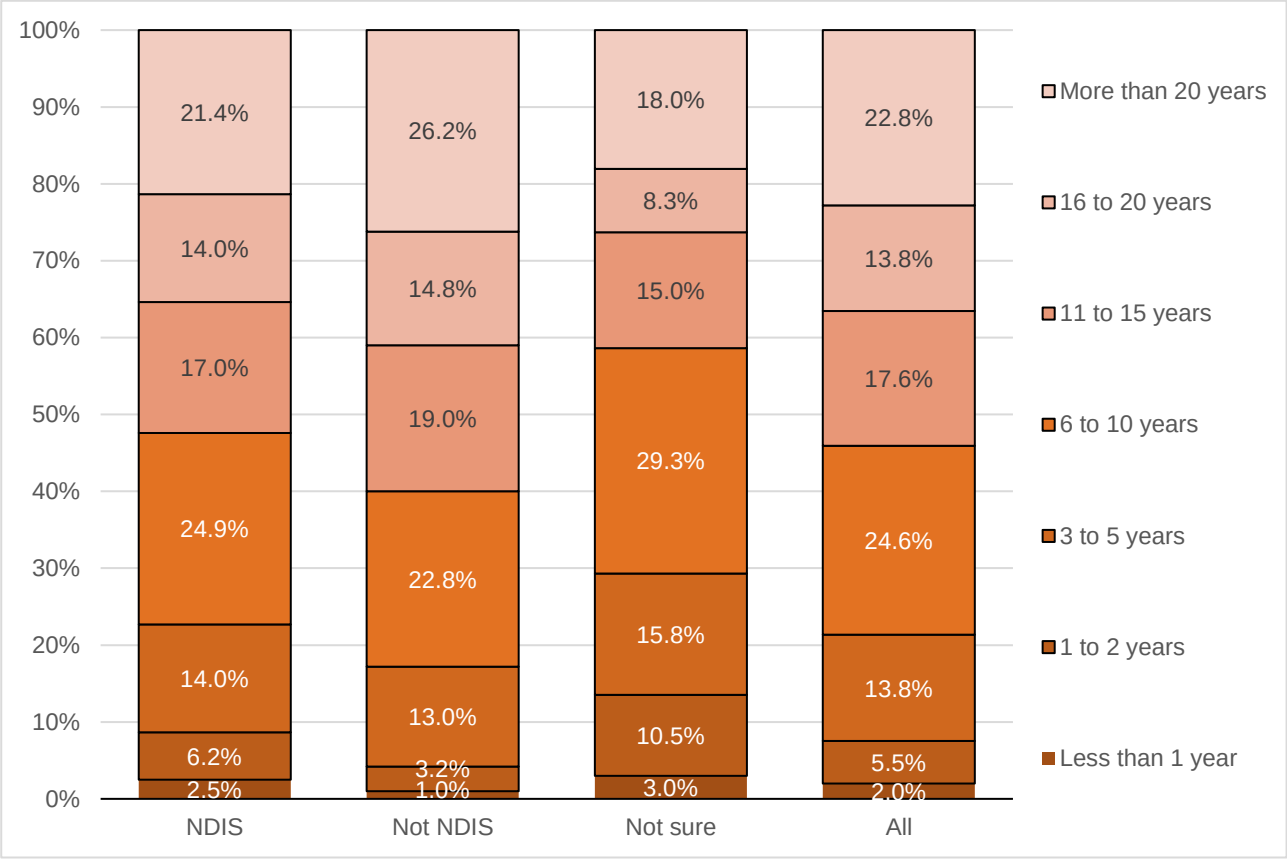


Figure 2.7 Number of years worked in the disability sector, by NDIS involvement, non-supervisory staff only, n=646

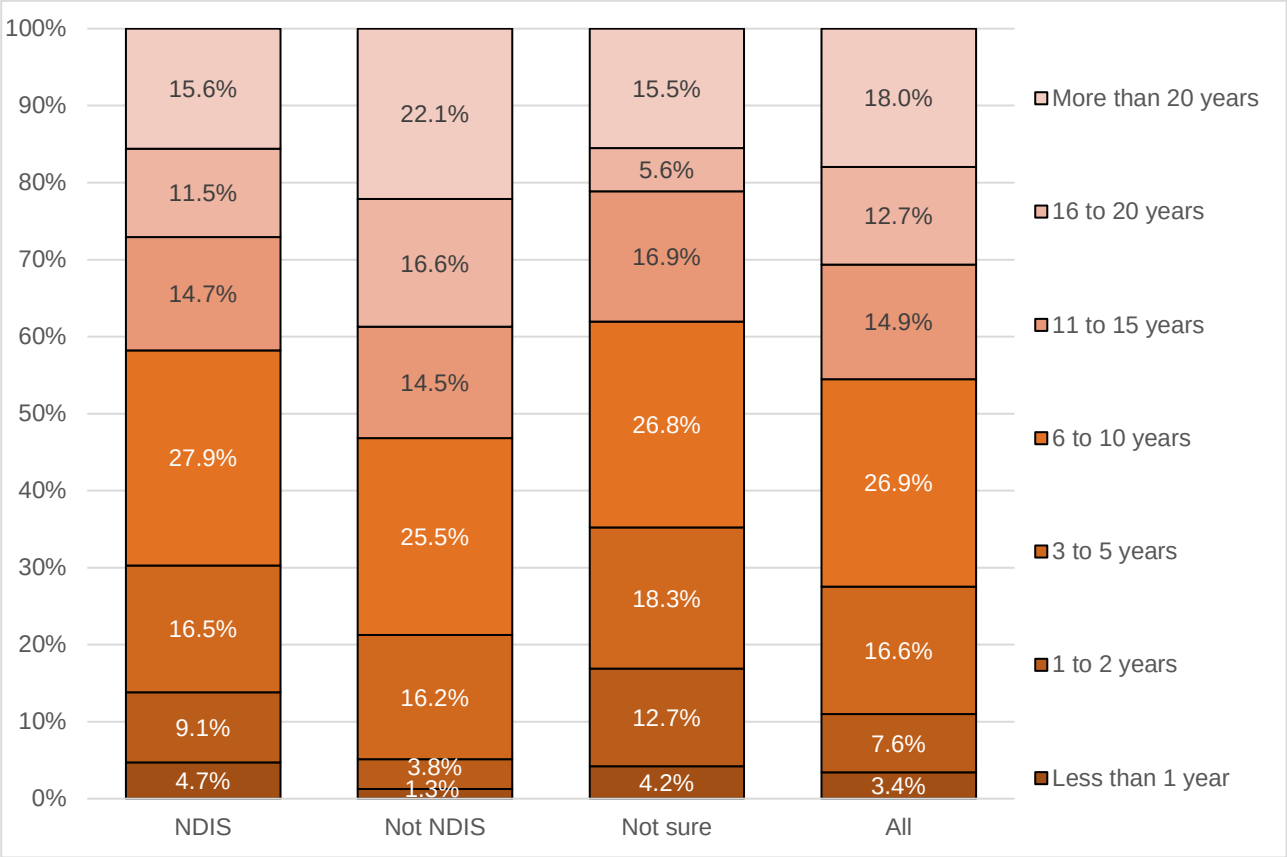
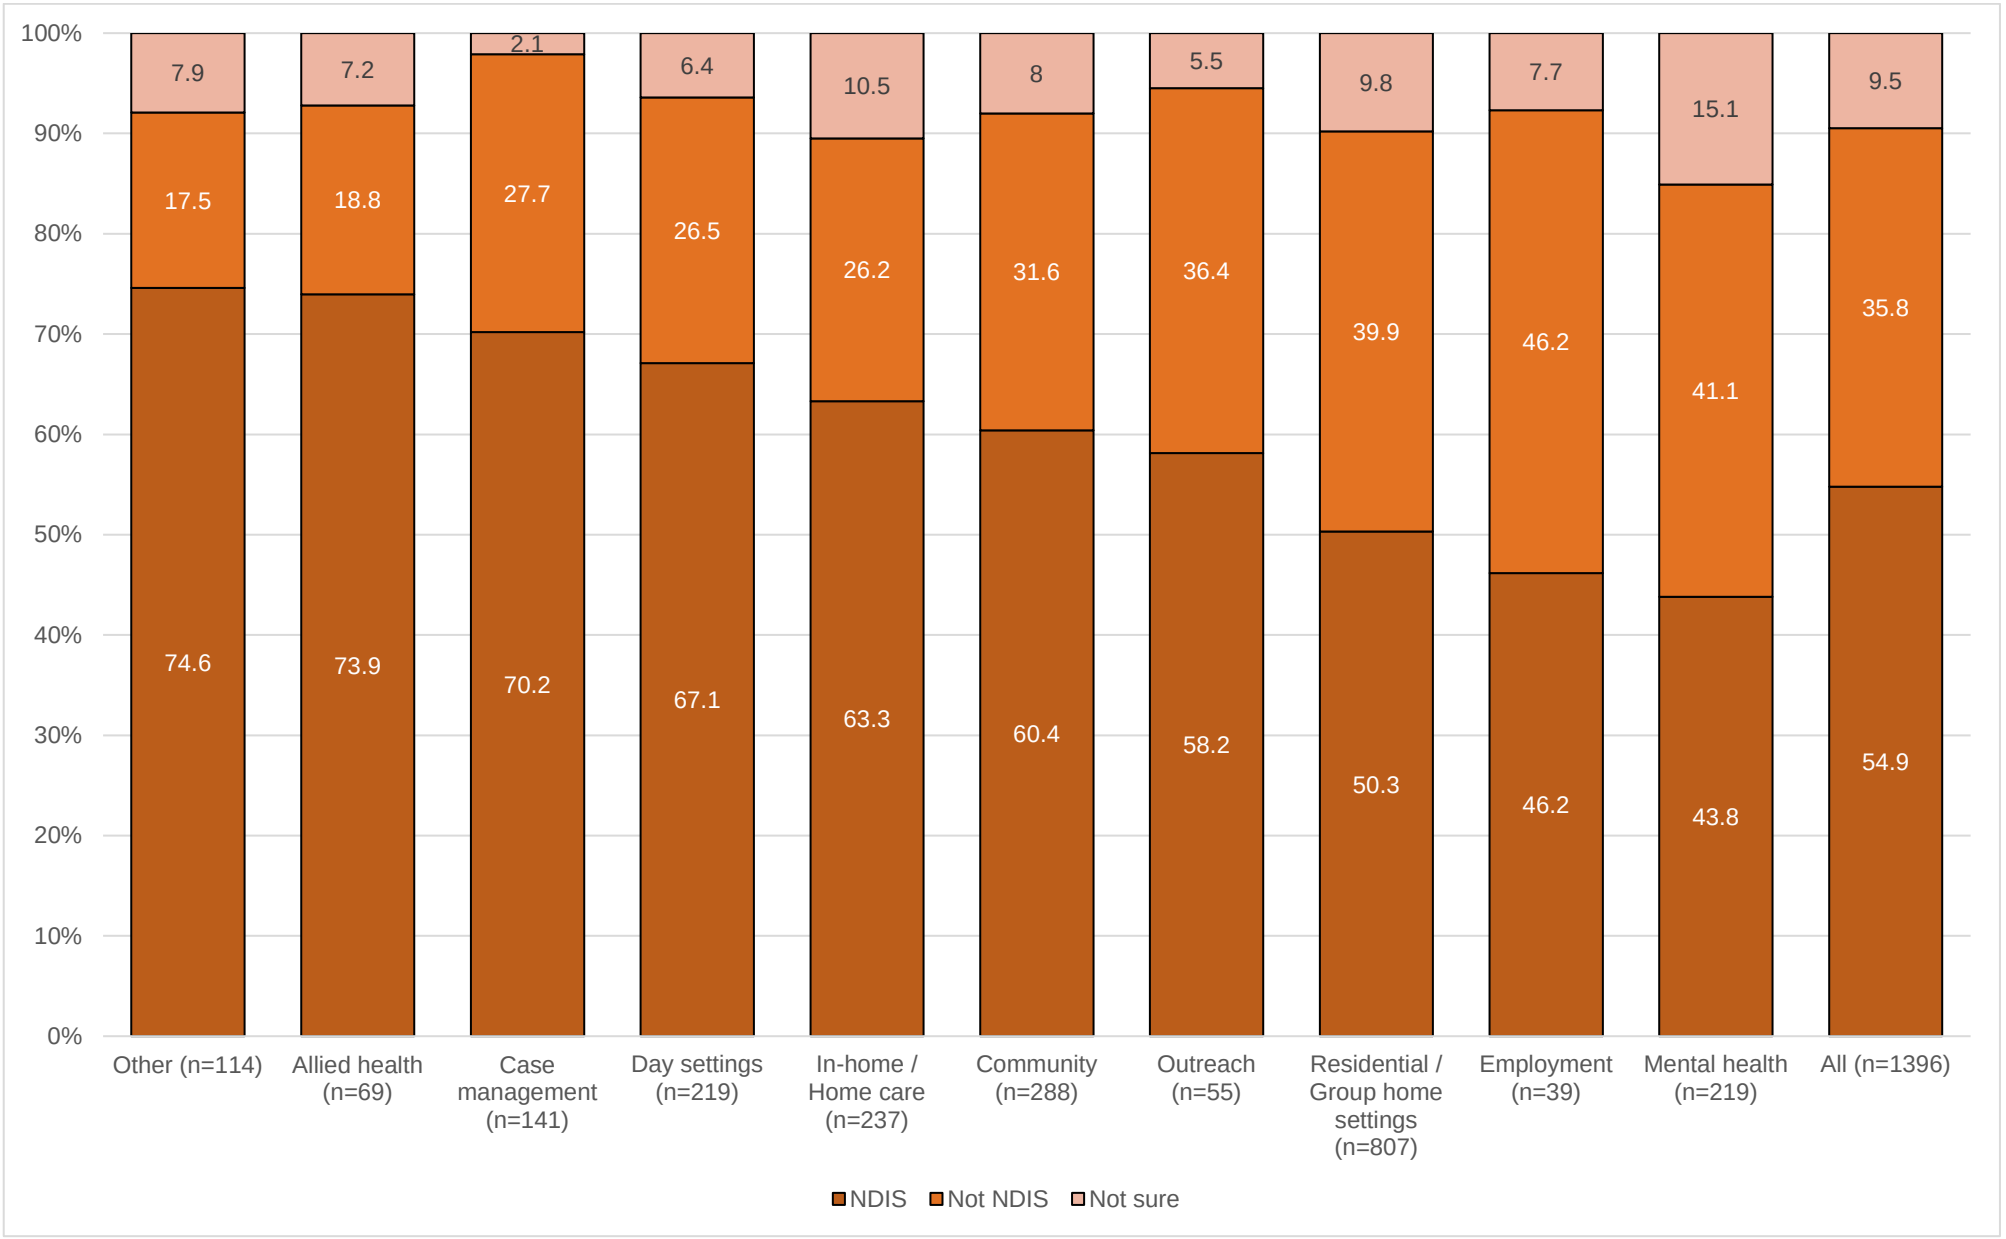


2.6 Disability settings and the NDIS

Figure 2.8 shows the proportions of survey respondents working in various settings who were working under the NDIS. The largest group of respondents were working in residential / group home settings (807, or 54.7%)[3]. A lower than average proportion of respondents in residential settings reported working under the NDIS (50.3%). The highest proportions working under the NDIS were in 'other' settings (not specified) (74.6%), allied health (73.9%), case management (70.2%), day settings (67.1%) and in home settings or home care (63.3%).

[3] Note that many residential workers also said they worked in community settings (20.5%), in-home settings (15.1%), and day settings (13.0%)

Figure 2.8 NDIS involvement for respondents working in the main disability service provision settings



2.7 Multiple job holding

Overall, 11.3% of respondents said they worked for more than one disability service provider or employer. However, this was slightly higher among non-supervisory staff 11.7% were multiple job holders compared with 7.2% of supervisory staff (see Figure 2.9). There was also a slightly higher proportion of staff who held multiple jobs among respondents working under the NDIS. Figure 2.10 shows that 12.8% of those working under the NDIS worked for more than one provider, compared with 8.8% of those who weren't. Further, in some disability settings, very high proportions of respondents worked for more than one disability employer. For example, 23.9% of respondents working in in-home or home care settings worked for more than 1 employer, as did 20.5% of those working in day settings. This is shown in Figure 2.11.

Figure 2.9 Whether respondent worked for more than one provider, by supervisory responsibility

	Works for more than one disability service provider		Works for one disability employer		All	
	n	%	n	%	n	%
Supervises other staff	30	7.2	386	92.8	416	100.0
Does not supervise other staff	76	11.7	571	88.3	647	100.0

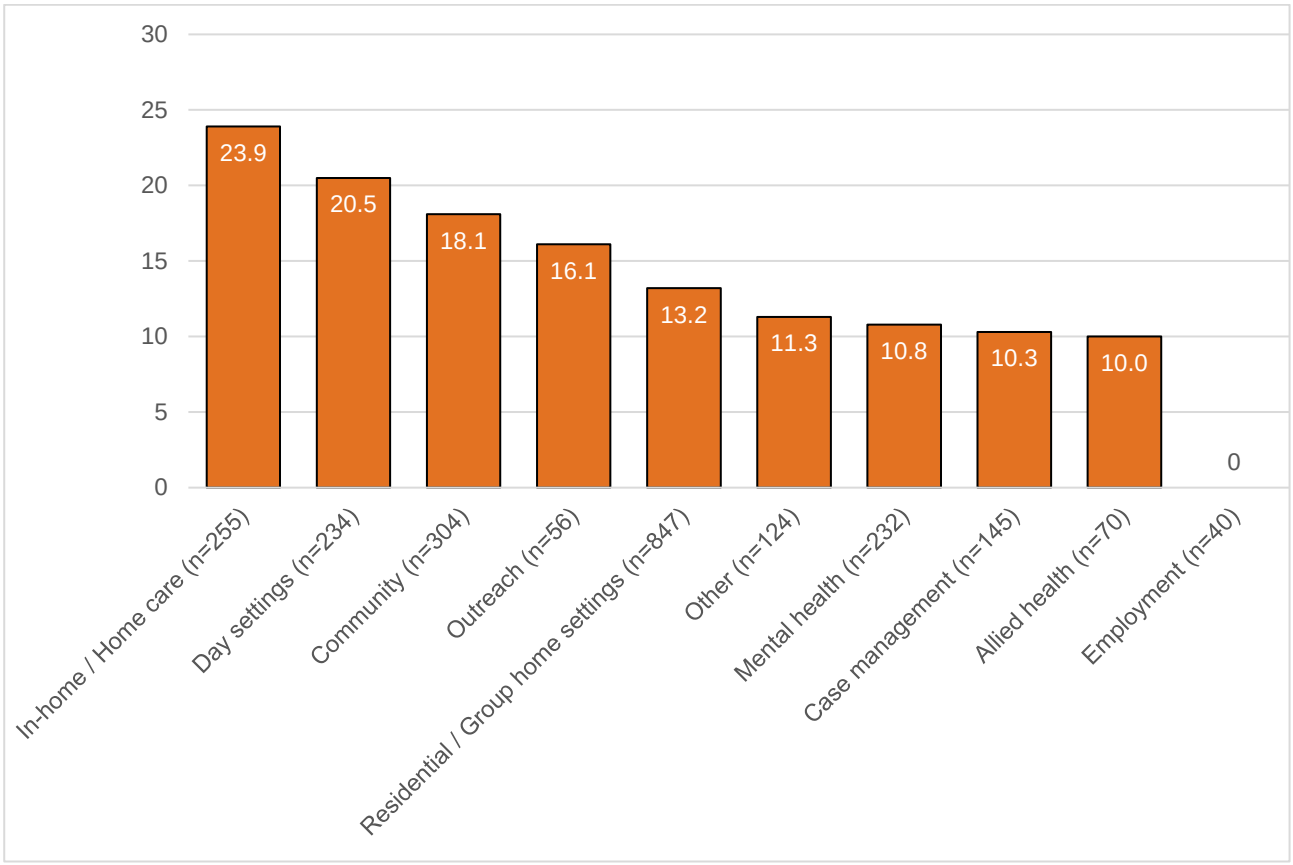
Figure 2.11 Proportion of respondents in each disability setting who worked for more than one disability provider / employer



3. Perspectives on pay

The survey asked respondents to indicate their level of agreement with the statements "I am paid fairly for the work I do" and "I am satisfied with my overall level of take-home pay". For each of these statements, only a minority of respondents agreed, and this was the case for each statement and in all states (see Figure 3.1 and Figure 3.2). There was little difference between levels of agreement among supervisors and other staff: in both cases and for both statements, only a minority agreed. There were also no significant differences in levels of agreement on either measure between staff working under the NDIS and those who were not; in either context only a minority of respondents were satisfied with their pay.

Figure 3.1 Proportion of respondents who agreed with statement "I am paid fairly for the work I do", by state

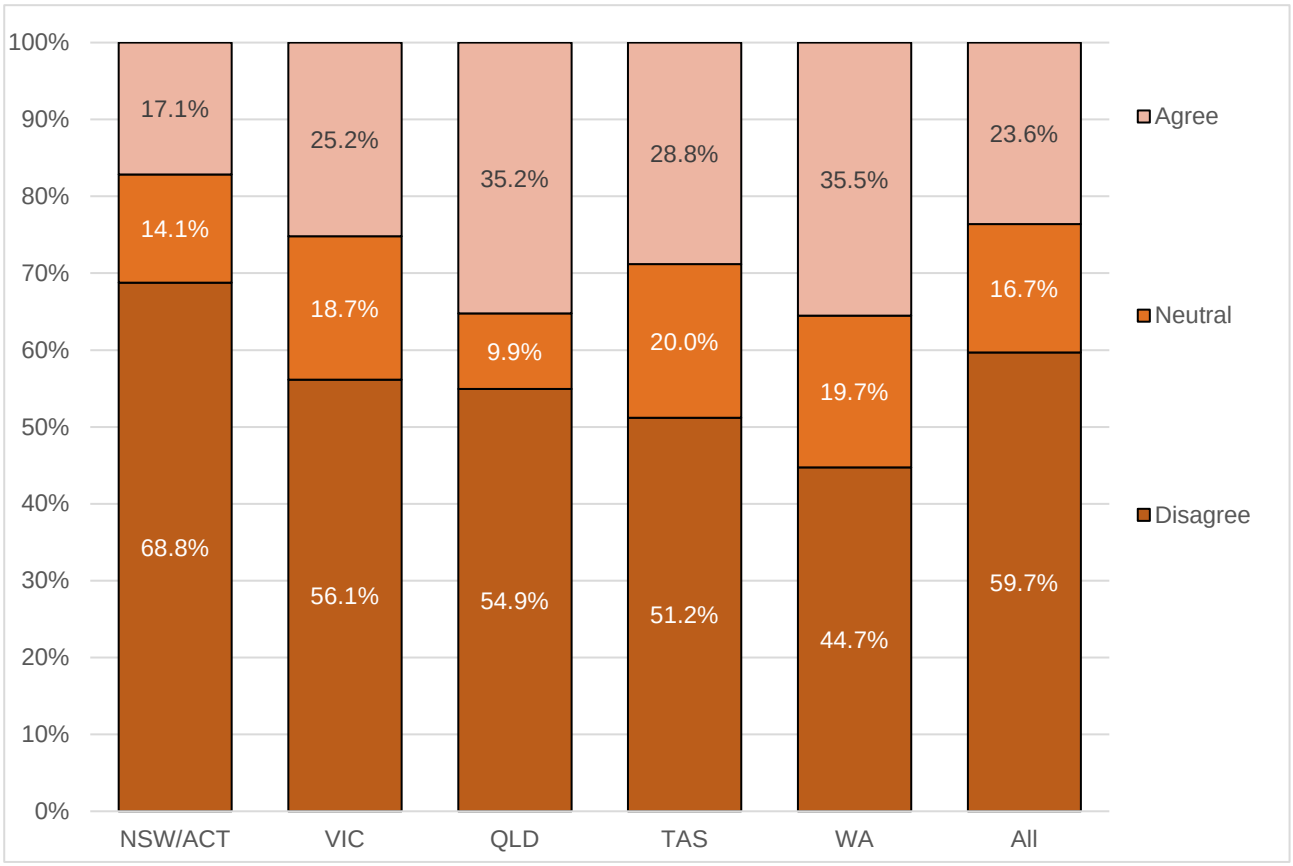


Figure 3.2 Proportion of respondents who agreed with statement "I am satisfied with my overall level of take-home pay", by state

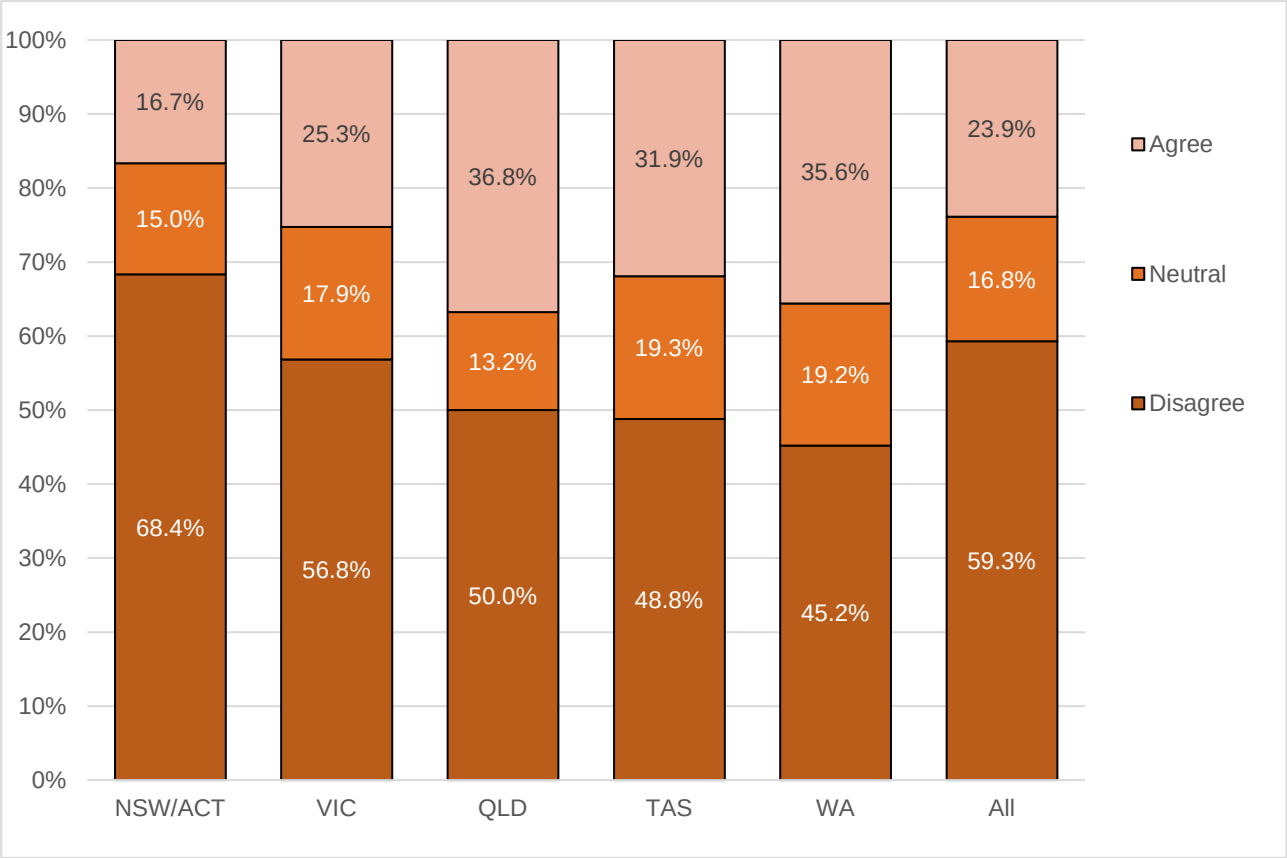

Figure 3.3 “I am paid fairly for the work I do”

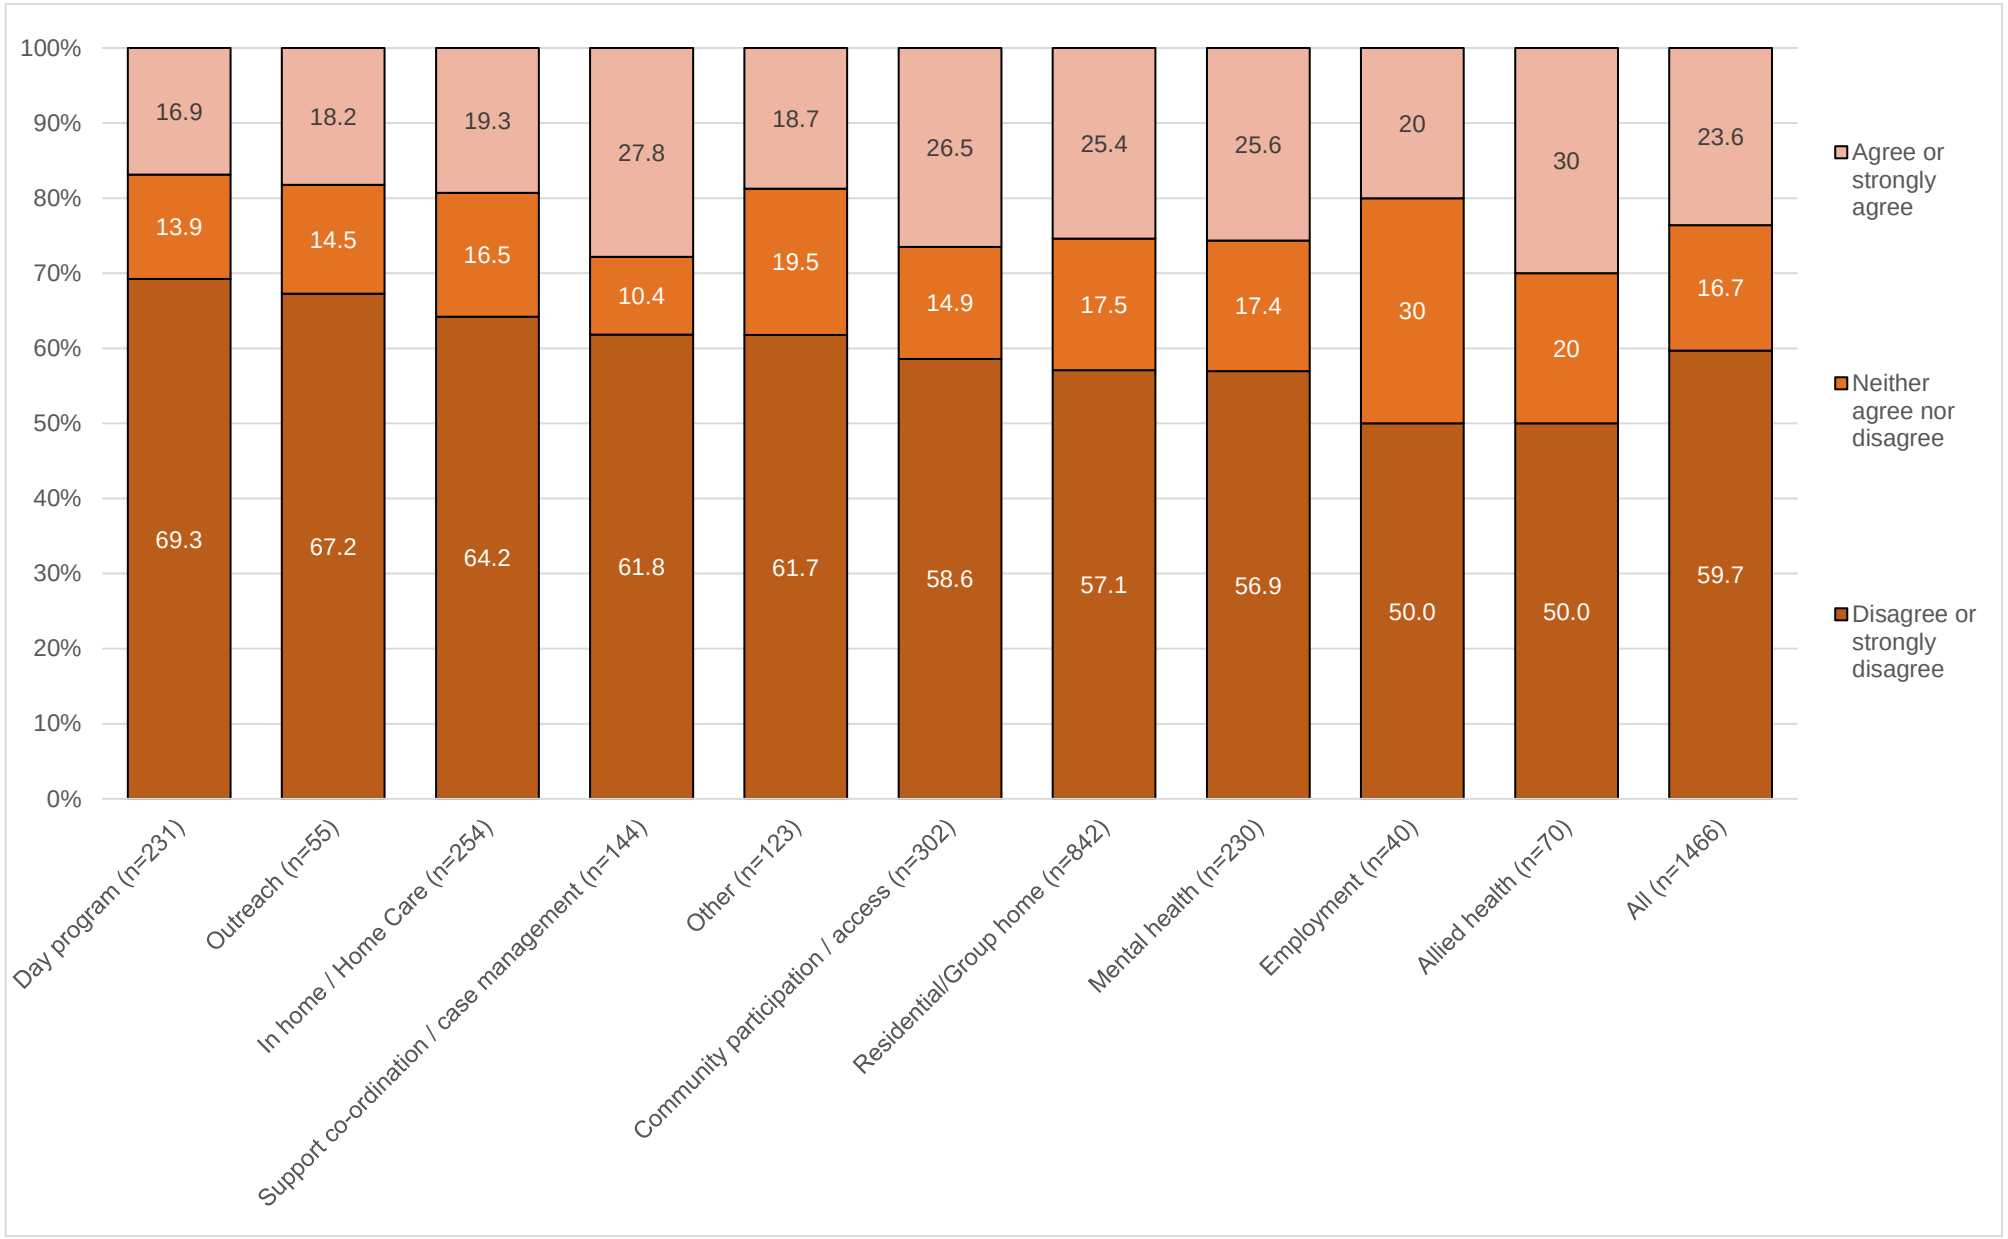

Figure 3.4 “I am satisfied with my overall level of take-home pay”

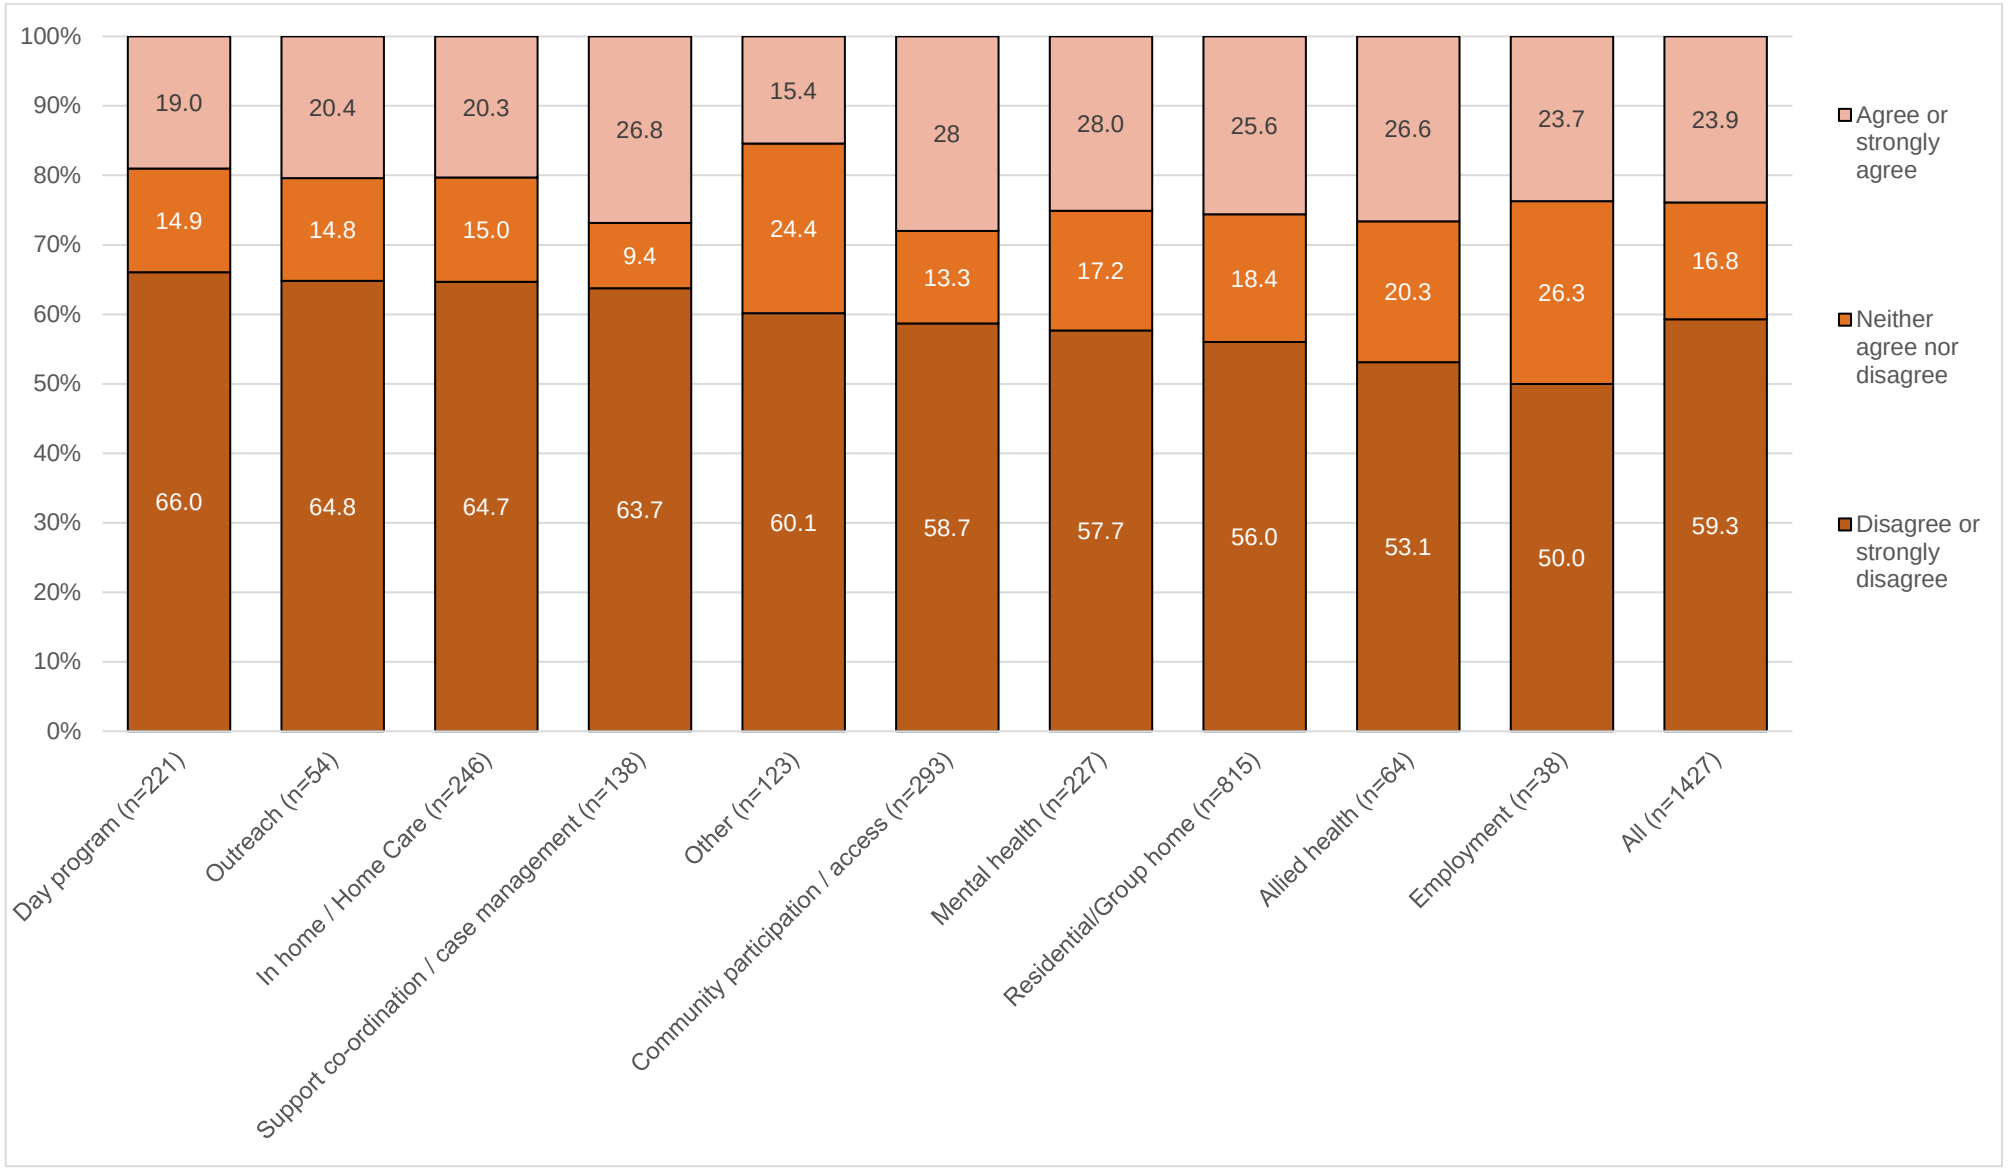

4. Perceptions of working under the NDIS

The survey captured respondents' perceptions of working conditions under the NDIS, through levels of agreement with three statements:

- Under the NDIS, I don't have enough time to do everything in my job (capturing workload and work intensity)
- Under the NDIS, I worry about the future of my job (capturing job security), and
- Overall, the NDIS has been a positive change for me as a worker (as a summary measure of the impact of the NDIS on working life).

As shown in Figure 4.1, more than half of respondents agreed or strongly agreed that under the NDIS, they don't have enough time to do everything in their job (55.9%), and only a small minority disagreed (11.4%). A larger majority agreed that they worried about the future of their job (72.2%), and 12.4% disagreed. Very few agreed the NDIS was positive for their working lives, with 10.6% agreeing and 52.6% disagreeing. The relatively large proportion who were unsure (36.9%) may have found it difficult to judge, for example if they were new to disability work or if the NDIS was new in their area, or if they had difficulty assessing the mixed impact of the Scheme on their work.

Differences in levels of agreement with the statements reported by workers in different disability settings tended to be small, shown in Figure 4.2. Figure 4.3 shows differences between respondents by their jurisdiction of residence. On all measures and in each jurisdiction, most reported the NDIS was having adverse impacts on their working lives. More detailed insight into experiences of working under the NDIS, in survey respondents' own words, is in Section 8.

Figure 4.1 Percentage of respondents which agreed with statements about working under the NDIS

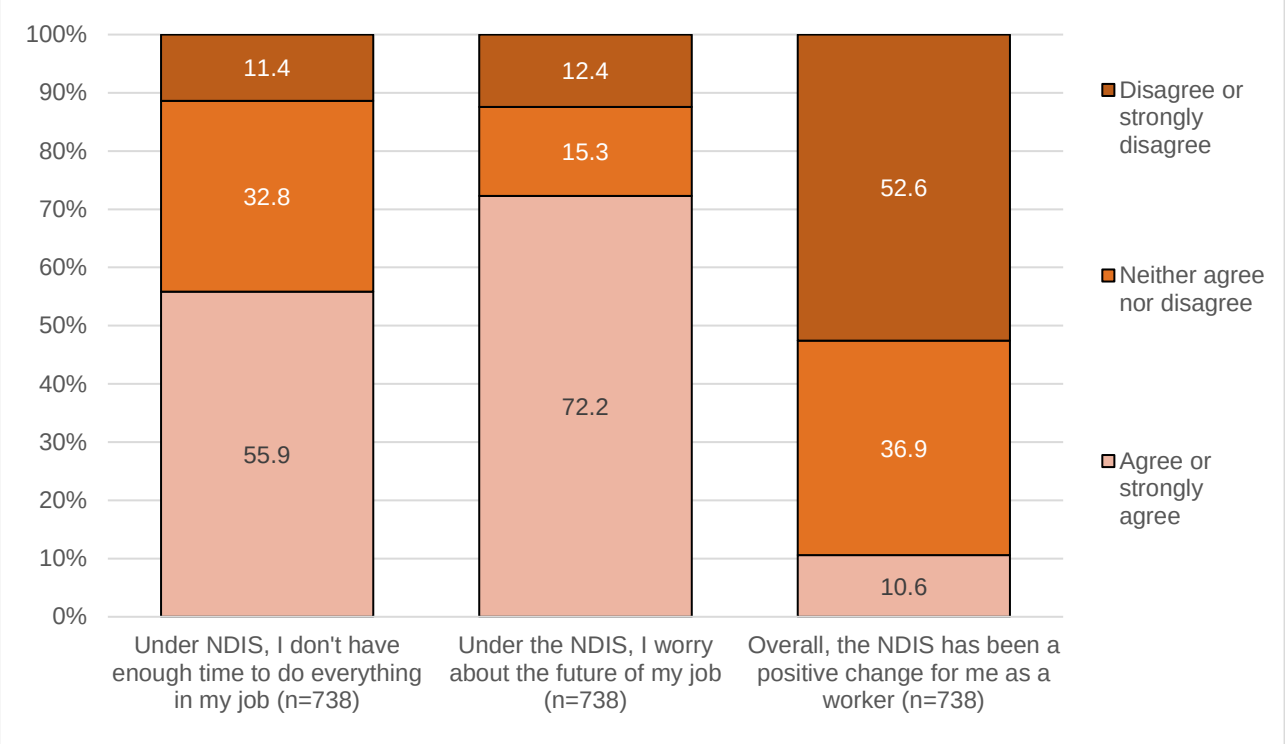

Figure 4.2 Proportion of respondents who agreed or strongly agreed with statements about working under the NDIS, by disability support service setting (%)

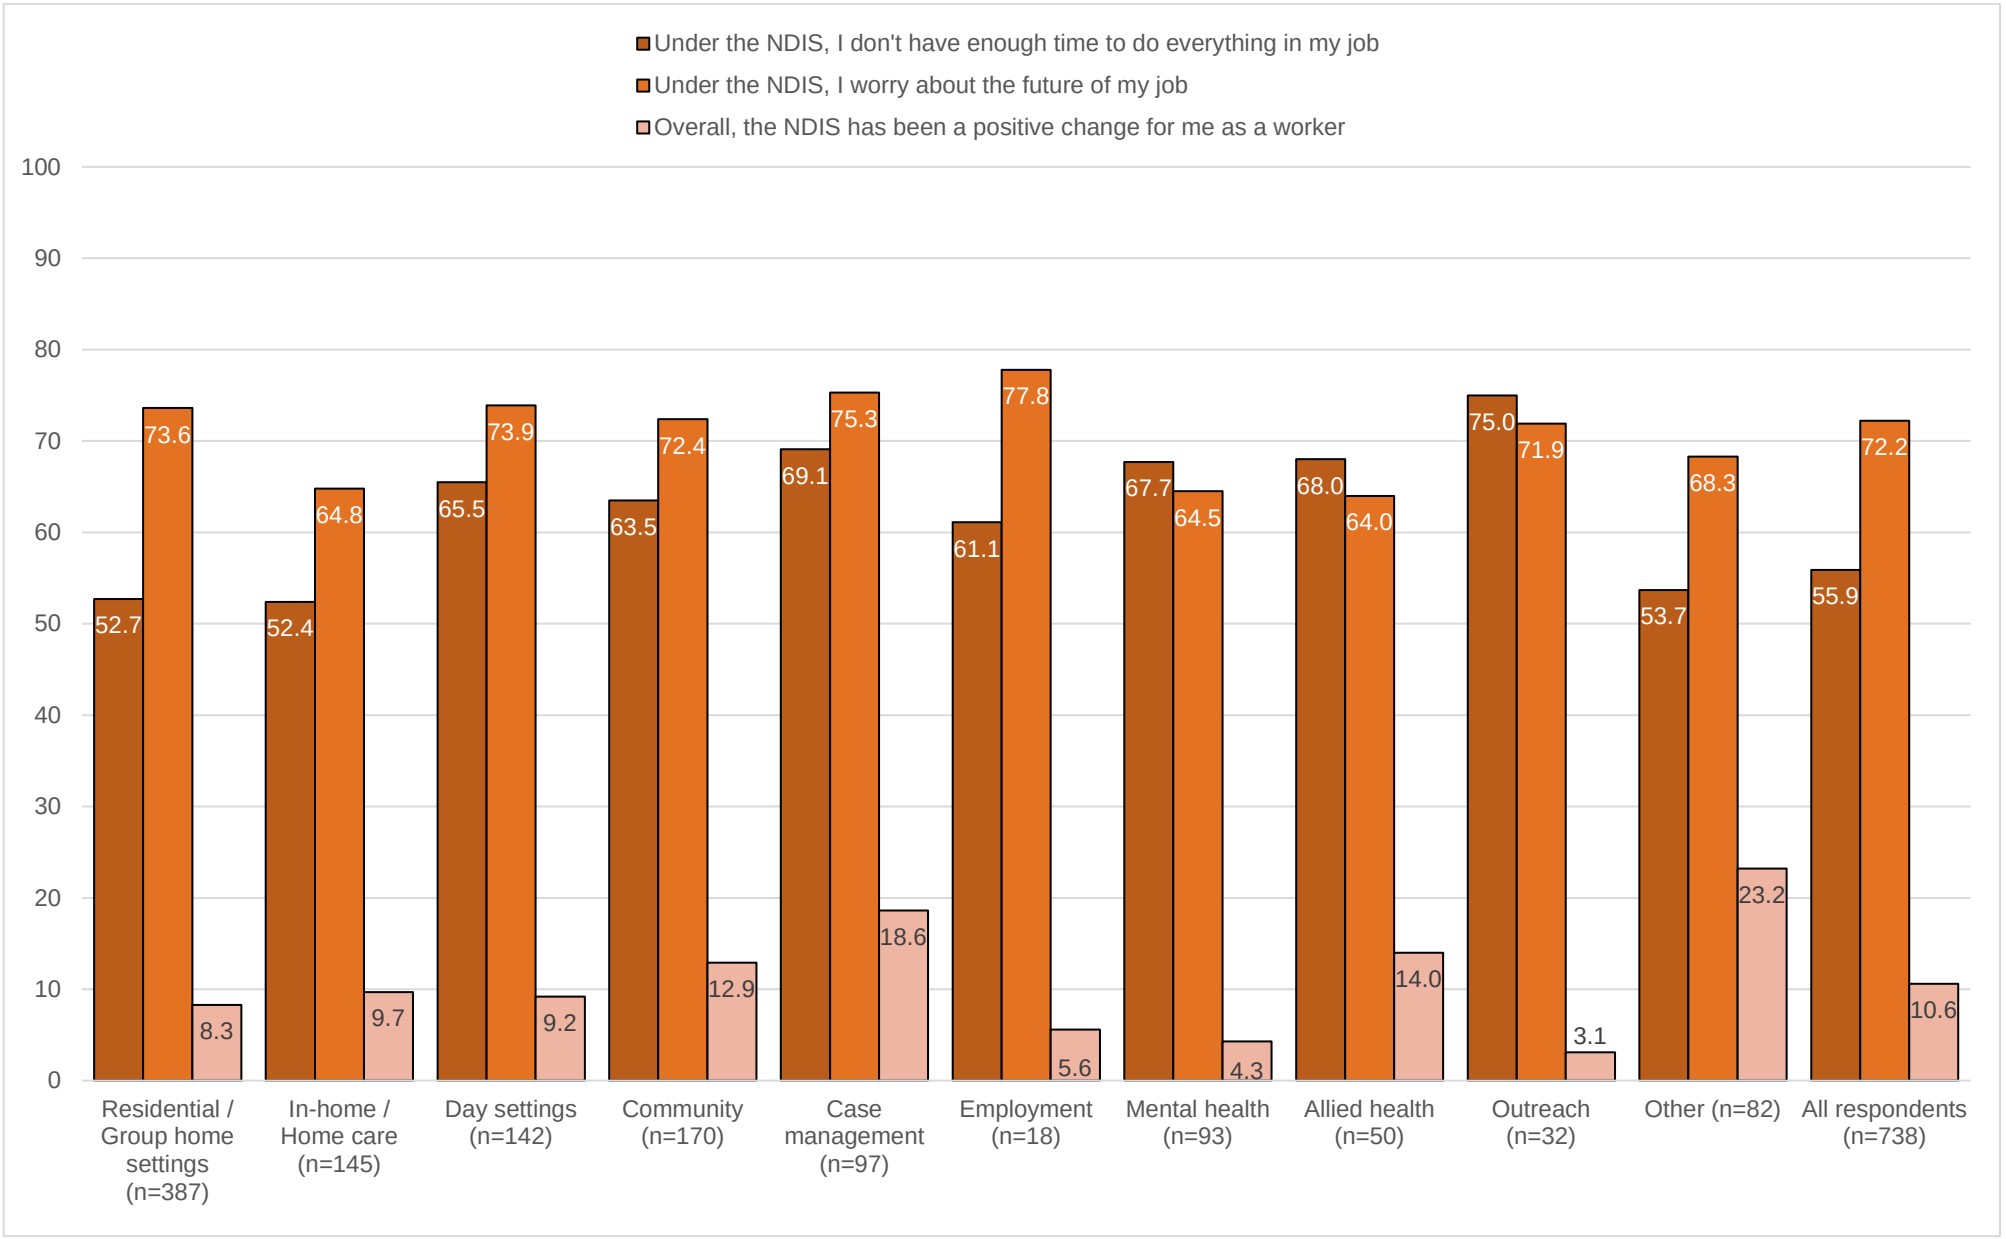

Figure 4.3 Proportion of respondents who agreed or strongly agreed with statements about working under the NDIS, by jurisdiction

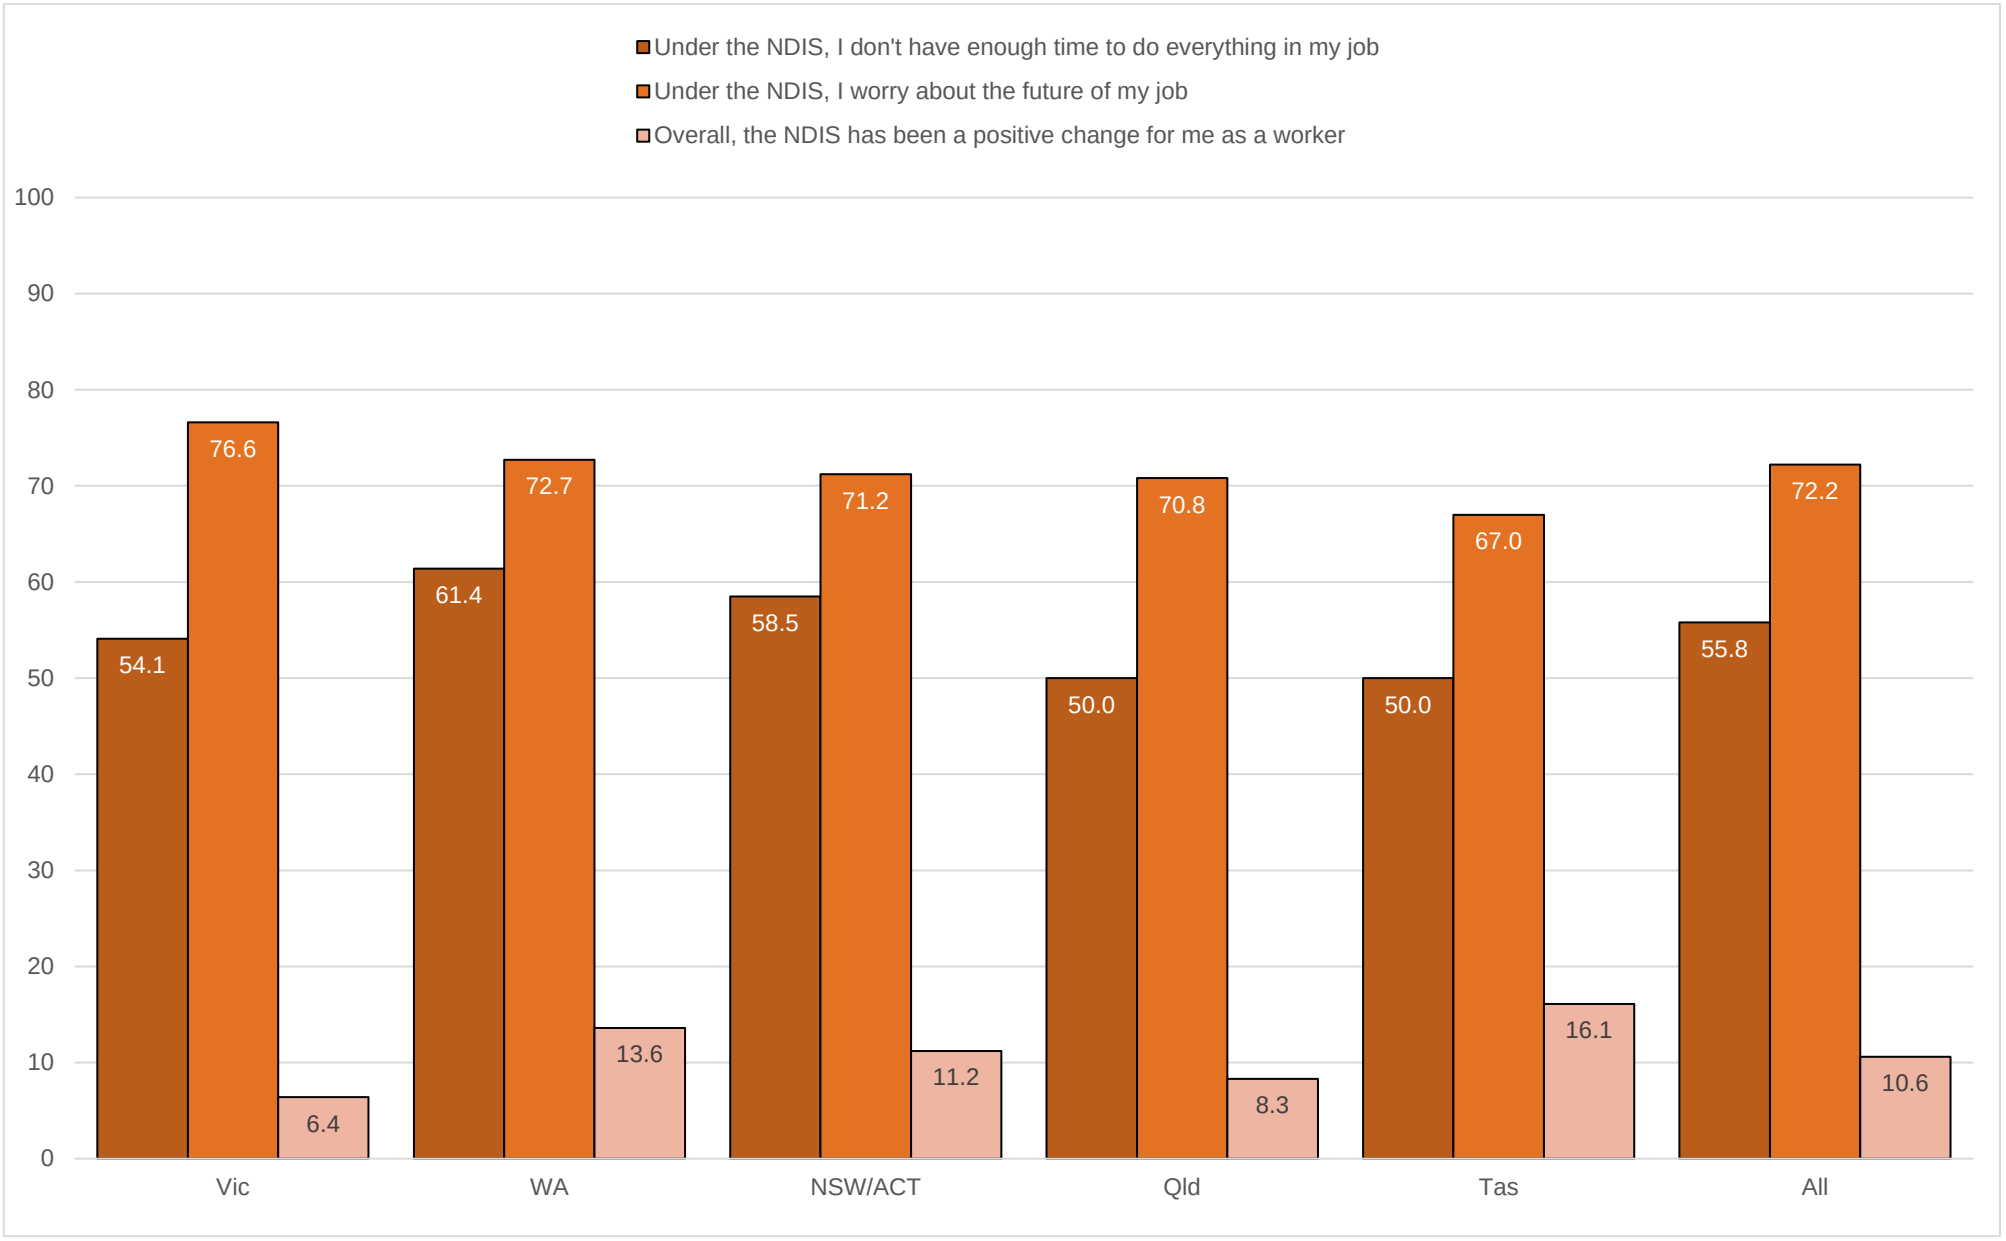

5. Perceptions of the impact of the NDIS on participants and families

As well as showing how workers widely perceive the NDIS to be impacting adversely on their working lives, the survey data also shows only a minority reported it was impacting positively on participants and families. Figure 5.1 shows only a quarter (24.7%) agreed or strongly agreed that the NDIS was positive for the participants they work with, and many more disagreed (37.8%). Similarly, only a minority agreed that families of participants were happy with the Scheme (14.6%) and 15.7% agreed that overall, the NDIS is better than the previous system.

Figure 5.1 Percentage of respondents which agreed with statements about impact of the NDIS

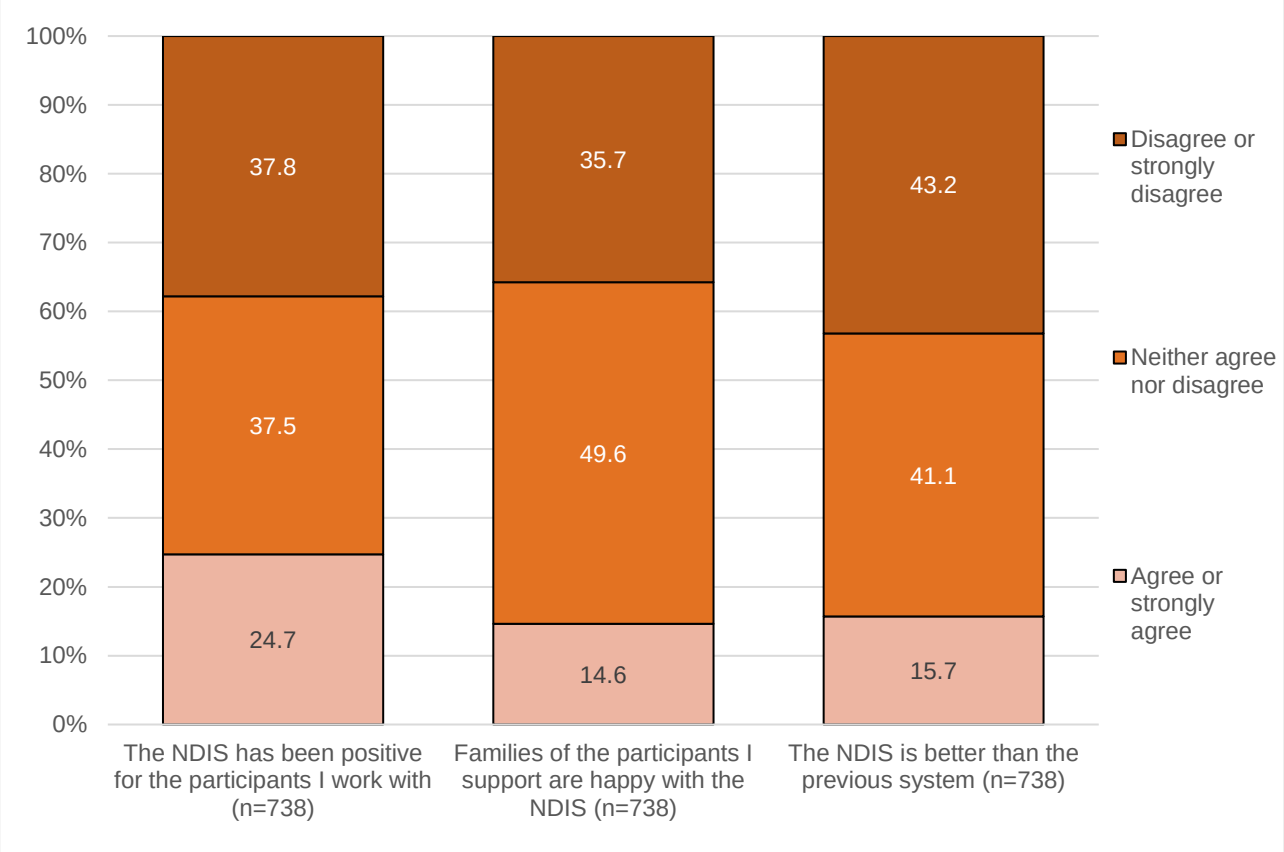

Figure 5.2 shows the proportion of respondents in each disability setting who agreed with the statements about the impact of the NDIS on participants and families. Among those in in-home, community, case management, allied health and 'other' settings, there were relatively high proportions of respondents who agreed the NDIS has been positive for participants, however, this remained a minority in all categories. Fewer agreed with the other statements, with variation by setting shown in Figure 5.2.

Figure 5.3 shows differences among respondents according to their jurisdiction of residence. Higher than average proportions of residents from Tasmania agreed with the statements, while agreement was lower for respondents from Victoria and Queensland.

Figure 5.2 Proportion of respondents which agreed or strongly agreed with statements about the impact of the NDIS on participants and families (%)

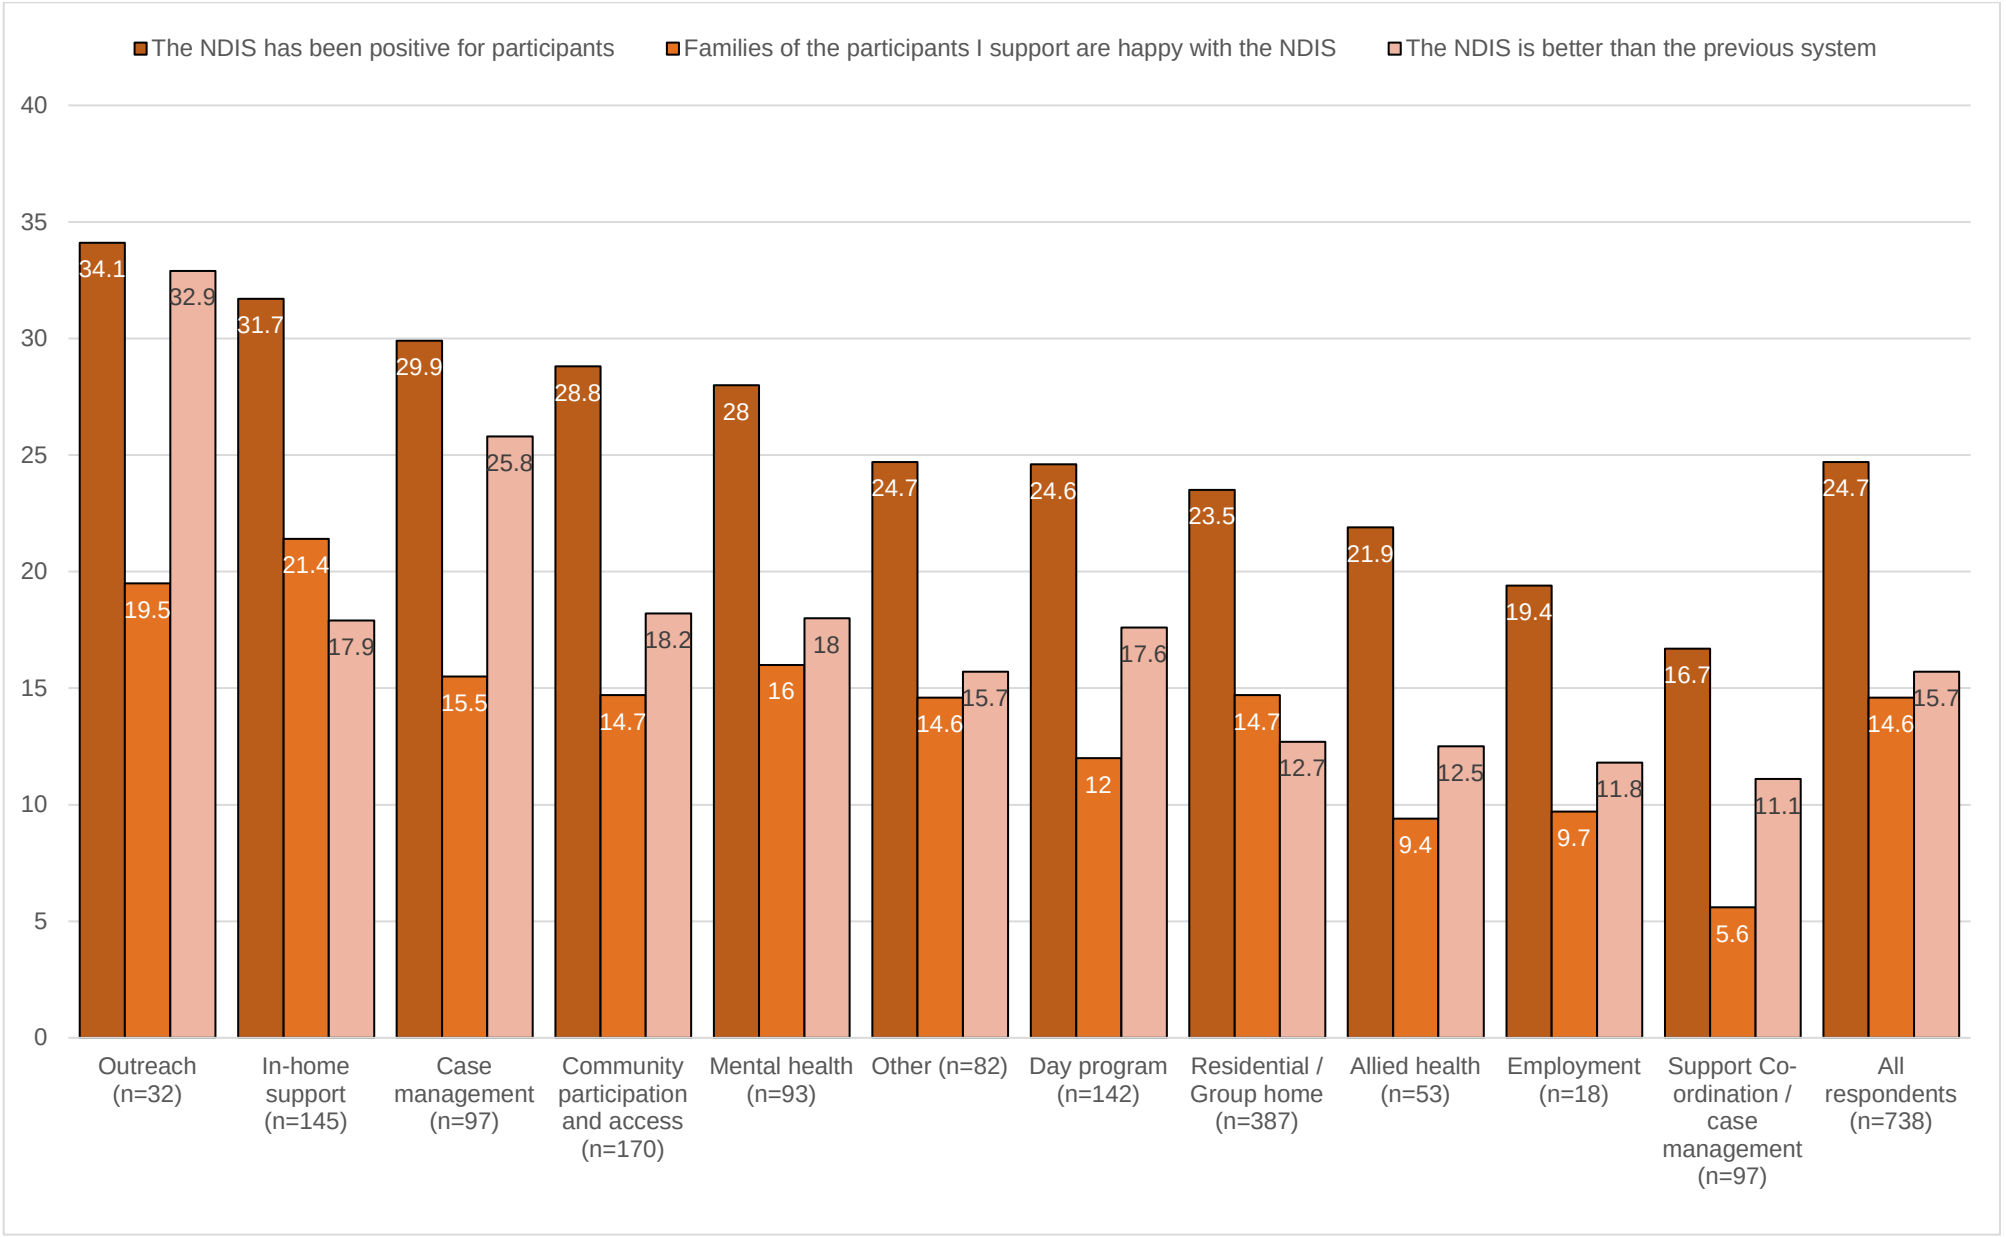

Figure 5.3 Proportion who agreed with statements, by jurisdiction of residence

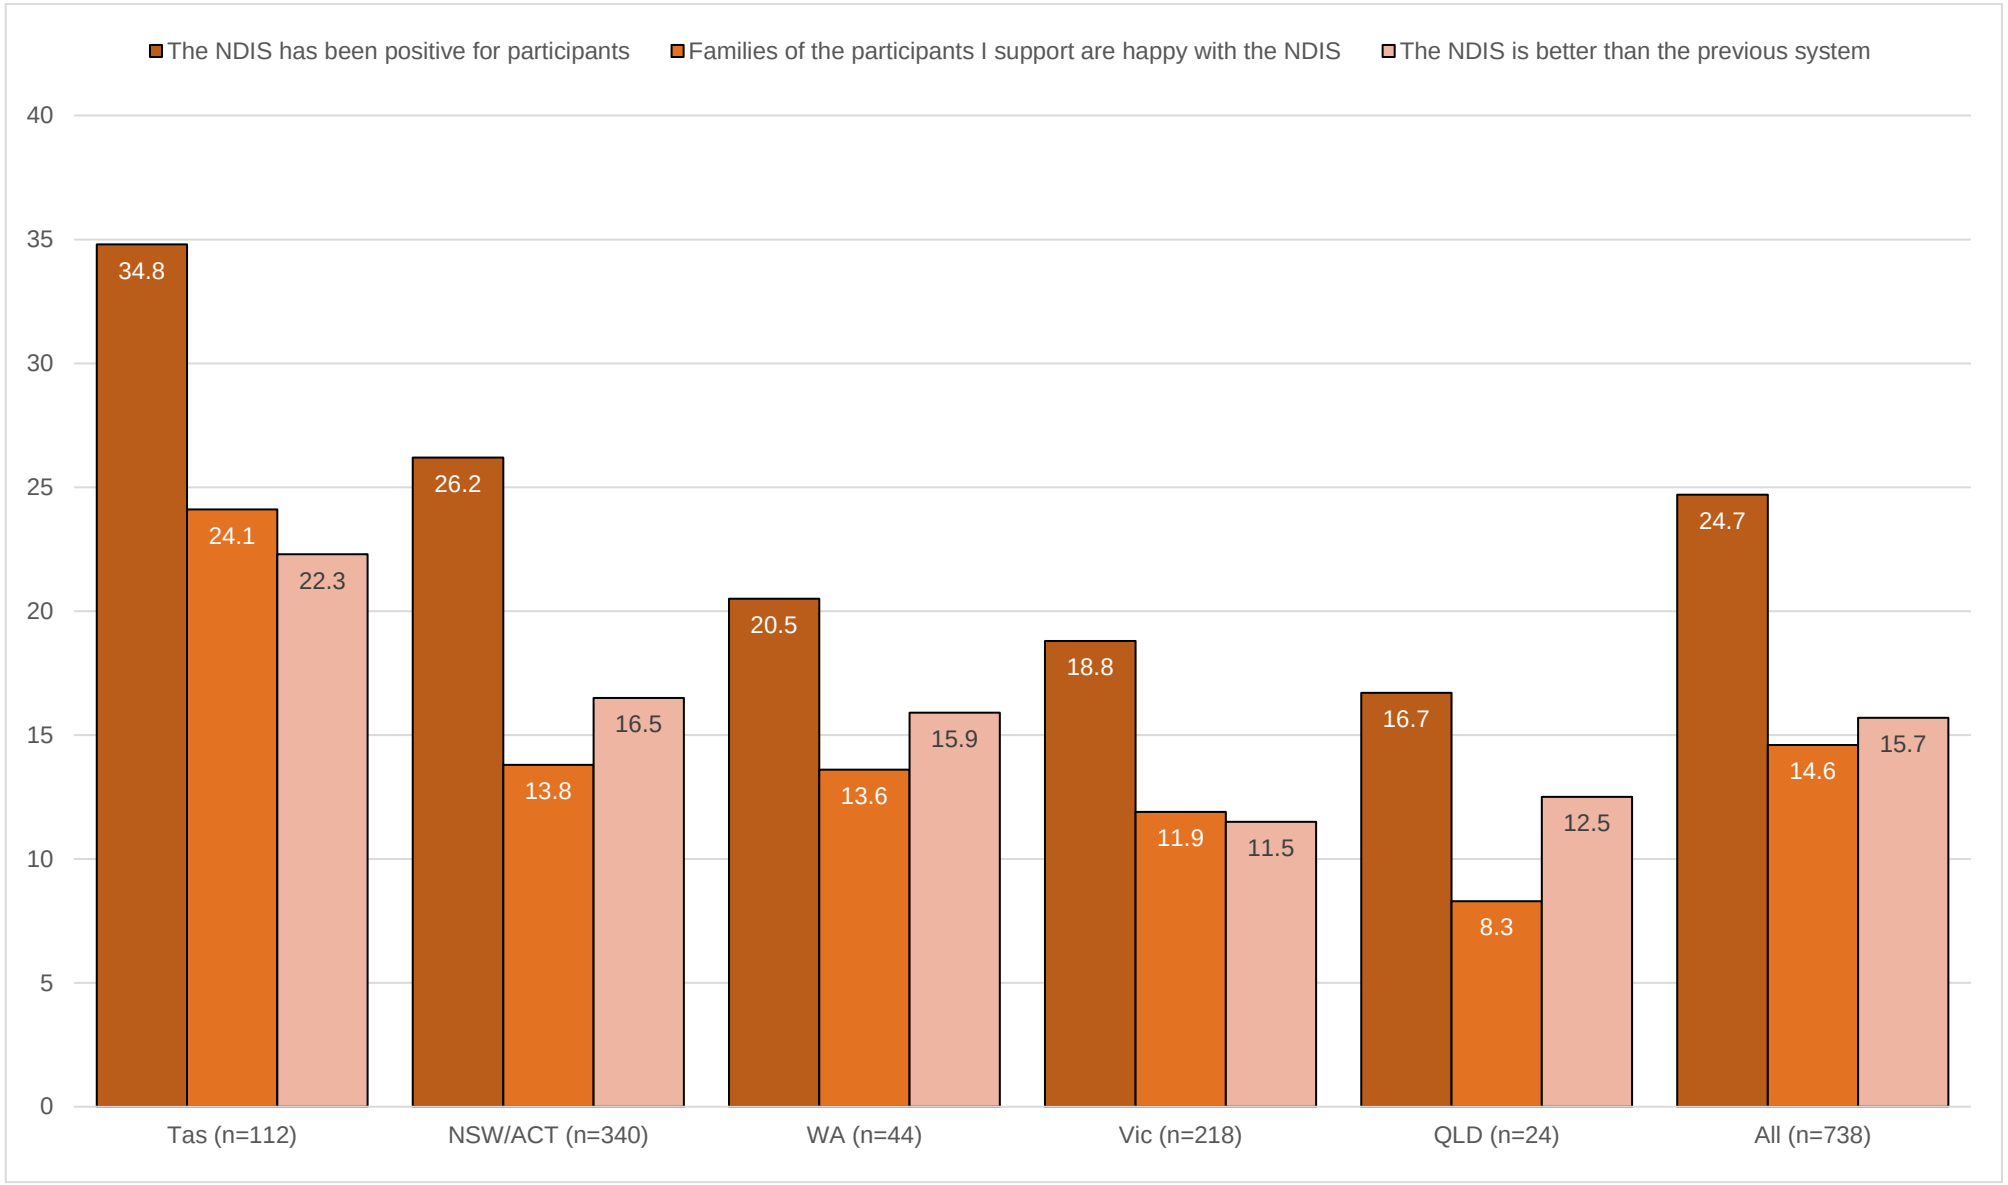

6. Intention to leave or remain in the disability sector

Respondents were asked "Do you intend to be working in the disability sector in five years' time?" Around half said they did intend to be working in the sector (51.5%), while 15.2% said they did not, and a third (33.3%) were unsure.

The main differences in intention to leave were according to age, with a smaller proportion of those aged 60 or over intending to work in disability in 5 years, presumably due to retirement (see Figure 6.1). Indeed, when those who reported they intended to leave were asked why, retirement was reported by 36.7%. Reflecting dissatisfaction with remuneration discussed in Section 3, 27.6% of those intending to leave said it was because they could get better pay and conditions doing work elsewhere. A further 13.1% pointed to the nature of the work, saying they would leave as the work was too difficult or risky, while 12.7% said they would leave due to limited career development opportunities. Smaller proportions were intending to leave because of the unsociable hours (5.9%).

The main reasons for staying were due to commitment to clients, with 60.7% reporting they intended to continue working in the disability sector as they were 'passionate about supporting people with disabilities' and a further 18.8% said because 'I enjoy the client contact'. 10.9% said they had the flexibility to meet personal and family commitments. A small minority (4.0%) said they receive good pay and conditions, 3.3% said it was the best job available, and 2.3% said they had good career development opportunities.

Figure 6.2 shows the proportion intending to remain in disability services, according to respondents' years of experience in disability, and whether or not they were working under the NDIS The proportion intending to stay was similar for staff working under the NDIS (52.2%) and those who were not (51.4%).

7. A closer look at supervision

As shown in Section 2.3, 28.5% of respondents said they currently supervise other staff, while about the same number (27.3%) did so sometimes. These supervisors (including those who always and sometimes supervised other staff) were asked further questions about the nature of their supervisory responsibilities, including how many people they supervised, and whether they experienced any challenges in providing proper supervision due to lack of time and the number of people they were supervising.

7.1 Numbers of staff supervised

The numbers of subordinates reported by supervisors working under the NDIS, and those who were not, is shown in Figure 7.1 (including information for those who 'sometimes' provided supervision). Overall, most supervisors reported only a few subordinates: 43.2% supervised one or two staff, and a further 20.4% supervised 3 to 5 staff. For this group, only 8.3% of supervisors supervised more than 14 staff[4]. However, this was higher for those under the NDIS, 10.3% of supervisors had more than 14 supervisees, compared with 6.8% of those not working under the NDIS.

Figure 7.2 provides the same indicators but excludes those who reported 'sometimes' supervising other staff. This allows a focus on the numbers of subordinates supervised by staff whose roles consistently involved supervision. For this group, 20.0% of those who worked under the NDIS supervised more than 14 staff, compared with 12.0% of those not under the NDIS.

[4] Supervision of more than 14 staff is of interest because the National Disability Insurance Agency's pricing model assumes supervisors directly supervise 15 staff, and provides resources accordingly. See NDIA (2014) NDIA report on the methodology of the efficient price: National Disability Insurance Agency.

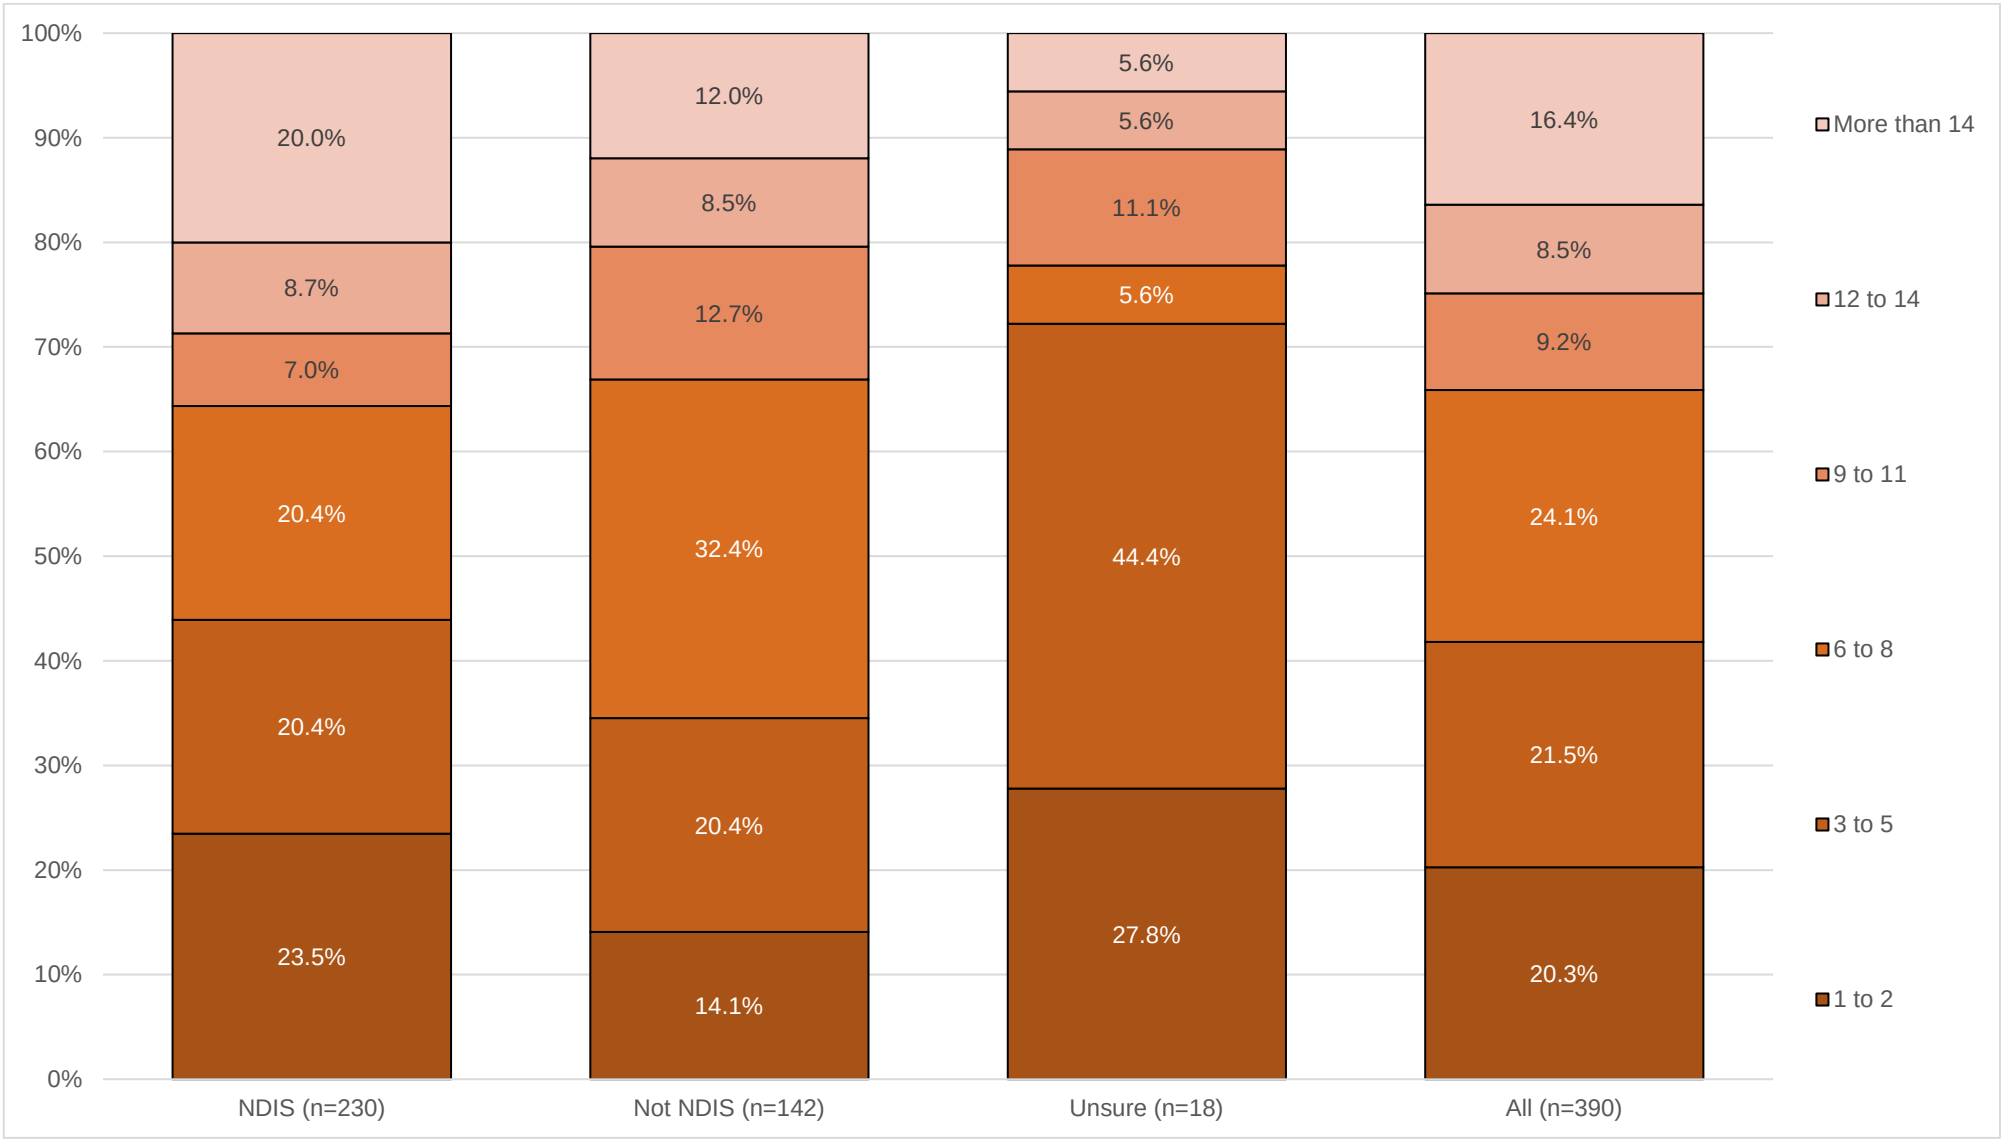
^NB: This includes supervisors who always or sometimes provided supervision.

Figure 7.2 Number of staff directly supervised, by whether or not respondent was working under NDIS, supervisors^ (%)



^NB: This includes supervisors who always provided supervision only (ie those who sometimes provided supervision are excluded).

7.2 Pressure on supervision

The data shows that supervisors who directly supervise large numbers of staff experience difficulties in providing proper supervision. As shown in Figure 7.3, the proportion of supervisors who agreed that they can't provide proper supervision due to lack of time increased with the number of staff directly supervised. Among those supervising only 1 or 2 staff, 16.7% strongly agreed with the statement, and a further 38.5% agreed. Among those supervising more than 14 staff, many more strongly agreed or agreed: 38.7% and 45.3% respectively. Figure 7.4 shows that similarly, the proportion of supervisors who agreed or strongly agreed with the statement "I can't provide proper supervision because I have too many people to supervise" increased according to the number of supervisees. Well over half of those supervising over 14 staff (58.7%) agreed with the statement. Figure 7.5 and Figure 7.6 shows differences in agreement with the statements according to disability setting. On both measures, higher proportions of supervisors in day, residential and case management settings tended to agree.

8. Logistic regression

8.1 Understanding the factors affecting impact of the NDIS on participants

To better understand the factors affecting whether or not respondents perceived the NDIS to be positive for participants, multivariate analysis (logistic regression) was used. Logistic regression allows exploration of associations that multiple variables have on a binary categorical (non-numerical) outcome variable. In this case the outcome variable was a binary indicator distinguishing whether respondents agreed (or strongly agreed) with the statement "The NDIS has been positive for the participants I work with" (coded as 1), as opposed to those which did not agree with the statement (coded as 0).

8.2 About the model

The model includes control variables to account for the effects of worker demographics, disability setting, and working conditions, each of which could influence perceptions of the impact of the NDIS on participants. Binary indicators were included to control for the effect of gender, and working in NSW and Tasmania (as higher proportions of respondents in these areas reported the NDIS was positive). It also controlled for disability setting, whether respondents had worked in disability services for less than 2 years, or more than 10 years, and whether the respondent worked for more than one disability provider.

Working conditions were captured with a binary measure of pay justice, job security, time pressure, and capacity to provide quality supervision. Pay justice was constructed as a binary measure which grouped together (and coded as 1) those who agreed (or strongly agreed) with both the statements about pay "I am paid fairly for the work that I do" and "I am satisfied with my overall level of take-home pay". Those who did not agree with both measures were treated as not perceiving pay to be just (and coded as 0). To capture job security, a measure was constructed capturing those who agreed with the statement "Under the NDIS, I worry about the future of my job" compared with those who did not. Similarly, time pressure was captured with those who agreed with the statement "I don't have enough time to do everything in my job" coded as 1 (and the remainder coded as 0). A measure of quality supervision was constructed. Those who disagreed with the statement "I can't provide proper supervision due to lack of time" and "I can't provide proper supervision because I have too many people to supervise" were considered to provide quality supervision, and coded as 1.

8.3 Results

Results (odds ratios) are in Figure 8.1. Odds ratios greater than 1 (and which were statistically significant) indicate the factor was associated with increased odds of reporting the NDIS was positive, while those lower than 1 predict lower odds of doing so. The results show that three factors predict whether or not respondents perceived the NDIS to be positive for participants: state, pay justice, and job security. In particular:

- Residing in NSW and Tasmania were associated with increased odds ratios (of 2.7 and 2.5 times, respectively).

- Perceptions of pay justice also more than doubled the odds of perceiving the NDIS to be positive for participants, with odds ratios of more than 2.4 times.

Poor job security was associated with lower odds of reporting the NDIS had a positive impact on participants:

- Worrying about the future of one's job lowered the odds of reporting the NDIS was positive for participants (Odds Ratio=0.3).

Figure 8.1 Odds ratios: Employees who agreed with the statement "The NDIS is positive for the participants I work with"

	Odds ratios	Standard error
Works for more than 1 provider	.83	0.4
Two years of experience or less in providing disability services	1.8	0.6

9. Comments and concerns about working in the disability sector

Respondents were asked if they had any comments or concerns about their work in the disability sector and / or the NDIS. Overwhelmingly, respondents used the opportunity to comment: 913 workers provided comments (60.0%). The themes below reflect areas of concern. Note that each quote comes from a different person, with quotes selected to exemplify key themes expressed from the group as a whole.

9.1 General concerns about the NDIS

Respondents expressed significant concerns about the working in the disability sector and under the NDIS. Several respondents expressed confusion about the NDIS and the process of change, for example:

> The organisation I'm with are not providing informing us what we employees should be doing to prepare for the roll out in our region, not sure they know what they are doing.

> Everyone feels that they are in the dark about the NDIS, no one knows what's happening, or where they will be standing in the future, whether our jobs or pay will be secure, who knows, because no one is telling us anything

As well as reflecting uncertainty about the process of change, respondents' comments provide insight into the range of adverse impacts workers see the NDIS to have on the quality of services and the quality of jobs. Some explained that although they agreed with the principles of the NDIS, the Scheme did not appear to be implemented in positive ways, as financial considerations were eclipsing the needs of clients. Many expressed concerns about the resource model. They saw funding levels for people with disability to be inadequate, which raised concerns about clients' ongoing and future capacity to purchase the quality and quantity of services required. Examples of this sentiment are in the following statements:

> I fear it is mostly a cost saving scheme for the government. Theoretically it should work well, but at the moment it appears to be underfunded.

> I am concerned that people will not receive adequate packages. I work in respite and there appears to be questionable future funding for this service.

> The NDIS has turned an industry which use to be about caring and nurturing into an industry which only cares about profit for the provider.

Concerns about resourcing of the NDIS centred on the impact on people with disability. One respondent explained:

> The funding for the NDIS needs to meet the needs of people with disabilities. The government needs to take a reality check and they need to remember that they are dealing with the lives of very vulnerable people. If the NDIS is funded correctly it will

> be a fantastic step forward if the funding is not there then people with disabilities will have to take a giant step backward to time before deinstitutionalisation!!!
>
> Many of my clients have wondered why they have to change and what are their choices if they don't go with the NDIS? Many of my clients cannot read or write or are very limited, they have no family and the NDIS was not designed for these types of clients. The NDIS should have been more carefully worked through but all clients have been lumped in the one boat. Many have been very stressed about the change and all that goes with it. They feel they have no choice but to go along with it.

As well as being concerned about the impact of the NDIS on people with disability, workers also expressed concerns about the impact on family members:

> People with high support needs will get less hours of support. There will be pressure for the mothers of people with disabilities in particular to look after their son or daughter for more hours.
>
> I am concerned about vulnerable families and how they will be able to articulate their needs and negotiate the system. Both staff and participants are very confused about how the NDIS will work.

Another respondent, working in a community participation / community access setting, also focused on the impact of the NDIS on parents of children with disability, and described their frustration at discovering plans were unsuitable for meeting their children's needs:

> The NDIS is the worst thing this country has done. I am constantly on the phone with parents, crying out of frustration as they feel that they have lost support, have nowhere to turn for help and basically do not totally understand the scheme as it stands. I have had one parent at the edge of totally giving up and was so concerned with his state of mind that he was referred onto support for himself. The amount of times I have heard families say, "I am so tired of fighting for my child". We have that many families who have appealed their plans as Local Area Coordinators and Planners have been employed with minimal or no experience in the disability sector. How can families receive a plan that suits their needs when the person who is supposed to be guiding them through the process has so little experience?

Other workers also expressed concerns about the quality of the planning process, pointing out how planning was conducted without ensuring support for participants, and without a face to face meeting:

> I feel that anyone changing to the NDIS needs support while being interviewed on the phone. There is no face to face meetings and the people doing the interviewing know nothing about the person being interviewed. This can be very misleading if the person being interviewed does not give a full history of their situation.

Another respondent outlined how the NDIS was reproducing inequalities, as people with disability who had strong family advocates had better access to Scheme resources:

> I have concerns about families not receiving the support they need to navigate the 'system'. From accounts with numerous families I have learned that NDIA support/funding is more likely to be received by families who 'jump up and down', which indicates to me that it is a reactive, not proactive system. For such an amazing concept, I think it is really important for access to the NDIA to provide equality, otherwise the same inequalities that have always been in the disability sector will continue to occur.

Several workers commented that the NDIS was failing particular groups of people with disability, in particular by failing to recognise the complexity of need. As one explained:

> NDIS has been created with a particular set of disabilities in mind, or at least as a priority, but in the case of intellectual disability there is not enough consideration given to the complexities of supporting those with complex care needs. Where participants are unable to self-manage or advocate strongly for themselves, supervisory staff are not being given the resources to properly provide choices and to collect the evidence that quality services are being delivered. What was sold as an opportunity to address the inequalities inherent in the block-funded arrangements has instead delivered a cost-cutting exercise; whether through accident or design, the lofty ideals of the NDIS are not being going to be achieved for a great many participants unless the paucity of funding to provide the best outcomes is rectified.

As well as people with intellectual disabilities, workers also noted the difficulty of engaging with the NDIS for people with mental health or psychiatric needs, older clients, people who were homeless or disconnected from family, and those unable to advocate for themselves.

9.2 Concerns about service quality

In their comments, workers expressed strong concerns about service quality under the NDIS. Perceptions that clients' needs would not be met under the Scheme were widespread, reflected in comments like:

> The only concern that I currently have is that the people that I work with, I'm worried that their needs won't be totally met.

Those working with NDIS participants had witnessed changes in practice which they attributed to the Scheme, while others commented that changes had been made by their organisation in anticipation of the NDIS rollout. Some commented that people with disability were 'treated like numbers' in ways antithetical to the ambitions of personalisation, while others noted high risks, including poor staff training, reductions in staff numbers, and grouping clients together in inappropriate ways. One respondent, who had been a casual worker in an accommodation setting for 10 months and was new to disability services, explained that she had never been shown how to manually assist in moving people in and out of wheelchairs. Another, working in a day program setting explained how services were being organised in ways which raised behaviour-related risks:

> The day programs I work at supports participants with high support need and challenging behaviours. Due to the lack of funding some of these participants receive we are currently grouping the participants up. This can be difficult as some of them do not like to be grouped up and this can cause behaviours which is not

> detrimental to the worker who could be on their own supporting this group but also the other participants in the group.

Risks were also seen to arise relating to the use of temporary casual and agency staff, and staff turnover, which were seen to undermine standards of care:

> Standard of care drops significantly when new, temporary and unfamiliar staff work with residents. The calibre of agency staff is significantly lower than that of ongoing employees. In my team, this is not just a job; it is a career that we are passionate about. We commit to our residents long term for consistent improvement and quality life experiences. I am concerned that NDIS will casualise the workforce, leaving staff disengaged, devalued and bitter, and clients in the care of people who are not committed to positive outcomes.

Others explained:

> There appears to be a trend of more agency and casual pool staff working then permanent employment. This impacts on clients' health and well being. Increased assaults at work results from staff who don't know clients enough to support them especially clients with behaviours of concern. Job security and not being able to retire is impacting staff health and wellbeing. Working on weekends impacts on family togetherness. The pay scales have not increased but the cost of living has and staff are struggling to meet basic living standards.

> The hourly rate payable is so low that we have to take what we get in term of staffing. This is extremely dangerous in a sector that does not require any prerequisite qualifications, skills, or knowledge, and will undoubtedly (especially with such little time to effectively supervise staff) result in people dying either directly or indirectly from staff actions (or lack of action). The NDIA will see a devolution of large residential services, which are filled with trained and qualified medical staff, mental health professionals, psychologists, psychiatrists and social workers. The people from these places are going to NGO's who have untrained and unqualified staff looking after these highly vulnerable and complex people, most of whom have been in the disability sector for a couple of weeks by the time they commence supporting them, coming from fast food/hospitality services, newspapers, and (even scarier) security services where brute force was the preferred option of dealing with people.

The use of untrained staff was seen as a major risk:

> I feel that our ability to support Individuals with mental health concerns has been undermined and negated by the new methodology of the NDIS. New staff that have been employed to fill the newly created gaps, they are not trained and are creating confusion with out supported Individuals. Apparently there is no training funded for these new staff members which I find absolutely horrendous. I have studied for approximately 5 years in this position. I am very worried about how this will impact on the individuals that we support. Also, that the sector will not retain quality staff members.

9.3 Concerns about pay and conditions

Survey respondents expressed significant concerns about their working conditions and remuneration under the NDIS. These concerns are captured in the following statements, which highlight degradation of working conditions in a range of ways, through subcontracting and self-employment, use of private vehicles, unpaid administrative time, loss of hours, and loss of penalty rates:

> I am concerned about changes to my working conditions under the NDIS. Forced to use own vehicle to provide support. Associated costs e.g. business rego and insurance, cleaning, wear and tear. Not paid until I reach the home of my next client. Not paid for admin time. I believe that the NDIS can be beneficial for people with a disability and may offer great opportunities. However the disability support staff seem to be the ones that have to make all of the sacrifices, money, time and workload.

> I am concerned about there being sufficient work available and a possible big drop in pay and working conditions and the possibility the weekend pay rate dropping and the country taking a huge step back in time in terms of pay and workplace conditions and standards.

> I'm concerned that the 'hidden' rort of subcontracting will become the norm and already on the NDIA website there are banners excitedly promoting self-employment opportunities. Standards of care will drop exponentially and the people that will suffer will be the clients. I will not work for peanuts whilst putting myself at risk of physical assault and I think many long-term employees with many years experience will do the same.

Many explained how they had experienced degradation in their work-life balance, and associated work stress, lowering enjoyment of the work:

> In the past year our staffing has been cut back dramatically and the customers are not able to get all goals realised or quality one on one time with staff, also I am finding I am exhausted and on some days rushing aimlessly trying to complete all tasks pertaining to all customers within the daily time frame, it's becoming ridiculous. Starting to hate coming to work, some days. And that's just not who I am, I don't like what's happening to the industry, I hope the changes make work life conditions better once things settle down with the NDIS transition.

Indeed, the challenge of delivering quality services and supports were a reason people were leaving, including this respondent:

> I have just resigned as a NDIS LAC due to over work, lack of management support, focus on KPI's not participants , changing requirements in the job, lack of follow up / time for participants after planning session, huge discrepancies in $$$ attached to plans by NDIA planners for similar situations/disability.

Remuneration

Overwhelmingly, workers considered the pay they received to be inadequate given the level of complexity and risk in performing work in disability services, or were concerned that pay would drop as a result of the NDIS making remaining in the sector untenable:

> The NDIS does not allow employers to offer appropriate wages, especially high risk clients. $22-25 an hour for high personal risk - no way. I'd rather work at Woolworths.

> I enjoy the client contact and believe the pay is fair but would reconsider working in the sector if I was paid any less for what I do.

> The NDIS is only paying award wages and not what I am currently being paid. I fear that I along with many others, will be financially disadvantaged! I fear that quality of care will gradually deteriorate for the clients.

Many comments gave examples of poor employment and work organisation practices, including being employed at low pay grades and on short term or casual contracts. Some explained how changes in rostering had left them worse off, or that they were worried about how shorter shifts would erode their pay, for example:

> I am worried that the hours of work offered will consist of 1 to 2 or 3 hour shifts and hardly worth traveling for once you factor in travel time petrol and time wasted to get to other shifts.

> Recently, I had a roster change, a take it or leave it change even though I was already working a permanent roster, since then my yearly income has reduced by $8000. When I questioned this the coordinator said that [the organisation] doesn't care about penalty rates or your personal life outside of work. We have also been cut on weekends from 2 staff to 1 to look after 5 high support clients. Lack of support is getting worse.

Employment classifications

Several respondents identified how the NDIS had caused their organisation to downgrade their employment classification and freeze their pay rates. As one worker explained:

> I am concerned that the organisation I work for is trying to downgrade mine and co-workers grades by using the NDIS as an excuse to do so. They claim in order to be attractive to families to want to use us that it is better for us to be grade one or two rather than grade three as we are at the moment. I believe they are just in a race to the bottom with only their own company profits as their main focus. I have qualifications in disability as in a Cert 4 but they would prefer to employ people off the street with no experience and no qualifications because they are cheap. What sort of service is that going to be for our clients? It's a disgrace.

Similarly, others explained:

> My employer and many others in our region are reducing pay grades in anticipation of the roll out of the NDIS. For the last two years all new employees are paid at SCHADS 2.2 instead of the previous starting rate of 3.2. By attrition they are

> eroding pay rates in order to shore up their financial position to weather the end of block funding and the introduction of fee for service invoicing under NDIS. There now are almost no new permanent employment contracts and most new contracts are offered on a three month basis at the most.
>
> We have been advised that our hourly rate is higher than what the NDIS rate is so as grade 3 employees, we will be now classed as grade 2. We won't lose pay immediately however we won't be getting a payrise until grade 2 rates catch up to ours. We currently access cars from our organization on leaseback as we use our cars daily for our work. We are losing the cars too. We have also lost our first aid allowance and we no longer get our first aid training paid for by our employer. We are also concerned that we will only be paid per the actual hours spent with clients and not for the travel in between and office time etc. Currently I may only spend 6hrs directly with clients (3 clients at 2hr each) and am paid for my whole day 9am - 5.00pm as that reflects my roster.

Another explained how employers were attempting to save money by reclassifying disability work under the 'homecare' part of the SACS award, to enable shorter shift times:

> The casual nature of the work and the pay/minimum hours is very unsustainable. My employer claims it is legal to pay under the Homecare part of the award for some classifications of clients and therefore legitimise a minimum 1 hour shift. It is also very difficult to come to work (often travelling 30 kilometres) for a 2 hour shift, then having to wait around for the next shift 4-5 hours later. There is little consideration for the impacts on workers - the entire focus for the organisation is on filling shifts and building customer (participant) numbers.

Workloads and stress

As well as pay, many highlighted how their workloads had increased under the NDIS, or in anticipation of NDIS, resulting in high levels of stress:

> As a carer, I feel I am placed in impossible and stressful work situations - there are so few carers available that I feel compelled to accept work hours & travel times (often unpaid) due to a sense of obligation and loyalty to my clients. During many services, there is insufficient time to complete all I need to do and if I exceed the allocated time, I am not paid. I know my clients are very grateful and value my commitment but I feel carers are being taken for granted & have no voice at all.
>
> We are being loaded with more work and less time for the people we support and are told we just have to deal with it as its going to get worse for us support workers as it is now we don't have enough time in a day to do all they expect us to do and from management it is like it or lump it.
>
> I am concerned that our rate of pay will be less and we will be required to support more people eg instead of two per day face to face it may be increased to four, therefore decreasing the quality of support currently being provided. Also it appears that our organisation is going to be a mobile workforce and we will have to use our personal vehicles etc which will increase our personal expenses plus increase isolation of workers where we will not have the opportunity to debrief with each

> other face to face. Many more concerns. However the financial aspect is very concerning.

Many workers who responded to the survey linked their concerns to both transition to the NDIS and the associated privatisation which has occurred or which was pending:

> I am concerned that under NDIS we have to take on more clients as we are now privatised. There is a lot more pressure to take on new clients so that the case load has increased. There is less recognition of mental health issues that impact on our work. Before we could spend extra time if needed with a client in crisis, now it is all about hours and money. The pressure is immense and we are monitored to every minute via a carelink software system and we have to bill everything. I have never felt so pressured as I do now and the pressure is just not the clients but also the system that surrounds NDIS. I worry that whoever provides the cheapest service will get the clients and this it becomes all about money. Certainly the money and hours is what is now pushed and this seems to be the main thing. As a worker this is very disappointing and has changed the face of disability work for the worse.

> Concerned that the residents that I support will have a poor standard of care should [my organisation] privatise. I have supported the same client group for 10 years and know their support requirements, service providers and family well. I would seek different employment opportunities available to me if [my organisation] was privatised.

Concerns about unpaid work

A strong theme within workers' comments about the adverse impact of the NDIS on wages and conditions was the amount of unpaid work required. Employees expressed concerns that expectations of unpaid work were increasing, including for travel and administration which were necessary elements of service delivery. Examples of comments that focused on this are as follows:

> The system does not provide funding for anything other than direct support, therefore all the ancillary tasks such as note writing, documentation, communication with other stakeholders must be done in the employee's own time. In my case I spend at least one hour each day unpaid doing file notes etc. This needs to be looked at as all of this documentation is mandatory.

> My biggest issue has been agency work where you use your own car and do not get paid between jobs. Sometimes I have been paid 1-2 hrs for spending over half a day doing job related activities. I see conditions getting worse under these conditions.

Job security and underemployment

Many employees also expressed significant concerns about job security and the security of their shifts and income, in the disability sector and under the NDIS. One respondents, who provided disability services for more than one employer, explained:

> My jobs feel very insecure, I'm forced to remain a casual as part time jobs are less available and can drop my hourly rate to just $20. In every job I've had we are

> ALWAYS understaffed and torn between multiple employers. Support worker turnover is fast, especially when there are management issues and this is detrimental to the clients and their continuation of care. I love my work but I'm so shocked at how ruthless service providers can be!

Workers perceptions that hours were under pressure, and that shifts were not secure, were reflected in the following comments:

> In one role I am employed in they are not offering part time permanent positions only casuals and they have reduced my rostered time by 1/2 an hour each day.

> I started on a 136 hour a month contract and lowered it to 120 and was told I could always put it up if needed the hours are always there which was not true, they would not let me increase my contract. They have just hired people on a 8 hour a month contract and 30 hour contract and they pick up extra shifts. I have always tried to be a reliable and valued employee but not feeling it now.

> I am concerned that I may lose the stability of the current shifts that I have once the NDIS roll out. For example if the client cancel the support and giving enough notice to the organisation.

Others expressed similar sentiment:

> I am a single parent and am worried that I will not maintain my current level and entitlements and salary which will affect me and my family directly.

> My concerns are job security and my future employment I still have almost 30 years of work ahead of me so it's important now!

> Currently not getting enough hours since the introduction of NDIS because of the 10hrs break in between shift that they just introduced

Together, these responses reflect significant concerns among employees about a wide range of quality and employment issues seen to arise from the NDIS, or which workers were anticipating would arise from rollout in their area.

10. Conclusions

Overall, these findings provide insight into the characteristics and experiences of workers in the disability service sector and in particular, their experiences of working under the National Disability Insurance Scheme. While differences between those working under the NDIS and other disability workers were not consistently evident, the results show a range of quality and workforce risks of the Scheme. While workers' primary concerns were with falling standards of service for people with disability, the survey also shows workforce problems such as high supervisory loads under the NDIS, multiple job holding, and major concerns about job quality, work time and financial security. Moreover, the regression analysis suggests that for this sample of highly experienced workers at least, decent pay and job security are associated with higher perceptions of outcomes for NDIS participants.

The findings indicate the importance of working conditions in the disability sector, and the links between working conditions and the quality of service provision. The results suggest some ways forward, including keeping supervisory loads at reasonable levels, and ensuring experienced workers are retained in the transition to the NDIS. This could be built on with an ongoing and ideally longitudinal program of research, to monitor workforce issues and working conditions in the disability sector through the process of change, and to assess the impact of interventions to improve working conditions and workforce quality and sustainability as a determinant of high quality disability services.

Reasonable, necessary and valued: Pricing disability services for quality support and decent jobs

Executive Summary

Research aims

This report is concerned with prospects for quality services and decent jobs under Australia's National Disability Insurance Scheme (NDIS). Specifically, it examines how the prices set by the National Disability Insurance Agency (NDIA) are:

- affecting disability support workers;
- enabling employers of disability support workers to meet their industrial obligations; and
- supporting development of a skilled, high-quality, and decently remunerated disability support workforce.

Data sources

To understand and assess NDIS pricing arrangements, data was collected from several sources:

- Government policy documents, industry submissions and reports were used to understand the structure of NDIS prices relevant to disability support work, and the assumptions underpinning price setting.
- These documents, along with findings from a survey of CEOs of not-for-profit organisations registered to provide NDIS services in NSW, were used to understand how pricing arrangements are shaping employers' decisions about the types of employment opportunities and services on offer.
- Interview and survey data from employees helped capture the experiences and perspectives of workers providing disability services under the NDIS. This enabled assessment of how pricing arrangements are affecting working arrangements and disability support workers' capacity to deliver quality services under the Scheme.

Key findings

Together, the data shows the range of ways that disability support work has been under-priced in the NDIS. Prices for disability support work set by the NDIA according to the 'Reasonable Cost Model' do not enable minimum Award conditions to be met, and prevent employers who offer above-Award conditions from meeting their legal obligations. Prices do not account for what is required to deliver high quality services, and arrangements are not fully enabling disability support workers to deliver services which are personalised, co-ordinated, responsive or safe. Quality is likely to diminish in the process of NDIS expansion. Particular issues include:

- Prices do not recognise the time needed to deliver quality services to NDIS participants. As a result, disability support workers are under pressure to work intensely in their jobs and have inadequate time to build relationships with participants, follow up on participants' needs, co-ordinate and communicate with supervisors and other workers, complete paperwork, debrief,

and handover between shifts, all resulting in lower quality support and increased risks for participants.

- Prices are not covering the induction and training required to enable staff to address the health and other complex needs and behaviours of participants, raising the risks that NDIS participants' needs will not be met. Some staff have been required to train in unpaid time or to personally cover the costs of mandatory training.
- Prices are limiting the pay and career progression of support workers and supervisors. Prices assume low Award classifications and do not account for the remuneration levels required to attract experienced staff or to encourage upskilling.
- Many disability support workers have very fragmented working time. Multiple very short shifts with unpaid time between them results in long working hours and inadequate time for rest. Unpredictable working time is also contributing to poor work-life balance.
- Pay for disability support work is low, exacerbated by under-classification and underemployment from short shifts. Low pay is undermining efforts to expand the workforce.
- Casualisation is contributing to financial insecurity for staff and worker turnover, disrupting services and exacerbating risks for participants.
- Physical injuries, exhaustion, stress and other negative psychological impacts arise from combinations of unsafe working conditions, high work intensity, overwork, lack of support, and workers' recognition that participants are not receiving the quality of supports they deserve.

Impact of NDIS prices for disability support work

While the NDIA will increase prices for 2017-18 in line with minimum wage and cost of living increases, these changes do not overcome underlying problems in the structure of prices, which are shifting the costs of provision onto workers and undermining quality. Although disability support workers' commitment to NDIS participants means they frequently perform unpaid work to compensate for under-resourcing, the level of under-pricing is such that the quality of supports is inevitably diminished.

Pricing is undermining quality in a range of ways, including through the loss of co-ordinated team approaches to support, lack of time for communication among workers and supervisors, reduced oversight and safeguarding, and increased casualisation. Promoting choice and control of people with disabilities is an important policy principle. However, to put these principles into practice requires that frontline staff have access to the resources needed to build strong relationships and tailor services to individual needs.

A disability support system predicated on cost-shifting onto low-paid workers is unsustainable. Under current conditions, it will be difficult to expand the disability services workforce, placing the supply of quality services at risk. Prices need to properly recognise and value frontline workers, and provide incentives for service providers to employ, support and retain a workforce capable of providing high quality services and supports.

1. Introduction

This report provides new evidence of how NDIS prices are contributing to service quality and workforce risks. It is structured as follows.

- The first section provides background information about the NDIS (Section 1.1), and explains the significance of NDIS prices (Section 1.2) and our focus on the prices for services and supports involving disability support workers (Section 1.3). We then outline the evidence on which the work builds (Section 1.4), and explain the multiple methods used in the study (Section 1.5).
- Section 2 shows evidence of the general pressures experienced by employees (Section 2.1) and employers (Section 2.2), arising from NDIS pricing arrangements.
- Having established that prices are causing difficulties for disability support workers and providers, we then turn to examine NDIS pricing in detail, outlining the base hourly price and circumstances under which it is varied (Section 3), followed by a more detailed analysis of the assumptions made in setting prices for the services and supports provided by disability support workers (Section 4).
- Section 5 then outlines evidence collected from workers and employers to show the impact of the NDIS and in particular, how pricing arrangements are failing to recognise the time support workers need to complete the mandatory and essential aspects of their work, as well as for co-ordination, relationships and professional development.

Overall, this shows that although many disability workers compensate for under-resourcing by performing unpaid work to ensure participants' needs are met, the systematic under-pricing of disability work in the NDIS contributes to high levels of risk in the service system (discussed in Section 6).

1.1 About the NDIS

The National Disability Insurance Scheme (NDIS) has been repeatedly described as Australia's largest social reform since the introduction of universal national healthcare (Gilchrist, 2016; NDIA, 2016b; Productivity Commission, 2017). It follows decades of activism underlining the importance of self-determination for people with disability, and the inadequacies of underfunded, paternalistic and inequitable models of support provision (Productivity Commission, 2011). The NDIS seeks to overcome the inadequacies of previous arrangements by promoting client choice and control through a market model, broadly following examples of consumer-based reforms in other liberal welfare states (Riddell et al., 2005; Ungerson, 2004; Wilberforce et al., 2011).

Rather than directly providing services or contracting commercial or not-for-profit providers to provide services to NDIS participants, the government, through the NDIA, funds individual packages of supports for eligible people with disability, to meet their individual needs. Once

allocated a plan, NDIS participants[1] are assigned a budget to meet the service and support needs which were deemed 'reasonable and necessary' by the NDIA, and contained in their individual plan. Providers are paid from consumers' allocated funds on invoice at rates currently set by the NDIA, although some items require approval of the NDIA following a quote. The majority of Scheme costs are arising from meeting participants' needs for assistance with daily living (NDIA, 2017c) and, as such, the rates set for this set of supports are particularly important for participants, providers and the ongoing sustainability of the Scheme.

The Scheme is ambitious in scale, with the individualised fee for service model intended to replace most programs which were previously block funded by the Australian Government or the States and Territories. The program will support an estimated 460,000 people by 2020, including many people with previously unmet needs (Buckmaster, 2017). It is expected to create 20 percent of all new jobs in Australia in the process of transition to the Scheme (Productivity Commission, 2017, p. 22, citing Bonyhady, 2016, p5.). Associated, the cost to governments is projected to increase from $4.2 billion in 2016-17 to $22 billion in 2019-20 (Buckmaster, 2017) and, although the intention was that participant plans be fully funded, cost containment is quickly becoming the dominant Scheme priority (Productivity Commission, 2017).

A managed market

Essentially the NDIS establishes a managed market, shaped through the activities of government. The NDIA, as the statutory agency responsible for implementing the Scheme, effectively 'constructs' the market through:

- Demand levers, including:
    - determining eligibility using parameters set under the NDIS Act;
    - working with participants to assess their needs and form a plan; and
    - funding participants' packages at particular levels; and
- Supply levers, including:
    - registering organisations and individuals able to provide support to NDIS participants[2]; and
    - setting the maximum prices that registered providers can charge for supports, which shapes providers' viability and decisions about supply.

In future, the market will also be shaped by additional quality and safeguarding arrangements, with the NDIS Quality and Safeguards Commission planned for 2018 intended to handle complaints and investigate incidents, with worker screening left to the States and Territories (DSS, 2016).

How the NDIA, as market manager, uses these levers establishes the resource environment for the NDIS and shapes the extent to which the Scheme can achieve goals of independence and

[1] We use NDIA term 'participant' to refer to someone who is receiving services under the NDIS. The term 'client' or 'service user' is used in the report where it has been used by others, such as service providers or workers in interviews, or to refer to people using disability services but not as part of the NDIS.

[2] Note however, that participants who self-manage are not required to use registered providers, so can source services and supports from organisations which are not NDIS registered or bound by NDIS prices.

wellbeing for participants. As with social care in the UK and elsewhere, there are risks of rationing and under-provisioning arising from restrictions to eligibility, poor quality planning and cost containment through price controls (Lewis & West, 2014). Indeed, Australian evidence is emerging that NDIS plans can be highly variable and may not necessarily fully or fairly recognise participants' support needs (Browne, 2017; Warr et al., 2017). On the supply side, providers may avoid providing less lucrative services or operating in areas in which they are less viable, contributing to 'thin markets' (Senior Officials Working Group for the Disability Reform Council, 2015). Quality risks may arise from registration of unscrupulous or otherwise low quality providers, or from poorly developed accountability and enforcement arrangements. Setting prices too high risks enabling profiteering and low value for money for participants, while setting them too low will make it difficult for service providers and workers to deliver services at acceptable levels of quality (NDIA, 2017a; Productivity Commission, 2017).

1.2 The significance of NDIS prices

Although risks to quality can also arise from other elements of the NDIS model, we are concerned with how NDIS prices are shaping the supply of disability services and supports, and impacting on disability support workers and the quality of support they are able to provide.

NDIS prices are significant as they are the prime means of determining the levels of funding allocated to participants to purchase the services and supports deemed ‘reasonable and necessary’ in their plan. They also set a limit on what providers can charge, although in some circumstances providers may obtain NDIA approval to fund supports over these levels. The NDIA claims that it sets prices to maximise value for money for participants, and to give providers flexibility, reduce risk of business failure and attract new providers to the sector (NDIA, 2017a). To do this, the intention is that price caps strike a balance for consumers and providers, being ‘as low as possible (but still achievable by providers)’, yet higher than a ‘theoretically efficient level’ to be achieved in the future (NDIA, 2017a).

A series of lengthy documents set out prices for different kinds of services and supports that can be provided under the NDIS. Prices for ‘core’ supports such as assistance with self-care, daily living and accessing the community are derived from a base hourly price, which is varied in some circumstances according to geography, intensity, time of day and week, number of people being assisted and the specific type of service (NDIA, 2016c, 2016d). The base hourly price is derived from the NDIA’s ‘Reasonable Cost Model’ (RCM), developed by a Joint Working Group comprising the NDIA, National Disability Services (the peak body for not-for-profit service providers) and consultants. The RCM has been described as a ‘bottom-up’ model (NDIA and NDS, 2014, p. 10) or ‘ground-up’ model (NDIA, 2014, p. 2), in that it was developed by seeking to identify and quantify all of the costs involved in providing eligible people with disability with assistance with self-care activities and assistance to access the community (NDIA and NDS, 2014, p. 2). The RCM consists of a range of components, each based on a series of assumptions. It claims to set prices at levels ‘sufficient to cover the efficient costs of a reasonable quality support provider’ (NDIA, 2014). Indeed, prices are intended to cover the full costs of providing supports deemed ‘reasonable and necessary’ in participants’ plans, so that user co-payments will not be required, and so that providers can grow capacity (NDIA, 2016c).

The NDIA regards the current prices to be transitional, and its role in price review[3] and price setting to be temporary, as part of a phase of change leading to a fully deregulated market[4]. The NDIA proposes to eventually deregulate prices, although price setting looks set to remain a feature of the Scheme for a decade post full Scheme rollout (DSS, 2017). [5] The vision is that ultimately the NDIA will not play a price setting role, as the 'mature' marketplace will determine the prices of supports.

1.3 Focusing on NDIS prices for disability support work

This report focuses on prices for disability support work, and explores how these prices affect prospects for decent working conditions and for support workers' capacity to work with participants in co-ordinated, responsive and respectful ways. Disability support workers are important as they work at the frontline, providing direct support and assistance to people with disability to meet daily living needs, and participate in the community. Disability support workers are also numerically significant in the disability service workforce, and financially significant to the Scheme. Indeed, most funding for NDIS plans is associated with assistance with daily living, which involves the direct care and support that disability support workers provide: 69.3% of funds in the Barwon trial site and 78.9% of funds in the Hunter site were dedicated to this set of supports (NDIA, 2017c).

1.4 Building on existing evidence

Material in this report builds on existing evidence about the place of the workforce in consumer-centred reform of human services and how frontline disability workers are faring in the process of change. Prior to the NDIS launch, research highlighted possible workforce risks associated with individualised funding models (Cortis, Meagher, Chan, Davidson, & Fattore, 2013). That review pointed out how few studies have captured the perspectives of workers, despite their central place in delivering services and implementing change, and despite accumulating evidence associating individualised funding models with risks for workers. These risks relate to service continuity and job security, income security, skill development, health and safety, and rights to voice and representation.

In the last few years, there does not appear to have been a significant expansion of the Australian or international literature; however, there has been considerable public focus on outcomes for support and care workers of the market-based social care system in the United Kingdom under very tight financial constraints (e.g. House of Commons, 2017). Although some research has identified links between pricing and workforce risks (e.g. Mavromaras, Moskos, & Mahuteau, 2016) relatively little scholarly attention has been specifically dedicated to the detail of this interface.

[3] Various reviews include: Personal Care and Community Participation 2016-17 Price Review - Discussion Paper (NDIA, 2016d); Context for 2016-17 NDIS Pricing Decisions (NDIA, 2016a); Summary of new and updated price arrangements for 2016-17 (NDIA, 2016e) . Further reviews are underway or planned.

[4] Recent changes include: in 2016, the hourly price for one-to-one support was increased by 3.9% in eastern states and 1.9% in other states and territories. Remote and very remote loadings increased to 18% and 23% and supported independent living prices in all areas were increased by 3.9%. Prices for most other supports increased by 2%. Prices were deregulated for participants who were self-managing their plans (around 8% of participants as at 30 June 2016 (COAG Disability Reform Council, 2016).

[5] The NDIA has stated its transitionary 'glide path' to an 'efficient' and eventually deregulated price allows for Equal Remuneration Order adjustments but no cost increases above this (NDIA, 2016e).

Since the review by Cortis et al (2013) the literature continues to highlight how individualised funding can shift risk from employers to workers. Macdonald and Charlesworth (2016) point out how employment outcomes under the NDIS depend on the underlying cost containment agenda and how services are regulated and monitored. Mladenov, Owens, and Cribb (2015) point out that although personalisation and consumer based funding embody ideals of both social justice and marketization, priorities of marketization can over-run social justice considerations. In relation to recent experience in the United Kingdom (UK) they suggest personalisation has been used as an ideological cover for austerity. The UK experience has continued to highlight the employment risks associated with low prices for adult social care services including disability support (Equality and Human Rights Commission, 2013; Rubery, Grimshaw, Hebson, & Ugarte, 2015) and inadequate employment regulation (Hayes, 2015), with poor quality jobs for support and care workers going hand in hand with increased risks for the quality of support provided to consumers (Commission on Dignity in Care, 2012; HM Government, 2012). Australian service providers have also recently identified job quality as a risk for service quality under the NDIS (NDS, 2016, p. 29).

In their review Cortis et al. (2013) identified uncertainty of demand, increased demand at short notice, increased administrative burden and higher transaction costs as some of the pressures likely to adversely affect workers as organisational costs and risks are passed on. The pressures on providers of the low price for one-on-one personal support under the NDIS (NDS, 2016, p. 26) can be added to these pressures, although to date there has not been any detailed scholarly analysis of the shortcomings of different elements of the price.

This report also builds on overseas research showing how, under consumer-based funding, providers have shifted risks and costs onto workers. This has been well illustrated in examples of two Scottish not-for-profit providers documented in recent case studies (Cunningham, 2015, 2016). In moving to personalised social care (and facing effective cuts to service funding of up to 25%) the organisations reported losing money on delivering services or having to subsidise service delivery from organisation resources. Both organisations closed some services but also responded to these pressures by reducing staff numbers or demoting staff to lower skill and pay levels, cutting pay rates, hiring new staff at lower skill levels, increasing the use of casual and zero-hours contracts, introducing split shifts, reducing paid leave and pension conditions, intensifying work, increasing full-time weekly hours, reducing training and/or charging employees for training, and reducing supervisory and management positions. The impacts on social care workers included reduced morale, reduced real and nominal pay rates, longer working hours, reduced leave, more fragmented work days and weeks, reduced training and development opportunities, reduced career prospects and greater employment insecurity.

These types of organisational responses and consequences for workers can be seen more generally in the adult social care sector in England. Cost pressures underlie the failure of some social care providers to pay social care workers the national minimum wage. Indeed, up to 220,000 social care workers have been estimated to be earning less than the minimum wage (Hussein, 2011). Key contributors include unpaid travel time, unpaid time spent in training and supervision, unpaid time assisting service users in emergencies, and overrun in support time beyond that which is recognised in hourly prices (Hayes, 2015). An investigation into 80 providers (HM Revenue and Customs, 2013) found that almost half (47%) were not compliant with National Minimum Wage regulations, while the Low Pay Commission (2016, p. xxvii) recently singled out social care workers

as particularly at risk due to employer non-compliance with minimum wage regulation. Social care work in England has very high levels of employment on ‘zero hours contracts’ meaning workers do not have stable hours or stable incomes; in 2016 it was estimated that almost a quarter (24%) of adult social care workers and a half (49%) of domiciliary (homecare) workers were employed on zero-hours contracts (Skills for Care, 2016, p. 28).

Early findings from the evaluation of the NDIS pilot sites suggest that the low NDIS price may be leading to the emergence of similar issues in Australia. The interim evaluation found increased use of casual and contract staff by providers in trial sites compared with non-trial sites (Mavromaras et al., 2016). In interviews, service providers reported difficulties in meeting industrial relations responsibilities due to low prices; increased use of casual and contract arrangements for support workers; reclassification of support roles at lower pay and skill levels; increased staff workloads; and increased problems with recruitment and retention including the loss of skilled staff. Providers were delivering less training and supervision than they had been at the beginning of the trial. Together, these factors were reported to be resulting in concerns about the declining quality of support.

1.5 Methods

To build on this evidence and assess whether NDIS pricing arrangements enable providers to meet their industrial obligations and provide decent employment opportunities, information was drawn from a range of sources.

Review of pricing arrangements

Reports from the NDIA, Productivity Commission and other government agencies were collated and analysed to understand the design of pricing arrangements, and their underlying assumptions. Explanation of the NDIS Reasonable Cost Model (RCM) is primarily contained in the key documents published in 2014 when the RCM was established (NDIA 2014, NDIA & NDS 2014). Subsequent NDIA documents explain changes in assumptions and variables in the RCM (NDIA, 2016e) including detailed annual Price Guides issued by the NDIA (NDIA, 2016c, 2016d). Primarily drawing on these documents, an analysis of the RCM was conducted to identify in detail the elements of the model and the assumptions and data used to generate the base hourly rate and the current price guides, with a particular focus on prices for disability support work.

Alongside analysis of pricing arrangements, we analysed reports and submissions of service providers and their peak bodies, including National Disability Services (NDS).[6] These reports and policy documents helped deepen understanding of the assumptions underpinning NDIS pricing arrangements and their impacts, and to identify any evidence about employment issues and challenges evident under current pricing arrangements.

Interviews with workers providing disability services

To explore how NDIS pricing arrangements are shaping workers’ experiences and perceptions of delivering disability services, the research analysed interview data from 20 disability support

[6] Documents included providers' submissions to the NDIA's *Personal Care and Community Participation 2016-17 Price Review Discussion Paper*, obtained under Freedom of Information.

workers—including some team leaders and supervisors—delivering services in the NDIS trial sites of Barwon, Victoria and in the Hunter, NSW.

Of the 20 interviewees, 8 were workers providing support to people participating in day activity centres, group homes, and providing personal support in the community or working as support co-ordinators. These interviews were conducted in February and March 2017 with interviewees recruited with the assistance of the unions commissioning the project. The other 12 interviews were undertaken between November 2016 and February 2017 by RMIT researchers. These interviews were with workers providing personal support and assistance to people with disability in the community and in private homes. Discussion of these 12 interviews draws on a working paper presenting work in progress by Bentham and Macdonald (2017) (attached to this report as Appendix A: CPOW Working Paper 2017-1).

Interviews centred on what workers thought was needed to ensure good quality support for people with disability who accessed their services and how they saw the NDIS impacting on the quality of support they and other support workers are able to provide, and on their job quality. While the interviewees identified positive changes for some people with disability as a result of the NDIS they also identified significant problems, many of which relate to NDIS pricing.

Interviews were audio-recorded and transcribed. Key themes, and excerpts of the interviews which illustrate them, are presented in this report. Case studies are used to give more in depth information about how individual interviewees experienced their work. More information about the methods are in Appendix B and Appendix C.

Survey of disability workers

A survey of disability services workers was conducted by the three unions, and findings were provided to the research team for analysis and inclusion in the report. Responses came from 1476 people working with people with disability. Of these 74% were female, and around a third were aged over 55. Around a quarter said they supervise other staff in their current role. As the survey asked if workers deliver services in an NDIS area or to NDIS participants, perceptions can be compared for those working under NDIS providers and others. A little over half of respondents (54.7%) were working in an NDIS rollout area or with participants of the NDIS.

Further details about the methodology, key characteristics of the sample, and supplementary data are provided in Appendix F. Additional analysis is available in Cortis (2017). Some material from this survey was also reported by Health Services Union (2017).

Survey of employers

Information about providers' experiences was drawn from a survey of CEOs of not-for-profit community service providers in NSW, conducted in February 2017 (Cortis and Blaxland, 2017). This is supplemented by information from policy submissions and other public documents. Of the 398 organisations whose CEOs responded to the survey, 135 (33.9%) were registered to provide services under the NDIS. These registered providers were asked specific questions about perceptions of NDIS pricing arrangements. These survey items were followed with the open-ended question ‘Do you have any other comments on what NDIS means for your organisation and staff’. Full findings are reported in Cortis and Blaxland (2017). This information was used to understand

how organisational leaders were experiencing the pricing model, and any differences in perspectives among different types of NDIS providers. Supplementary tables are in Appendix G.

2. Experiences of delivering services under NDIS

This section presents an overview of how employers and employees are experiencing the NDIS and observing that problems are arising from current pricing arrangements. First, data from employees shows that, despite their high commitment to people with disability and to principles of consumer rights and control, many disability workers are finding it difficult to achieve what they consider to be acceptable standards of quality under the NDIS model, and do not see it as positive for people with disability or their families (Section 2.1). Providers are also experiencing difficulties operating under NDIS pricing arrangements (Section 2.2). This material highlights how both employees and employers are finding it difficult to work under current arrangements. It provides a basis for our closer examination of the design of the pricing model and the assumptions underpinning it, in Sections 3 and 4. The adequacy of these pricing arrangements is then assessed, based on the experiences of service providers and employees who have been working under the NDIS (Section 5).

2.1 Employees' experiences of service delivery under NDIS

Both the interviews and the data from the employee survey show that employees are finding it difficult to deliver quality services under the NDIS. The interviews show how frontline disability services workers are very positive about the key focus of their jobs: providing support and assistance to people with disability. All employees spoke of the satisfaction of working closely with people and supporting them to gain independence and to live fulfilling lives. They also spoke of enjoying many of the challenges of their work that required them to be creative and to resolve problems to best support the people they worked with. The fulfilling nature of working closely with people with disability and helping them achieve milestones in their lives is explained by this interviewee:

> I find it immensely rewarding that, through my work, I can support someone and achieve maybe a small milestone.. …And it's just, it keeps you on your toes that you've got to think beyond the box, well okay, if that's not going to work maybe we should try that and in that I find that challenging. You get someone to laugh or you get someone to (achieve a personal milestone), it just seems to, it just gives me a fulfilment, I suppose. (Employee 1)

That workers valued making a difference in the lives of people with disability lives was also highlighted in Bentham and Macdonald (2017), for example:

> (I)t's good to wake up every morning and think that you have the opportunity to influence somebody's life today and that you can choose to make that a positive influence, and help someone with their goals that otherwise without you they wouldn't have been able to do. (DSW22, Bentham and Macdonald, 2017)

When asked about the qualities necessary for providing good support to people with disability, workers identified the importance of skills acquired through training and preparation for the specific needs of the individuals they were working with; being able to respond to individual needs and

goals; and having respect for clients and for their independence. However, the interviewees also explained how it was difficult to provide services in ways that met their ideals of quality support under the NDIS. Many pointed to lack of time to develop familiarity and trust which are well recognised in practice scholarship as the basis through which clients and workers attune to each other to negotiate individual-centred support (Denton et al., 2015; Rugkasa et al, 2014). Interviewees also identified a lack of consistency and co-ordination in teams, lack of flexibility and spontaneity to address clients' needs, and lack of safeguards.

Exemplifying several of these themes, a support co-ordinator with almost 20 years' experience in the disability sector explained how she observed difficulties meeting the needs of people with disability under the NDIS, largely because of a presumption that participants can access kin-based care and because of time pressure and fragmentation between systems and workers:

> Whereas previously there's been a lot of time to work with people in a more person-centred way, get to really know them, what their goals are, how we're going to help them, and support them to achieve those goals. …(Now) (t)here are a lot of participants out there that you feel really concerned about because their family may not have capacity to provide for their disability support needs, and you're working a really complex system I suppose where there's lots of different isolated systems, trying to work together to support somebody and it doesn't always work very well... (Employee 5)

When asked about the impact of the NDIS on participants, workers noted that increased choice was benefiting some people with disability. However, experienced employees who had been working in the NDIS trial sites highlighted some negative impacts on the quality of support and assistance provided. They felt there was reduced scope to provide quality support, and that the pricing model was a key contributor. When asked about the quality of support that participants were receiving under the NDIS, one interviewee expressed concerns that were typical: that although staff were trying their hardest, the resources available under the NDIS and the emphasis on economic efficiency precluded quality provision:

> I suppose there were a lot of people who weren't getting supports (prior to NDIS), and we were very aware of that. And to be honest, for some people the NDIS has been the best thing that's ever happened. … (But) If you want to provide a quality service, you can't provide it for the hourly rate that the NDIS has determined… I mean I know from working in this organisation that we do absolutely the best we can as far as providing an excellent quality service. But I think it's problematic where maybe there's too much counting of money. And an unwillingness to be flexible, and creative, and yeah, it's just really challenging. I can't see it as being a positive thing, really, to tell you the truth. It's really quite depressing. (Employee 4)

Employees identified only negative impacts of the NDIS on the quality of disability support jobs. Many of the negative impacts they experienced relate to funding and the pricing of disability support work, which reduced resources available, fragmented service delivery arrangements and increased the prevalence of short hours and casual positions staffed by people with little experience or training. Of the 20 workers interviewed seven said they were taking active steps to

leave their current jobs—including six who said they were leaving disability work altogether—while several others were thinking about leaving.

As well as low pay and underpayment, employees highlighted interlinked problems of extended and fragmented working days and weeks, including: unsocial hours and weekend working; a lack of days off; unpaid work; inadequate or no training; poor supervision and/or organisational support (especially for new employees); increased work intensity and overwork (often unpaid); casualisation; stresses caused by a decline in the quality of supports and risks to participants' safety; and additional health and safety issues for staff. These factors contributed to workers' intentions to leave. One support worker described how the combination of stresses related to seeing the decline in quality of support for her clients, together with all the other negative aspects of the job, made it difficult to stay even though—and largely because—she was deeply committed to her clients:

> I'm waiting to see how things pan out but, and I know a lot of staff are anxious about how (the NDIS) is going to work for our clients. But if it really goes downhill, and it breaks my heart to see what's happening with our clients, I don't know that I could stay. The stress would be too hard. I have actually looked at what, how much people at Safeway and Big W get paid, I have actually looked into that. *Interviewer: And what did you think?* Oh well you go to work… you do your job and that's it. You can leave it all at work. You're not ringing up and saying how's such and such doing and, when you come back in the next day, well how did that all work out, what did the doctor say about this, what's the policies and procedures we're following now, signing for medication, signing for money… you walk in, you walk out. (Employee 1)

Data from the survey of disability workers corroborates the concerns expressed by the interviewees. While many respondents working in NDIS rollout areas or with NDIS participants were unsure or neutral about the impact of the Scheme, only a minority agreed it was generally having positive impacts on participants (see Figure 2.1). Around a quarter agreed or strongly agreed that 'the NDIS has been positive for the participants I work with', but many more (37.8%) disagreed. Around half of respondents were unsure or neutral on the issue of whether families of participants were happy with the Scheme, but many more disagreed than agreed (35.7% compared with 14.6%). Similarly, 43.2% disagreed with the statement that 'The NDIS is better than the previous system', while 15.7% agreed.

A breakdown by service type, which shows that across all service types more respondents disagreed than agreed, is provided in Appendix F: Details and supplementary data from worker survey.

2.2 Employers' difficulties operating under NDIS prices

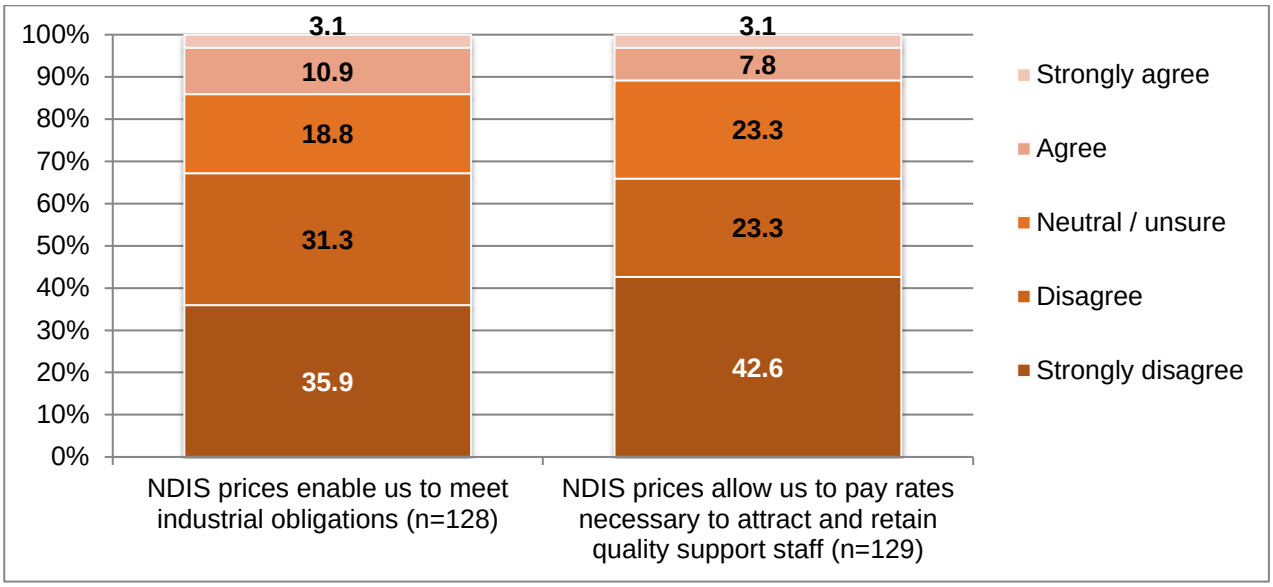
Like the employees interviewed and the workers who took part in the survey, employers have also reported that approaches to NDIS prices are not conducive to quality service provision. The peak body for not-for-profit disability service providers, National Disability Services (NDS), has argued the NDIA's approach places too much emphasis on managing disability markets through price setting, with low prices for disability support causing providers to carry the burden of cost-containment (NDS, 2017). National Disability Services has argued that prices are too low to cover providers' overheads and the margin necessary to cover future costs, and, as such, the pricing mechanism precludes existing providers from developing the additional service capacity required to meet demand (NDS, 2017). Based on surveys of their members in 2016, they found two in three providers agreed or strongly agreed that they would be unable to provide services at the prices offered under the NDIS (NDS, 2016, p. 15). Close to half of providers (46%) agreed or strongly agreed that quality would need to fall in order to provide services at the prices offered (NDS, 2016).

National Disability Services also found that, in 2016, aligning NDIS prices with the actual costs of supply were the highest priorities for 58% of NDS members (NDS, 2016). They have articulated the need to increase one-to-one support prices, establish a mechanism to set more appropriate prices for services delivered to participants in groups, change prices to more accurately reflect jurisdictional and geographical differences in costs, and set prices that better reflect complexity of support (NDS, 2016, p. 24). They have also reiterated the Auditor-General's concerns that the design of the Scheme failed to consider possible conflict of interest between the NDIA's role as both funder and price regulator; that is, that low price setting could be used to achieve funding goals of containing costs, rather than recognising the costs of service provision and providing adequate resources (Auditor-General, 2016; NDS, 2017).

The arguments of NDS and employers, however, have not closely focused on the link between price levels and workforce issues. To explore this in more depth, specific questions were asked about workforce management under NDIS pricing arrangements in the survey of not-for-profit CEOs conducted in NSW as part of a larger survey that is reported in more depth in Cortis and Blaxland (2017). Figure 2.2 shows that overwhelmingly, employers delivering services under the NDIS are finding that NDIS prices are undermining their capacity to operate as 'good' employers:

- 2 in 3 (67.2%) CEOs disagreed with the statement ‘NDIS prices enable us to meet our industrial obligations’ and only 14.0% agreed. 18.8% were neutral or unsure, showing that a substantial proportion are uncertain about pricing adequacy.
- 2 in 3 (65.9%) CEOs disagreed with the statement ‘NDIS prices allow us to pay rates necessary to attract and retain quality support workers’ and only 10.9% agreed. Almost 1 in 4 (23.2%) were neutral or unsure, again showing a high level of uncertainty about the operating environment.

Figure 2.2 Registered providers' perspectives on pricing (%)



Source: Survey of Employers, see Cortis and Blaxland (2017)

In the open-ended survey question, there was some recognition that pricing arrangements depend on the type of service and practitioner employed. In general, pricing was most problematic for organisations employing support workers, as those employing allied health practitioners received prices more attuned to actual costs. Several organisations made general comments on the difficulties they faced in managing and developing their workforce under the NDIS, for example:

> There is still considerable uncertainty in relation to how we can best manage our workforce under an NDIS - balancing choice and control for participants

> whilst still meeting industrial and professional obligations under existing NDIS pricing. (CEO of medium sized non-metropolitan service[7])

Others delved deeper to focus on particular areas of difficulty arising from the price. These respondents focused on the amount of activity required of the organisation which was not paid for under the NDIS (including administration and travel time), the difficulty of skilling staff, and the need to subsidise provision from other sources. Typical comments included:

> An enormous amount of backoffice work that is not paid for by the NDIS (CEO of small non-metropolitan service)

> Covering travel cost is a major concern as most of the clients we support live in rural remote areas. Without adequate funding to cover travel, our service may not be able to continue to provide support to clients in these areas. There are no other services in some of the areas we provide support in. (CEO of medium sized non-metropolitan organisation)

> Low NDIS prices are causing staff to be employed on lower wages, making it difficult to attract and retain quality staff. This will lead to decrease in quality services provided to people with disability. Staff will receive less training to the detriment to the people with disability. (CEO of medium sized non-metropolitan organisation)

Providers' comments were, however, imbued with commitment to the principles of choice and control underlying the NDIS, mixed with disappointment about the Scheme and uncertainty about prospects for future provision. For example:

> Whilst we agree that the NDIS is the greatest social reform since Medibank, it is chaotic, underfunded, poorly priced and with almost daily changes in rules and policy. We fear that it will lead to a deskilling of our workforce and we cannot yet identify how the pricing will permit the essential back office operations. We have been providing NDIS services for over two years, but almost every package has to be subsidised from our diminishing equity. (CEO of very large multi-state organisation)

Many linked the NDIS, and NDIS prices, in particular, with a range of workforce challenges:

> The hourly rate is unsustainable and does not allow funds for training or CPD[8] or staff meetings or supervision. This all is covered by the org as a commitment to maintaining quality. Hours cannot be guaranteed so we look to a casual workforce in our regional areas, we cannot meet demand with staffing and are constantly short staffed. Travel is a nightmare in regional

[7] Organisations with less than 20 staff are described as small, those with 20 to 50 staff are described as medium, those with over 50 are described as large, and those with over 200 staff are described as very large.

[8] Continuing Professional Development

> areas with agencies needing to pay mileage as well as travel time. (CEO of medium sized non-metropolitan based)

Another focused on the failure of NDIS prices to reflect providers' industrial requirements:

> The lack of alignment between how NDIS is funded and employers obligations under the Modern Award (particularly in NSW with higher rates under transitional arrangements) make it incredibly difficult to attract and retain quality staff and operate at a level of efficiency and quality that is sustainable (Human resource manager in very large multi-state organisation)

Another explained how the NDIS had diverted the organisation from its focus on quality, to its focus on market share:

> Competition between other providers and an unspoken message that staff needed to try and ‘win’ business to secure their own work changes the nature of our organisations focus from providing quality services to splitting attention to having to ‘capture’ business. I believe this may have counterproductive consequences to the overall industry and depersonalisation of our sector in the future. (Senior manager in large multi-service, multistate organisation)

As the data presented so far shows, both employers and employees note a range of difficulties of working under the NDIS and of the NDIS pricing arrangements. To explore these issues in more depth, the remainder of the report introduces the design of NDIS prices (Section 3) then details the assumptions underpinning prices for disability support work (Section 4). We more closely explore the adequacy of pricing arrangements in Section 5.

3. NDIS prices for services requiring Disability Support Workers

Having shown that employers and workers are experiencing difficulties working under NDIS in Section 2, Section 3 provides an overview of the design of NDIS prices for services requiring disability support workers, as a basis for systematically assessing the adequacy of prices. Prices for disability support work are the major component of Scheme costs and are expected to increase as full Scheme rollout increases demand for support workers. Section 3.1 outlines 2016-17 prices for services provided by disability support workers, with further detail about the structure of prices in Section 3.2. Section 4 examines the assumptions underpinning the base hourly rate for disability support work, and grounds for variation according to geography, intensity and other factors (Section 4.7).[9] Section 5 assesses the adequacy of prices for disability support work, using data collected from disability support workers and leaders of service provider organisations.

3.1 2016-17 Prices

Prices for services provided by disability support workers are set out in four Price Guides.[10] These guides set out prices for three major 'support purposes' (Core, Capital, and Capacity building). Each contain a number of 'support categories', which contain support items ('line items'). Two support categories are relevant to disability support workers:

- Assistance with Daily Living (containing 43 relevant support items)[11], and
- Assistance with Social and Community Participation (containing 27 support items).

Figure 3.1 shows the structure of these categories. Appendix D sets out their 70 items and their prices. Together, prices for these Support Categories are important because they set the amount of funding allocated to participants to access assistance from disability support workers, and because they are the main components of Scheme costs (NDIA, 2017c). Assistance with daily living, and with social and community participation are also critical to Scheme costs given the prevalence of disability types among NDIS participants: 30% of NDIS participants in Barwon were people with intellectual disability (29% in Hunter), and almost a quarter of participants were people with autism and related disorders (22% in Barwon and 23% in Hunter) (NDIA, 2017c, p. 95). People with these types of disabilities are likely to require assistance with daily living and with social and community participation, and so can be expected to draw on disability support workers (NDIA, 2017c, p. 95).

[9] Analysis is based on 2016-17 prices and the best available information about how these were developed. However, at the time of writing, a complete account of how prices were determined is not in the public domain.

[10] The four guides for 2016-17 have identical structures and definitions, but refer to different areas: non-remote areas in the four eastern states (NDIA, 2016b) and other jurisdictions (NDIA, 2016c), plus separate guides for remote areas, and very remote areas. Differences in prices between each guide are shown in Appendix D, and the sources of the differences are explained below. Other than actual prices, any citations in this report for NDIA (2016c) are identical for the other Price Guides.

[11] There are three service types under Assistance with Daily Life that do not use Disability Support Workers (Figure 4.2).

Figure 3.1 NDIS Services, by Support Purpose and Support Category

PURPOSE	CATEGORY
Core	**1. Assistance with Daily Living** 2. Transport 3. Consumables **4. Assistance with Social & Community Participation**
Capital	5. Assistive Technology 6. Home
Capacity building	7. Coordination of Supports 8. Improved Living Arrangements 9. Increased Social and Community Participation 10. Finding and Keeping a Job 11. Improved Relationships 12. Improved Health and Wellbeing 13. Improved Learning 14. Improved Life Choices 15. Improved Daily Living Skills

• **Group-based community, social and recreational activities**	16
• **Assistance with Daily Life (community, social and recreational activities)**	1(*)
TOTAL	**27**

Source: Derived from NDIA 2016c, pp.24-33. Note (*): There are some items that are not necessarily provided by disability support workers, e.g house maintenance, linen, meals.

3.2 The structure of NDIS prices

The NDIS prices relevant to 'Assistance with Daily Living' and 'Assistance with Social and Community Participation', and which therefore underpin prices for disability support work, are derived from three main elements:

1. First, the **base hourly rate,** is paid for services provided (a) in a non-remote area (b) on a weekday in the daytime (c) on a one-to-one basis (d) with a participant who does not have complex (high intensity) needs. The base hourly rate has been derived using the NDIA's Reasonable Cost Model (RCM), based on a set of assumptions and data concerning six factors: the level of disability support workers, the time-allocation of disability support workers, the level and workload of supervisors, staffing on-costs, corporate overheads, and a 'return on capital' margin.[12] The assumptions underpinning the base hourly rate are detailed in Section 4.

2. Second, a number of factors may be applied to vary the base hourly rate to take account of differences in participants and service situations. These **variation factors** relate to geographic location, the intensity (or complexity) of the support needs of a participant, the time of the day or week that the service is provided, and the number of participants being supported. These factors are also based on various assumptions (discussed in Section 4.7).

3. Third, there are a number of relevant Support Items where the prices have apparently been based on **benchmarks** established by the NDIA on the basis of empirical data from a small sample of providers, rather than being directly derived from the base hourly rate and four variation factors (although some take into account the number and/or level of need of participants). The most significant of these services is Supported Independent Living (SIL). These prices are not the key focus of our analysis.

Figure 3.2 summarises this structure, showing that of the 70 relevant prices, 37 are directly derived from the base hourly rate, combined with the four variation factors. The NDIA has stated that these are 'cross-checked against rates under schemes covering similar services, such as the Transport Accident Commission (TAC) in Victoria (NDIA, 2017a, p. 7).

Since the pricing methodology was introduced in July 2014 (NDIA and NDS, 2014), prices have been periodically adjusted upward from the initial base hourly rate of $38.78, but the underlying methodology has been not been substantially amended. However, the NDIA is currently reviewing its underpinning assumptions (NDIA, 2017a), and the intention is to align rates across the two sets of state and territory jurisdictions. In 2016-17 the base hourly rate for daytime self-care was $42.79 in the four eastern states (NDIA 2016c), $43.58 in the other four jurisdictions (NDIA, 2016d), and higher in remote and very remote areas (see Appendix D). Appendix D also shows how current prices vary according to the time service delivery, the number of participants and other features of the service.

[12] The term 'base hourly rate' was not used in the original Joint Working Group report (NDIA and NDS, 2014). That report uses the term 'hourly rate' to refer to this concept), but the term 'base hourly rate' has now been adopted by the NDIA (NDIA, 2017b). This ensures that the concept is not confused with the large number of hourly rates used for the various Support Items.

Additional points relevant to understanding the context of pricing arrangements are in Appendix E, including that prices were set using the Social, Community, Home Care and Disability Services Industry Award 2010 (the SCHADS Award) (also discussed in Section 4), indexation arrangements, assumptions about provider characteristics, the vision for an efficient price, and levels of transparency in price setting arrangements. Next, in Section 4, we more closely examine the assumptions underpinning current prices, before assessing these in Section 5.

Figure 3.2 Services provided by disability support workers by basis for deriving the price

BASIS OF PRICE	SUPPORT TYPE	Number of SUPPORT ITEMS
Base Hourly Rate • **Level of disability support workers** • **Time-allocation of disability support workers,** • **Level & workload of supervisors** • **Staffing on-costs** • **Corporate overheads** • **Return on capital (margin)**	• Assistance with self-care activities: day • Assistance to access community, social and recreational activities • Group-based community, social and recreational activities • Assistance with Daily Life (specialised home-based assistance for a child) **TOTAL**	10 10 16 1 **37**
Four Variation Factors • **Geographic location** • **Intensity (need) of participant** • **Time the service is provided** • **Number of participants**		
Other Bases for Prices • **Primarily derived from benchmarking based on the empirical experience of a small sample of providers**	• Assistance with self-care activities: overnight • Centre Based Group • Assistance with Daily Life • Supported Independent Living • Assistance in a shared living arrangement **TOTAL**	4 4 4 18 3 **33**

4. Detailed assumptions underpinning pricing arrangements

This section outlines the assumptions underpinning the 2016-17 price arrangements based on the Reasonable Cost Model (RCM) in more detail, to provide a foundation for assessing the extent to which they recognise the full costs of disability support work (in Section 5). Specifically, we explore the assumptions underlying six major components of the RCM:

- The classification of disability support work at a particular pay-point under the Social, Community, Home Care and Disability Services Industry Award 2010 (SCHADS Award) (Section 4.1);
- how disability support workers spend their time (Section 4.2);
- supervisors' time and workloads (Section 4.3); and
- staffing on-costs (Section 4.4), corporate overheads (Section 4.5) and margin (Section 4.6).

4.1 Classification levels of disability support workers

The RCM assumes that disability support workers are employed at SACS (Social and Community Services) Level 2.3 of the SCHADS Award (NDIA and NDS, 2014, p. 2). The NDIA deemed this level to be a 'reasonable direct staff pay-point, qualification or experience level' for Disability Support Workers (NDIA, 2014, p. 2). Earlier statements indicated this level was chosen as 'the reasonable minimum qualification and experience level' for disability support workers (NDIA, 2014, p. 3). However, more recently (NDIA, 2017a, p. 10) the NDIA has described this level as an *average* rather than minimum, indicating that some workers could be expected to be employed below Level 2.3, as well as above it. The 2016-17 rate for a SACS 2.3 level disability support worker is $24.70 per hour (which represents 58% of the base hourly rate of $42.79 in the four eastern states).

4.2 The time allocations of disability support workers

The base hourly rate assumes that disability support workers spend less than 5% of their paid non-leave time away from participants. This derives from the assumption in the RCM that 85% of a worker's paid time *including* leave is 'client-facing' or spent with participants, and that 95% of a worker's paid time *excluding* leave is with participants. This has been described by the NDIA as a 'minimum utilisation rate' (2014, p. 3). Thus, under the RCM, only 10% of a disability support worker's paid time is deemed to be leave[13], leaving only 5% of time 'on duty' but not with participants or travelling between participants (equivalent to 3 minutes per hour). There does not appear to be any publicly available data or detailed analysis about the extent to which these

[13] NDIA (2017a, p. 10) sets out the NDIA's assumptions underlying the figure of 10% of a disability support worker's paid time is leave: staff are entitled to 10 days paid personal leave and all 10 days are used; staff are entitled to 4 weeks paid annual leave and all 4 weeks are taken each year; there is a 17.5% leave loading for the 4 weeks annual leave; and staff are entitled to 8.67 weeks long service leave after a 10-year tenure, and 17.98% of employees qualify for long service leave.

assumptions reflect the time demands on disability support workers arising from the range of essential tasks required of workers when they are not with participants, and whether administration, handover and communication between disability support workers, supervision, training, team meetings, breaks, and other requirements are accounted for.

The NDIA has previously indicated that the assumed time that disability support workers are not with participants could be reduced in future: 'Staff utilisation rates are a key lever in the cost of disability support services and for a more competitive supply of such services. The current industry utilisation rates and the efficient utilisation frontier may be materially different.' (NDIA, 2014, p. 3). More recently, it has indicated that it 'is considering expanding on the assumptions relating to utilisation' (NDIA, 2017a, p. 11).

4.3 The levels and workloads of supervisors

The RCM assumes that supervisors are employed under the Award at SACS Level 3.2, seen as 'an average pay-point and experience level for program management and administration' (NDIA, 2014, p. 3). As it is assumed to be an *average*, it could be expected that some supervisors will be employed below it (NDIA, 2017a, p. 10). The RCM also assumes a 'supervision span' of 1 supervisor for 15 staff (1:15). As noted above, the original assumption (NDIA and NDS, 2014, p. 12) was that the 1:15 ratio applied for both standard and more complex (high intensity) support, but more recently the NDIA has implied the 1:15 ratio is only for 'standard needs' (NDIA, 2017a, p. 1). The NDIA has also said that increasing the supervision span from 1:15 to 1:18 is one of the major means by which the transition to an 'efficient' price will be achieved (NDIA, 2014, p. 4).[14]

4.4 Staffing on-costs

Common practice is to include a loading of 25-30% for staff on-costs, which is broadly the amount outlined by the Joint Working Group on Pricing (NDIA and NDS, 2014, p. 12). The NDIA has stated that the RCM allows for staffing on-costs that include superannuation and workers' compensation (NDIA, 2014; NDIA and NDS, 2014, p. 3). It has also noted the specific assumptions for superannuation (9.5% of total salary costs) and workers' compensation (4%) (2017a, p.11). However, it is not clear from public documents precisely how this element of the RCM was calculated, and which other costs, if any, were included, making it difficult to assess its adequacy.[15]

4.5 Corporate overheads

Corporate overheads are normally assumed to include the costs of governance, back office support, service and staff development and quality assurance, logistics for organising service sessions (e.g. IT rostering software), and business development activities. The RCM assumes an

[14] As part of a current review of pricing, the NDIA is considering whether this assumption 'is appropriate for the current state of the NDIS, …[and how it] may vary according to the complexity of need.' (NDIA, 2017a, p. 11).

[15] Table 1 in NDIA and NDS (2014, p. 12) shows on-costs of $8.76 which represents 38% of the 'salary cost including client-facing time' of $22.56 per hour that is shown in the table. There may be various reasons for this high number, for example if it also includes the on-costs for supervisors and program management/administration staff as well as Disability Support Workers (NDIA, 2014, p. 3), and/or some allowance for staff development. Alternatively, the $8.76 is 23% of the total 'per hour price of $38.78 shown in that table, which is unduly low, and 27% of the sum of the salary cost and on-costs ($31.32).

allowance of 15% for 'reasonable infrastructure and overhead costs' while acknowledging 'that providers can choose to run their operations in any number of different ways' (NDIA, 2014, p. 4). The 15% is based on the 'total salary, management, and non-client-facing expenses' (NDIA 2017a, p.11). In setting the rate of 15%, the 2014 Joint Working Group considered benchmarks and data from the NSW and Victorian NDIS trial sites; from health, aged care and mental health providers; and from earlier benchmarking studies (NDIA, 2014, p. 4). In July 2014, the NDIA proposed that the movement to the 'efficient' price' should include a reduction in the allowance for corporate overheads (NDIA, 2014).

4.6 Return on capital (margin)

The RCM assumes a margin of 5% as a 'return on capital'. The 5% (presumably applied on top of the staffing, supervision and overhead costs detailed above) is intended to ensure sufficient working capital (cash flow) for daily operational needs, and to meet a number of future expenses (e.g. replacing depreciated assets, new investment and innovations, and major unforeseen contingencies). The 5% does not appear to include provision for the payment of dividends to owners or shareholders, but such payments are not explicitly excluded.

Ensuring that providers have adequate working capital is especially important at present, as NDIS providers adjust to receiving their revenue from individual participants after the services are provided, rather than through block funding in advance of service provision. In deciding to use 5%, NDIA stated that 'there is no real benchmark information available for Australian disability suppliers' and presented data on a number of relevant measures of return to providers from other human service sectors, before concluding that:

> While NDIA is not in the business of dictating return characteristics of suppliers we believe that an overall net profit below 4% is likely to be problematic. Below 4% most organisations struggle to keep pace with inflation let alone replacing critical assets or business innovation. The working group agreed to 5% [but this] should be regularly reviewed against relevant aged care and community health results for reasonableness. (NDIA, 2014, p. 5)

4.7 Variation to the base hourly rate

Sections 4.1 to 4.6 have outlined the assumptions underlying the base hourly rate for disability support work. This price can then be varied in recognition of the diversity of participants and circumstances in which NDIS services are provided. The pricing model involves the application of *four variation factors* to address differences in:

- the geographical location of the service;
- the intensity (complexity) of the participant's support needs;
- the time when the support is provided; and
- the number of participants being supported.

These factors are applied variously to the different service types. Along with the assumptions underpinning the base hourly rate, assumptions about these variations also affect the funding

allocated to participants to access services provided by disability support workers. A brief outline of these variation factors are below, with the resulting differences in 2016-17 prices shown in Appendix D.

Geographic location

NDIS prices vary according to jurisdiction and remoteness. A number of the prices for the four eastern states are slightly less than for the other four jurisdictions.[16] These differences are gradually being removed, as the NDIA intends to align the prices across jurisdictions in coming years. In addition, there are loadings for remote areas (18%) and very remote areas (23%). These loadings, which are based on the Modified Monash Model[17] are applied to the (higher) base hourly rate for the non-eastern state jurisdictions ($43.58 in 2016-17). For the 2017-2018 financial year, these loadings will be increased to 20% (remote) and 25% (very remote). At the time of writing the rationale for this is not clear.

Intensity (complexity) of participant support needs

Participants are assessed by NDIA as having standard or high intensity support needs[18] For participants with high needs, a loading is applied. The various pricing documents recognise that 'high intensity [support] requires additional experience, risk management, and supervision' (NDIA and NDS, 2014, p. 12), and that the higher rate for supports 'may be considered when 'frequent (at least 1 instance per shift) assistance is required to manage challenging behaviours… [and] continual active support is required due to high medical support needs.' (NDIA, 2016d, p. 17).

However, additional demands of high intensity participants recognised in the above statements are not reflected in the loading. The original formulation of the RCM noted that 'higher intensity support in the model is built from the same support worker pay-point with lower utilisation, but this mix may not reflect the actual reality of the cost of providing these supports' (NDIA and NDS, 2014, pp. 10-11). In fact, the price loading for more intense needs only takes account of the additional worker time required away from participants. Thus the prices for supports for high intensity participants assume 'client-facing time, *including* leave' is 80%, not 85% and that 'client-facing time, *excluding* leave' is 90%, not 95%.

Time when the support is provided

NDIS prices for a number of service types requiring disability support workers vary by the time of day and/or the day of the week when the service is provided. Depending on the particular service type, there are up to six periods for which prices may be set, namely (i) daytime (6am-8pm) (ii) weekday evening (8pm-12am) (iii) Saturday (iv) Sunday (v) public holiday (not used for group programs), and (vi) overnight. The reasons for differences in prices between these periods are not

[16] This is relevant for 32 of 65 support items (5 of the 70 in total are by quote only).

[17] http://www.health.gov.au/internet/main/publishing.nsf/content/modified-monash-model

[18] There is also a category of 'low' intensity, which is only used for Supported Independent Living, based off benchmark prices, rather than the RCM. Note that from July 2014 the NDIA had used the term 'Intensity' to refer to the level and complexity of the support needs of a participant. NDIA (2017a) has used 'complexity' while 'intensity' has not been used at all in that document. This report primarily uses 'intensity', as this is the term used in the current Price Guides.

completely apparent but they appear to reflect the shift loadings and penalty rates in the SCHADS Award at the time the RCM was developed.

Number of participants

This factor applies to 'Group based community, social, and recreational activities', with separate prices for two or three participants. A provider only receives in total the base hourly rate ($42.79) for each activity, with the cost allocated equally between the number of participants. In effect, this assumes that there are substantial economies of scale, with no extra costs arising from each additional person. Where there are more than three participants in any group activity, an additional disability support worker should attend, such that the ratio of participants to disability support workers should never be more than 3:1. Centre-Based Group and Supported Independent Living (SIL) services also each have different prices depending on the number of participants in the group or residence, but the prices for these services are not based on the base hourly rate.[19]

4.8 Other aspects of NDIS pricing

Other services provided by disability support workers

In addition to the prices for the 37 Support Items that are determined using the RCM (including the four variation factors) there are another 33 Support Items for services requiring disability support workers where the price does not derive (at least not directly) from the RCM and the four variation factors.[20] These services, which include supported independent living and assistance in shared living arrangements are shown in Appendix D. In most cases these are considered 'benchmark prices' whereby a provider can either accept that price or submit a quote (and seek NDIA approval) where its costs are higher than the benchmark prices. This arrangement contrasts with other prices, where the price is a firm cap (Australian Senate, 2016). The bases of the prices for these services are not clear from the public documents, but in general they appear to have been derived by seeking to establish 'benchmarks' based on the empirical experience of a small number of providers, especially those in the NDIS trial sites.

Other costs for services requiring disability support workers

There are also costs which the NDIA will cover which are not part of the RCM or variation model nor paid according to quote. These include the travel of workers, cancellation fees, and

[19] In some cases, prices appear based on assumptions that there are economies of scale, while in others, they do not. For centre-based group supports for example, the same rate per participant is charged regardless of the number of participants, assuming no economies or diseconomies of scale. For supported independent living on the other hand, the indicative price per participant declines as the number of people assumed to be sharing accommodation increases. Thus, 'returns to scale' are assumed for supported independent living, presumably achieved through some 'sharing' of Disability Support Workers by participants (NDIA, 2016d, p. 12).

[20] Only 28 of these 33 Items actually have a price. The other five require a quote or are listed as 'Varies.'

establishment fees[21], shadow shifts[22], and case management[23]. For disability support workers, the most significant of these is travel. Rather than providing a separate amount for travel, providers can use up to 20 minutes of the first hour of support to travel between participants, for services of less than four hours. In 2016-17, the Price Guide states that for travel to provide personal care and community access:

> the time that a worker spends travelling from home to the workplace (or first participant) and from the workplace (or last participant) to home cannot be claimed at the hourly rate for the relevant support item [but] where a worker travels from one participant appointment to another, up to 20 minutes of time can be claimed against the second appointment at the hourly rate for the relevant support item. (NDIA, 2016c, p. 13)

The NDIS website clarifies that although the first 20 minutes of a service may be for travel, it is expected that the outcomes required in the delivery of support will still be met (NDIA, 2017b).

4.9 Future developments in NDIS pricing

There are a number of possible changes to future prices arising from measures that have been announced by the NDIA or about which the NDIA has expressed a view, including proposed price reviews (NDIA, 2016a), the move to 'efficient prices' by 2019-20 which would be aligned across jurisdictions, and eventual price deregulation (NDIA and NDS, 2014). A current review (NDIA, 2017a) is focusing on:

- the levels of price controls for supports under the categories of 'assistance with self-care activities' and 'assistance to access community, social and recreational activities';
- simplification of shared care price controls; and
- other specific updates to pricing arrangements.

Assessing the pricing model

Section 4 has provided a detailed account of the structure of NDIS pricing and the assumptions underlying the base hourly price, and other aspects of pricing arrangements. The next section builds on this by examining the appropriateness of the assumptions that underpin the various elements of the NDIS pricing model, using empirical data.

[21] Details of cancellation and establishment fees are detailed in service agreements between participants and providers, however the NDIA will only pay a provider for 8 cancellations per participant, per year. (NDIA, 2016b).

[22] Case management is charged as either 'Support connection' ($56.61 per hour in 2016-17), or as 'Coordination of supports' ($92.27) for participants with high needs and more complex situations. These supports are listed under a different Support Category from the Service Types that are the focus of this report, and are not typically provided by disability support workers (although in practice, some disability workers may carry out aspects of co-ordination to ensure continuity of services for participants).

[23] Providers can claim up to 6 hours of weekday support for the purposes of 'shadow shifts', which allow a new worker to accompany an existing worker to participants before they provide support on their own. These are considered necessary where participants have limited communication, or high medical or behaviour support needs (NDIA, 2016b). It doesn't cover 'buddying' of new staff in usual circumstances.

5. Assessing NDIS prices for disability support work

This section draws on data from employees (disability support workers) and from provider organisations to assess the adequacy of assumptions on which NDIS prices for disability support are based, and the challenges emerging from pricing arrangements.

The analysis shows the range of ways that disability service provision is under-priced under NDIS, as prices have been set based on assumptions which have failed to recognise the nature and value of disability support work. The level of under-pricing is such that NDIS prices do not enable minimum award conditions to be met without diverting resources from other functions. As the material shows, NDIS prices are predicated on:

- under-classification of support workers and supervisors;
- under-estimation of the time needed by both disability support workers and their supervisors to deliver quality services to NDIS participants, especially participants with more complex needs; and
- under-estimation of a range of other costs that providers must incur to develop and maintain quality staff and services.

Inadequate prices are having adverse effects on disability support workers, on providers, and on services received by NDIS participants, and contributing to the problems described in Section 2. For workers, access to training and induction are under pressure and levels of risk are high. Staff are performing unpaid work to compensate for systemic under-resourcing. Providers wishing to meet their basic industrial obligations are having to divert resources from other functions. In turn, these pressures on workers and providers are affecting the quality, responsiveness, equity, efficiency, and stability of services, and the overall sustainability of the NDIS.

This section examines each of the elements underpinning NDIS prices, which were outlined in Sections 3 and 4, and shows the adverse impact of the 2016-17 pricing model on workers and services. The elements of the base hourly rate are explored in Sections 5.1 to 5.6, while Section 5.7 considers the variation factors and other elements of NDIS pricing.

5.1 Classification levels of disability support workers

Assumptions made in the RCM about the skills requirement and award classification level of disability support workers is a key means through which the work is under-priced. [24] Specifically, the RCM assumes employment is at Level 2.3 of the SACS classification of the SCHADS Award. [25]

[24] Moreover, the actual amounts that are calculated for all but one of the other assumptions underpinning the base hourly rate are essentially mark-ups on the rate payable for the assumed level of support workers. The exception is the level and workload of supervisors, but under-pricing of that factor also has similar effects on the other assumptions.

[25] In earlier statements by the NDIA, SACS Level 2.3 was described as a minimum level (NDIA, 2014). If set as a minimum, employment costs of current long-term staff, and the progression of new staff above this level will not be covered. However, the most recent statement from the NDIA indicates it is an average (NDIA, 2017a).

There is no allowance made for above award wages, for example those provided under an enterprise agreement.
The SCHADS Award sets out that an employee at Level 2 performs personal care services or 'elementary tasks within a community service program', involving functions which are defined by established routines. Level 2 staff are not expected to engage in problem solving and have only a 'limited scope to exercise initiative', working under general guidance and assistance which is 'readily available'.[26] Under the Award Level 2.2 is the *minimum* pay point for an employee with an appropriate Certificate level qualification, while Level 3.3 is the commencement level for graduates with a three-year degree.

Evidence from employers and from workers also shows that the classification level assumed for disability support work is too low. NDS for example, has stated that Level 2.3 is lower than the sector pays (NDS, 2017). Problematically, some employers have downgraded or 'frozen' staff classifications at this level as a result of NDIS prices. An employee explained in the survey:

> We have been advised that our hourly rate is higher than what the NDIS rate is so as grade 3 employees, we will be now classed as grade 2. We won't lose pay immediately however we won't be getting a pay-rise until grade 2 rates catch up to ours.

Similarly, an interviewee highlighted how the classification assumed in pricing arrangements had precluded career progression in her organisation:

> Our company argues that anyone on 2.4 is already costing us money and that's not true, but it's a really good stopgap for the company to say, 'Stop whingeing.' (Employee 2)

Level 2.3 is also too low, given the tasks performed by disability support workers. As shown in Bentham and Macdonald (2017) workers deploy a range of skills in the course of the working day, applying their knowledge across a wide spectrum of advanced skills, including knowing how to respond to complex health needs such as epilepsy, PEG feeding, calming people with dementia; responding to medical emergencies or violence; managing demanding workloads under time pressure including accommodating unforeseeable events; deploying negotiation and strategic skills to achieve the best for their clients; and working across agencies. Disability support workers often work on their own and perform these functions with minimal levels of support, with supervisors only available remotely, for example, over the phone or days later in planned supervision meetings.

Several of the workers we interviewed described the risks inherent in over-reliance on inexperienced staff members particularly in the NDIS context where training has been cut. For example, one supervisor spoke of her concern for participants because untrained casuals were being left to perform PEG feeding (in which a tube is inserted through the abdomen directly into the stomach to enable feeding):

[26] Corroborating this, the assumption that supervisors will be overseeing the work of between 15 and 18 staff (discussed below, under 'The level and workload of supervisors' suggests general guidance and assistance is unlikely to be readily available.

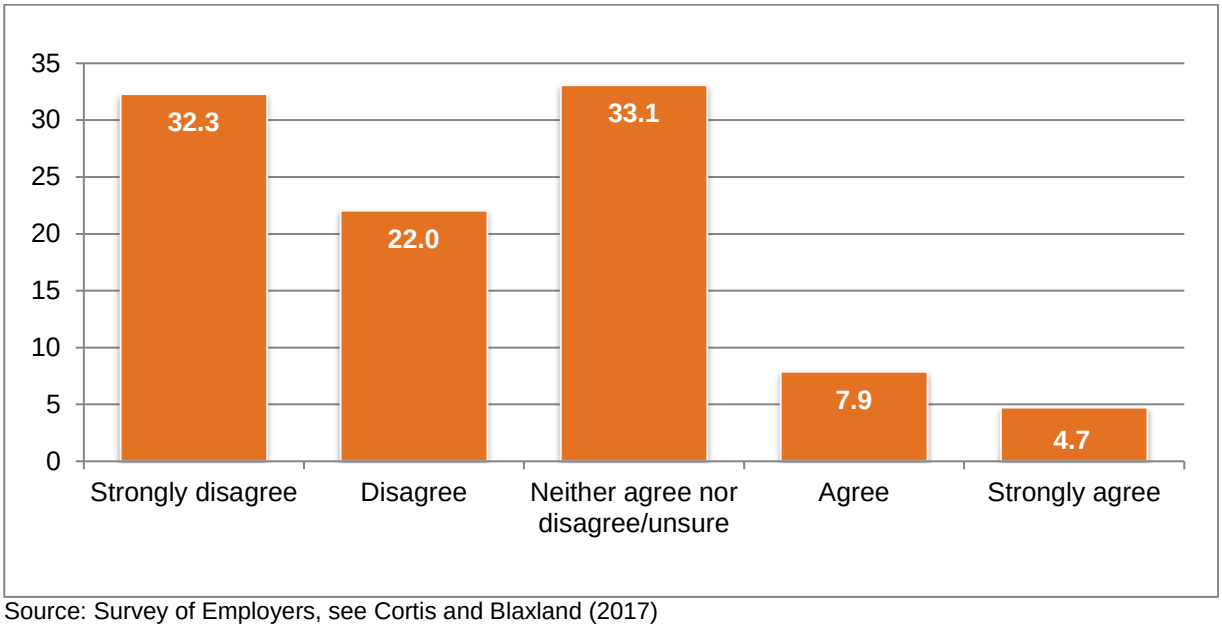
> I've had staff members say that to me, 'Oh, how does she drink this?' …(W)hen I started with this company I had weeks of training before I was supervised to do that …[and transporting groups of people], now, it's, 'Off you go, get in the bus, have a good day, we'll see you when you get back… (Employee 2)

Additional evidence of the problematic nature of assuming employment at Level 2.3 comes from the survey of employers in NSW. Indeed, in their comments, employers described Level 2.3 as 'entry level', and described how they instead needed to employ experienced staff and ensure they could advance through the organisation and be retained. This is reflected in the statement of a leader of a registered provider in NSW, who explained that Level 2 was not a classification they used, whilst also describing several other challenges arising from pricing arrangements. This CEO described the NDIS as:

> A huge change as the NDIS hourly rates for direct care work barely cover entry level positions only (Level 2 SCHADS whereas we currently use level 3) so no room for any advancement. (CEO of medium sized metropolitan organisation)

The survey data shows that many employers shared the view that career advancement was restricted under NDIS. The employer survey asked for the level of agreement or disagreement with the statement 'Under NDIS, the organisation can provide pathways for staff to advance their careers'. More than half of organisation leaders (55.3%) disagreed or strongly disagreed, reflecting how the pricing assumptions are recognised to restrict career progression (see Figure 5.1).

Figure 5.1 Percentage of registered providers who agreed with the statement 'Under NDIS, the organisation can provide pathways for staff to advance their careers' (n=127)



Source: Survey of Employers, see Cortis and Blaxland (2017)

Based on comparison with definitions in the SCHADS Award, and on employer and disability worker accounts, Level 2.3 is considered entry level, and under-classifies disability support workers. This component of the price is misaligned to the actual profile of the workforce, creating

incentives to hire less qualified, competent and permanent staff. As expectations of the disability support workforce grow, and new skills demands arise from individualisation and quality and safeguarding measures (DSS, 2016), the assumption that workers will, on average, be employed at Level 2.3 provides a disincentive to organisations to support upskilling and career progression.

5.2 The time allocations of disability support workers

Evidence from disability workers and employers shows NDIS prices for disability support do not allow adequate time for quality support. For example, there is too little allowance made for legal requirements such as breaks for workers, and for essential tasks such as administration and co-ordination, or for the development of workers through training and time for supervisor and peer support.

Employees expressed high commitment to performing their jobs well, and pointed out how pressure on their time meant they undertook significant amounts of unpaid work. This is a common feature of under-funded support and care delivery. Rubery et al. (2015), for example, point out that arrangements in home care work in the UK have relied on workers' altruism. They observe

> Current practices rely on care staff's goodwill to work more hours than they are paid for even when their hourly pay rate is already close to the minimum wage, to fund their own travel, and to constantly reschedule their times to maintain earnings. (Rubery et al., 2015, p. 769).

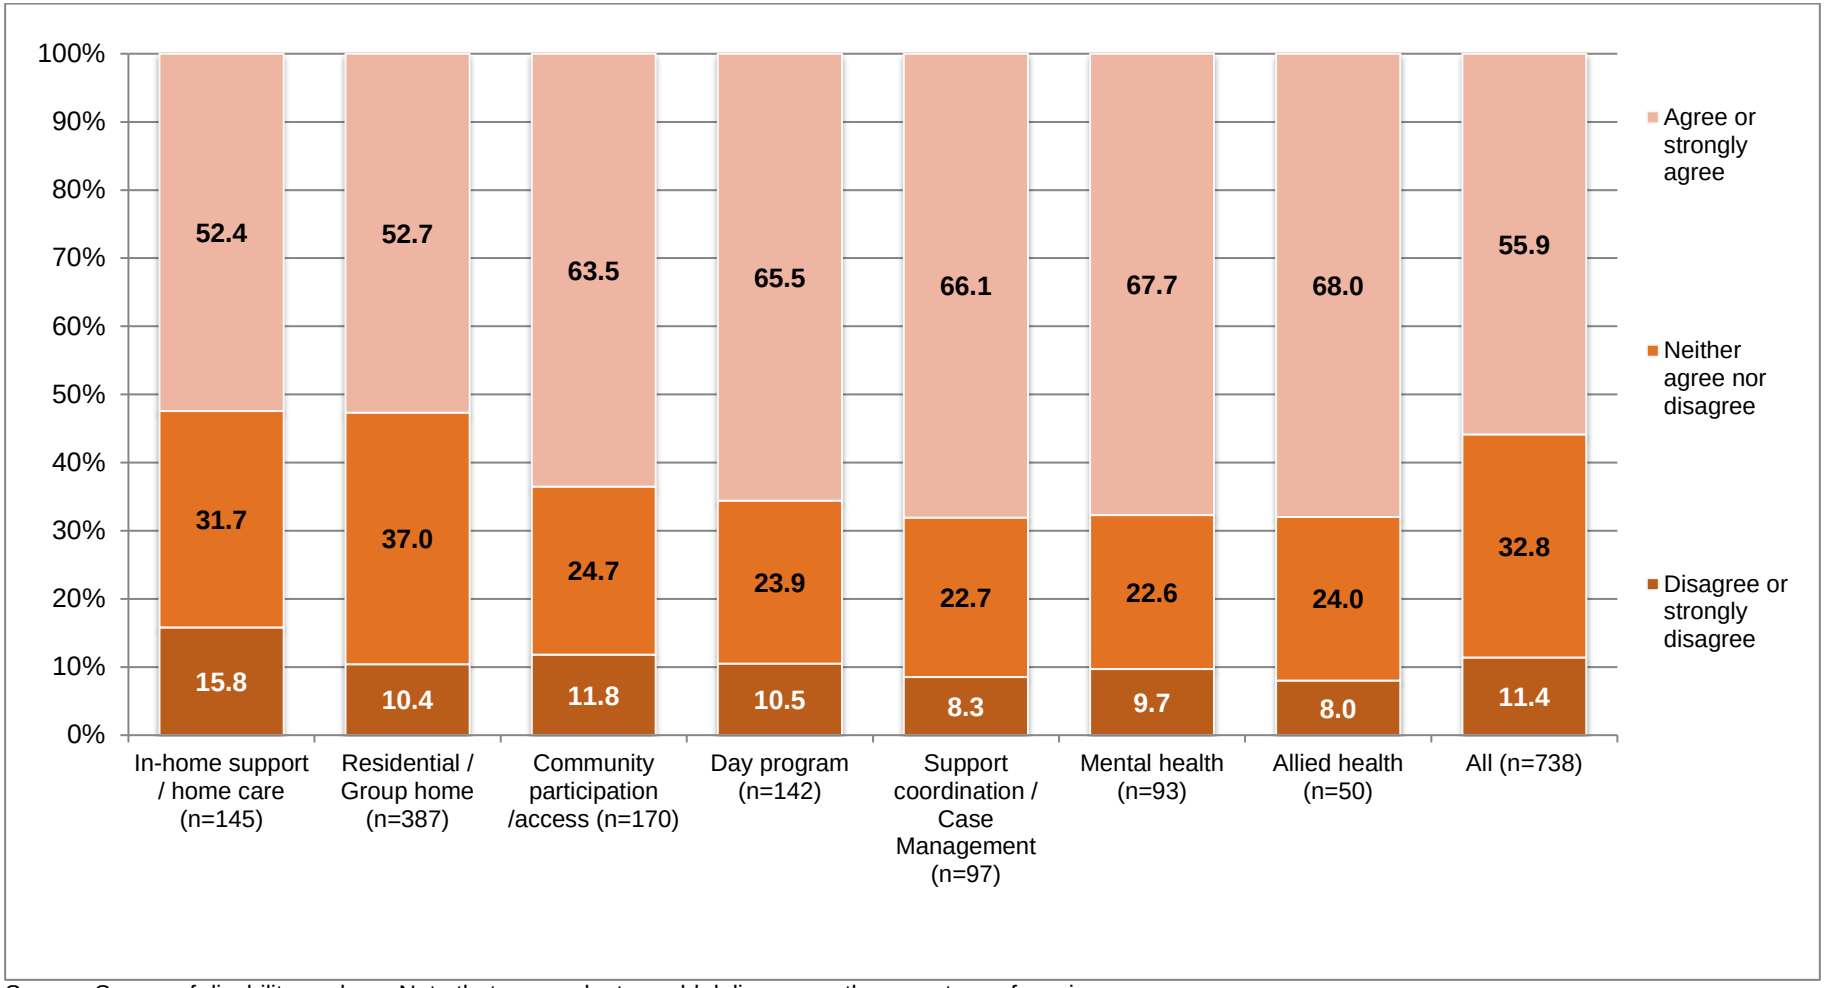
However, where employees contribute additional unpaid time, while cost pressures may be offset, evidence also shows the quality of services is inevitably affected.

Analysis of the pricing model in the context of the SCHADS Award shows prices do not adequately account for non-client facing time, including breaks. The pricing model assumes that just 3 minutes per hour of workers' time is not spent either with participants or travelling between them (Section 4.2). This allows for little more than the 10 minute paid tea break required every four hours under the SCHADS Award, leaving minimal time for other non-client facing activities.

The failure to fully recognise the time demands on workers places workers under pressure. In the survey of disability workers more than half of respondents (55.9%) agreed or strongly agreed with the statement 'Under NDIS, I don't have enough time to do everything in my job' and only 11.4% disagreed. This is shown in Figure 5.2. In open ended comments respondents elaborated on this, underlining how their work takes place under increasing time pressure under NDIS, for example:

> There is a lot more pressure to take on new clients so that the case load has increased… …Before we could spend extra time if needed with a client in crisis, now it is all about hours and money.

Figure 5.2 Percentage of disability workers who agreed with the statement 'Under NDIS, I don't have enough time to do everything in my job'



Source: Survey of disability workers. Note that respondents could deliver more than one type of service.

Similarly, the disability support workers who were interviewed for this study reported they had inadequate time in their jobs to do what was necessary to maintain participants' safety and well-being and/or to do the job as their employer required them, and this resulted in a high level of work intensity and hours of unpaid overtime. This was a major source of frustration and distress for frontline disability support workers. Support co-ordinators also experienced this problem:

> The time you have allocated to each person is a huge factor in what sort of a service you can provide. And if you're a support coordinator … there's a bigger responsibility to make sure that people have maximum, I suppose, support around understanding their plan and implementing it. But I still think there's a lot of restrictions around [that] because of all the aspects of the job that we have to fulfil, it's not just the direct contact, it's all the admin side of stuff, it's about the rostering of the time, it's all that sort of stuff that makes it I suppose less user friendly. I don't know. That's how I feel. …And I haven't had any training [since commencing this role] and what I keep asking for is I just want, I really want someone from the NDIS to come here and just explain this scheme to us, so it's not so mystical. [But that hasn't happened] and then you're sort of, you're told that the best way to keep up to date is to read the NDIS, go on their webpage and read all the updates. But in reality I don't, I honestly don't have time. (Employee 5)

A worker in a residential setting who responded to the employee survey described staff as 'under the pump':

> Responsibilities seem to be getting greater, as clients age and have more health problems. When this happens clients need more staffing hours, and therefore more funding, especially when chronic health issue need constant care. I notice a lot of staff under the pump, some working over hours for no pay at times to get things done, and generally being taken advantage of. It is hard to provide the levels of good quality support that is expected and anticipated, when the staff to client ratio is so low in some group homes.

Others identified a range of risks arising from the time pressures under NDIS. Another survey respondent summed up their experience under NDIS, which capture how time pressures were reducing scope to personalise services:

> Clients going without more outings without rapport being built with the client. Less opportunities /funding for clients being treated as a number without existence. Clients being rushed or misunderstood without a carer that understands the client. e.g non verbal client / behavioral. Client being rushed on 1 hour outings rather than being able to take their time e.g unstable on their feet, cognitive issue / behavioral client. Less contact with staff whom the client know and have built rapport with. Strangers taking the clients for appointments. Client becoming house bound, as they don't feel comfortable with unknown services / staff. Client not getting heard! as the NDIS appointments are so rushed.

The failure of the RCM to adequately address the time demands upon disability support workers has had the effect of preventing workers and their supervisors from effectively carrying out all of

their essential tasks. This can be seen in relation to time available for communication between staff, administration, travel, training, and other activities integral to performing disability work.

Lack of time and opportunity for communication

A particular concern among disability support workers, and a source of risk, was the inadequate time allowed under the NDIS for handovers between support workers, for communication (including with office staff), and for support workers to complete required paperwork. Inadequate time for staff handovers was made worse by high levels of staff turnover and use of casual staff. Direct support workers interviewed said it was much more difficult under the NDIS arrangements to pass on important information to other support workers, even when that information was vital to participant wellbeing or service operations or recording was mandatory. As one respondent in the employee survey explained:

> The system does not provide funding for anything other than direct support, therefore all the ancillary tasks such as note writing, documentation, communication with other stakeholders must be done in the employee's own time. In my case I spend at least one hour each day unpaid doing file notes etc. This needs to be looked at as all of this documentation is mandatory.

Many commented that communication was more difficult under the NDIS as, often, staff were not paid to attend team meetings. In some cases this was because their employer now allocated less or no time for team meetings. In other cases, more complex communication was required under the NDIS, as the 'team' supporting an individual now comprised multiple (and changing) individual support workers from several organisations, requiring more extensive cross-agency communication than previously. While the separation of different support services to different providers was seen to make it logistically difficult to communicate, in these workers' experiences the difficulties were worse because time for even basic communication, such as 'handover', was not funded. Any opportunity for support workers to share knowledge with workers from different organisations was severely restricted due to minimal time for support workers to do anything other than provide face-to-face support to participants. Several workers in residential services spoke of not wanting to use up too much of the small amount of time participants had in their NDIS packages for participation in community activities. One interviewee explained:

> … and as much as we try to give a handover to the [other service provider] staff, there's a, if a client's only got 2 hours [a week] to get out into the community, you've got to be very short, quick [in your handover]. [For example, you might need to explain] 'this person needs clear boundaries, you can't fluff around, they don't cope well with open-ended questions, you need to say do you want a chicken sandwich or a ham sandwich because otherwise it's just not going to work. You need to get in the backseat of the car because they can't, they're too distracted with all the stuff that's in the front seat of the car'. There's a lot to handover. (Employee 1)

Workers felt quality was also undermined as they had insufficient time to give information to other support workers, or to receive information from other support workers, especially at the changeover of shifts. This communication is essential to ensure continuity of support and to maintain a good awareness of participants' needs and well-being. Interviewees also felt quality was

undermined where they were not receiving the information they needed from other support workers:

> ...[support workers] basically bring the client in, well some of them don't even bring the client in, they just drop them off at the front door and drive off. …So, but they'll say, they'll turn around and go 'Joe Blow had a good time', Well what does that mean? What did you do? ... Well some clients are capable of [telling you], but not all clients are capable of doing that (Employee 1).

Time for administration

Workers also reported that increased paperwork associated with the NDIS had also increased their workloads causing spillover into unpaid work time. Bentham and Macdonald (2017) explain how one worker listed the tasks she had to complete in extra unpaid time at the end of a week and sometimes at the end of a shift. These included: recording any extra shifts in her diary; printing up her roster; fill out a claim form for her client's travel kilometres; making notes about any issues with clients; going into the office to deliver paperwork; discussing issues regarding clients with managers; discussing new clients with managers; correcting errors in rosters; and making appointments for clients.

In the other interviews, in which workers were asked if the NDIS had changed anything, one worker said: '...in some respects I see it's given more choices and more opportunities for people with disabilities'. She also said:

> Our workload's increased, because we have to justify everything we do. Simply taking the ([participants out], because their goal might be to access the community more. …We then have to justify in this, in these particular forms, every single time we take them out…. …They say we should be able to get case notes and shift records and all our paperwork done within half an hour. It takes two staff half an hour to get it done and sometimes you still need longer. (Employee 6)

This worker felt in a dilemma about completing administration, as she needed to cut short her client's activities in order to complete her paperwork in her paid time:

> … we've got to get all of this [paperwork] done. [For example] you're looking at your time because you're out on an outing where your client's having an absolute ball. You've got to be back by quarter past one because you finish at 2 o'clock. You know? So, you're potentially pulling a client out of an activity that [took] three hours to get them to be comfortable to be accessing the community, and now you're here, she doesn't want to leave, but you've got to go. (Employee 6)

Others also pointed out how the additional administration had been created by the NDIS. An interviewee in a service co-ordination role explained how she was struggling with the combination of a very high workload and the need to balance the needs of a large number of clients. Added to this she was now required to account for her work time in 15 minute slots that were allocated to individual clients' funding:

> …I'm finding that this position is … overwhelming and distressing … *Interviewer: Okay. So what do you find distressing about it?* Probably the workload I guess, it's an incredible amount of work involved with each person. There's a lot of administrative kind of work that needs to be done. I have to account for every 15 minutes of my day, as far as rostering my time, and making sure that I'm using my time effectively. … So there's a lot of kind of record keeping around making sure that I'm being fair and making sure that I'm using people's time wisely I suppose and if I am working with a particular person, because I could work up to 15 people a day I could be supporting, in that time I've got to be able to work out how many minutes did I work with that particular person, how many minutes did I work with the other person. (Employee 5)

This support co-ordinator, who was considering if she would stay in her job, said she used to spend time researching to support her clients but she no longer did due to the stress of overwork:

> [I was doing this in] my personal time [but now] I really don't want to be going home from work and reading about the NDIS. Whereas in the past I didn't feel as overwhelmed, and I was able to, I was really interested in research, really interested in reading articles and looking up different service providers, and what they offered, and getting a really sound understanding of the system. But I think in this system it's just you feel so overwhelmed all the time. (Employee 5)

These sentiments were echoed in comments in the employee survey:

> I have concerns about the viability of the NDIS. We have been told there is not allocated funds for administration however the administration requirements have significantly increased. In order to provide a plan that is individualized a provider needs to be flexible [and] to do this costs money. Each time a person chooses to make changes to their goals or planning it takes time and therefore money.

They also echo concerns raised in the evaluation of the NDIS (Mavromaras et al., 2016), in which staff raised concerns about their increasing administrative workloads.

Case Study 1: Jessica's unpaid administration

Jessica has worked in disability support for around twenty years. She is a permanent part-time disability support worker in a community residential unit with five residents. Several times each fortnight Jessica works unpaid overtime to complete work that is supposed to be undertaken during shifts. Here Jessica describes her typical sleepover and morning shift which often results in her undertaking unpaid work:

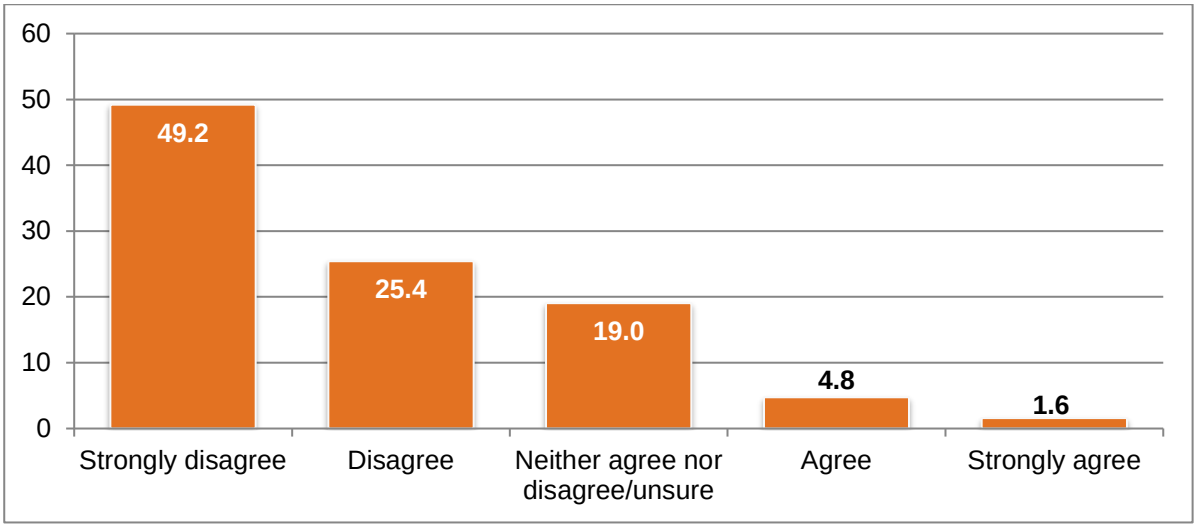
> So you sleep over, so you wake up and you're on shift at 6:30am and you finish at 8:30am. Our second staff member or the first day shift [worker] is 7:15, they come in and the second day staff person comes in at 8:15. …(S)o from 7:15 til 8:30 we've got to get the medication, all medication must be administered by 8:30am and we have a lot of creams and … 'cause we've lots of personal care, we've got creams, we've got pad changes, we've got tablets. …(S)o we've got any personal care that needs to be done in that period of time, which is often a couple of pad changes, …[one resident] has seizures so these are all factors that come into our morning but there might be a seizure, there might be a fall, there might be … and it happens, it does happen quite frequently. Then we also have, we have case notes to write up. So this is all in that first hour and 15 minutes, so it's medication, any personal care, attending to anything, if the residents are having showers, then we need to attend to those. Then we've got the case notes that we have to do on CareLink and then we have the shift records that we have to do on the computer system itself. I've also then got to write up any incident reports, that may have happened on the morning because I'm the sleepover, so I've got to finish them. And then potentially if one of these two staff members are new, they will have done an induction to the house so (…) they've already been to the house and done a bit of a run-through but on this first shift I go through and say, 'Okay, well in this folder, this is where you'll find this information, this is here, this is here.' A rundown, give them the protocol folder to read (…), communication book and diary.
>
> And also while giving them a handover of what may need to be done that day. So, 8:45 the second staff member comes in and then I walk out at nine o'clock and all of that has to happen before I walk out the door. [However] it's rare for me to be walking out that door at 9:00 normally, it's closer to 9:30 and occasionally it'll be a ten o'clock. (Employee 6)

Travel time

Pricing of workers' time spent travelling between clients under the NDIS is a vexed issue. Service providers, and the NDIA recognised that prices in the reasonable cost model did not account for travel time of workers between participants (NDIA and NDS, 2014), and arrangements were subsequently changed to allow payment for 20 minutes between clients. However, travel time remains a major issue for employers, reflected in their survey responses. As Figure 5.3 shows,

around half of CEOs in registered not-for-profit providers in NSW 'strongly disagreed' that NDIS pricing covers the full costs of staff travelling between clients, and a further 25.4% disagreed. Very few agreed or strongly agreed.

Figure 5.3 Percentage of CEOs of registered providers who agreed with the statement 'NDIS pricing covers the full cost of staff travelling between clients' (n=126)



Source: Employer survey (Cortis and Blaxland, 2017)

In their comments, survey respondents explained:

> Covering travel cost is a major concern as most of the clients we support live in rural remote areas. Without adequate funding to cover travel, our service may not be able to continue to provide support to clients in these areas. There are no other services in some of the areas we provide support in. (CEO of medium sized non-metropolitan organisation)

> We are [in] a rural and remote area, NDIS has no concept of what this means in relation to travel times. All adult clients are over 20 minutes away and we are the closest provider. One person who we used to provide services to the driveway was 20 minutes from an unsealed road. Travel needs to be reassessed (CEO of small non-metropolitan service)

> We are transitioning at the moment and our client base are quoted on for service provision - they are outside the NDIS benchmarks. The transition has not been smooth and it is hard to make favourable comment at this stage. We know the costs, NDIS acknowledges the costs - we do not know if they will be met. We are a charity 90% of our costs are staffing. NDIS has not allowed for client travel and transport costs in a rural setting- a major problem (CEO of medium sized non-metropolitan service)

Travel time is also a serious concern for disability support workers who explained it is a major source of unpaid work. A survey respondent explained how her payment for travel had changed under NDIS:

> I do drop in support. We used to get paid when traveling to the next client as well as our kilometres. Now we only get kilometres our days are longer with the same pay. I'm worried that our penalties will be cut as it's the penalties that make our job worthwhile.
>
> I am worried that the hours of work offered will consist of 1 to 2 or 3 hour shifts and hardly worth traveling for once you factor in travel time petrol and time wasted to get to other shifts
>
> We are also concerned that we will only be paid per the actual hours spent with clients and not for the travel in between and office time etc. Currently I may only spend 6hrs directly with clients (3 clients at 2hr each) and am paid for my whole day 9am - 5.00pm as that reflects my roster Currently I'm perm part time 26hrs/week over 4 days.

Bentham and Macdonald (2017) show that employers' treatment of travel differs, but where shifts are short, unpaid travel time is often seen to make it not worth working. Indeed, unpaid travel time between home and work for very short shifts is a key contributor to very low pay experienced by support workers:

> And it's like, I'm driving forty minutes out there for a forty-five minute job; I'm getting paid like seventeen, eighteen dollars– and that sounds really cold and callous, because it's not all about the money – but in the end, nah, doesn't make sense.' (DSW11) (Bentham and Macdonald, 2017)
>
> The shortest (shift) I do is half an hour. …I've got one this week. It's a 9:30 to 10:00 shift at night. And it's …about 25 minutes [from my home]. And it's only a half hour shift, and then 25 minutes home again. (DSW04 Bentham and Macdonald 2017)
>
> …But the hours are really hard. We've got to sort of keep ourselves open for a 13-hour day …and we only work five hours of that. (DSW19 Bentham and Macdonald 2017)
>
> …oftentimes I will have just that one shift that's half an hour away and I won't have anything for another hour or two which means that I don't get paid to go there or back, and essentially it's like the money that I get paid for the shift is covering the petrol to get there and back and it's probably like $5 left over for the actual work once you take that into account. (DSW22 Bentham and Macdonald 2017)

Case Study 2: Marlene's short shifts and unpaid travel

Marlene is a disability support worker with around ten years' experience, a Certificate IV in disability support and an additional diploma-level specialist qualification. She works for two service providers, casually in one job and as a permanent part-time worker in the other.

Marlene works extended days and weeks providing support to people in their homes. Although she usually works only 30 paid hours a week Marlene works on most days and has only one weekend off a fortnight. Due to her work being organised in multiple short shifts she has many days in which she has periods of one to two hours or more between work shifts and she spends a lot of time travelling to and from home to work for which she receives no pay.

Three days a week Marlene works for a non-profit service provider, starting around 9am and finishing 13 hours later at around 10pm. Marlene is paid only for the time she spends working directly with clients, which consists of between 4 and 6 separate shifts. Usually, these shifts amount to between 5 and 6.5 hours of paid time. In addition, Marlene usually spends about 1.5 hours each day travelling back and forth from her home to work between shifts. She travels around 100 km per day excluding her first and last trips. She is not paid for any of this travel time nor does her employer reimburse her for costs associated with the use of her own car to undertake the travel. Marlene must also complete administration for her work that is unpaid.

Unpaid work comprises a very substantial proportion of Marlene's work time. The first day of Marlene's work diary shows that she is not paid for 21% of her work time. On the second day she is not paid for 24% of her time. Marlene says she is 'tired' and feels that she doesn't 'have a life' because she is always working or waiting between shifts:

> You can't go out for dinner, you can't do this, you can't do that, cos it's time to go back to work.
>
> My ideal would be 9-5 so I could have a life, like any normal working person.
>
> (DSW19) (Bentham & Macdonald, 2017)

Time for training

Employees we interviewed also reported that time for training was squeezed under NDIS.[27] For example, one interviewee was adamant about the importance of disability support workers having some knowledge of new participants as they came to the support service and she said she read new participant files to ensure she could provide a good service. Asked if she had time to do this in

[27] This may relate to both under-accounting for employees to spend time in professional development in the pricing model, or to provide for sufficient overheads to cover it. As such, it is considered here, and also later in assessing the pricing model's assumption in relation to corporate overheads.

her job she said she was not given any time, so she did so in her own time. She also said her employer had removed access to training under NDIS:

> No. Not now. We used to, but before NDIS. Since NDIS, no. We have no training, we used to have it …, we would have a total day where no clients/customers had service that day, where all staff came in, we had training for the full day or shift, which would be some upgrading of mental health training, manual handling, clients, new client inductions so staff would have a general awareness of who a new person was coming in, and enough details to at least get past. You would have team meetings for people who have one-on-one direct support, that all their staff could get together during the week and have a chat and see what was working, what wasn't working, come up with new plans. …NDIS came in and we stopped doing that because the company assumes, designates that nobody's going to pay for me to sit around and learn. I as a worker, and I as a parent – I'm a parent of a child with a disability, I would rather have a well-trained staff than somebody who was just flying by the seat of their pants. ….. When I started with this company we had a really well-trained, committed team of people and now we have a lot of people … doing a couple of hours a week here, nothing against them, but the company's training is nothing. Literally nothing. ...It's a very grey area about training at the moment, and I think it's leading to poor service (Employee 2)

Asked if new employees received training or induction, this interviewee described:

> Well the company would say, 'Yes,' but I have yet to see anyone in the last three years have proper inductions, of any sort. …If you were to come in as a new staff member today and I put you with Justin Bieber, let's call him Justin Bieber. You've walked in at nine o'clock this morning and [we've said to you] 'you're working with Justin Bieber.' You're literally then walked around the building to [be] shown where the toilets, kitchen, staffroom is, shown where the file room is, had five seconds or a quick verbal about Justin, and then, off you go, get in the car, and have a good day with Justin. Oh, by the way, he has [difficult] behaviours. By the way, he has epilepsy. By the way, he has medication … we have people that have never had any training, and certainly no certificates, some who haven't even had lived experience that have been employed, have not been trained by this company, who are delivering medication. (Employee 1)

She described how lack of training, or inadequate training carried extremely serious risks for participant health and safety:

> We've had staff arrive at the centre with no brake on the wheelchair, which is, you stop, you're stopping to look in the window, it's mandatory you put the brake on, it's automatically a thing that you do without thinking now. But no brake on the chair, no straps on, and they've driven maybe for half an hour in that vehicle, and that's my fear that, as I said, you hit the brakes because someone cut you off or there's a red light ahead, that continues, flying through a hole with, and a lot of those people … are non-verbal, some of them are silent, so they can't even make a noise that they've been frightened or that they're choking. (Employee 2).

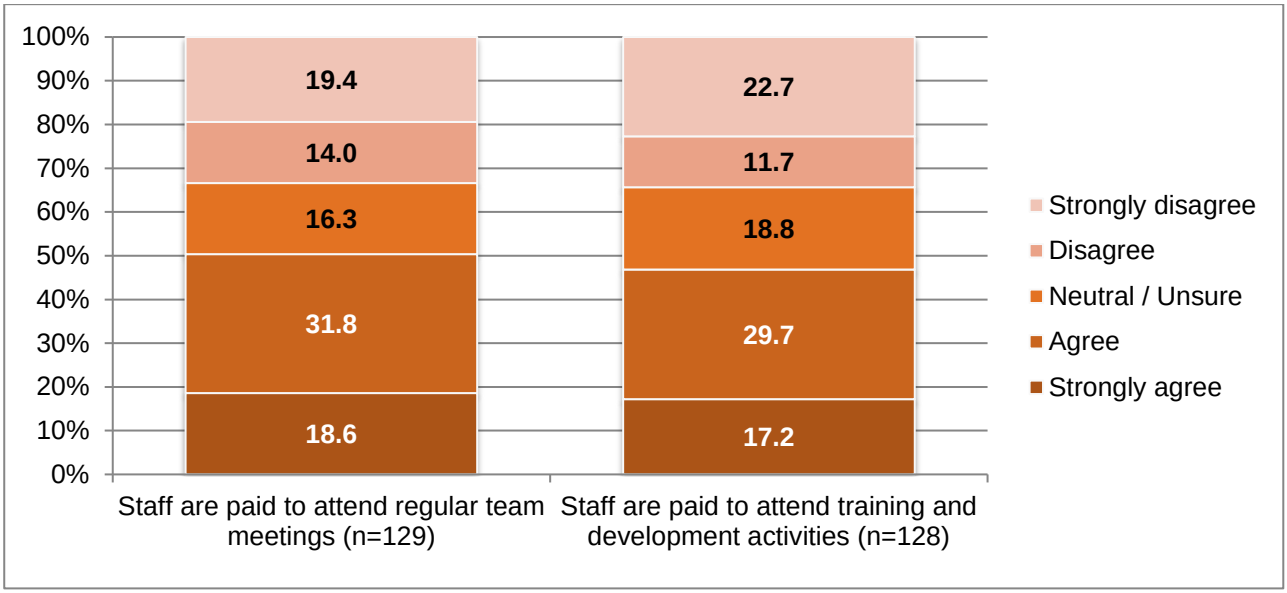
This employee explained the importance of the formal and on-the-job training she had undertaken prior to the NDIS and she described how training, along with experience working consistently with and getting to know individual clients, was important for enabling her to ensure participants' health and safety:

> So I would look at the five people that I'm putting on my bus and go, 'Well, you're sitting here sweetie where I can see you in my rear vision mirror, because you're my choking hazard,' I would look at who was sitting in the front because maybe they had some behaviours or maybe they were epileptic, and I would rather have you right next to me in the front seat of the car where I can see what's going on, or pick [a seizure] as it's coming and pull over as opposed to you're right down the back behind a wheelchair and two other people, and what's that noise, that hitting against, and oh, that's your head smashing on the window. (Employee 2)

A further account from this employee demonstrating systemic lack of training for epilepsy is included as part of Case Study 3.

Employers corroborated employees' reports that staff were not provided with adequate training with many reporting that under the NDIS support staff were not paid for their time to attend training and development. Indeed, 1 in 3 survey respondents reported that support staff delivering NDIS services were not paid to attend training and development activities (34.4%), and the same proportion (33.4%) disagreed that staff were paid to attend regular team meetings (Figure 5.4).

Figure 5.4 Percentage of CEOs of registered providers who agreed that staff are paid for meetings and training and development



Source: Survey of Employers, see Cortis and Blaxland (2017)

Case Study 3: Jessica and Michelle's training for epilepsy

Jessica was responsible for supporting a participant who had epileptic seizures. However, because of understaffing in the residential unit, she was not given training in how to administer the drugs required in the event of a seizure. At the time, high turnover, staff on sick leave and high use of casuals meant many of her co-workers were new and also untrained:

> I was started in the house in February. So for eight months, approximately seven, eight months, I didn't have Medaz training for our client who needed it. So if she had a seizure, I would have to ring an ambulance or hope that someone with Medaz training was on shift…. …. We were getting casuals coming and going… Then we had people leaving and people coming and it [training] just never happened. We had a team leader leave, we had [our new team leader] come. And it was her pushing for it that we finally got [the training]. (Employee 6)

Michelle, working in a different setting, also explained lack of training around epilepsy:

> It's not just this company, I've had friends that work in other companies and it's exactly the same in their company too. Some are still doing better training and working their training a lot better around taking small groups of staff off direct support and training them repeatedly, like that's four or five people out of 55 people, once a month, I think, they go through theirs. Which is better than nothing, don't get me wrong. But in the same sense, if you've got five people that are really well-trained in epilepsy …and then they might be working with people for the next four months that have no epilepsy training but are working with people who have epilepsy. (Employee 2)

Leave required under the SCHADS Award

The RCM assumes that 10% of workers' paid time will be taken as leave. Against this however, the NDIA has also assumed that support workers take 10 days personal leave and four weeks annual leave each year, which in total represents 11.54% of the year (i.e. 6 out of 52 weeks) (NDIA, 2017a, pp. 10-11). This does not reflect leave entitlements. Where employees work more than four hours on ten weekends a year, they are classified as shift workers, and entitled to an additional week's annual leave, which is not accounted for in the RCM's assumptions.

In addition, the NDIA assumes that 17.98% of Support Workers are eligible for 8.67 weeks of long service leave every 10 years, which represents a further 0.16 weeks of leave per annum across all Support Workers (NDIA, 2017a, pp. 10-11).[28] However, these assumptions are incorrect. Long service leave entitlements differ across Australia, with the ACT for example having a portable long service leave scheme leading to higher eligibility. There are also instances in which higher long service leave entitlements result from expired enterprise agreements which were maintained in

[28] That is, each year over a 10-year period, there would, on average, be 10% of 17.98% of Support Workers taking 8.67 weeks long service leave. That is [0.1 x 0.1798 x 8.67] = 0.16 weeks.

transition to the modern award. Thus, the assumption that 10% of workers' paid time will be taken as leave does not fully account for industrial requirements.

5.3 The level and workload of supervisors

Assumptions about supervision also contribute to the under-pricing of disability support work. Good supervision is a key element of quality service provision, but one which is poorly recognised under NDIS pricing arrangements. In Australia there have been some concerns, including prior to the NDIS, of poor skills and knowledge among disability support workers, exacerbated by poor supervision (Commonwealth Senate Community Affairs References Committee, 2015; Iacono, 2010; Mitic, 2013; Office of the Public Advocate, 2016; Parliament of Victoria, 2016). While good supervision will boost morale and staff retention, insufficient or inadequate supervision will raise quality risks and contribute to unpaid overtime (Cookson, 2013, p. 44; Gray & Muramatsu, 2013; Judd, Dorozenko, & Breen, 2017; Larsen & Hewitt, 2012).

The RCM assumes a ratio of one supervisor to 15 workers (1:15), and the NDIA's intention is that increasing the span of control to 18 workers (1:18) will be a source of efficiency which allows the price to drop. However, these ratios do not appear to be based on existing practice or any model of good practice, and do not recognise how disability support work is organised. In the employer survey, for example, a respondent stated this pricing assumption was misguided:

> The expected [supervision] ratio per staff member is 1:15 whereas we currently operate on 1:10. (CEO of medium sized metropolitan organisation)

Further, there is a strong link between the level of support workers (discussed above) and the supervision span. If all workers were employed at SACS Level 2, as per the pricing level, the span would need to be much less than 1:15. However, as Level 2.3 is assumed to be the average for support workers (with some employed at higher levels and some lower), in order to make 1:15 acceptable, supervisors would need to be employed at SACS Level 4 or higher, rather than at Level 3.2 as assumed in the RCM. The SCHADS Award stipulates that Level 3.2 staff 'supervise a limited number of lower classified employees'. The assumed level of supervisors, at Level 3.2, is below the commencement level of a graduate with a three-year degree (Level 3.3). Under the SCHADS Award a characteristic of Level 4, is that positions may involve a 'substantial component of supervision'. This would more plausibly reflect supervision spans of 1:15, than the 'limited number' stipulated at Level 3. Further, larger supervisory spans (such as the 1:18 envisaged in future) require higher levels of responsibility and employment of supervisors at higher levels, and are poorly aligned with the description of responsibilities at Level 3.2.

Empirical data shows supervisory spans of 1:15 and 1:18 are much higher than is common practice. Data from the survey of disability workers shows that among disability workers with supervisory responsibilities, 2 in 3 were supervising 8 or fewer staff (66% of supervisors). Only 16.4% of supervisors reported supervising over 14 staff, although the figure was higher for those working under NDIS (20%) compared with those who were not (12%). This is shown in Figure 5.5 and also contained in Cortis (2017).

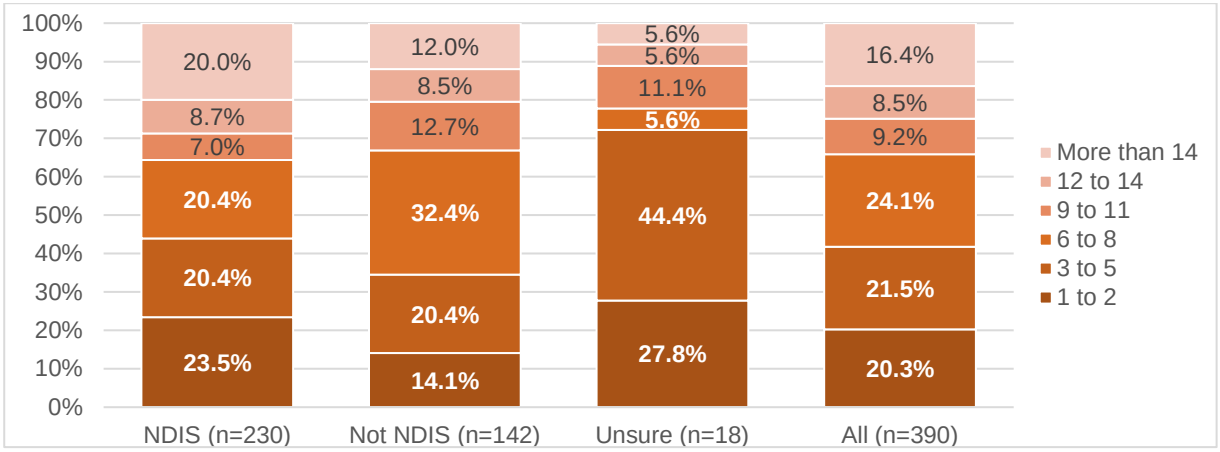
The proportion of supervisors overseeing over 14 staff was higher for workers in in-home settings and case management (each 26%) and community settings (24%), while it was low in outreach

(8%), allied health (11%) and residential/ group home settings (16%). These data are contained in Appendix F.

These data underline how the pricing model has assumed a larger supervision span than accords with the SCHADS Award classifications or than is common practice. Supervision of 15 staff as per the pricing model would entail significant (and unrealistic) change to the design of supervisory roles, and would intensify supervisory workloads for around 83% of supervisors in the survey.

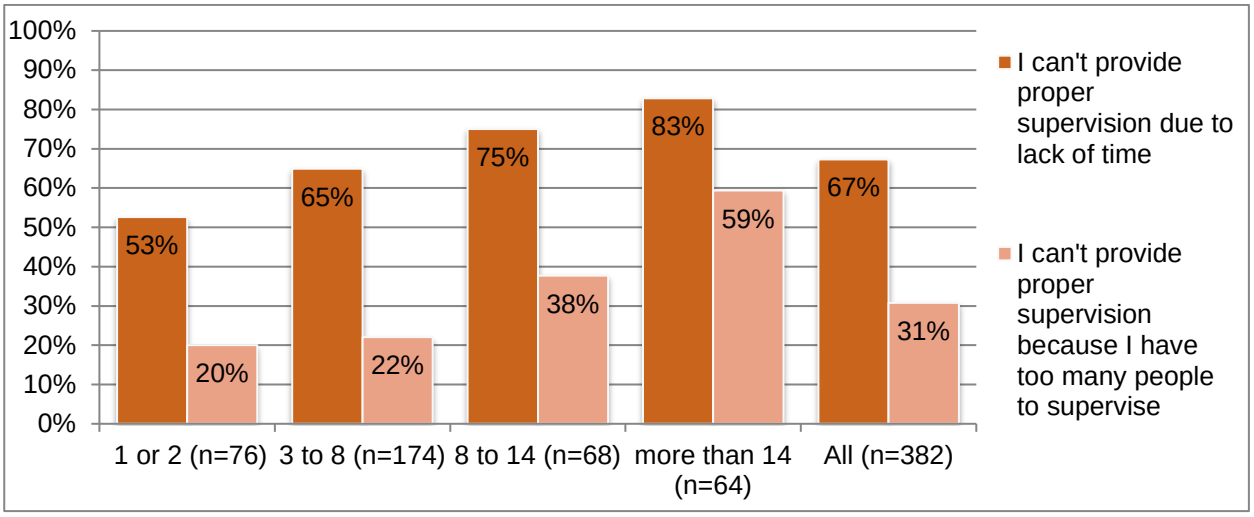
Further, supervisors with high numbers of supervisees are struggling to provide proper supervision. As the survey of disability workers showed, 83% of supervisors who supervise more than 14 staff (the level assumed in the NDIS pricing model) agree or strongly agree that they can't provide proper supervision due to lack of time, and 59% agree or strongly agree that they can't provide proper supervision because they have too many people to supervise (see Figure 5.6). This underlines how increasing the number of supervisees to levels assumed by the pricing model is predicated on poor quality supervision.

Figure 5.5 Number of staff directly supervised, by whether or not respondent was working under NDIS, supervisors (%)



Source: Survey of Disability Workers, 2017

Figure 5.6 Percentage of respondents who agreed with statements on supervision, by number of staff directly supervised



Source: Survey of Disability Workers, 2017

A respondent to the employee survey commented on the difficulties of supervision under the NDIS, and the Scheme's failure to recognise the time requirements for the type of supervision required to support choice and quality assurance:

> It appears that the NDIS has been created with a particular set of disabilities in mind, or at least as a priority, but in the case of intellectual disability there is not enough consideration given to the complexities of supporting those with complex care needs. Where participants are unable to self-manage or advocate strongly for themselves, supervisory staff are not being given the resources to properly provide choices and to collect the evidence that quality services are being delivered. What was sold as an opportunity to address the inequalities inherent in the block-funded arrangements has instead delivered a cost-cutting exercise; whether through accident or design, the lofty ideals of the NDIS are not being going to be achieved for a great many participants unless the paucity of funding to provide the best outcomes is rectified.

Loss of supervision and support for workers was identified as something that had occurred with the NDIS and was felt directly by many workers, mainly in that they—as qualified, trained and experienced workers—were relied on to support new, inexperienced casuals. For example one disability support worker who did not have formal supervisory responsibilities for other staff described needing to step in to supervise less experienced staff:

> When you're working with casuals, because you're attached to the house as a staff member, you're the most senior person there on staff so depending on what needs to be done, then you're directing staff to do that. I'm also the OH&S rep and the union delegate. So in those roles I'm supporting staff. Not so much supervising, but supporting them to make sure that we're all doing A, the same thing and we're all doing it the correct way. *Interviewer*: So how often would you have to be working with casuals? … *Interviewee*: I'd say every second shift I'm working with a casual. (Employee 1)

A broader perspective was offered by a support-co-ordinator who observed new service providers in her region were not putting resources into supervision and support and this was impacting on the quality of support for people with disability. In her own organisation she had seen training and supervision cut to an extent that she believed was having a negative impact on quality of support, particularly for one-on-one personal support. She said:

> … there's a lot of agencies that have started up in…. [and] they don't have that sort of supervision and governance with their direct care support staff. And direct care support staff can get themselves into some tricky situations I suppose around boundaries and that sort of thing. So I see that because I support other people to engage with other agencies, so I see when the problems arise. (Employee 4)

Interviews with disability support workers suggest a combination of reductions in training and support for disability support workers, increased use of inexperienced casual employees and increased supervisor workloads are creating unsustainable pressures on supervisory staff. For example, one supervisor reported that she was working at least 10 to 15 hours unpaid overtime a

week undertaking essential work such as keeping up-to-date with participants' medical needs to try to ensure a safe, good quality service and a safe workplace:

> I'm not getting any training ... So who's to say I'm doing things the right way and showing you how to do things? That worries me. That terrifies me, that I show someone, or explain something to someone, and it's completely wrong. I put someone at risk of, at best, an emotional outburst, at worst of physical violence and psychological injury, because I've told you to do things this way, or such-and-such and it's completely wrong. And that terrifies me. That eats my soul. Which is probably why I do the 10 hours extra [unpaid], making sure that I know what I'm talking about and who I'm talking about and I'm reading people's plans and I'm seeing if anything's been updated in their plans, their diagnosis, their medication. (Employee 2)

5.4 Staffing on-costs

The adequacy of provision for staffing on-costs is difficult to assess, and data was not specifically collected on this theme in the survey or interviews. It appears that the types of costs usually included as staffing on-costs, such as superannuation and workers compensation, have been included in the RCM. However, the actual amounts in the RCM (based on the calculations used in NDIA and NDS, 2014) are inevitably much less than what is necessary, because on-costs are a percentage mark-up on direct wage costs, which, as shown above, are significantly under-stated, based on the under-classification of workers and supervisors, and under-estimates of the time required to provide disability support (as detailed in 5.1, 5.2 and 5.3).

5.5 Corporate overheads

Low allowance for overhead expenses in contracts with governments (or donors) is a problem for not-for-profit financing, as it feeds a cycle of under-investment (Lecy & Searing, 2015). Lecy and Searing (2015) identify how the excessive pursuit of administrative efficiency has caused a steady, self-perpetuating practice of cost-cutting in organisations, which in turn harms not-for-profits and their service users. Reductions in overheads can cause a myriad of behaviours which are detrimental to the long run productive capacity of not-for-profits, including cutting expenses relating to personnel development. Low overheads also place organisations at risk of financial shock, and have long term consequences by depleting organisational capacity, through starving organisations of funds to invest in skilled and efficient management, and training and development. Low overheads result in burned out staff, under-maintained capital, out of date programs, and other manifestations of poor quality.

It is difficult to assess the appropriateness of NDIS prices for corporate overheads, given the diversity of providers' operational models. Indeed, Lecy and Searing (2015) caution against a simple rule of thumb for all not-for-profits, and instead show that organisations have different levels of overheads depending on their size, subsector and stage of growth. However, it is pertinent that disability service providers report that NDIS pricing arrangements do not adequately cover overheads. One CEO explained, how under NDIS, there is:

> Very little face to face time, eg for supervision, meetings and training and it is inadequate and we will have to reduce all 3. We will be cutting back on our regular 3 full training days a year. We will initially be putting people on casual now as we will be unable to determine ongoing employment. The pricing may cause viability issues for us and is a poor outcome for our staff. (CEO of medium sized metropolitan organisation)

Commonly, inadequate provision for overheads was seen to impact on employers' capacity to cover staff development and training:

> The pricing is not appropriate and for many of our participants it is not reasonable or necessary for them to live an ordinary life. The apparently arbitrary allocation of service costs at 12% or 15% does not allow for staff development or training. The NDIS is squeezing organisations and promoting casualisation of the workforce and skills atrophy of staff. It is great in theory, and I really love the concept, but the implementation and understanding by government, the NDIA Board and the NDIA staff is poor. (CEO of large metropolitan organisation)

> The pricing structure for NDIS means that opportunities for training, professional development are being called into question and how/what type of training can be delivered. Individual plans are also not covering the cost of clinical services and requisite training to staff to deliver particularly in relation to behaviour management. Also the cost of team meetings is not being covered. In many cases the plans for supported independent living do not cover even the direct support needs of people with disabilities (CEO in large non-metropolitan organisation)

> It is challenging to maintain quality and an appropriate level of L & D[29] and supervision under the NDIS. This is particularly important as we deal with quite complex cases that require this support. Also the qualifications of people who can deliver different supports has meant an entire organisation restructure and recruitment to ensure our employees can deliver the required supports…. …Also, there has been great pressure on employees to deliver NDIS work efficiently when they have to learn new systems as well as work under dual systems of current funding and NDIS funding. (CEO of small metropolitan organisation)

As discussed in Section 5.2, workers also identified the loss of paid time for training as something that had occurred with the NDIS with negative impacts on workers' ability to their jobs, and negative impacts on job satisfaction as they observed declining capacity and service quality. Workers we interviewed had experienced their organisations significantly cutting back on support for induction and training of support workers, and for supervision and team meetings. Impacts on service quality were very apparent as there were often many new support workers and many more casual and short hours' part-time workers in their services than previously. As Bentham and

[29] Learning and development

Macdonald (2017) found, workers reported their ability to deliver quality, safe support to clients was often compromised. As one stated:

> …I know one new girl who buddied up with me once, she said, '[our employer] gave me a box of gloves and said, off you go'. (DSW12, Bentham and Macdonald, 2017)

Many other workers reported having inadequate information about the people they were supporting; for example one worker said:

> … [The person was] the most complex client I have ever been sent to …there were no written notes. …I wasn't told that he self-harms, but he does self-harm. So the most crucial information wasn't provided. (DSW07, Bentham and Macdonald, 2017)

She also said that the strict routine required by one person she worked with who had high support needs required around '30 different steps in a one hour [shift]. …And I was expected to know this routine after maybe two shifts.' (DSW07, Bentham and Macdonald, 2017)

Workers said they highly valued staff meetings, as these were important opportunities for workers to share information and ideas to improve support strategies for individual clients. However, several reported that their organisations did not have meetings for support workers at all. One worker said that support staff had asked for meetings but had been told the organisation didn't have funding for staff meetings. Some workers felt so strongly that meetings were essential, they organised and conducted them in their own unpaid time:

> Usually when something arises in the team – because you put it to the office [that we should have a staff meeting], 'Oh, no, we can never find time,' or 'it doesn't allow for that in their NDIS package' or something – so we'll just meet for coffee. Probably every two-three months, or if someone new comes onto the team, we'll sort of have a get-together with coffee and sort of discuss some of the behaviours, and strategies we use and things like that …because as I said before, for a team to work, you all have to be on the same wavelength. (DSW01, Bentham and Macdonald, 2017)

Another support worker connected the lack of support and supervision she was receiving with the move to the NDIS:

> When I now say a 'team leader', look, really there is no team. They say that there's a team, we're in the complex team, …program, but we never get together. Like there's no meetings, there's no supervision. ... Previously there was just that sense of you were a part of a team, and a team that cared about those people, the clients within that team. At the moment it's so scattered that we're all fragmented, it doesn't feel like a team at all. [Previously] you run past things with people, you get other ideas. It's like, you know, a whiteboard and you've got all these different ideas coming at you and you're going, 'Oh yeah, look, I didn't think of that.' You know, like it's reflection, it's feedback, it's all those things that, [now] who are you going to talk to? I'm not going to go home and talk to my husband and say, 'Hey listen, what do you think of this?' You need that, you do, you need that sense of support around

> you as a worker. And, I don't know, I guess it's a feeling of belonging, of belonging to an organisation that really cares and nurtures and all that sort of thing. Had that before; don't have that now.' (DSW20, Bentham and Macdonald, 2017)

Some employers also pointed out how under NDIS, organisational overheads were higher, given both the need to spend time negotiating with service users, and the high costs of working with the NDIA:

> NDIS requires both of our organisation and our staff to be more flexible in terms of meeting the more frequently changing needs and demands of clients. It will also increase our administrative cost because our staff members will spend more time in negotiating with clients before they use our services and after they discharge from our services. (Human Resource Manager in large metropolitan service)

> At the moment, we still have great confusion among some of our clients and their plans. Even so, there are plans in place, they cannot always be accessed for the service we provide or the client has used up funds in one category but then has difficulties to access another part. To ring NDIA it takes often up to a hour on hold to get to talk to someone, who then in turn cannot always help with a solution. For a small organisation like us NDIS is nearly not worth the hassle. We have to pay our staff, but have delays in getting paid. We have one admin staff, who cannot spent hours trying to solve all the issues. Fees do not cover cost of the professional provider and admin cost. We find NDIS very heavy on administrative cost, which is hard to manage for a small organisation like us. We hope with time this gap will significantly reduce and make servicing NDIS clients more viable for us. (CEO of small non-metropolitan organisation)

5.6 Return on capital (margin)

An appropriate margin would allow organisations to ensure sufficient working capital and to accumulate a small reserve to meet future expenses, which can help ensure future capacity to pay staff (Calabrese, 2013). The interviews and survey data collected for this study did not specifically explore the appropriateness of the 5% allowance for a margin in the NDIS pricing model, making it difficult to assess its adequacy. However other sources suggest this may be a little low, especially for a period of transition, where providers have high costs of adjusting to new models and need to invest to expand capacity.

Some evidence of the margins achieved by registered NDIS providers comes from NDS (2016). Around 1 in 5 organisations reported no surplus in the last financial year, and 46% had a margin between -3% and +3%. Around a third (32%) reported margins which were above this level. Another source of information comes from the financial reports made to the Australian Charities and Not-for-Profits Commission (ACNC) by 14,896 charities which listed people with disabilities among their beneficiaries in 2015, the average margin (net income as a percentage of total income) was 6.3%. When limited to the 7,963 registered charities who listed people with disabilities

as a beneficiary group and were in the sectors relevant to NDIS, charities had an average margin of 5.2%.[30]

While the employer survey did not indicate the exact margins organisations needed, it shows that, under current pricing arrangements, providers are under pressure. For example:

> Under the NDIS rates we are being asked to provide the same hours of work for a lot less money (around 1/3) - something must give. … We have not accumulated surpluses…. How do you maintain safety, probity, supervision, training with such low margins- I guarantee each organisation will be cutting corners somewhere. (CEO of large non-metropolitan service)

The evidence about the adequacy of the pricing assumptions relating to margins is fairly thin and requires further research. It may appear that the pricing model allowance for margins is a little too low and that the 5% margin is likely to be unachievable by most providers in the context of underfunding of the other elements of the price.

5.7 Variation to the base rate, and other NDIS pricing issues

As discussed above, NDIS pricing is contributing to under-classification, time pressure, and unpaid work among disability support workers, primarily because of under-pricing through the base hourly rate. Less evidence is available about the adequacy of variation arrangements, such as the geographic and time of day loadings, and other aspects of NDIS pricing, although some conclusions can be drawn.

To assess the adequacy of geographic loadings in 2016-17, and the increases scheduled for 2017-2018, would require more focused research on providers' costs and practices across the full range of geographic contexts, while the time of day loadings similarly require assessment against the full range of industrial entitlements, including those in enterprise agreements.

However, the evidence does however show the loading for intensity is far too limited, as it fails to take account of the range and cost of strategies that are essential to assist participants with complex support needs, in particular the need for more senior workers and the frequent need for more than one worker to work with participants. The loading only takes (inadequate) account of additional non-client time required of workers, with a 5% reduction allowed from the proportion assumed in the base hourly rate. Under current arrangements, the higher rate of supports can be considered where assistance to manage challenging behaviour is required at least once per shift or where continual active support is required, but it is the case that some participants have more intermittent complex support needs. Case Study 4 shows how prices need to take into account that

[30] These figures come from an online analysis tool at australiancharities.acnc.gov.au, and were calculated using a subset of charities which listed people with disability among their beneficiaries and whose main activities were in the ACNC's categories of social services, health, law and advocacy, development and housing, and culture and recreation. This excluded those in the categories of education and research, environment, international, other, religion, and philanthropic intermediaries, which are unlikely to deliver NDIS services. Note that it is not clear how many of these were actually delivering NDIS, rather the figures are indicative of the margins of disability charities more broadly.

in some cases, more than one worker will be required to work with participants with complex needs, or for reasons of worker health and safety

In terms of variation for numbers of participants, prices for Group based, Community, Social and Recreational Activities assume substantial economies of scale, in that a provider is paid the base hourly rate for providing support to a single participant when providing support to 2 or 3 participants. For Centre-based Care, the same price is charged for each participant, and thus prices assume there are no economies or diseconomies of scale. For Supported Independent Living (SIL), the price per participant reduces as the number of participants increases, and thus prices assume there are economies of scale. There does not appear to be any publicly available explanation of the reasons why the NDIA made the various assumptions about the nature of the economies of scale in each of the three cases, nor why the assumptions are different in each case. As for the other variation components, further information is needed for a full assessment.

Case Study 4: Jane's experiences of under-staffing

Jane, a disability support worker described health and safety problems that placed workers and participants at risk. Due to understaffing Jane has been required to use a hoist to lift a person on her own, despite this being unsafe for her and or the person she was supporting:

> Every single person that works there has had to hoist him by themselves, one time or another because of [they are working on their own when there should be two support workers assisting the person]. …This is a very stressful situation to be in.

Lack of enough staff in the organisation has meant Jane and her colleagues work shifts when they are unwell even when there may be health risks for themselves and a risk of exposing participants with weak immune systems to illness:

> Say that a carer got sick and they rang up to say, 'We can't go to this client's house today because I'm sick,' then oftentimes, like often she's said to me, 'Well, I'll have to tell him that nobody's coming then,' because they rang everybody else and because there's so little of us if everybody else said no there's not really much you can do.' And sending us in is not a good idea because you don't want the client to get sick, so yeah…
>
> (S)ometimes we still go to work even if we really shouldn't. There's a [co-worker] that was told not to go to work for a month because she hurt her knee, and they didn't want her to be walking on it or hoisting on it or doing anything, but she still had to go to work because there's so little of us that there's nobody else to cover her shift. (DSW22)

6. Concluding discussion

This final section summarises the overall impact of inadequate prices on NDIS services and the staff employed to deliver them, and suggests some ways forward.

6.1 Summary of inadequacies in pricing arrangements

Drawing on data from disability support workers and employers, this report has shown a range of problems arising from the assumptions embedded in the RCM. Overwhelmingly, the evidence shows that NDIS prices are not covering the full costs of disability service provision or supporting quality services. Under-pricing of services is inherent in the key assumptions underpinning the NDIS pricing model.

Prices have been set with little transparency, which appears inappropriate given the Scheme's high public costs, and the significant implications prices have for provider viability and supply, workers' financial security and participants' quality of life. More transparency about all the NDIA's assumptions and decision making is required. Principles of transparent, evidence-based pricing should guide the operations of the NDIA or any independent price regulator.

Major problems with the NDIS pricing models and prices include:

- The assumed average level of workers at SACS 2.3 is acting as a cap at entry level, and does not reflect the actual profile of the level of workers. It is creating incentives to hire less qualified and less competent staff, and is limiting career paths and progression, and prospects for staff retention. Level 3 would be more appropriate.
- Pricing arrangements fail to recognise the costs of supervision. The assumed classification level of supervisors at Level 3 is low, and the supervision level and span does not align with either the assumed level of support workers who are supervised, evidence of current supervisory practices, or the classification descriptions contained in the SCHADS Award. Level 4 would be more appropriate.
- The assumed amount of non-client time involved in disability support work (5%, or 21 minutes in a 7 hour day) is inadequate. While there appears to be large variation between service types and providers, administration and co-ordination demands have increased under NDIS. Disability support workers are experiencing excessive time pressure which is unsustainable, and antithetical to supporting participants' needs in individualised ways.
- Development and co-ordination activities, such as training, peer support and team meetings are not adequately funded under current prices. As a result, there are greater risks to participants, where disability support workers are not properly trained, where supports are poorly co-ordinated, and where workers lack the capacity to provide supports in individualised ways.
- While more research is necessary to assess price variation, the variations based on intensity are inadequate. The 'discount' of non-client facing time does not adequately recognise what is required to assist clients with high support needs, such as the need for more than one support worker, or the employment of more highly skilled workers. If the costs of working with

participants with high support needs are not available under NDIS, there are real risks that providers will avoid supplying these participants. Similarly there may be other gaps in the overall supply of NDIS services and supports if the other variation factors do not fully cover the costs across the range of places and circumstances that the NDIS is supposed to serve.

Overall, the data shows how provider organisations are finding it difficult to be 'good employers' and to meet their industrial obligations and cover required pay rates and conditions. Many are reconsidering whether they are likely to be able to provide services in viable ways in the future. Further evidence of employers' difficulties covering the costs of staffing are reflected in the substantial proportion of CEOs who report that their organisation cannot provide staff with regular hours, and their low likelihood of offering an expanded number of permanent positions in the future. Reports from employees confirm that some employers are adopting workforce strategies to minimise labour costs, reducing support workers' pay and employment conditions and, in some cases, undercutting legal minima.

This context creates real risks for the future of the NDIS, and for NDIS participants. Pricing is predicated on under-classification of workers and insufficient time for workers and supervisors to do their jobs well, problems which are exacerbated for participants with more complex needs. Prices are not supporting thorough induction and training, contributing to high levels of risk. Workers are compensating for under-resourcing with unpaid work. Under these arrangements, attracting and retaining the additional disability support workers necessary to meet projected demand is unlikely. Indeed, even retaining the current workforce is a matter of concern.

6.2 Building alternatives

Any review of NDIS costs and the factors affecting Scheme design need to recognise that current prices and price setting processes are inadequate. Urgent intervention is required to develop more realistic assumptions and ensure prices are based on evidence of what is required to deliver good quality services, and the importance of a well-supported and reasonably remunerated workforce. Although prices are being indexed upwards for 2017-2018 to account for cost of living, minimum wage and ERO increases, these increases leave the underlying structure of prices intact. These arrangements are unsustainable, as the effect of under-pricing is to shift the costs of provision onto frontline staff, undermining quality support and prospects for decent jobs for support workers.

Prices are incentivising cost-cutting and creating imperatives for low quality provision. Fairer pricing arrangements would recognise that providers require access to resources which enable them to attract, train and retain high quality staff, and to employ staff in decent jobs that provide adequate hours and earnings, safe workplaces, job security, and a reasonable work-life balance. Dedicated funding for training, and a loading to cover employment of support workers above entry level, would help to provide career pathways and aid in staff retention and workforce expansion. The NDIS quality and safeguarding framework should be enhanced over time to ensure quality disability support is underpinned by a well-trained and qualified workforce, through mandating or creating incentives for minimum requirements, such as qualifications at Certificate IV level.

The NDIA has repeatedly promoted the ideal of a mature NDIS market within which competition will drive prices down. In light of the evidence showing service provision is under-priced, this vision seems unrealistic. The NDIA has stated expectations that movement to an efficient price will be

driven by reduction in corporate overheads, expanding the supervision span, and increasing staff 'utilisation' (time with clients), but has given little indication of why or how this will happen, except for generalised claims about the impact of 'competition'. These changes seem unrealistic in the context of current pressures on organisations, existing supervisory practices and the very limited amount of non-client facing time currently allowed. Any lowering of NDIS prices is likely to reduce the quality of services further below acceptable minima, and work against the achievement of NDIS objectives.

A more realistic vision, based on robust evidence of the nature of quality service provision and measures of quality, would help guide reform in ways that avoid a race to the bottom. Pricing should be informed by research about the ways disability work is performed, and the experiences of those who perform it, and recognition of the links between employment arrangements and outcomes for people with disability. Measurement of participant satisfaction and health and wellbeing outcomes which are linked to job quality measures could help assess the contribution of different employment models, and could be used to evaluate any future changes to prices, and the ongoing process of reform.

Principles of transparency in price determination are also vital to enable all stakeholders to assess the adequacy of prices in relation to the full costs of provision. As well as transparency of NDIA decision making, consideration should be given to requiring providers to report workforce information, to demonstrate the integral position of workers in the logic of implementing the NDIS and supporting participants to achieve outcomes. It could become a requirement of NDIS registration, for example, to publicly report specific workforce data, including the numbers of qualified and experienced workers, and workers employed on a permanent basis. The National Minimum Dataset for Social Care (NMDS-SC) [31] in the UK provides an excellent model for workforce monitoring, enabling time series analysis of the social care workforce as a whole over time, whilst also providing more granular information for particular areas or service types, to inform research, benchmarking and quality assurance (Hussein, 2009; Hussein & Manthorpe, 2012).

Disability support work under the NDIS: Initial analysis of workers' experiences

April 2017

CPOW Working Paper 2017-1

Centre for People, Organisation and Work, RMIT University

Melbourne, Australia

Report contents

This working paper presents preliminary findings from an initial analysis of some of the data collected for the *Day in the Life of a Care and Support Worker* research project led by Fiona Macdonald and Sara Charlesworth with Eleanor Bentham and Jenny Malone as part of three larger research projects . All three projects have received funding from the Australian Research Council: *From Margins to Mainstream: Gender Equality and Decent Work* (DP110102963), *Prospects for Quality Work and Gender Equality in Frontline Care Work* (FT120100346) and *Paid Work in Cash-for-Care: Australia in Comparative Perspective* (DE 160100543).

Overview of research and summary of findings

The research

This working paper explores some of the experiences of people employed to provide personal support and assistance to people with disability under the National Disability Insurance Scheme (NDIS). It presents a preliminary analysis of semi-structured interviews conducted in late 2016 and early 2017 with 12 Disability Support Workers (DSWs) for the *Day in the Life of a Support and Care Worker* research project. In this work in progress paper we focus on aspects of workers' experiences that are affected by NDIS funding and pricing arrangements.

Summary of findings

Workers were very positive about their roles supporting people with disability work. Nevertheless, six of the 12 workers were taking active steps to leave their jobs as disability support workers. This working paper examines what is behind this apparent contradiction, It reports on workers' experiences of disability support work under the NDIS and identifies that most of the negative aspects of work for these disability support workers are not inherent to the work but are the result of the ways in which the work is organised and the limited funding, training and support associated with their jobs. Workers experienced poor training and support, low earnings, excessive unpaid work time, and extended working days and weeks as significant negative aspects of their jobs.

The research and the research participants

The 12 disability support workers (DSWs) whose experiences are reported in this paper were among a larger group of workers who participated in two individual face-to-face semi-structured interviews with researchers in which they were asked about their jobs, and their employment and working time arrangements. In between the first and second interviews each of the research participants completed a ‘diary’ outlining their working time over three days. The analysis presented in this report is drawn primarily from the worker interviews.

Research participants were recruited for the research through advertisements in a local newspaper and also through snowballing, with some people passing on the invitation to participate in the research to their colleagues. Interviews were conducted in public locations offering privacy (e.g. in private rooms in community centres and public libraries) and with permission from participants were audio-taped.

The 12 research participants were women aged from early 20s to over 60 years. Nine of the 12 were aged over 40, most of them in their 50s or 60s. Five of the 12 DSWs were employed by two or more organisations to provide support to people with disability. Three workers held other jobs in addition to their disability support roles. Some also worked as homecare workers providing personal assistance to aged people in their homes (This work is not discussed in this analysis).

The women were employed by not-for-profit, for-profit and public sector organisations with several of these organisations providing a range of support, care and other services in addition to services provided to people with disability as part of individual support packages under the NDIS (for example home and community care to elderly people). Four workers were employed by more than one type of provider.

Almost all the disability support workers provided personal care and assistance to a number of NDIS participants, working with adults or children with physical and intellectual disability or cognitive impairment. Two provided support to people with mental health issues.

One worker was employed full-time on a fixed-term contract. Five others were permanent part-time employees (some working full-time hours) and six were casual employees, mostly working part-time hours.

Workers’ years of experience in their current roles or in similar work ranged from five months to 30 years. Most of the workers were either the main or sole breadwinner in their household or were joint earners with a partner.

Preliminary findings

Disability Support Workers' skills and responsibilities

The disability support workers reported providing support to a variety of people including some with complex support needs. Most of their work involved providing support to people in their homes; typically the workers were working on their own, or with one other worker, and often without immediate access to a team leader or supervisor. Workers spoke of having to deploy a range of skills in the course of the working day, including the following examples:

- applying knowledge across a wide spectrum of advanced practical skills, such as: knowing how to do PEG feeding[32] or safely use a hoist to lift someone; knowing how to respond when someone has an epileptic seizure; and knowing what routine or intervention will prevent someone from self-harming or keep a client with challenging behaviours happy and calm;
- monitoring and assessing participants' wellbeing and health, and taking appropriate steps to address problems, for such things as a person not eating; having unexplained bruises; or having their health deteriorate requiring action;
- responding to urgent situations, such as medical emergencies or violence;
- using interpersonal skills to lift a depressed client's mood, provide an enjoyable experience for a child, calm a distressed client with dementia, or support a terminally ill client and their grieving family;
- working with people to help them achieve their short- and long-term goals;
- managing a demanding workload under time pressure, including frequently accommodating unforeseeable events within a tight schedule;
- understanding and working in compliance with requirements of the various legal, regulatory, funding and healthcare systems applying to their roles; and
- negotiating with their employers and other health and support agencies to achieve the best for their clients.

Supporting people with disability: The positive aspect of the work

Disability support workers were overwhelmingly positive about the key aspect of their work: supporting people with disability. All the workers said they enjoyed working with people and making a difference in their lives.

> There's certainly a bit of everything in this job. That's what I love about it. …And I love that you build an attachment to people, although you're not supposed to. I

[32] PEG is an abbreviation for percutaneous endoscopic gastrostomy, a procedure in which a flexible feeding tube is placed through the abdominal wall and into the stomach to enable feeding directly into the stomach.

> shouldn’t say an attachment; you build a friendship. You’re not supposed to; it’s a big no-no. But that’s totally unrealistic. I mean, you’re a carer, you’re going to care. (DSW11)

> (I)t’s good to wake up every morning and think that you have the opportunity to influence somebody’s life today and that you can choose to make that a positive influence, and help someone with their goals that otherwise without you they wouldn't have been able to do. (DSW22)

> I love it. I’m really enjoying the experience, yes. I love it. …Every day’s different. …Yeah, I’m enjoying it. Because it’s still quite new, it’s different and I’m enjoying it, the difference. But yeah, all my clients are just lovely. And sometimes I go into a home and I work with a person and they’re just lovely. And I just go away thinking, oh, that was such a pleasure to do that job. (DSW04)

The difficulties of disability support work

While all 12 workers said they liked or loved their work, all also readily named aspects of their jobs they found very difficult. Workers talked about their work being physically, mentally and emotionally tiring or exhausting; and they spoke about the stress of trying to provide essential support without having enough time to do so. Some experienced verbal and physical abuse from people they supported. Many workers spoke about the stressful elements, and emotional strain of their work: some described experiencing distress working with people with degenerative diseases and about their grief when long-standing clients passed away, and others spoke of the difficulties they experienced supporting people who had limited social contact:

> …when you go into someone’s home, they may not have a support network around them. So I think it is a lot more emotional for me (than working in a group setting). Because I take on people and their worries and their problems.

> You always have them in the back of your mind. It’s that kind of industry. …It’s really hard not to think about your clients when you’re not with them. (DSW04)

The negative aspects of disability support workers’ jobs

While some of the difficult aspects workers identified were largely inherent to the work, disability support workers spoke to us about many more problems with their jobs that were not, and that multiplied the difficulties identified above. These were: inadequate training, inadequate supervision and organisational support, low pay, and working time problems associated with split shifts, unsocial working hours, extended work days and weeks, and casual conditions.

Inadequate training and support to do the job well

Despite not being explicitly asked in interviews about training and support, half of the workers raised lack of training and/or supervision and management support as serious problems, and only a few described good training and support.

Supports that workers wanted but reported not receiving included: ready access to supervisors who could be contacted in an emergency and who were familiar with the clients; regular meetings with supervisors and colleagues to develop improved support strategies for clients; timely provision of essential information about clients necessary to keep themselves and their clients safe; training and support to ensure workers' safety when working with potentially dangerous clients; supervisors and managers who would follow up on concerns about client wellbeing raised by workers; and the opportunity to gain familiarity with individual clients' needs, personalities and interests through regular consistent shifts with the same clients and on-the-job training.

Several workers contrasted their current negative experiences of work with the good-quality training and support they had received previously, either with government providers or prior to the NDIS. For example, one worker spoke highly of the training and support offered by her government employer, compared with the lack of support she received from the not-for-profit she now also worked for:

> …we have one-on-one meetings every six weeks. …They are for any grievances you might have – if your roster's too full, if you're not getting enough hours, if you want to change something around, if you have a problem with a particular client – just whatever's going on with you workwise. And we also have team meetings every four weeks, which is great, and then for an hour and a half we often have guest speakers. And we just finished a workshop on (a specialist topic), which was really interesting. And again, you can bring something up that's relevant to everybody else in the room, and we can kind of brainstorm: 'Well this is how I chose to deal with it, I don't know if that's always going to work,' …and they offer counselling services and physio services. (DSW11)

By comparison, she said of her not-for-profit employer:

> you don't have anything to do with them. …I know one new girl who buddied up with me once, she said, (the employer) gave me a box of gloves and said, off you go. (DSW11)

Many workers said that the lack of training and support meant that their ability to deliver quality, safe support to clients was compromised, or that their own health and safety was compromised. Many also reported having inadequate information about the people they were supporting; for example another woman said:

> … she was the most complex client I have ever been sent to …there were no written notes. …I wasn't told that she self-harms, but she does self-harm. So the most crucial information wasn't provided.

> This woman also said that the strict routine required by this client to manage their behaviour required '[dozens of] different steps in a one hour (shift). …And I was expected to know this routine after maybe two shifts.' (DSW07)

Workers said they highly valued staff meetings, as these were important opportunities for workers to share information and ideas to improve support strategies for individual clients. However, several reported that their organisations did not have meetings for support workers at all. One worker said that support staff had asked for meetings but had been told the organisation didn't have funding for staff meetings. Some workers felt so strongly that meetings were essential, they held them in their own unpaid time:

> Usually when something arises in the team – because you put it to the office (that we should have a staff meeting), 'Oh, no, we can never find time,' or 'it doesn't allow for that in their NDIS package' or something – so we'll just meet for coffee. Probably every two-three months, or if someone new comes onto the team, we'll sort of have a get-together with coffee and sort of discuss some of the behaviours, and strategies we use and things like that …because as I said before, for a team to work, you all have to be on the same wavelength. (DSW01)

> We did mention yesterday that we need to maybe meet out in the community sometimes once a fortnight or something like that. (We would) just organise it ourselves, because (Not-for-profit Provider) is not interested in doing it. It feels like they're just interested in getting the hours paid for, getting the numbers and getting the hours paid for. (DSW20)

A worker, employed by a large not-for-profit provider, said that team meetings were 'non-existent'. (DSW07) Another said that she had had little contact with colleagues since 'my induction, that was when I first started. And so I've barely seen people at (not-for-profit provider) after that'. (DSW04) One support worker who was working with clients who had very complex conditions connected the lack of support and supervision she was receiving with the move to the NDIS:

> when I now say a 'team leader', look, really there is no team. They say that there's a team, we're in the complex team, …program, but we never get together. Like there's no meetings, there's no supervision. ... Previously was just that sense of you were a part of a team, and a team that cared about those people, the clients within that team. At the moment it's so scattered that we're all fragmented, it doesn't feel like a team at all. (Previously) you run past things with people, you get other ideas. It's like, you know, a whiteboard and you've got all these different ideas coming at you and you're going, 'Oh yeah, look, I didn't think of that.' You know, like it's reflection, it's feedback, it's all those things that, (now) who are you going to talk to? I'm not going to go home and talk to my husband and say, 'Hey listen, what do you think of this?' You need that, you do, you need that sense of support around you as a worker. And, I don't know, I guess it's a feeling of belonging, of belonging to an organisation that really cares and nurtures and all that sort of thing. Had that before; don't have that now.' (DSW20)

One worker employed by a small organisation said that her supervisor, was ‘very hard to contact’. She went on to say:

> Yeah, so you kind of pick and choose what you ring her for, because it’s like she’s not going to answer anyway. One time …they hadn’t covered (a) shift for the night. So, there’s meant to be two people and there was only me, and I tried ringing her like x amount of times. She didn’t answer. So I started ringing the other workers, and asking if anyone can come help, because the boss isn’t answering and it’s like a normal thing for us. So that happens quite a bit. (DSW22)

One worker said that employees with her employer had expressed a desire for more training, but had not received it. She said she was willing to offer her time unpaid to receive training, including some ‘basic’ information about the organisation’s directions and the NDIS:

> I think it’d make a great difference if staff were included and …even training sessions, perhaps more refresher training sessions that could be held at the office, where there’s a big conference room there. So staff could be invited in there, I’m not saying necessarily to be paid to be there, but as a choice for them, perhaps, to go in and maybe the supervisors could say, explain to us how the systems work, how the communication moves around ..with the NDIS as well as them. And also give us the heads up about any new things that maybe going to be implemented, like different programs, give us some options too. (DSW08)

This worker also reported that her employer did not give them support to identify community activities to take clients to; the service provider was instead relying on individual workers to use their own, unpaid time to find out about suitable activities:

> If we have …a client who we’re with and we have to structure their day, (I’d like my employer to) give us some guidance as to what’s available within the community. At the moment I have to find those things out myself. And I really don’t have the time. (DSW08)

Several workers reported they had not received adequate support from supervisors when experiencing difficulties with clients. One worker said she had been verbally abused by a client and the client’s family, but had had little support from the manager. She said:

> (I)t makes me unhappy going there because I never know how he’s going to treat me when I walk in the door. I’ll be dreading going there in case his (relative) is there. (DSW22)

Another worker described how under the NDIS funding model, allocation of case management support had become less personalised, meaning that some clients with complex needs had inadequate levels of case management support:

> I find a lot of the client’s case managers are too busy and like especially since NDIS have come in, like they’re only allotted, I think it’s like an hour a week, to do everything per client. (I)f you get a difficult client an hour a week would be one phone call with some of their issues, whereas they don’t sort of see each client as

> an individual and like some of them would probably need five hours a week and some wouldn't even need that hour. So yeah they don't see them as individuals. (DSW01)

Fragmented working time: very short shifts and extended working weeks

Many workers spoke of working regular shifts of less than the two hours' minimum engagement period in the SCHADS Award, and some spoke of working shifts of less than the one hour minimum engagement for homecare workers. In addition, almost all workers complained that they had long periods of empty time between (often short) paid shifts. This fragmented working schedule resulted in workers having to work very long days, across six or seven days a week (sometimes in multiple jobs), to earn an adequate income. A significant number were underemployed, despite being available for more work and sometimes or always working extended weeks of six or seven days.

One woman reported that her shortest shift was 30 minutes and another said she had refused to 'do shifts less than 45 minutes' (DSW13). Another worker said she had regularly been working 14 one-hour shifts a week, along with 14 two-hour shifts, working from breakfast through to the bed-time shift. Others said:

> The shortest (shift) I do is half an hour. …I've got one this week. It's a 9:30 to 10:00 shift at night. And it's …about 25 minutes (from my home). And it's only a half hour shift, and then 25 minutes home again. … You're taking all day to make up three or four hours. It's quite time consuming. I don't mind the travel where a lot of people don't like the travel. But it is a big day for very little benefit, financial benefit. (DSW04)

> I can start at quarter to eight in the morning and I can finish at four o'clock at night and I only have done five hours. That's the worst part – any carer will tell you that's the worst part of this job. (DSW11)

> Yeah I love it. But the hours are really hard. We've got to sort of keep ourselves open for a 13-hour day …and we only work five hours of that. (DSW19)

Many said that they would prefer to work full days – even long days – without multiple breaks:

> I'd much rather have full days. All the days that I'm working I'd rather them all be full (DSW04)

One woman was new to direct support work and said she was prepared to accept short shifts and long days in the short term. However, she was also planning to leave this provider in search of longer shifts.

> It's a big day, and at the end of the day I could have been doing a lot more stuff than spending all that time to get an hour's work. But I'm still new, I'm still putting my foot in the water, still testing the water, and slowly I'm picking up other shifts, getting more. But even though it's only an hour it's still an hour's pay, it's still money in my pocket. And it's, I'm learning, I'm meeting people. (DSW04)

Some workers were working extended weeks or days because employers could not find other workers to take shifts. One DSW reported that she had just completed three weeks without a break, doing days that started around 8am and finished around 11 or 11:30pm, after which she sometimes had to complete notes.

We asked DSWs what their ideal working week would look like. Almost all of them said that they would prefer to work weekdays during the day, except for those who said that they wanted to work weekends because of the extra pay they received, or who said they would continue to do a single weekend or evening shift just to support a particular client.

> I would also like the weekends off because I work most weekends, the majority of the weekend, and I don't really get to socialise or see my family or my partner as much as I would like to. (DSW22)

Working time: Short notice, unpredictability and one-way flexibility

All of the DSWs said that they regularly received messages asking them to do extra shifts. It was not unusual for this to be at extremely late notice. One woman said 'I could get a ten-minute notice.' She also said this had occurred, 'In the last two months, probably about five times.' (DSW08). Another woman said that every week she had been taking two or three extra shifts at one or two days' notice to fill weekend shifts.

DSWs found it difficult to assert their rights to say no to last-minute shifts. Most of the workers reported feeling pressure to work when they didn't want to, either because they feared losing work altogether, or because they felt responsible for clients' wellbeing. Some felt their supervisors exploited their vulnerability:

> …like often (the supervisor's) said to me, 'Well, I'll have to tell (the client) that nobody's coming then…' (DSW22)

> When you cross (my employer), he punishes you by taking shifts away. …the guilt trips, especially if it's after hours, and you say no. 'Oh, but what will the client do without you? How will they cope?' …(The) guilt trips are horrific. (DSW01)

Workers often experienced flexibility to be only one-way. If a client cancelled at a day's notice workers would not get paid :

> …under our policies at (not-for-profit provider), a client can cancel the day before and not be liable for any fee. Right. But a support worker probably has to give something like six weeks' notice to get out of a shift. Because even though that shift won't be allocated probably until the day or two before, we're still told you're not allowed to do it, which is really extremely difficult to know six weeks in advance. (DSW07)

One worker said she felt angry that the NDIS system did not provide incentives for service providers or participants to consider workers' needs in relation to scheduling. She said her employer accepted that participants could change their support times for what she considered to

be trivial reasons. However the worker received no compensation for the loss or change of shift at short notice and the employer would not ask the participant to consider the worker's interests:

> (The participant) can ring, maybe I'm due there in an hour and a half, and he can ring and say 'Oh no, tell (me) to come an hour later'. I get the call 'Go an hour later'. … 'Well hang on, that's going to make me an hour later finishing'. 'Oh well this is what the client has requested and he is your client, he's on your roster. That's what we have to do'. …
>
> It's not so much the money part of it, it's the assumption being that my time is so flexible that I can change it within an hour, an hour and a half …I don't get an explanation as to why, but generally …it'll come up in conversation (with the participant): 'I was out having lunch with friends and we were having such a good time, didn't realise the time', that sort of thing. And I don't think that's terribly fair.' (DSW08)

When workers received their rosters with very little notice—a common occurrence—they found it extremely difficult to either schedule shifts for their second jobs or to plan their own lives. For example, one DSW said she usually received her roster for the week beginning Monday:

> …(i)n between Friday and Sunday; sometimes it could be 8 pm on Sunday night. It just depends what my boss is up to. …it's hard to organise anything else during the week until I know when I'm working, and I can't accept shifts with (another provider) until I know when I'm working with that agency, so to find out so late just puts everything else on hold. (DSW22)

Other workers spoke of late changes to their rosters and the expectation they would work with little notice as making it very difficult to plan their lives:

> I'm sick of making (personal health-related) appointments thinking I'm free, and then something crops up and you've got to cancel your own personal stuff to fit in with work. (DSW01)
>
> …quite often I have my medical appointments in the spaces in between and I need to maintain a regular gym routine as well because I've got (a health condition) and I find that that's the only way I can really keep on. And also for my mental health that's really my outlet. And it is quite difficult to organise it all.' (DSW07)

Fluctuating incomes and low wages

A number of workers reported that they found it difficult to plan financially, due to substantial fluctuations in the hours they were allocated. Several workers employed on a casual basis said they would prefer to have certainty of income if they could get permanent part-time work and have guaranteed minimum hours even though it would mean working for a lower hourly rate.

However, even workers employed on a permanent part-time basis were not protected from dramatic fluctuations in weekly hours and earnings; some had minimum guaranteed hours of only one or two hours' work per week. Five of the 12 workers said they worked in second jobs because of insufficient hours and pay in their main disability support work jobs. Workers' earnings also varied due to work hours being cut with very little notice.

One worker who said she was guaranteed 2.5 hours per week as a casual also said:

> I'd prefer the permanent part-time because …I need to basically know what kind of money's coming in so I can go 'Right, I can afford to pay my gas bill this week or I can afford to put some extra money on the mortgage because I know what money's coming in'. (DSW04)

Unpaid work: travel time

Like most workers, DSWs are not paid, or reimbursed, for travel time and costs between home and work. However, many DSWs providing direct support services are doing very short shifts, of as little as one hour then having to return home again:

> oftentimes I will have just that one shift that's half an hour away and I won't have anything for another hour or two which means that I don't get paid to go there or back, and essentially it's like the money that I get paid for the shift is covering the petrol to get there and back and it's probably like $5 left over for the actual work once you take that into account. (DSW22)

> The one that I was doing in (another suburb) it's half an hour drive, half an hour work, half an hour drive home. So there's an hour and a half to earn half an hour, plus costing in your petrol. (DSW04)

Most of the workers we spoke to were not paid at all for the time they spent travelling; most were merely reimbursed a per-kilometre rate for the costs they incurred using their own cars. One worker who was not reimbursed was told by her employer to claim the expense on tax. Workers described regularly travelling 20- to 45-minute journeys four or five times in a day, often to do short shifts of less than one hour up to two hours. For example, one DSW said that on several days a week, she drove four return journeys from her home to a client who lived 20 minutes away. As a result (excluding her first and last trips to/from home) she drove at least 100km each day, spending a total of one hour and 45 minutes' unpaid travel time to undertake 5-6 hours' paid work.

Another DSW said, 'I can remember one weekend with (Provider E) I did a hundred and eighty-nine kilometres' (DSW11)

The long distances workers travelled resulted in some being paid for less than half of the time they spent at work. For example, one worker said that her employer would sometimes ask her to do a 45-minute weekday evening shift that required a total of 80 minutes' driving:

> And it's like, I'm driving forty minutes out there for a forty-five minute job; I'm getting paid like seventeen, eighteen dollars– and that sounds really cold and callous, because it's not all about the money – but in the end, nah, doesn't make sense.' (DSW11)

Disability support work case study: Short shifts and unpaid travel

Marlene is a disability support worker with around ten years' experience, a Certificate IV in disability support and an additional diploma-level specialist qualification. She works for two service providers and is employed casually in one job and as a permanent part-time worker in the other.

Marlene works extended days and weeks providing support to people in their homes. Although she usually works only 30 paid hours a week Marlene works on most days and has only one weekend off a fortnight. Due to her work being organised in multiple short shifts she has many days in which she has periods of one to two hours or more between work shifts and she spends a lot of time travelling to and from home to work for which she receives no pay.

Four days a week Marlene works for one service provider, starting around 9 am and finishing 13 and a half hours later at around 10:30 pm. In her job with this employer (a not-for-profit service provider) Marlene is paid only for the five to six hours she spends with clients over four or five separate shifts. In addition to this Marlene spends about an hour and 45 minutes travelling back and forth from her home to work between shifts, travelling a total of 100 km per day excluding her first and last trips. She is not paid for any of this travel time, nor does her employer reimburse her for costs associated with the use of her own car to undertake the travel.

This unpaid travel time between shifts, along with unpaid administration work associated with her job, add up to about 8 hours over the 4 days, an additional 26% of the 30 hours' work Marlene is paid for. Marlene says she is "tired" and that she doesn't have a life because she is always working or on a break:

> You can't go out for dinner, you can't do this, you can't do that, cos it's time to go back to work.
>
> My ideal would be 9-5 so I could have a life, like any normal working person.
>
> (DSW19) (Bentham & Macdonald, 2017)

Other unpaid work

Many support workers reported spending considerable time, unpaid, at the end of the day completing notes on clients or completing required paperwork. While some workers had been told by employers they should finish ten minutes early to write up notes or to contact the supervisor with any issues or concerns, they also said this was difficult or just not possible. Some said it was clients' expectation that the worker would use the full hour supporting them. Others said it was just not possible to complete their work in less than an hour:

> Because you don't get time - like, in the perfect world, they tell you to do (the paperwork) at the end of each shift, but you don't get time, because you're running off to the (next) client. You're supposed to take off from your client, say, 10 minutes earlier and just go sit in your car and do them. But some clients you can't leave early. … Because their needs haven't been met. So you know, they allow you an hour, (leaving early could mean) maybe not, you know, giving them a proper breakfast maybe, if it's a morning. Yeah. Just not doing what you get paid to do. (DSW01)

> …it's all your own time, …you can't do a monitoring form while you're on shift. (DSW07)

Some workers said that a lack of support from their employers forced them to spend additional unpaid time to ensure that their clients received support they felt was essential:

> 'Usually with progress notes, with (provider), you just hand them in with your timesheets once a fortnight. But I don't think that's good enough. To me, if there's a concern that needs immediate help, I will ring them up as soon as I finish the shift and tell them. But then, also when I get home, I will put it in an email as well, because sometimes when you ring you get the impression that their mind's concentrating on 20 million things and sometimes you don't get a response. …And I always ask for a read receipt too, so I know when they've read it. And if they haven't got back to me within, say, half a day, I'll ring up and nag. (DSW01)

> One worker listed the tasks she had to complete in extra unpaid time at the end of a shift or week. These included: recording any extra shifts in her diary; printing up her roster; fill out a claim form for her client's travel kilometres; making notes about any issues with clients; going into the office to deliver paperwork; discussing issues regarding clients with managers; discussing new clients with managers; correcting errors in rosters; and making appointments for clients. (DSW08)

Many said that they did not claim overtime when they were kept late for some reason, because the provider's processes made it so difficult to do so. One worker said a client's informal carer was late back from work on a fairly regular basis:

> 'But I would have to ring the office and ask them for approval to stay. I simply cannot stay without their approval. And I can't leave. …(T)here is an after-hours call centre, but it is an appalling situation there. Because they use an agency so they

> screen, this after calls service screens the calls that come in and then they decide where the call has to go, whether it's going to go to a supervisor who may be doing the after-hours shift. The process that that involves, giving your name, where you are, the client you're with, and it's all done in (the city), so they don't know the areas. …That could take up to five to eight minutes.' (DSW08)
>
> One worker with a large organisation said, 'We get paid for half an hour of work to do admin kind of thing.' However, she said she usually spends an additional 40 minutes or more on top of that 30 minutes per week, despite working less than 20 hours per week. (DSW13)

Casuals can spend a considerable time sorting out problems with rosters, completing and submitting timesheets (some agencies require that they be submitted in person) and responding to requests to take or cancel shifts. 'So (from) 9:50 to 10:06, (I) answered texts about shifts' (DSW13, reading from her time-use diary)

Completing the paperwork required to be paid wages, or reimbursed for travel, could take considerable amounts of time. One worker said she regularly took around 90 minutes a week on this:

> '(M)y regular hours are printed out and then it might take me 20 minutes to half an hour to add in all my extras, all the ones that I've picked up, so I fill in a (time)sheet for them. … It could take me maybe an hour (per week) to fill in my petrol allowance travel claim form, and then I've got to drop those two bits of paperwork in at the office. …They said to me that I don't need to claim my petrol because they know what petrol I'm doing, but when I have a client, two of my clients I transport them but we do stuff together. (The administrative staff) don't know how far I've driven with (that client).' (DSW04)

Risks to clients' health and safety

Many workers expressed unhappiness with impacts on their clients' quality of care. Some reported that their providers forced working practices on them that put their clients' health and safety at risk. For example, more than one worker reported being asked to, or having to, use a hoist alone, despite regulations requiring that two workers always undertake hoisting, for the safety of both clients and workers. One reported being pressured to go to work even when ill, due to understaffing, despite the risks to clients.

Disability support work case study: Understaffing leading to health and safety risks to workers and participants

Jane, a disability support worker we interviewed, described health and safety problems that placed both workers and participants at risk. Due to understaffing Jane has been required to use a hoist to lift a person on her own, rather than with a co-worker, despite this being unsafe for her and or the person she is supporting:

> Every single person that works there has had to hoist him by themselves, one time or another because of (understaffing)…
>
> This was, she said, 'a very stressful situation to be in.'

Lack of enough staff in the organisation has meant Jane and her colleagues work shifts when they are unwell, even when there may be health risks for themselves and a risk of exposing participants with weak immune systems to illness:

> Say that a carer got sick and they rang up to say, 'We can't go to this client's house today because I'm sick,' then oftentimes, like often she's said to me, 'Well, I'll have to tell him that nobody's coming then,' because they rang everybody else and because there's so little of us if everybody else said no there's not really much you can do.' And sending us in is not a good idea because you don't want the client to get sick, so yeah…
>
> [S]ometimes we still go to work even if we really shouldn't. There's a [co-worker] that was told not to go to work for a month because she hurt her knee, and they didn't want her to be walking on it or hoisting on it or doing anything, but she still had to go to work because there's so little of us that there's nobody else to cover her shift. (DSW22)

Risks to workers' health and safety

Some workers had injuries from their work. Many others spoke of being exhausted by their work, citing long days, extended working weeks and not having full days off to rest as well as coping with the physical and emotional intensity of the work.

> I was really stressed, really stressed all the time; I was tired all the time, my back was hurting all the time, … And I was just running myself ragged. I didn't know how to say no, and these people, like I used to think, but if I don't go, maybe they can't find someone else to do it – as if they can't – like I thought I was quite indispensable. No, I didn't think that; I just thought, well I don't want to let anybody down. And so I put my own health at risk, and would do everything that was asked

> of me, and get paid peanuts, and come home buggered. Pay the bills, and off I'd go again the next day. (DSW11)

Several workers also reported musculoskeletal injuries serious enough to require treatment and surgery, which they attributed to the physical aspects of the work such as moving clients, and long hours of repetitive movement required with house cleaning, particularly vacuuming and mopping of floors. (DSW01; DSW11; DSW19)

Work/life problems

Many DSWs described the conflicts with their personal and family life, caused by the extended and unsocial hours they worked:

> I know I've got to cut back, because some fortnights you work 14 days straight, and I know, my partner's complaining as it is, we never sort of have days anymore to go do our own stuff, and the kids are complaining, 'Oh, you don't see the grandkids much or anything. (DSW1)

> I didn't have a life. Even my friends would come around and say, you're never home – no, I'm working. And I'd say, I've got Friday and Saturday off, and they'd go, all day Friday and Saturday? Oh no, well I'm working Friday night and Saturday, and they'd go, well then you haven't got it off, and it was just silly.'(DSW11)

> I've got friends … that I quite often go up and visit and I'll go up and stay the night, so it means that if I go to visit them it's a short trip up and a short trip back, because I can't stay the night because I might have a shift the next morning. And if I want to go and have a social drink with them I'm not going to have a social drink because I'm working the next morning. So, yeah, it does affect my social life a little bit.

> …most of my friends have weekends off. They work weekdays and have weekends off. (DSW04)

> '…because I work a morning shift and come home for one hour, and then go back to work for another three hours, and come home for one hour, it's like you can't really fit social things into those one hour slots in between shifts. So it's always a struggle to have a social life while working my job.' (DSW22)

Intentions to leave

Our interviews did not canvass DSWs' intentions to stay in or leave disability support work. However, a surprising number offered, unprompted, the information that they were planning to leave the industry.

None of our interviewees said that they were planning to leave because they didn't enjoy the work. On the contrary, all expressed very positive feelings about the work itself. However, as one DSW put it, while the work was great, the job itself was not.

One young worker found the stress of working unsupported in physically and emotionally difficult conditions so great, she was actively taking steps to find work in another field. Others spoke of leaving because of emotional and physical exhaustion exacerbated by excessively long days and weeks, despite only having part-time hours and part-time (low) pay::

> … apparently, there's jobs out there that you can earn money the same as what I'm earning while I'm working days and nights. (I am) applying for jobs left right and centre.' (DSW11)

> I do enjoy (disability support work), but it's more just, because of the time gap, so like today, I've got 11:30, then a gap until 3:30, then a gap from 4:30 to 8:00. (DSW13)

An additional reason for leaving offered by three workers was feeling they could not provide good-quality support under the NDIS.

Appendix B: Details of interviews

Data comes from interviews from two data collection exercises.

- 8 union member interviews

The first eight employees interviewed were among union members contacted by the unions commissioning this project who were invited to email a member of the research team if they were interested in finding out more and participating in the research. We conducted interviews with the first eight employees who emailed us and agreed to an interview. In recognition of their time we gave each interviewee a token shopping voucher to the value of $50.

The employees participating in the interviews were five direct support workers, two support co-ordinators and one support services manager. Four of them were employed by one of two government service providers and the other four were employed by not-for-profit service providers, with services including disability activity, personal support and accommodation services. All were permanent employees and worked full-time, although one was employed on a part-time basis.

All the employees are women and their ages range from early 30s to late 50s. One worker had seven years' experience working in disability services and the others all had 15 or more years' experience. Seven of the eight All of the employees had a qualification in disability services ranging from one with a Certificate III, others with Certificate IV or Diploma qualifications and two with Advanced Diplomas.

In the interviews we asked workers about their experiences working in disability services and about their experiences of any changes working under the NDIS arrangements. The interviews ranged from 40 minutes to an hour and 20 minutes in length. With participants' consent the interviews were audio-taped and transcribed by a professional transcription service.

- Data collected from Bentham and Macdonald (2017), see Appendix A: CPOW Working Paper 2017-1.

Appendix C: Interview topics

Worker background and motivation: Motivations for working in the disability sector; pathway to current role; qualifications or training; multiple job holding

Worker's current role: Usual tasks, types of service users, examples of work done in a typical day, supervisory responsibilities, any aspects of work liked and disliked, any aspects of job difficult, how this is dealt with.

Working under NDIS: How job changed under NDIS, whether employer requirements have changed, whether nature of service to client has changed. View of quality clients receive, what makes a good service, barriers to providing good service, how NDIS affects quality for clients. Perceptions of capacity to respond flexibly to client needs under NDIS, timeliness and adequacy of information and plans; expectations of worker time for work tasks, adequacy of training, time to complete case notes.

Client relationships: Number of clients, whether they are the same each week, whether time with clients is sufficient, relationships with families, and barriers to maintaining good relationships with clients and families.

Worker relationships: Regular meetings with line manager, support from co-workers, opportunities to meet with workers from other services used by clients.

Working conditions: Flexibility with rostering, de-briefs and responding to issues for clients, nature and amount of training, skill requirements in the role

Working time: Usual working hours, full-time/part-time, ongoing/fixed term/casual, suitability of schedule, whether NDIS has changed any aspect of working time, adequate breaks / rests, underemployment, long work days, fragmented working time, predictability of shifts, other work-life issues.

Pay, health and safety: Classification, hourly rate, casual loading, travel time & expenses, paid leave, super. Costs associated with work you have to meet yourself. Unpaid overtime, unpaid administrative work. Safety of work environment. Whether these have changed under NDIS.

Progression, career and aspirations: Intention to leave job and organisation, opportunities for career progression, future career plans.

What would improve employment: Anything that needs to be done to improve jobs for disability support workers, anything that needs to be done to improve service quality under NDIS.

Appendix D: 2016-17 prices of services and supports requiring disability support workers

Appendix E: Other aspects of the design of NDIS prices

Other relevant aspects of the design of NDIS prices include:

- **SCHADS Award:** In general, where relevant, the NDIS Prices for the services requiring disability support workers are based on the Social, Community, Home Care and Disability Services Industry Award 2010 (SCHADS Award). No allowance was made to cover employment on enterprise agreements (EAs) that provide better pay or conditions.
- **Indexation***:* Since the current pricing system was introduced in July 2014, prices have been regularly increased to take account of cost increases, and the implementation of the Equal Remuneration Order (ERO) relevant to disability support workers employed under the SCHADS Award. The NDIA has stated that 'it will update prices on at least an annual basis, effective 1 July each year taking account of national trends, changes in costs and wage rate.'[33] At this stage, it has not been proposed to use a specific index or weighted set of indices. Rather, the NDIA will determine the basis for indexation year-by-year, considering the consumer price index and wage price index.
- **Transitional and Efficient Prices:** The NDIA regards the basis on which it currently sets prices to be transitional. Its aim is to move to lower 'efficient prices' nationally by 2019-20, along a 'transitional glide path', before eventually moving to a situation where most prices are deregulated. The decision to use transitional prices from July 2014 was based on recognition of limitations of available data and the need for further research; and the need to ensure providers can adjust from block funding to payments made by individual participants based on prices set for each service (NDIA & NDS 2014, pp.15-17).
- **Diversity of providers:** There is much diversity between NDIS service providers, especially in relation to their structural dimensions (e.g. ownership, scale, service scope, geographical spread, longevity), their motivations, their suite of services, and their service delivery models. Thus, an important implicit factor in the design of NDIS prices concerns the assumptions that have been made about the dimensions and operations of a 'typical provider' that underpin the explicit assumptions about cost factors that are in the RCM. NDIA (2017c) specifies that at least one pricing assumption is based on 'a typical medium sized provider, employing between 40 and 100 staff'.[34]
- **Transparency of pricing:** There is no comprehensive and detailed explanation of the basis on which the NDIS prices have been constructed available in the public domain, making it difficult to identify all assumptions underlying price setting and current prices. Although much of the rationale and calculations for pricing can be pieced together from publicly available documents,

[33] https://www.ndis.gov.au/providers/pricing-and-payment

[34] This is the assumption that one manager supervises fifteen staff members. As a broad approximation, providers employing between 40 and 100 staff would be likely to have an annual turnover of $4M-$10M. The ABS define a small business as having less than 20 full-time equivalent employees, which Davidson (2015, pp. 429-430) shows is broadly consistent with the ATO definition of a small business as having a turnover of less than $2M per annum.

there is no publicly available formula that enables replication of the original base hourly rate (as shown in NDIA and NDS (2014, p. 12) or the variation factors; and there is minimal public information showing the sources of various assumptions about elements of the RCM, or the sources of prices for services not based on the RCM. A more comprehensive account may emerge from the current review of NDIS prices (NDIA, 2017a).

Appendix F: Details and supplementary data from worker survey

Notes on method

The survey of workers was developed by the HSU, ASU and United Voice, and distributed online through the networks of these unions (in all states except for SA and NT). As such, it is a non-probability based 'opt-in' sample. This approach was taken to enable a focus on members of the relevant unions, and to compare experiences and perceptions of those working under the NDIS and those who were not. As a result of the distribution method, workers newer to the industry (who are less likely to be union members) are under-represented, but it nonetheless provides important insights into the experiences of working in disability and differences in experiences and perceptions among workers in different circumstances and settings.

McKinsey&Company

Independent Pricing Review

NATIONAL DISABILITY INSURANCE AGENCY

Final Report | February 2018

Contents

Executive Summary

THE NDIS AND PRICING

The National Disability Insurance Scheme (NDIS) is a new way of providing support for 460,000 Australians with permanent and significant disabilities ('participants'). It represents a fundamental shift in how disability support is delivered. Under the NDIS, participants can exercise choice and control by purchasing their supports directly from providers. This means funding of disability supports will no longer take place through block funding for providers, but rather through individualised support funding for participants.

Once the NDIS reaches maturity, it is intended that the market itself will set the price of supports. However, temporary price controls are needed to ensure participants can access affordable supports, while the market is still growing. The National Disability Insurance Agency (NDIA) uses price caps on many supports and services to regulate price, but striking the right balance is challenging. If prices are set too high, this will encourage the supply of supports, but reduce the purchasing power of participants and negatively impact the sustainability of the NDIS. If prices are set too low, this could lead to a supply shortfall in the market and compromise participant outcomes.

Some providers of disability supports and other stakeholders have expressed views that current price caps are too low and are hindering market development. These issues have been raised in submissions by providers to the NDIA, as part of the NDIA FY2017/18 Price Review, as well as to the Productivity Commission as part of the review of NDIS costs.

THE INDEPENDENT PRICING REVIEW PROCESS

In June 2017, the Board of the NDIA commissioned McKinsey & Company to undertake an Independent Pricing Review (IPR) to investigate the appropriateness of the NDIA's pricing strategy and approach, and the suitability of current price levels for supports and services. The scope of the IPR was defined by the NDIA Board in the Terms of Reference (TOR):

1. Provide recommendations in relation to improved pricing effectiveness, including but not limited to:
   - National versus regional pricing
   - Pricing of services with different levels of complexity
   - Pricing of respite services
   - Thin and undersupplied markets, particularly in regional and remote areas
   - Relative provider efficiencies, including overheads
   - Adequacy of provider returns
   - Effectiveness of the Hourly Return approach used to set prices

2. Provide recommendations in relation to the potential early deregulation of price in more mature sub-markets and the glide path for the eventual deregulation of price more generally.

Over the last six months the IPR team has conducted its review, including extensive consultations with stakeholders – providers, peak bodies, the NDIA, academics, and state and territory governments. Through the provider consultation process, the IPR team engaged with over 1000 individuals across Australia through 10 open forums, 9 webinars and 45 one-on-one interviews, to understand how providers have been responding to current price settings. The IPR team also undertook detailed analyses of provider economics, market development and NDIA data. This report provides a summary of the evidence gathered by the IPR team, and 25 recommendations for changes to the NDIA's pricing approach and policies. Recommendations are grouped by the items in the Terms of Reference.

FEEDBACK FROM CONSULTATION

Key issues raised by providers and other stakeholders in submissions and during the consultation process were:

- The NDIS requires a significant change in providers' operating models and there are administrative costs associated with transition; as well as opportunities to improve the efficiency of the NDIA's systems and processes, for example, the online portal.
- Current loadings for complex participants do not fully reflect the additional costs of serving these participants, such as higher wages for a more skilled workforce, additional time required for training and reporting, and higher supervision ratios. In addition, there is no clear definition of what constitutes 'complex', and as a result the high intensity loading is applied inconsistently.
- Current travel allowances do not adequately cover the costs of provider travel and participant transport in regional areas and isolated communities.

Other issues were raised in relation to specific support types:

- In attendant care, some providers, who have historically been funded by state-administered block funding, are struggling to adjust their business models to operate under the NDIS unit-funding model and the current level of price caps. To operate profitably within the price caps requires improved levels of utilisation and overheads; and better matching of skills to participant needs.
- In therapy, the existing single price point does not reflect the diversity in therapy supports and the travel allowance is insufficient for some participants in regional areas. In addition, limiting therapists to recover the costs from a maximum of 2 hours of cancellations per year is imposing additional costs on some therapists.

Additionally, issues regarding the price setting process and the opportunity for innovative price setting were raised, including:

- The price setting process could be more transparent, and providers would appreciate earlier communication of changes to price level and/or structure to refresh service agreements and adapt operating models.

- Some providers and participants expressed the desire for the NDIA to explore outcomes-based approaches to pricing on the basis that would create better incentives to improve outcomes than the current hourly rate approach.

KEY FINDINGS AND SUPPORTING EVIDENCE

To address the issues raised by providers and other stakeholders during consultation, and to assess whether current price caps are adequate, the IPR team looked at three sources of evidence: evidence of market development/supply shortages; provider economics and operating models; and benchmarks of comparable schemes.

The key findings of the IPR are:

- While there is not yet evidence of generalised supply shortages, data on market development is mixed and there are certain markets for which undersupply is a risk in the future:
  - Across support types, provider entry and exit data suggests market growth is keeping pace with demand and utilisation data does not provide compelling evidence of supply shortages:
    - The rate of growth of month-to-month provider registration outpaced the rate of growth of participant registration throughout 2017.
    - Utilisation data from the trial sites suggests lower than expected utilisation was driven by participants being unfamiliar with the NDIS and how to use their supports, rather than a supply shortage.
  - In the attendant care market, there is not yet compelling evidence of participants being unable to access supports, but there are signals that are concerning, including a significant proportion of providers that currently have unprofitable operating models.
  - There are cohorts of participants for which supply shortages are high-risk due to the increased cost of service provision and limited availability of workforce, including those who: are in outer regional, remote or very remote areas; have complex needs; are from culturally and linguistically diverse backgrounds; are Aboriginal and Torres Strait Islander Australians; or have acute care needs such as in crisis situations.
- While some providers have operating models that are profitable at current price points, many are struggling, particularly traditional providers delivering attendant care supports:
  - In the attendant care market, there is significant variation (from <$40 to $55+ per hour) in the cost of service delivery between providers. There are examples of low cost models that are profitable at current price points, including the online platform model and lean-operating model. However, many traditional providers are struggling to operate profitably at current price points. This is attributable to a combination of factors: higher overheads; challenges in adapting to unit pricing and NDIA systems improvement opportunities; lower utilisation of workers; and higher labour costs.
  - In therapy, the single price point is working for some providers, such as physio and speech therapy providers and many sole traders. However, it is not working so well for some others, such as psychological therapy for more complex participants.

  - In Supported Independent Living (SIL), Support Coordination and Plan Management, feedback indicates that most providers can operate profitably at current price caps/benchmarks for lower complexity participants. However, the rollout of a more accurate SIL pricing process may make it more challenging for providers to cross-subsidise other supports in the future.

- Benchmarking of NDIA support price caps against comparable schemes highlighted that the NDIA price is broadly aligned with prices of accident compensation schemes, including the Transport Accident Commission and WorkSafe, although market prices for some similar aged care services are higher.

RECOMMENDATIONS

Ultimately, the test of whether the price caps set by the NDIA are adequate is whether participants can access the quality supports and services required to achieve their goals. While there is not yet evidence of widespread supply gaps occurring, the Scheme is in a state of transition and rapid growth, and the situation could change quickly. Further, the absence of supply gaps does not diminish the fact that the current price caps are challenging, and many providers are unable to operate profitably within those price caps. Providers and participants have raised concerns that where providers are unable to supply services at a given price level, new supply will not be made available quickly enough to ensure that participants have access to an adequate level of support.

To proactively manage the key risk of supply gaps, the IPR team proposes three steps for the NDIA to undertake. Firstly, the NDIA should collect and analyse a broader set of indicators of market development and participant outcomes to both better monitor the risk of supply gaps and build institutional capacity to avert supply challenges through market intervention.

Secondly, the NDIA should implement appropriate amendments to price loadings and policies, to improve the economics of efficient providers and reduce the risk of supply shortages in high-risk markets – particularly rural and remote, and highly complex participants. Those changes include:

- Adding a third tier to the complexity loading of 10%, to account for higher level of skills/experience of workers and additional training required.
- Allowing providers to charge up to 45 minutes of travel time in rural areas, and quote for services in isolated regions.
- Changing the cancellation policy to allow providers to charge participants for cancellations after 3pm on the day before the service.
- Removing the $1000 travel cap for therapy supports and aligning the travel policy with attendant care travel policy.
- Changing the therapy prices to better reflect different therapy types, and introducing a second tier of pricing for therapy assistants.
- Addressing specific NDIA systems and processes, such as portal functionality and quoting, to enable providers to reduce administrative tasks and overhead costs.

Finally, the NDIA should assess the implementation of a temporary price supplement to the attendant care price cap to address short-term issues with provider economics. The IPR team's assessment is that while generalised supply gaps have not occurred to date, there is a material risk of gaps emerging over the next year. Demand will continue to rapidly increase as new participants enter the Scheme, and many providers are struggling to operate a surplus at the price cap with their current operating model. There is a risk that profitable providers will not grow quickly enough to supply the services required. The IPR team proposes a model of Transitional Support for Overheads (TSO) in the form of a 2-3% increase in the price cap of 1:1 attendant care for the next 12 months. This would apply in addition to the normal annual indexation of the price cap. This adjustment reflects what the IPR team believes are reasonable cost improvement assumptions for most providers to achieve in the near term. The exact quantum of the TSO should be a policy decision the NDIA makes in view of other more targeted interventions government will undertake in the next 12 months to mitigate the risk of supply shortages. There should be a review in 12 months to determine whether any level of temporary support is required for a further period. The expectation is that 12 months is a reasonable timeframe for providers to make the necessary changes to their business models, and for the NDIA to assist and encourage the development of efficient and effective alternative supply options (e.g. e-marketplaces), so that the TSO would not need to be renewed.

Longer term, the development of a competitive marketplace should enable changes to the Scheme's current pricing model of price caps and fee-for-service. The IPR team's recommendations include actions that the NDIA can take to pilot and prepare for different pricing models. Firstly, the NDIA should conduct a trial of outcomes-based pricing. This is an appealing alternative to input-based pricing as it encourages providers to maximise outcomes, rather than the volume of services provided. However, it is significantly more complex and requires strong baseline data and measurement systems. A trial would provide valuable learnings on how this approach might be implemented in some supports.

Deregulation of pricing remains an appropriate goal, but there is not yet a clear path towards reaching it. To better prepare the market and the NDIS for deregulation, the IPR team proposes strengthening and monitoring provider and participant readiness, including investing in key infrastructure, such as an e-market. Trialling price deregulation in one geography or support type market will also help the NDIA collect more detailed information on the impact of deregulation on market development and participant outcomes.

IMPLICATIONS

In developing its recommendations, the IPR team has sought to address provider concerns in a way that best balances potential trade-offs between participant outcomes, market development and Scheme sustainability. The effectiveness and efficiency of pricing mechanisms and levels was considered, subject to available data. Some recommendations go directly to changing the effective price, such as Temporary Support for Overheads (TSO) and a new complexity loading for very complex participants; some target root causes of the problems, such as changes to cancellation and travel policies; and some propose stronger market monitoring and intervention capabilities. Each of these recommendation types will have different impacts on the three Scheme aspirations: better participant outcomes; a growing market with innovative supports; and a financially sustainable scheme.

In the aggregate, the IPR team estimates that the above recommendations will have a potential financial impact of ~$250-420m per annum over the next 12 to 24 months, will alleviate some of the financial pressure currently placed on some providers, and will improve participant outcomes by addressing challenges that are impacting some providers' abilities to deliver quality services. Cost estimates have been made on the best data available. However, data will remain incomplete until the Scheme becomes more mature. As a result, the IPR has made a number of assumptions leading to a wide range of estimates.

Beyond the next 24 months, the IPR team believe it is possible to implement the IPR recommendations and manage the Scheme so that it is financially sustainable and within the current budget estimates. Approximately 50% of the total cost implication of the IPR recommendations is temporary and will therefore not have an adverse impact on the Scheme's longer-term financial sustainability. Also, as the Scheme matures, the NDIA should be able to offset any financial impact of these recommendations by appropriately assessing their effectiveness and efficiency. For example, as evidence develops as to which interventions are most effective in reducing costs associated with complexity, it should be possible to reduce the number of complex participants and provider costs and prices. It should also be possible to encourage more local providers in rural and remote areas that will assist in reducing travel costs. There should also be some savings from introducing tiered therapy pricing.

1 Introduction

1.1 OVERVIEW OF THE NDIS AND NDIA

The National Disability Insurance Scheme (NDIS) is a new scheme designed to change the way supports and services are provided to Australians with significant and permanent disabilities ('participants'). By 2020, the NDIS will provide about 460,000 people with the reasonable and necessary supports they need to live an ordinary life. The NDIS is currently in the transition period, with participants entering the Scheme according to an agreed phasing plan.

The National Disability Insurance Agency (NDIA) is the statutory authority responsible for administering the NDIS. The NDIA has three external aspirations (NDIA aspirations):[1]

1. Facilitate outcomes of economic and social independence and deliver an exceptional service for participants, and their families, carers and providers ('better participant outcomes').
2. Work with participants and other stakeholders to facilitate the growth of a market of adequate size, quality and innovation ('a growing market with innovative supports').
3. Deliver a financially sustainable scheme based on insurance principles within agreed funding ('a financially sustainable Scheme').

1.2 THE ROLE OF PRICE

The NDIS represents a fundamental shift in the way disability supports are provided. Under the NDIS, people with disability will be able to exercise choice and control over the supports they receive. This way of providing supports and services requires a transition from a prior model of block funding for providers, to individualised funding for supports for participants.

In a mature market, participants exercising choice and control will drive the price of supports, and in turn drive competition and innovation among providers. This is an important feature of the NDIS. However, where the market is not sufficiently mature and where there is an imbalance in bargaining power between participants and providers, price regulation helps ensure value for money for participants.

The NDIA sets price caps for many supports. The price of supports has implications for the NDIA aspirations, and trade-offs may be required among them (see Exhibit 1). For example, higher prices may encourage the supply of supports, but reduce the purchasing power of participants and negatively impact Scheme sustainability, whereas lower prices may increase value for money but lead to a supply shortfall in the market. Ultimately, the test of whether the price caps set by the NDIA are adequate is whether participants can access quality supports and services required to achieve their goals.

[1] NDIA: *Corporate Plan 2017-21*. The Corporate Plan outlines four aspirations for the NDIA: three 'external aspirations' and one 'internal aspiration', which is to build a high performing NDIA.

1.3 BACKGROUND AND SCOPE OF THE IPR

Some providers of disability supports and other stakeholders have expressed concerns that some of the current price caps are constraining market development and outcomes for participants. These concerns were raised in submissions to the NDIA, as part of the NDIA FY2017/18 Price Review, as well as to the Productivity Commission as part of its review of NDIS costs. In June 2017, the Board of the NDIA commissioned McKinsey & Company to undertake an Independent Pricing Review (IPR) to understand the significance of provider concerns, and create an evidence base to inform decision making and help to mitigate the risk of future supply shortages as the NDIS transitions to full scheme. The objective of the IPR was to investigate the appropriateness of NDIA's current pricing strategy and approach, and assess the suitability of current price levels for supports and services.

The scope of the IPR was defined by the NDIA Board in the Terms of Reference:

1. Provide recommendations in relation to improved pricing effectiveness, including but not limited to:
   - National versus regional pricing
   - Pricing of services with different levels of complexity
   - Pricing of short-term accommodation (respite) services

- Thin and undersupplied markets, particularly in regional and remote areas
- Relative provider efficiencies, including overheads
- Adequacy of provider returns
- Effectiveness of the Hourly Return approach used to set prices

2. Provide recommendations in relation to the potential early deregulation of price in more mature sub-markets and the glide path for the eventual deregulation of price more generally.

Pricing of specialist disability accommodation (SDA) was excluded from the scope of the IPR on the basis that there was separate work being undertaken by the NDIA on this topic.

This report provides a summary of the evidence and findings from provider consultation and analysis conducted by the IPR team (Sections 2 and 3), and presents recommendations against each item of the IPR Terms of Reference (Section 4).

1.4 PHASES OF THE IPR

Phase 1 (Jul-Aug 2017): Review of submissions and NDIA documents and initial assessment of provider economics

The first phase of work consisted of reviewing and analysing the NDIA's market stewardship role, building a provider economics/cost model, and analysing supply challenges likely to emerge at the sub-market level. Submissions to the NDIA and the Productivity Commission were reviewed and documented, to identify priority issues for further consultation.

The IPR team also conducted analysis of comparable schemes, e.g. Accident Compensation, Aged Care, and State-funded disability – to assess NDIA prices versus other relevant sectors.

Phase 2 (Sep-Oct 2017): Provider consultation and evaluation of options

Phase 2 focussed on engaging with providers and other stakeholders. The IPR team held ten provider forums in: Adelaide (SA), Townsville (QLD), Melbourne (VIC) (2), Darwin (NT), Canberra (ACT), Sydney (NSW) (2), Newcastle (NSW) and Campbell Town (TAS), with ~800 individuals attending in total. In addition, nine online forums were held, with a total of 270 individuals joining from across Australia.

The IPR team engaged individually with 45 NDIS and aged care providers, and participated in working groups with providers, peak bodies, advisory groups, and state and territory governments. This included multiple consultations with the Independent Advisory Council (IAC) representing participants.

Though no formal written submissions were requested, many providers chose to submit supporting evidence/documentation to the IPR. In total ~20 written submissions were received from across the sector; this was in addition to the submissions made to the Productivity Commission and NDIA FY2017/18 Price Review.

Phase 3 (Oct-Nov 2017): Development of draft recommendations

The third phase of work focused on summarising findings, conducting further analysis and developing draft recommendations. The consultation phase highlighted examples of providers operating profitably at current price points, as well as examples of providers who find the current price points very challenging. Phase 3 involved collecting data on different operating models to identify features of models that are working, and key drivers of cost in models that are not. The IPR team engaged with providers to identify options for solutions that would help improve provider economics.

In considering solution options, the IPR assessed the appropriateness of options in achieving NDIA's three aspirations- better participant outcomes, a growing market with innovative supports, and a financially sustainable scheme. Implications of the recommendations were assessed, and the effectiveness and efficiency of pricing mechanisms and levels were considered, subject to available data.

Phase 4 (Dec 2017): Syndication and refinement of recommendations and preparation of final report

The final phase of the IPR involved testing of recommendations with providers and other stakeholders and preparation of the final report. The implications of recommendations were identified and quantified, where possible, in terms of impact on the three NDIA aspirations. Estimates of costs were made based on the best information available. Given a lack of appropriate data as the Scheme matures, the IPR made several assumptions to inform estimates of costs, leading to wide ranges in estimates presented in this report.

1.5 ACKNOWLEDGEMENTS

The IPR team is grateful for the cooperation of many providers and representatives of peak bodies, member groups and state and territory governments, who generously gave up their time to meet with the team and provide input to the IPR. The IPR would like to especially thank the 45 providers who met one-on-one with the IPR team and shared detailed financial information, modelling and analysis, as well as the IAC that invited the IPR to join four of its meetings.

The IPR team would also like to acknowledge the many individuals within the NDIA who shared their expertise and helped the team understand current practices related to pricing and work underway in the NDIA.

Further, the IPR team would like to thank AlphaBeta Advisors who provided support to McKinsey & Company throughout the entirety of the IPR.

2 Input from submissions and consultation

The IPR team examined input from various sources, including:

- Written submissions to the Productivity Commission report on NDIS Costs; the NDIA FY2017/18 Price Review; and the IPR team.
- Face-to-face consultation with providers to the NDIS; providers in adjacent sectors such as aged care; peak bodies including the Independent Advisory Council (IAC) representing participants; state and territory governments; and academics.

Provider submissions to the Productivity Commission report on NDIS Costs and the NDIA FY2017/18 Price Review had different areas of focus. The Productivity Commission sought responses on pricing with a holistic view of the disability market, whereas the NDIA FY2017/18 Price Review sought responses focused on specific modelling assumptions detailed in the *2017 Price Review – Discussion Paper*.

The objective of consultation undertaken through the IPR was to identify a comprehensive list of issues and challenges faced by providers that the IPR team could test for significance and impact on the NDIA aspirations: improving participant outcomes, growing a market with innovative supports, and a financially sustainable scheme. To do this, the IPR team consulted with over 1000 provider representatives through provider forums; and consulted individually with 45 providers that are broadly representative of the disability market, including providers across NDIS support types, large and small providers, providers with new service models, providers delivering services in regional and remote areas, and new entrants with potential to scale in size.

This section of the report records the challenges and opportunities raised by stakeholders – as was committed to do during consultation, prior to testing their significance on the NDIA aspirations. Actions being taken to address some of these challenges, as advised by the NDIA, are also recorded. Section 3, *Key findings and supporting evidence*, details evidence the IPR team sought to test, challenge and validate opportunities, including those raised by providers, that are within the scope of the TOR. Section 4, *Recommendations*, outlines the IPR team's recommendations to address the challenges and opportunities raised by providers and other stakeholders, underpinned by further analysis and data to support how these recommendations assist the NDIA in achieving its three aspirations.

The IPR team recognises that not all challenges and opportunities raised by providers are specifically within the scope outlined in the TOR. However, where these challenges are likely to have a flow on impact on provider economics, they have been noted below. Other challenges that are less likely to impact on provider economics, but could assist the NDIA to improve participant outcomes, will be raised separately with the NDIA.

Feedback received during consultation can be summarised into four areas:

- Increasing price loadings to adequately cover the cost of service delivery for rural and remote geographies, participant cohorts, and support types (see Section 2.1 below).
- Reducing the cost of administration for providers by improving the NDIA's provider-facing systems and processes (see Section 2.2).

- Increasing the emphasis on policies that support the development and growth of the market, including a greater focus on participant outcomes (see Section 2.3).
- Improving aspects of participant planning quality and consistency that would assist provider economics as well as participant outcomes (see Section 2.4).

While discussions with providers centred around challenges they are facing, most expressed their strong support for the reforms and objectives of the NDIS, and aspirations of the NDIA, as well as the positive work underway by the NDIA to achieve these aspirations and address provider challenges. Several providers were also excited about their success in developing new business models that could work successfully in helping participants achieve their objectives, and improve their outcomes, in a financially sustainable way.

The remainder of this section summarises provider and other stakeholder feedback on the following topics:

- 2.1 Provider economics
- 2.2 NDIA processes and systems
- 2.3 Market growth and development
- 2.4 Planning process.

2.1 PROVIDER ECONOMICS

Many providers raised challenges with the assumptions included in the NDIA's *2017 Price review – Discussion Paper*, which detailed the input assumptions to be used by the NDIA to model the price of attendant care (a combined category comprising Assistance with Daily Living and Assistance with Social and Community Participation). In Section 3 – *Key findings and supporting evidence*, the IPR team tests these challenges by benchmarking against other schemes, and examining effective models that are working in the market, as well as those that are not working.

These providers considered that the NDIA should continue to refine the following assumptions:

- The wage assumption. The NDIA assumes that the disability support worker will be employed at a level 2.3 under the Social, Community, Home Care and Disability Services Industry Award (SCHADS Award). Some providers believe the assumption is low and does not allow for career progression. Other providers commented that they pay higher wages due to Enterprise Bargaining Agreements (EBA) or a more mature workforce. By way of contrast, some providers commented that they are successfully operating in a consistent way with the wage assumption, utilising different mixes of part-time/full-time employee models, casual employment and accessing new talent pools.
- The utilisation assumption for support workers. The NDIA assumes a utilisation level of 95% for disability support workers. Some providers believe this level of utilisation is difficult to achieve. Some providers that consulted with the IPR reported that 80-85% utilisation of direct support staff is typical. By way of contrast, some are achieving 95% to 100% utilisation.

- The utilisation assumptions for supervisors. The NDIA assumes a 1/15 supervision ratio, and a utilisation level of 95% for supervisors. Some providers believe this level of supervision is difficult to achieve, and that it does not allow sufficient time to undertake quality/compliance requirements and support worker management. Others are finding that they do not require the level of supervision of 1/15 to offer quality support to the participants they serve.
- The overhead assumption. The NDIA assumes an overhead level of 10%, which equates to 15% if a provider is not subject to payroll tax. Some providers are finding it difficult to achieve this level of overheads, particularly those with higher expenditure on training, reporting and participant engagement during transition. While the Department of Social Services (DSS) and states and territories have provided funding to support transition, some providers claim this is insufficient – given that the participant-driven service model requires most providers to make new investments in areas such as training, IT, marketing, and recruiting. Further, some providers noted that NDIS processes contribute to higher overheads, e.g. through lost administration time associated with information and communication technology (ICT) challenges. By way of contrast, some providers reported that they are currently able to achieve an overhead level of 10%.

Providers also raised issues related to the higher cost of service provision for certain cohorts of participants. This includes participants living in remote areas, with complex needs, and those requiring Assistive Technology (AT). More specifically, they considered that the NDIA should consider the following:

- Remote loadings are not sufficient for some remote areas where there are high costs-to-serve due to factors including extra travel time, lack of infrastructure and facilities, and the cost of deploying/housing a workforce. In some cases, such as for communities in the Northern Territory, air travel and overnight accommodation is necessary to reach participants, and this cannot be claimed from the NDIA.
- Travel is also a concern in some regional areas, as providers are not being fully remunerated for travel in all circumstances.
- The differentiation in price levels for support workers serving participants with complex needs is not sufficient to cover the costs of a higher skilled worker with increased qualifications or experience, which some providers believe are required to provide high quality support to these participants. Some providers expressed a view that the current price could discourage providers, both existing and new entrants, from serving participants with complex needs and instead focus on those that can be served with a lower cost support model.

The NDIA has recently announced the development of an independent provider benchmarking function to generate important strategic information both for providers and the NDIA. The initiative seeks to collate and share market knowledge on the cost structures and pricing of providers. Participating providers will receive information that enables them to understand how they are performing relative to their peers, and where there are specific opportunities for organisational improvement. The data generated by the project will be at an aggregate and anonymised level, and will provide government with a clearer sense of what is happening in the sector, and where intervention by the NDIA may be necessary.

2.2 NDIA PROCESSES AND SYSTEMS

Providers raised challenges relating to additional overhead costs associated with operating in the NDIS, which they believe are partly attributable to NDIA processes and systems. Opportunities identified by providers for the NDIA to improve system and processes include:

- Reducing the administrative load when providers interact with the NDIS, including the one-time costs associated with pre-planning and quoting (where applicable) when a participant enters the NDIS, and ongoing administration such as billing, invoicing, and reporting. For example:
  - Improve the functionality and efficiency of the Provider Portal, as they consider errors are still occurring and can be time consuming to resolve.
  - Increase the speed at which SIL quotes can be created and processed. Some providers commented that they have submitted reports between 100-200 pages in length as part of the additional information they consider is required for 'above benchmark' SIL quotes, while other providers reported that they have waited up to 3 months to receive a response from the NDIA on SIL quote outcomes.
  - The quoting process for Assistive Technology and home modifications can disadvantage the provider developing the initial quote, as they are required to spend more time and effort to develop a quote together with a participant, typically in-home, and often an assessor, usually an occupational therapist. As the NDIA requires at least 3 quotes, additional providers are sent the initial quote to develop their own quote in isolation from the participant and assessor. This advantages subsequent providers by giving them the opportunity to undercut the initial quote due to the reduced cost of quote development.
- Improving the clarity and consistency in communication of policies to providers. Some providers commented that they spend significant amounts of time contacting the NDIA, and become frustrated with the inconsistency of responses from NDIA staff. Others commented that they're increasingly satisfied with NDIA staff responses.
- Increasing the transparency of the price setting process, and the timeliness of communications relating to price changes, to allow providers sufficient time to update service agreements prior to pricing changes coming into effect.

The NDIA has advised the IPR team that they have made several improvements in the design and functionality of the Provider Portal in the last 12-18 months in response to feedback from providers. However, the NDIA also recognises there are opportunities to further improve functionality and provider experience, and will continue focusing on this as part of its ongoing work. The NDIA also has two projects underway to address the challenges providers are facing relating to SIL: the SIL Tool project, and the SIL Redesign project. Data from the NDIA shows the SIL Tool has reduced the processing time for SIL quotes by up to 50%, however additional improvements will be required for the NDIA to achieve its target of a 14-day turnaround time.

2.3 MARKET GROWTH AND DEVELOPMENT

Providers raised issues about price levels inhibiting the growth and development of a skilled workforce. Some providers believe there is a risk of supply shortage as demand increases towards Full Scheme, and there are anecdotal reports that some providers are choosing to reduce their services or not grow beyond their existing service levels due to pricing constraints. Some providers believe there is also potential that new participants and participants with complex needs could have difficulty finding a service provider if the market is not growing at the necessary rate to meet demand. At the same time, these providers recognise there are also new providers entering the market and some other existing providers are expanding their services. Providers suggested:

- Setting prices at a point that allows providers to attract and retain a more skilled workforce to care for participants with complex needs. Some providers serving participants without complex needs also raised this as an issue, as they are having difficulty attracting highly skilled workers necessary for some categories of service.
- Explicitly allowing a provision for training, as some providers believe the utilisation assumption used in modelling is not sufficient to cover enough time for training, in addition to other non-client facing activities such as incident management, administration and reporting. This issue is more pronounced for providers serving participants with complex needs.
- Developing market infrastructure to increase the ability for the market to grow. For example, there is no functioning e-market, and participants vary in their abilities to exercise choice and control.

Some participants and providers suggest that the hourly rate approach to pricing does not provide sufficient incentives to improve outcomes and consistent adherence to insurance principles. Specifically, they requested the NDIA to consider the following:

- An approach to pricing consistent with an outcome focus. Prices are currently focused on units of care in hours. The IAC and some providers would like to see an incentive in the pricing structure for providers to reduce a participant's support needs over time. While the focus on units of care helps to ensure participants receive a defined number of service hours, it can also inhibit innovation by limiting flexibility in how participant packages can be spent.
- A more consistent adherence to insurance principles that focuses on early investment to reduce participant needs over time and reduce their lifetime cost to the NDIS. Participant plans should be looked at more holistically to understand how a greater investment in capital supports such as Assistive Technology and home modifications could reduce the need for other supports. Looking at capital supports in combination with opportunities to reduce other supports, and focusing on quality as well as price could improve outcomes for participants, as well as assist the sustainability of the NDIS.

The NDIA has advised the IPR team that it has identified initiatives to expand its monitoring and support of market development. It is developing a market assessment framework, which seeks to bring together disparate data sources and metrics into a coherent assessment process. It is also investing in a benchmarking function to share market knowledge and identify opportunities for providers to improve their businesses. The NDIA is also focused on

increasing its understanding of how the NDIS is affecting participant outcomes through regular surveys and participant consultation. For example, the Short-form Outcomes Framework questionnaire has helped the NDIA build a baseline understanding of participant outcomes during the NDIS transition period.

2.4 PLANNING PROCESS

The planning process is not formally within the scope of the IPR, as defined in the TOR. During consultation, issues were raised by providers about how the quality and consistency of plans could be improved to positively impact both participant outcomes and provider economics, both initial plans and plan reviews:

- Improving the planning process to support NDIA planners and Local Area Coordinators (LACs) to consistently capture all the needs of a participant to deliver quality plans for participants. This can reduce the time and resources providers invest to help some participants rectify issues with their plans such as correcting plan errors and submitting additional documentation to justify the need for additional funding in participant budgets. It can also help reduce the time providers spend educating participants and their families on how to engage with the NDIA and LACs, including how to utilise their plans with providers. These improvements will benefit participant outcomes by ensuring they have sufficient funds for specific functions. It is recognised by providers that there will always be more opportunities to improve plans, and the role of the NDIA is to improve the capabilities of its planners over time in identifying and planning for all needs of participants and how to improve outcomes.
- Improving the consistency in timing and communications for plan reviews, to make sure providers are aware reviews are taking place. This would help providers understand when they may need to update service agreements with participants, and alert them to when there could be service continuity issues if there are changes to a participant's funding allocation across different supports.

The NDIA has advised the IPR team that significant improvements are underway to the planning process to address many of the challenges raised by providers, and are currently being implemented as part of the Participant and Provider Pathways Review. Piloting has commenced in Victoria in December 2017, with improvements including:

- A significantly re-designed planning process to make it easier for participants to see how their goals have been recorded and linked to community, other government services and funded supports.
- Face-to-face planning meetings with an LAC, an NDIA planner and a participant to improve plan quality and educate participants and their families on how to utilise participant packages.
- Participants being able to see a working version of their plan as it is developed and the opportunity to ask questions and provide feedback during the planning meeting, to allow for any queries to be discussed and addressed before the plan is finalised.
- The use of simple language to improve communication.

Some providers argue that the challenges described in this section are having an impact on their abilities to operate at a sufficient surplus in the sector. In Section 3 – *Key findings and supporting evidence*, and Section 4 – *Recommendations*, the IPR team has worked with the providers, the NDIA and other stakeholders to explore the challenges raised by providers that are within the scope of the TOR, to provide a sufficient evidence base to justify the need for action, and propose recommendations relating to pricing that can be adopted by the NDIA to address these challenges.

3 Key findings and supporting evidence

To address the issues raised by providers and other stakeholders during consultation, and to assess whether current price caps are adequate, the IPR team looked at three sources of evidence:

- **3.1. Evidence of market development and shortages in supply,** including analysis of the available market data such as utilisation rates, rates of market entry and exit, and market surveys.
- **3.2 Provider economics and models,** including detailed bottom-up analysis of providers' costs-to-serve and comparison with the hourly rate model.
- **3.3 Benchmarks from other schemes,** including comparison of NDIS prices to state accident compensation schemes and the Commonwealth's aged care and veterans' support programs.

3.1 MARKET DEVELOPMENT

Close to 11,000 service providers have been approved to cater to participants in the NDIS, with approximately 5,000 service providers already active in supplying support services.[2] Many of these service providers are small suppliers, with 60% of active providers catering to fewer than 10 clients each. The larger providers account for most of the Scheme expenditure to date. Approximately 70% of NDIS payments have been to providers which cater to 100 or more participants each.[3]

The IPR team recognises that the provider market landscape is likely to change significantly in response to providers shifting to a new consumer-driven, unit funded environment. For example, the current provider landscape for in-home attendant care, a significant support type in the Scheme, is dominated by not-for-profits and medium to large providers.[4] Going forward, new providers, many of whom are likely to be for-profit organisations, and could leverage technology innovatively, are expected to enter the market, having identified a profitable niche or operating model. Some existing providers will exit the support category because they cannot adjust to this new market landscape, while providers who successfully adjust their operating models are likely to expand to meet demand. It is unclear how quickly this market adjustment and new provider entry will occur. A dynamic and responsive approach to monitoring the market will be critical to ensuring there is sufficient and quality supply to allow participants to continue to receive safe and quality supports.

The key test of whether current prices are adequate is whether participants can access the quality supports and services needed to achieve their goals, as defined and funded in their

[2] National Insurance Disability Agency: *National Insurance Disability Scheme COAG Disability Reform Council Quarterly Report* (30 September 2017).

[3] Analysis based on NDIS payment data.

[4] Not-for-profits consist of 62% of the disability sector, while 88% of in-home attendant care service volume in 2016-17 was delivered by medium to large providers.

plans. Market data on participant and provider behaviour and intent offers the most direct evidence of whether current prices are consistent with this test. Analysis of provider entry and exit rates, utilisation rates, and participant outcomes reveals a market that is, to date, providing the supply required to match demand. However, this evidence is not unequivocal. Gaps in the available data and the volatility of a transitional and rapidly growing market mean that this data does not yet provide certainty as to whether participants will be able to continue to access the supports they need into the future.

The remainder of this section examines the available data sources on market development:

Provider entry and exit data

Provider entry and exit data offer evidence of a market that is growing to meet demand. The number of registered providers more than doubled in FY16/17. The rate of growth of quarter-to-quarter provider registration has outpaced the rate of growth of participant registration throughout 2017. In the latest quarter, provider registrations grew by 21%, with a total of 10,507 providers currently registered in the Scheme.[5]

In the trial regions, less than 15% of providers decreased or ceased supply during the trial, whereas 30% of providers increased supply or entered after the trial began (FY13/14 to FY15/16).[6] The existence of some provider exits is also not in itself an indication of inappropriate prices. It is to be expected that as providers adjust to the NDIS, some will be unable to make enough changes to their business models and operations to supply services at an efficient price, while others will choose to specialise in some supports but exit other supports. It is also important to recognise that providers may have been willing to invest in the trial to test whether they could develop an effective model, so limited exits during trial may also not be predictive of future provider behaviour.

Participant utilisation data

Another key data point – utilisation – also does not provide compelling evidence of supply shortages. The utilisation rate is the share of a participant's budgeted supports that has been used. The average utilisation rate across the Scheme in FY16/17 was 66%, which is well below the expected utilisation of the Scheme at maturity of 85-95%.[7] However, the available evidence suggests that it is more likely caused by participants being unfamiliar with the Scheme and how to use their supports, rather than a supply shortage. In the trial sites, the average utilisation rate also started low, at 64%, but increased to 75% in the final year, reaching 80% in some sites. This change occurred without a reduction in the average size of plans, discounting the possibility that individual plans simply became more restrictive, despite the number of participants increasing as the trial progressed. Evidence from transition also indicates that the utilisation rate increases as participants spend more time in the Scheme and move onto their second and subsequent plans. The share of participants with high utilisation rates (>75%) almost doubles from first to subsequent plans. There is little participant survey

[5] National Insurance Disability Agency: *National Insurance Disability Scheme COAG Disability Reform Council Quarterly Report* (30 September 2017).

[6] Analysis based on NDIS payment data.

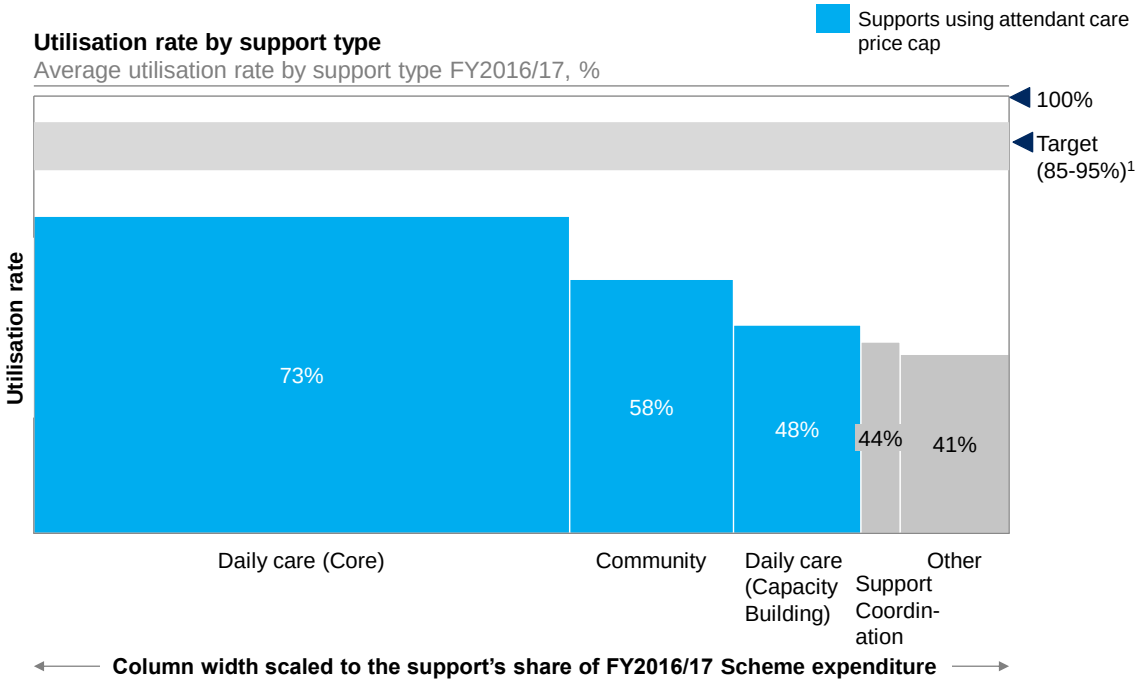
[7] Average utilisation rate for FY16/17 as at December 2017. Utilisation rates continue to increase after the end of the period being measured due to delays in claims and payment processing, so it is likely the final average utilisation rate for FY16/17 will be higher.

data to understand the drivers of this utilisation rate. Surveys during the NDIS trial showed that 27% of NDIS participants had at least some difficulty in accessing supports for which they had funding. More recently, baseline outcomes performance reported quarterly by the NDIA shows that 68% of participants nominate having no difficulty in accessing health services they require. However, a similar metric for NDIS services is not reported.

Analysis of utilisation by support type shows utilisation rates are highest in the largest support types and supports using attendant care, with the category of core daily care support services having a utilisation rate of 73% (Exhibit 2). This category includes support services such as assistance with daily living. Other support types reliant on attendant care, like assistance with social and community participation ('Community') and support for capacity building daily activities, have the next highest utilisation rates. The lowest utilisation rates are in capital and intermediary supports, which are of concern but are less likely to represent an imminent shortfall in critical supports.

EXHIBIT 2

Average utilisation of daily care (core) supports was higher than any other support type



1 Target utilisation rate estimated based on consultation with the NDIA and review of annual budget papers.
SOURCE: Scheme Actuary, FY17 utilisation data by support category

Aggregate analysis of firm entry/exit and utilisation data is complemented by anecdotal evidence of new private sector investment and innovation. For example, firms such as HireUp and BetterCaring[8] have made large investments to build new digital infrastructure to provide services in the disability services market. Such upfront investments offer evidence of the private sector's willingness to invest in this market. Similarly, the state government in New South Wales sold its Home Care business for $114 million, indicating the willingness of private capital to enter the disability services market.

Participant survey data

An evaluation of the NDIS trial by the National Institute of Labour Studies (NILS) revealed most participants found supports for which they had funding. This survey was initiated in 2014 and therefore covers more of the early experience of the Scheme. Approximately 73% of participants responded that they were able to access all supports for which they had funding. The average number of different supports accessed by participants has increased to 3.3 from 2.2 since the introduction of the Scheme, and 44% of participants report having greater choice and control over the supports they do receive since their enrolment in the NDIS. [9]

More recent measurement of participant outcomes reveals that 71% of participants believe that the NDIS has helped the level of choice and control they experience. 75% of participants identify the NDIS as having helped their daily living conditions, and 63% identify that it has helped their social, community, and civic participation.[10]

Evidence of provider intent

Other factors point to significant challenges as the Scheme continues to grow. The Productivity Commission acknowledged several studies that point to a potential future shortfall in supply to meet projected demand, with current workforce growth rate estimated between 6-13% versus a required growth rate of 18%. However, this can partly be explained by the ramp-up in demand that is expected, i.e. future growth rates are expected to be higher than current growth rates. The Productivity Commission also identified several participant cohorts for which a shortfall in supply is a risk. These included participants in remote and very remote areas and participants with complex needs. While there is not yet evidence of a shortfall in supply occurring across the Scheme, this is a risk that needs to be closely monitored.

Furthermore, some providers reported to the IPR team during its consultation process that they were drawing on surpluses and other funding sources, and cross-subsidising some support types, to continue to serve participants while they transition. They are concerned as to whether they can achieve a sustainable operating model in the future. Some major providers also reported that due to challenging economics operating in the Scheme, they are not accepting new participants for some services and are planning to reconsider their support

[8] Better Caring is not a registered provider under the NDIS, but has a profitable operating model in the disability services market supporting self-managed participants.

offerings in 2018. Ongoing close market surveillance and liaison with providers will be essential for identifying the intention of large providers to exit or reduce services.

3.2 ANALYSIS OF PROVIDER ECONOMICS

The financial sustainability of providers in the NDIS is critical to ensuring ongoing supply of supports to participants. While providers may be able to absorb losses for a period, operating in the NDIS needs to be attractive in the long term for enough providers to meet the growth in demand.

To understand the economics of providers in the NDIS, the IPR team gathered evidence from various sources, including a detailed cost-to-serve analysis of a sample of NDIS providers. The IPR team is grateful for the cooperation of many providers, who generously shared detailed financial information to enable the team to analyse their costs-to-serve.

The remainder of this section examines the evidence available on the following:

- 3.2.1 Cost of transitioning to the NDIA
- 3.2.2 Overview of provider economics across support types
- 3.2.3 Provider economics in attendant care

3.2.1 Cost of transitioning to the NDIS

For providers across all support types, the cost of transitioning to the NDIS and interacting with the NDIA's systems and processes added materially to their cost base and affected their short term financial position.

Moving to a unit-funded, consumer-driven environment has required providers to employ new staff to process payments and invest in IT systems and marketing. Some providers estimate that these costs have added 1.5% to their annual expenditure.[11] This is detailed further in Section 4.6.1.

Improving the NDIA's systems and processes related to the portal and planning as articulated in Section 4.6.2, would reduce administrative costs and cash flow risk. Anecdotal evidence indicates that these improvements could amount to ~0.5% of total annual expenditure for some providers.[12] Anecdotal evidence also indicates that the cumulative effect of unapproved SIL quotes, unresolved portal errors and expired plans has resulted in cash flow risk for some providers; one large provider submitted that at one point they were owed ~10% of their total revenue in services unclaimed. The IPR team has been advised by the NDIA that substantial improvements to the portal have been made in the last 12-18 months, and the NDIA currently has a significant program of work underway, the Provider Pathway Project, to review and address the issues noted above.

[11] Based on 45 one-on-one interviews with providers in September 2017, in which three large providers (revenue > 50 million in FY16/17) gave detailed evidence of these costs.

[12] Based on 45 one-on-one interviews with providers in September 2017, in which three large providers (revenue > 50 million in FY16/17) gave detailed evidence of these costs.

3.2.2 Overview of provider economics across support types

Across all support types there were examples of providers operating profitably, and examples of providers struggling (see Exhibit 3).

EXHIBIT 3

Provider cohorts where pricing is working economically versus where it is challenging

Support type[1]	Working economically	Challenging
Assistance with daily life and social/ community participation (36.1%)	▪ Tech-enabled for-profit providers serving participants with lower complexity needs or strong informal supports ▪ Some incumbents with economies of scale ▪ New entrants with lean operating models	▪ Providers serving complex participants or operating in low density areas ▪ Providers with more qualified, specialist or experienced workforces ▪ Providers with EBAs that are more generous than the Award
Short term accommodation (1.7%)	▪ (Limited) Providers serving less complex participants with lower care ratios	▪ Providers serving complex participants ▪ Providers operating on weekends/ holiday periods/ overnight
Therapy (5.0%)	▪ Some therapy providers (e.g. sole traders in physio, speech) ▪ Providers in high density, metro areas	▪ Remote/rural areas where lots of travel is required ▪ Some psychotherapy service providers
Life skills and support coordination (5.3%)	▪ Support coordination and plan management providers for low complexity participants ▪ Some employment service providers	▪ Providers serving complex participants, where plans do not adequately cover coordination activities undertaken
Supported independent living (39.0%)	▪ Some SIL providers, as SIL is a quoted item	▪ Providers serving complex participants with onerous quoting requirements ▪ Emergency/crisis situations

1 Numbers in brackets represent percentage of Scheme spend in FY17, based on payments data provided bythe NDIA
SOURCE: Provider Consultation, Sep-Oct 2017

In Supported Independent Living (SIL), Therapy, Support Coordination and Plan Management, analysis indicated that most providers can operate profitably at current price points/benchmarks. However, the costs involved in meeting quoting requirements and delays in approving quotes in SIL are impacting provider overheads.[13] In addition, the rollout of the new SIL pricing process may reduce surpluses that providers are generating, and reduce their ability to cross-subsidise other services.

In attendant care, there was a higher proportion of providers who submitted they were unable to operate profitably. Given the emphasis from providers on the challenges associated with profitably delivering attendant care, the IPR team conducted detailed analysis of provider economics for this support type.

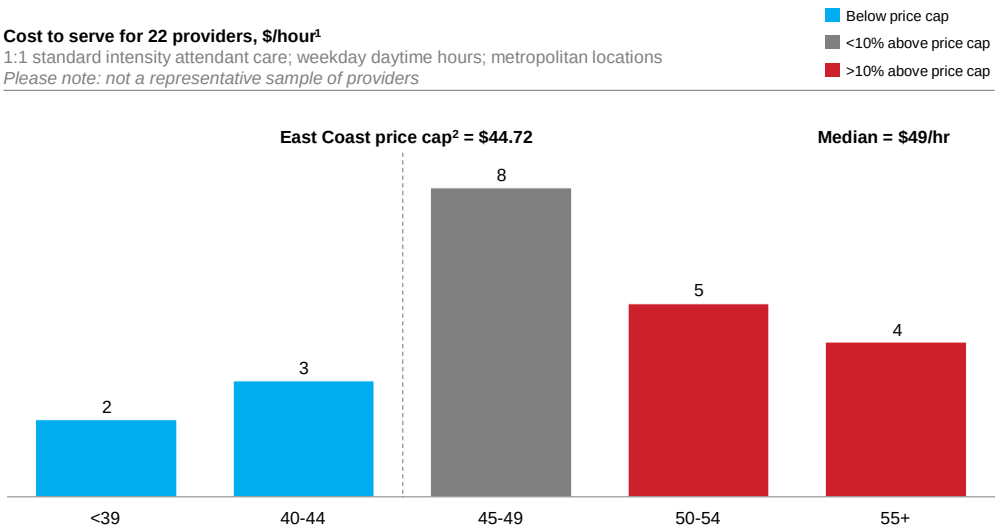
13 Anecdotal evidence from provider consultation indicates that SIL quoting requirements can be onerous: some providers have submitted reports of 100-200 pages in length to justify above benchmark quotes. NDIA data indicates that the average time to approve a SIL quote in Jul-Sept 2017 was 40 days, down from 107 days pre-July 2017.

3.2.3 Provider economics in attendant care

There is significant variation in the cost of service delivery for attendant care between providers. For the 22 providers who shared their financials, costs-to-serve ranged from under $40 to $55+ per hour for standard intensity weekday support (see Exhibit 4).[14]

EXHIBIT 4

Distribution of provider costs-to-serve for attendant care



1 Based on 22 providers who provided costings information for 1:1 standard intensity attendant care as part of the IPR or the 17/18 Price review. Some providers submitted a cost to serve based on actual data that represented their actual workforce mix. Where a provider submitted a cost to serve that assumed an 100% permanent or 100% casual workforce, and where the IPR had information about their workforce mix of permanent v casual staff, the IPR team adjusted their costings to reflect their true workforce mix. 2 Price cap for VIC, NSW, QLD and TAS. The 'East Coast' price cap is shown here as this is the cap that applies to most providers on this chart. The price cap for ACT, SA, WA and NT is $45.54.

This variation is attributable to differences in operating models and different cost structures across providers:

- For providers with more mature and formally highly qualified workforces, or who are bound by more generous working conditions and pay scales compared to the SCHADS award and pay scale, base labour wages were a key differential cost driver.
- For providers with heavier supervision structures, the cost of supervision was a key differentiating cost driver.
- For providers in regional geographies, travel was often a key cost driver.
- For providers with predominantly casual workforces, workforce utilisation was significantly easier to manage.

14 While the IPR's sample of 22 medium to very large providers was not comprehensive or representative of the market, the IPR was limited by the information providers were able to provide.

- There was significant variation in the cost of corporate or indirect overheads between providers, with expenditure on corporate overheads as a percentage of direct labour costs ranging from less than 10% to over 20%.[15]

For a more detailed summary of key drivers of differences in costs between providers, see Appendix A.

Participant characteristics can also influence provider economics. Margins were more compressed (or negative) for providers operating in areas with low density of participants, e.g. rural, remote and very remote areas, and for those serving participants with complex needs. On the other hand, the profitability of some providers can be in part attributed to their focus on specific participant segments. Providers who serve participants at the lowest end of the complexity spectrum often have lower labour and supervisory costs. These providers submitted that it is not necessary to pay a highly qualified or trained worker to deliver attendant care supports to participants that are not medically or behaviourally complex, for whom the risk of incidents is extremely low. Rather what they focussed on ensuring was that they had support workers with the right mindset, compassion and soft skills to deliver high quality support.[16] Providers who serve participants with predictable and high volumes of care are also able to operate profitably in attendant care, because workforce rostering and utilisation is easier to manage.

While a substantial number of providers assessed are not yet able to operate profitably at the current price cap, there are some providers who submitted they are able to deliver 1:1 standard intensity attendant care at a sustainable surplus, while complying with their award or enterprise agreement obligations. These providers often have lean operating models, leverage technology successfully, or are sole traders. Some of these providers have operated in the sector for some time, while others are new providers that entered the disability space in response to the NDIS opportunity.

- **Traditional providers with lean operating models:** Some traditional providers who run extremely efficient operations and have achieved a degree of scale are able to operate profitably. These providers exhibited some, or all, of the following characteristics: lean corporate overheads facilitated by effective investments in IT systems; effective rostering systems and a mix of casual and permanent staff to maximise staff utilisation; and/or a supervision model where supervisors only focus on quality assurance and co-ordination, while rostering work is done by a separate team. Providers in this group submitted they can achieve corporate overheads of ~10% of direct labour costs. Providers in this group who hire predominantly casual workers can maximise the amount of time their workers perform client-charging work and achieve 95+% workforce utilisation rates. These

[15] Data based on information from 22 providers who provided detailed financial information to the IPR. Corporate overheads refers to costs that are not directly attributable to client care (e.g. IT, HR, rent, marketing, business development, senior management salaries).

[16] This is particularly relevant in the context that there will be more than 100,000 people who receive NDIS funding who did not previously receive disability funding, A segment of the 100 000 new participants will have a psychosocial disability and may need highly qualified workers to support them. A segment of the new participants whom will have lower packages relative to participants who were existing recipients of State block funding, are likely to be at the lower complexity end of the spectrum. For these participants, a support worker with the right mindset may be more appropriate than a highly qualified worker.

working models provide insights on tactics that can be used by struggling traditional providers to improve their financial performance.

- **Tech-enabled providers**: These providers serve participants via online platforms, which allow participants to book and manage their own care schedule directly, reducing the work required to be completed by a provider and minimising corporate overheads. Support workers are typically casual, allowing providers to achieve high utilisation levels, as staff will only work when there is known demand from a participant. These providers estimate their cost of service delivery is up to ~20% lower than the current price cap. These providers also leverage technology to manage quality and safety: customers are able provide feedback after every shift online and an algorithm helps detect potential problems with service quality or customer satisfaction. However, this operating model relies on participants or their carers having the capacity and desire to manage their own supports. These providers currently only serve a small proportion of the market, and while this model appears to hold significant potential, it is unclear as yet what percentage of the standard intensity attendant care market this model will be able to serve at full Scheme.
- **Sole traders:** Sole traders can deliver attendant care significantly below the current price cap. This is because a self-employed support worker does not incur the supervisory or corporate overhead expenses of a small provider. While sole traders currently deliver less than 1% of service volume in in-home attendant care market, the emergence of e-marketplaces connecting self-employed care workers and participants could see a significant growth in this group of providers.[17]

The IPR believes these profitable and successful operating models offer valuable lessons to learn from for other providers who are struggling.

3.3 BENCHMARKING WITH COMPARABLE SCHEMES

There are several other State and Commonwealth schemes in Australia that offer comparable supports to their participants, including state accident compensation schemes and the Commonwealth's aged care sector. There is also significant overlap in the provider markets that service these other schemes. For example, ~90% of providers in one of the benchmarked schemes are also registered NDIS providers.[18]

To assess the adequacy of NDIS price caps for various supports, the IPR team benchmarked prices against available prices in the other schemes. The IPR team undertook detailed benchmarking for attendant care and therapy supports. Attendant care was chosen given the large proportion of Scheme spend attendant care represents, and given the recent scrutiny on the price cap for 1:1 attendant care (see Section 4.6.3.1). Therapy supports was chosen

[17] NDIA data. Sole-traders that are registered NDIS providers can serve all NDIS participants, whereas sole traders that are not registered NDIS providers cannot serve Agency-managed participants.

[18] McKinsey analysis, conducted by checking providers in the comparable scheme with NDIS registration data.

because the single NDIS price cap for therapy appeared to be inconsistent with the multiple price levels, and structure, of other comparable schemes.

3.3.1 Attendant care

Benchmarking the unit price of 1:1 attendant care under the NDIS with comparable schemes is complicated by a variety of factors: each scheme has a different funding model, different cohorts of clients, different business rules associated with care delivery (e.g. travel rules, cancellation policy, funding for training), and different fee structures (e.g. weekly price cap versus hourly price caps, composite versus time differentiated price caps). For instance, the Transport Accident Commission (TAC) and Worksafe have composite price caps in which the price cap for 1:1 care does not vary for time of the day or day of the week. By way of contrast, the NDIS rates are specific to the time of the day and day of the week. While TAC and Worksafe attendant care standard price caps do not vary for complex participants, the NDIS price caps differentiate for 'higher intensity' and 'standard intensity' prices.

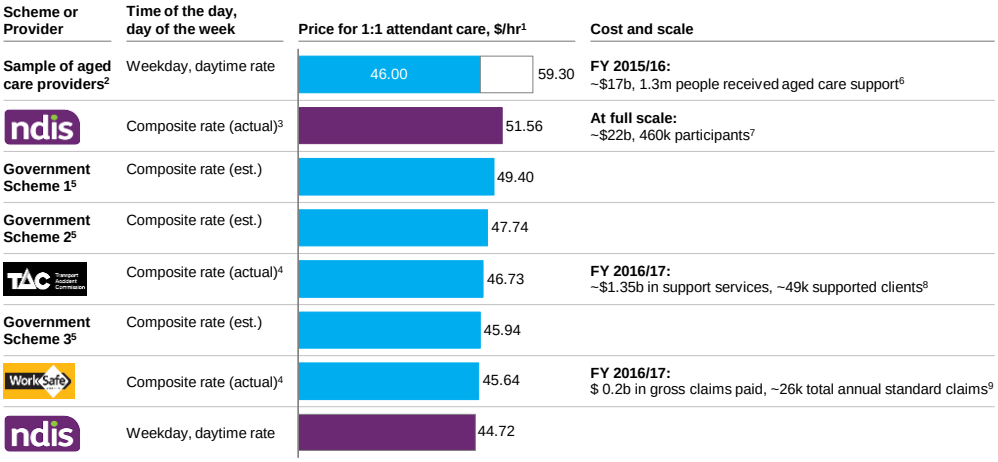
It is also important to recognise that other government schemes such as the TAC and Worksafe are significantly smaller than the NDIS, and revenue from these schemes is less likely to be the primary source of revenue for providers. Further, providers under other government schemes such as Worksafe are often guaranteed they will serve a participant for a set amount of time, and this demand certainty allows providers to manage their business and workforce planning more efficiently.

Despite these limitations in comparing across schemes, benchmarking is nonetheless useful to understand whether NDIS prices are broadly aligned with prices of other schemes. This benchmarking highlighted that the NDIS prices for standard intensity attendant care are in fact broadly aligned with prices of the accident compensation schemes, although market prices for many aged care services are higher (see Exhibit 5). While the NDIS composite price is higher than the composite rate for other schemes, other schemes provide more generous conditions associated with the delivery of care.[19] For example, TAC and WorkSafe offer establishment fees of ~$1200, compared to $500 in the NDIS. TAC also reimburses providers for training at a rate of $43.10 per hour, compared to no specific provision for training reimbursement under the NDIS.

[19] The NDIS composite rate is a weighted average of the various NDIS standard intensity time of the day and day of the week price caps.

EXHIBIT 5

The NDIS attendant care price cap is aligned with comparable compensation schemes, although market prices for aged care appear higher



1. Benchmarking the unit price of 1:1 attendant care under the NDIS with comparable schemes is difficult for a variety of factors: each Scheme has a different funding model, serve different cohorts of clients, different business rules associated with care delivery (travel rules, cancellation policy, funding for training etc) and fee schedules with different fee structures (e.g. weekly price cap vs hourly price caps, composite vs time differentiated price caps). 2. We sampled a range of aged care home care providers in metro regions in Sydney and Melbourne for their weekday daytime attendant care prices. These rates were private rates, meaning they are not necessarily fully government subsidised. 3. NDIScomposite rate for Eastern States, based on actual distribution of service volume between time of the day and day of the week;. 4.IQRS accredited rate. 5. For these Government Schemes, we estimated the composite rate. Where the Government Scheme provided a weekly cap, we divided this cap by the recommended number of hours of care per week. Where the Government Scheme provided different rates for time of the day and day of the week, we estimated the distribution of service volume to calculate a composite rate. 6. 2015/16 Report on the Operation of the AgedCare Act 1997, p9 and 10. 7. NDIA 2017 Corporate Plan, p11. 8. TAC 2017 Annual report, p6. 9. Worksafe Victoria Annual Report 2017, p57 and 15

3.3.2 Therapy

The NDIA has a single price cap in place for all therapy supports delivered by a qualified therapist under the NDIS. The price cap allows therapists to charge participants up to $175.57/hr for the delivery of services in a participant's own environment, which for a child could be in their home or at school, or in a therapist's office.[20] When a participant requires therapy supports to be delivered in their own environment, a therapist can make a separate claim for travel against a participant's package to reimburse them for the costs they incur. The NDIA has created a separate allowance in participant packages for therapy travel, which is capped at $1000 each year per therapy support type. The current travel policy allows therapists to claim travel time at the hourly rate of the service being delivered for travel over 10km.[21]

Other comparable insurance schemes in Australia offer different therapy prices dependent on the number and complexity of the conditions experienced by the participant. Examples include the TAC, WorkSafe, Department of Veterans Affairs (DVA), and NSW State Insurance Regulatory Authority (SIRA). The categorisation of the number and complexity of conditions vary by scheme. To simplify, the IPR team has named them Level 1, Level 2, and Level 3, with the number of conditions and/or complexity of the support increasing with each level (see

[20] NDIA: *2017/18 NDIS Price Guide VIC-NSW-QLD-TAS (version release date July 2017)*, p. 61
[21] NDIA: *2017/18 NDIS Price Guide VIC-NSW-QLD-TAS (version release date July 2017)*, p. 15

TABLE 1). Price ranges to equate each level of therapy support were observed both across schemes and within schemes for common types of physical therapy including physiotherapy, speech therapy, and occupational therapy. These schemes are typically associated with physical disabilities, but each include psychological therapy as a reimbursable support. When benchmarking to comparable schemes, it is important to recognise that travel policies specifically for therapy services vary across different schemes, and the NDIS travel policy is more generous than other schemes. For example, the TAC does not pay any travel allowance above the hourly rate for out-of-room care, and the DVA pays an allowance for every kilometre travelled above 10km of $0.90/km excluding GST.[22]

For physical therapy, three discrete levels of therapy support exist, each with a different range of prices (see TABLE 1).

TABLE 1: BENCHMARK PRICES FOR PHYSICAL THERAPY SUPPORTS[23,24,25,26,27]

Level of support	Benchmark price range ($/hr)	NDIS price cap ($/hr)	Description
Level 1	$90 - $130	$175	Includes treatment on a one-on-one basis and focused on treatment of a single physical condition
Level 2	$120 - $160	$175	Includes treatment of multiple (2-3) entirely separate injuries or conditions, where treatment applied to one condition does not affect the symptoms of the other injury
Level 3	$170 - $200	$175	Includes treatment related to complex pathology and clinical presentation (including complicated injuries involving multiple joints and tissues, spinal cord injuries, head injuries, major trauma)

For psychological therapy, the entry level of support is at a higher level of complexity than Level 1 physical therapy, and more equivalent to Level 2 physical therapy (see TABLE 2).

TABLE 2: BENCHMARK PRICES FOR PSYCHOLOGICAL THERAPY SUPPORTS

Level of support	Benchmark price range ($/hr)	NDIS price cap ($/hr)	Description
Level 1	$160 - $180	$175	Includes psychological therapy on a one-to-one basis focused on treatment of a psychological disability in a low risk environment
Level 2	$190 - $240	$175	Complex psychological therapy requiring a very skilled and experienced clinical professional, often necessary where a participant poses a high risk to themselves or others because of their disability

The findings outlined in this section form the basis of the suite of recommendations detailed in the following section. Recommendations are grouped by the items of the Terms of Reference. Under each item, further detail is also provided on the issues and evidence relevant to the topic.

4 Recommendations

As outlined in Section 3.1, the fundamental test of whether price caps are adequate is whether participants can access quality supports and services. There is not yet compelling evidence of supply shortages occurring, other than what was recently observed in short term accommodation and has now been addressed through price changes. However, there is still a risk of future supply shortage, particularly for participants in rural, remote and very remote areas and those with complex needs. The IPR team's analysis also identified a significant number of providers that have not yet developed a profitable operating model, particularly in the service category of attendant care.

To improve provider economics and confidence in the NDIS, minimise the risk of supply shortages in the future, and assist the NDIA to achieve its aspirations, the IPR team has made 25 recommendations, detailed in this section. These recommendations are designed to target the root cause of issues identified through consultation and further analysis.

Together, these recommendations will have a positive impact on provider economics, improving overall industry margins by 2% to 4%, with even higher margin improvements for providers serving participants with complex needs or in rural, remote and very remote areas. Examples of these recommendations that will have a direct impact on provider economics are:

- Adding a third tier to the complexity loading of 10%, to account for higher level of skills/experience of workers and additional training required.
- Allowing providers to charge up to 45 minutes of travel time in rural areas.
- Allowing providers to quote on the delivery of services in isolated regions.
- Changing the cancellation policy to allow providers to charge participants for cancellations. after 3pm on the day before the service.
- Removing the $1000 travel cap for therapy supports and align the travel policy with attendant care travel policy.
- Changing the therapy prices to better reflect different therapy types, and introduce a second tier of pricing for therapy assistants.
- Continuing to improve NDIA systems and processes (e.g. portal functionality, quoting) to enable providers to reduce administrative tasks and reduce costs.
- Introducing temporary overhead assistance equivalent to a 2% to 3% loading on the price for providers delivering attendant care for the next 12 months.

The recommendations in this section have been grouped according to items in the IPR's Terms of Reference (see Section 1.4). There were some issues raised during the consultation phase that were outside the scope of this review. These issues have been captured and will be raised separately with the NDIA.

The structure of this section is as follows:

- Section 4.1: Approach to price setting, covering Recommendations 1 to 2
- Section 4.2: National versus regional pricing, covering Recommendations 3 to 5

- Section 4.3: Pricing of services with different levels of complexity, covering Recommendations 6 to 9
- Section 4.4: Pricing of short-term accommodation (respite) services, covering Recommendation 10
- Section 4.5: Thin and undersupplied markets, covering Recommendations 11 to 12
- Section 4.6: Provider efficiencies and adequacy of provider returns, covering Recommendations 13 to 21
- Section 4.7: Price deregulation, covering Recommendations 22 to 25

4.1 APPROACH TO PRICE SETTING

The NDIA sets price caps for an hour of service for most support services supplied in the NDIS. The price caps are reviewed annually and a new price guide is published, though the NDIA has also twice amended prices outside the annual review process. In assessing the approach to price setting used by the NDIA, the IPR considered both the process for setting price caps, and the way in which price caps are applied as an hourly (or other time-based) rate.

Section 4.1 covers the following topics:

- 4.1.1 Determining appropriate price caps
- 4.1.2 Alternatives to an hourly rate

The use of price ranges and deregulated pricing are considered separately in Section 4.7.

4.1.1 Determining appropriate price caps

Issues and evidence

The NDIA has amended prices through its annual price reviews as well as interim changes where required. The current price caps are a result of the NDIA FY2017/18 Price Review concluded in June 2017 and a change to short term accommodation price caps from 30 October 2017. The NDIA FY2017/18 Price Review was based on an assessment of the underlying methodology used to estimate the hourly costs of personal care and community supports, feedback from the disability services sector including 82 provider submissions directly in response to the annual review process, new economic data such as increases in the Wage Price Index, and an assessment of the impact of proposed changes by external consultancy HoustonKemp. The annual price adjustment also accounted for changes in the national minimum wage and the operation of the Equal Remuneration Order (ERO).[28] This led to several changes. For example, base prices for the support type 'Assistance with daily living' were increased by 4.5%, loadings for remote and very remote areas were increased, and the

[28] The Equal Remuneration Order is an order made by the Fair Work Commission in 2012 which required wages in the social and community services industry to be increased regularly to 2020. The ERO increases occur each December according to a prescribed formula.

cancellation policy of therapy services was amended. The NDIA published the amended Price Guide on 12 June 2017 before it took effect on 1 July 2017. These changes were then followed by a tailored change to price caps for short term accommodation services, announced on 18 October this year, with the new prices being revealed a week later and taking effect two weeks later, on 30 October.

The NDIA does not yet have a comprehensive evidence base to inform its regular pricing decisions, but it has been increasing its scope of data collection. For example, the NDIA does not keep a collated record of supply shortfalls identified by LACs and regional offices, nor does it directly survey participants on whether they experienced shortages in supply of supports for which they had funding.[29] However, it has developed and implemented a Short-form Outcomes Framework questionnaire which measures participant outcomes and it is deploying a benchmarking survey of providers to understand evolving cost structures across the NDIS. The NDIA is also working with DSS to develop a set of metrics to monitor market development, as well as developing a market intervention strategy to identify and respond to instances in which prices have been unable to attract sufficient supply.

Recommendations

1: The NDIA should include a broader set of indicators of participant outcomes and market development in its price setting process, and clarify its methodology for implementing price setting decisions.

The NDIA's current process for setting prices and ensuring provision of services for participants can be enhanced. The IPR team recommends a four-step process (see Exhibit 6). This process should apply to the annual price reviews, as well as any interim adjustments which may be necessary in response to changing market conditions. The IPR team recommends that the NDIA considers the following four steps as it develops its market intervention strategy:

1. Continuous market monitoring
2. Focused data collection on at-risk markets
3. Data analysis and policy decision
4. Implementation of decision

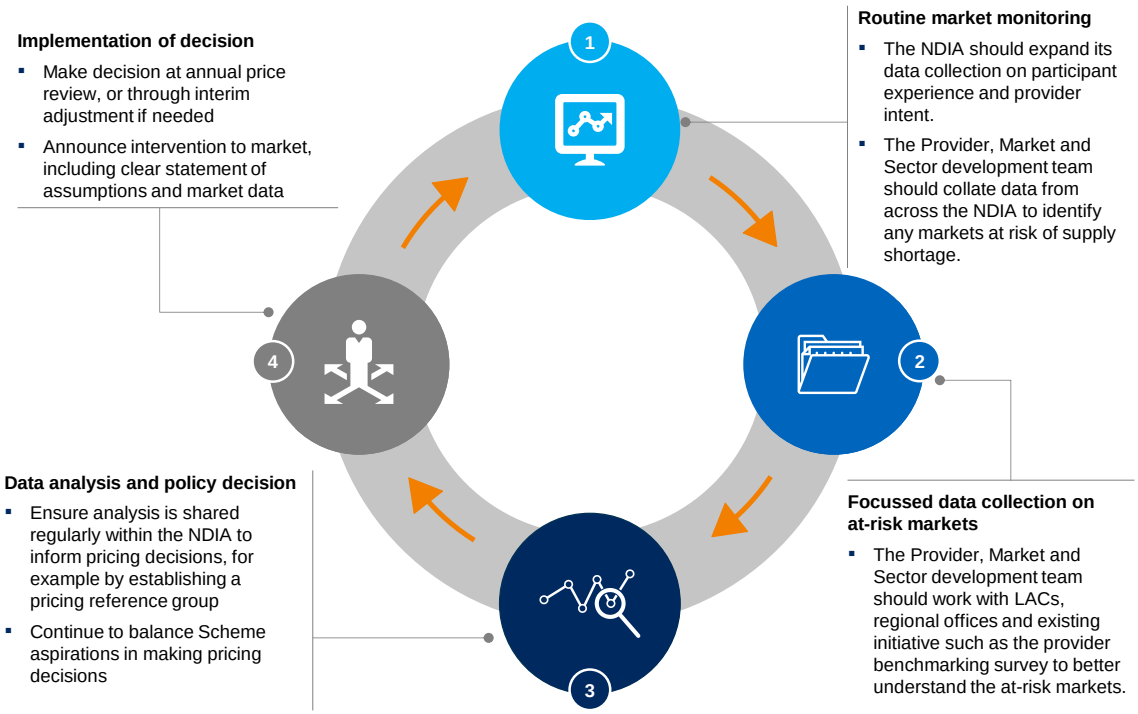
The most significant departure of this prescribed process from NDIA's current practice is to include a more thorough assessment of the risk of supply shortages, including a more comprehensive analysis of alternative supply options and the range and distribution of costs to serve of providers. The driving question should be whether participants are able to access all the services for which they have funding. In the case of an existing provider no longer being able to offer services, participants will require options to access alternative providers. Where there are signals that participants are at risk of not being able to access services, the NDIA should assess options to intervene through evaluating impact on the NDIA aspirations.

[29] The NDIA does monitor the number and broad category of complaints lodged by participants, as well as tracking the overall participant satisfaction rate, which has consistently been above 85%. However, neither of these are directly related to observations of supply gaps in the Scheme.

It is important that the price-setting process continually balances the NDIA aspirations, which can involve trade-offs. This is because in an immature and developing market, price caps not only regulate provider competition but also act as a signal of efficient prices, enable value-for-money for participants, and affect the long-term development of the NDIS.

EXHIBIT 6

The process for testing whether to amend price caps should incorporate thorough market monitoring and transparent decision making



Step 1: Routine market monitoring

The NDIA should complement its existing initiatives to advance its market monitoring capabilities through three additional initiatives: collecting data on the share of participants affected by supply gaps, extending its provider consultation and feedback processes, and collating market data and sharing internally to all relevant decision-makers.

The NDIA should collect more comprehensive data on the ability of participants to find the supports they require across each geographical region and support type. The most desirable way to collect this information is regular surveying of participants. This could be done through a new survey, or by expanding the existing participant assessment in the Short-form Outcomes Framework.

Secondly, the NDIA should establish proactive and regular consultations with providers, including surveys, to assess provider experience and intent. The NDIA should construct a representative sample of new and mature providers to gauge their financial sustainability, intent for growth, self-assessment of ability to cater to demand, and knowledge of any current or emerging supply gaps. Whilst some of this data is currently collected by other

organisations, the NDIA should have access to a more regular and reliable source of data that it can rely on for its own decision making.

The above sources of data should be part of a regular monitoring framework which also incorporates existing market data such as utilisation rates and evidence of provider entry or exit (see Exhibit 7). See Section 4.5.1 for a detailed discussion of the relevant metrics.

Finally, all relevant market information should be collated and analysed by the Provider, Market and Sector development team. Regional offices, LACs, the Scheme Actuary and other parts of the NDIS should share the relevant data with this team. The data and analysis should then be regularly reported to key stakeholders within the NDIA such as the Chief Executive Officer (CEO) and the Board. This will enable rapid identification of any markets that may be at high risk of undersupply and a consistent flow of information within the NDIA.

If this market monitoring process reveals any markets that are at risk of developing supply gaps, the NDIA should take immediate steps to collect more focussed data on those at-risk markets.

EXHIBIT 7

Supply in Scheme markets can be evaluated through considering a mix of indicators from surveys, utilisation rates and entry/ exit data

Indicator and relevant metrics		Data Source	Discussion on limitations
1 Participant experience	**1.1**: Share of participants with funding who had difficulty or were unable to find services	▪ Participant survey, e.g. "In the past year, did you have difficulty or were you unable to access supports because of a lack of suppliers in your market?" ▪ Compare across respondent region and support type	▪ Broad surveys may be too expensive or time-consuming to be sufficiently representative and timely ▪ Consider focusing on "at-risk" markets which show other indicators of supply shortages, such as low rates of market entry or poor utilisation rates
	1.2: Share of participants who are unsatisfied with quality of services accessed	▪ Participant survey, e.g. "Were you satisfied with the quality of supports you have received in the past year?" ▪ Compare across region and support-types of respondents	
2 Provider intent	**2.1**: Share of providers intending to grow/ shrink number of participants served	▪ Provider survey, e.g. "Are you intending to serve more participants in the next year than you did in the last?" ▪ Compare across respondent region and support type.	▪ Provider intent may be informed by non-Scheme features ▪ However, reason for withdrawal/ expansion is not as relevant as identifying the outcomes that are consistent with existing price settings
	2.2: Share of providers intending to expand into/ withdraw from support types/ regions.	▪ Provider survey, e.g. "Are you intending to expand the number of regions in which you operate? ▪ Compare across respondent region and support type.	
3 Utilisation rate	**3.1**: Level of utilisation by support type and geography ("utilisation rate")	▪ NDIA planning and claims data ▪ Share of funds allocated in participant plan which were disbursed in the relevant time period ▪ Compare relative averages and distribution across markets	▪ Utilisation rates are affected by many non-supply factors, e.g. plan quality ▪ However, comparing to average utilisation rates and measuring change over time can help to determine markets in which persistent low utilisation is likely to be due to insufficient supply.
	3.2: Change in utilisation rate over time by support type and geography	▪ NDIA planning and claims data ▪ Percentage point change in utilisation rate from one time period to the next	
4 Rates of market entry/ exit	**4.1**: Number and share of providers which withdrew from current markets.	▪ NDIA payment and claims data ▪ Number of providers who sought payments from fewer regions/ support types in this year than last	▪ Benchmark entry/ exit rates are difficult to establish due to volatility in transitioning markets ▪ However, the data can be used to identify outlier markets which warrant further investigation
	4.2: Number and share of providers which expanded into new markets.	▪ NDIA payment and claims data ▪ Number of providers who sought payments from more regions/ support types in this year than last	

Step 2: Focussed data collection on at-risk markets

More focussed data collection on specific markets should include investigating the causes of participants being unable to access supports, through LAC feedback and qualitative research with participants. It may also include assessing the economic performance of providers to

understand whether the supply gap is likely to worsen over time. If this data confirms that providers are struggling to provide the required supports in a financially sustainable fashion, and supply gaps are likely to continue, the NDIA should proceed to evaluate the effectiveness of different interventions to address this risk of supply shortage.

In some cases, this market monitoring process will identify instances where participants require a more immediate solution than amendments to price controls or related policies. This is discussed in further detail in Section 4.5 (*Thin and undersupplied markets*).

Step 3: Policy decision

The data collected by the NDIA should inform its annual price review, but also inform any interim price or non-price interventions that may be required. Interim interventions should be used where there is an immediate market concern, as was the case with the change of short term accommodation prices in October 2017. Once the NDIA has assessed markets that need intervention, it should identify intervention options which may involve targeted adjustments to specific policies or terms of business (e.g. travel or remoteness policies), non-price levers such as changes to the planning process or NDIA's systems and processes, or changes to prices.

The identified policy options should be assessed against each of the NDIA aspirations, to test which options will have the most favourable impact on all aspirations while ensuring that participants are able to access all the services for which they have funding. This should be done with input from all relevant parts of the NDIA, so that information on how the options will affect each of participant outcomes, market development, and Scheme sustainability can be fully considered. The assessment of policy options should be coordinated by the Provider, Market and Sector development team and made available to all relevant decision makers, including the CEO and the Board.

The NDIA should consider the addition of new organisational mechanisms to support this stronger internal collaboration and ensure proper governance of the pricing process. It may be appropriate to establish a pricing reference group with participation from all relevant parts of the NDIA, such as the Scheme Actuary, senior management, the Provider, Market and Sector development team etc. For pricing decisions which affect a smaller part of the market or Scheme spend, the NDIA may consider authorising the CEO or the Provider, Market and Sector development team to make policy decisions. Regardless of the model chosen, the NDIA should be satisfied that holistic information is available on the rationale and consequences of changes in price levels or other policies.

Step 4: Implementation of decision

The NDIA should give providers sufficient notice of price changes that result from the annual price reviews. The IPR team recommends that this notification period be one month for core and capacity building supports. A notification period of a month will allow organisations to calculate the impact of new prices and make informed business decisions. It will also allow providers to communicate and advocate for their new prices to participants. Price changes should also be scheduled to take effect at the beginning of the financial year to align with the corporate planning procedures of providers. The NDIA should also make clear the reasoning for price decisions and disclose relevant market data.

For interim price adjustments where a single support service or market is being affected, a shorter notice period of two weeks would be acceptable. This is because by their nature interim pricing decisions need to be implemented more rapidly, and are likely to affect a smaller proportion of the Scheme.

4.1.2 Alternatives to an hourly rate

Issues and evidence

It is important to differentiate between the funding model and the pricing approach of the NDIS. The NDIS funds individual supports for participants, to help them achieve their goals and desired outcomes. Under the previous block-funding model, providers were funded to deliver a range of services to a participant over a quarter or year.

The predominant mechanism for setting prices across the NDIS is a cap on the hourly (or other time-based) rate that can be charged for providing the relevant support service. Under this approach, providers are paid for their 'inputs'.

Input-based pricing, sometimes referred to as fee-for-service, rewards providers for work done, and creates a transparent price that can be used to stimulate provider efficiency. However, this form of pricing is sometimes criticised for creating incentives for providers to increase volume of services, rather than focusing on how to improve outcomes.

Outcome-based pricing is an alternative method which remunerates service providers based on an agreed improvement in the service user's outcomes resulting from the provision of services. For example, employment services could be priced based on whether users of the services are able to obtain and maintain stable employment. An example of such a payment model for providers is the Federal Government's jobactive program. Outcome-based pricing encourages innovation by prioritising the delivery of the desired outcomes at the lowest cost. It encourages providers to find more productive ways to deliver services, rather than rewarding providers who simply provide the highest volume of services. However, this method requires outcomes which are able to be clearly defined and monitored so that the improvements can be measured and an appropriate price established. The method also requires careful design choices so that providers are not encouraged to deliver short-term measurable outcomes at the expense of more sustainable, long-term improvements in a participant's welfare.

Recommendations

2: The NDIA should continue to use an hourly rate approach, but trial outcomes-based pricing

The current measures of participant outcomes are not yet sufficiently defined or tested to support an outcomes-based pricing model. Currently the NDIA is measuring progress of participants against multiple outcomes through the Short-form Outcomes Framework questionnaire, and as part of participant plan reviews. However, many of these outcomes are broadly defined such as increased choice and control or community participation. Given that many participants are receiving different supports from a range of providers, it will be difficult to attribute improvements in outcomes to a specific support. In addition, there are not yet clear

outcomes baselines for most services, or alignment on evidence-based approaches to test and monitor improvements in outcomes. As a result, outcomes-based pricing approaches will require further development and testing before becoming a viable alternative to the current hourly rate approach.

The NDIA should start to build its capability to design and manage outcome-based pricing through a trial for a support service which is amenable to outcomes measurement. Services which are most amenable to outcome measurements include employment services, learning supports, and some types of physical or behavioural therapy. For example, the NDIA could pay providers of employment supports a bonus based on their ability to find stable employment for participants. To encourage long-term improvements in outcomes, such bonuses could be paid out in part at the time of placing a participant in a job, and in part at the 12-month mark if the participant continues to be in work. For behavioural supports, the NDIA could reward providers based on their ability to reduce the incidence of certain behaviours or behavioural interventions such as restrictive practices. Before commencing any trial, the NDIA will need to be satisfied that it has a good understanding of baseline outcomes in that market, and the capability to both monitor and price outcomes going forward. A trial would develop the NDIA's capacity in designing outcomes-based pricing systems, offer useful insights on whether the NDIA is able to sufficiently monitor outcomes, test whether providers can adjust to this model of service provision, and provide evidence for whether such a system improves participant outcomes.

4.2 NATIONAL VS REGIONAL PRICING

One of the questions posed for the IPR team was whether there are significant differences in the costs of serving participants within and across states and territories.

Within states and territories, the cost of service provision varies by geography due to travel and other service delivery costs associated with remote and very remote areas. For example, in very remote areas providers often incur higher wages, higher accommodation and food costs and higher staff turnover. To compensate providers for these costs, the NDIA applies loadings to prices of 25% in very remote areas and 20% in remote areas.

Once travel and remoteness are accounted for, there is little difference in cost structures within a state. In the disability sector, approximately 80% of the cost of service provision is labour, and labour costs are typically based on the SCHADS Award.[30] Most providers pay their workers in line with these award rates or their EBAs, with no further adjustments for the location of service provision.

Across states, labour costs vary a little due to some small differences in award rates. These differences are minor (under 3%) and will converge by 2020.[31] The NDIA currently has two

[30] Estimate based on independent modelling of the IPR, consultation with providers and comparison with modelling of comparable Schemes. The NDIA's current pricing methodology makes a similar assumption as to share of labour costs.

[31] See Appendix C for further detail on SCHADS Awards by state. Convergence of national awards is a result of the Equal Remuneration Order (ERO) made by the Fair Work Commission in 2012. For full detail on the ERO and SCHADS Awards rates, see: https://www.fairwork.gov.au/pay/minimum-wages/social-and-community-services-industry-pay-rates.

price guides – one for Eastern states (NSW, VIC, QLD, TAS) and one for Western states (ACT, NT, SA, WA). The difference in prices between these guides does not correlate with differences in SCHADS Awards or other cost differences between those states. The current disparity between these price guides appears to be based on legacy arrangements among jurisdictions, rather than any direct correlation with regional costs.

Section 4.2 covers the following topics:

- 4.2.1 Service provision in remote and very remote regions
- 4.2.2 Service provision in rural areas
- 4.2.3 Single national price

4.2.1 Service provision in remote and very remote regions

Issues and Evidence

The NDIS operates in several regions which are located far from existing providers and workforces. These regions are categorised as remote or very remote, depending on classification systems that assess a combination of population size and distance factors. The NDIA is currently changing the classification system it uses from 'Remoteness Areas' (RA),[32] which ranges from category 1 to 5 by increasing remoteness, to the 'Modified Monash Model' (MM), which ranges from category 1 to 7 in the same way.[33]

'Remote' regions are those classified as 'MM 6' and are broadly comparable to RA – 4. Examples include the Central Highlands region in Queensland and Western NSW. 'Very remote' regions are those with the 'MM 7' classification and are broadly comparable to RA – 5. Examples of the most remote regions catered to by the NDIS include the unincorporated regions of far western NSW, the Central Desert region in the Northern Territory, and the Central Highlands region in Queensland.

The cost of service provision in remote and very remote areas is often higher than in other regions due to travel and other service delivery costs – for example, higher wages, higher accommodation and food costs, and higher staff turnover. To compensate providers for these costs, the NDIA applies loadings to prices of 25% in very remote areas and 20% in remote areas. These percentages are based on loadings developed by the Independent Hospital Pricing Authority (IPHA). Some providers stated that the remoteness loadings are inadequate in situations where air travel or long-distance road travel is required to serve isolated communities, or where local market infrastructure is limited.

In the absence of local supply, providers sometimes need to resort to fly-in, fly-out (FIFO) or drive-in, drive-out (DIDO) service models to reach isolated communities that may be located tens to hundreds of kilometres from the nearest town (e.g. Palm Island). Furthermore, the cost of running and maintaining off-road vehicles is very high. Providers have reported to the IPR

[32] Remoteness Area classifications are based on the Accessibility/Remoteness Index of Australia (ARIA) and the Australian Statistical Geography Standard (ASGS).

[33] See National Disability Insurance Agency: *Rural and Remote Strategy 2016 – 2019* (February 2016) for more detail on how the NDIA classifies areas according to remoteness.

team that they could spend up to $2,000 per vehicle per month for leasing (or depreciation) and operational costs. Due to the remote areas that they cater to, there are few opportunities for economies of scale and some providers maintain fleets with tens of vehicles. Many of these costs can be avoided if service delivery was instead conducted by more local workforces but this is difficult in the short term.

Many isolated communities are discrete Indigenous communities. In these communities, service provision must account for a range of cultural factors such as: gender matching for workforce and clients, family-based decision making, differences in conceptualisation of disability, and travel challenges for participants that may result in unexpected cancellations.

Providers indicated that catering to remote and very remote areas often requires an investment to build up foundational market infrastructure. For example, participants in the region might not yet have been identified by the NDIA, nor is there an understanding within the community of the value of disability support services. One provider consulted by the IPR team illustrated this issue with recent experience. The provider described a market in remote North Queensland with a population of approximately 1,000 people (60% of whom were of CALD background) where just one NDIS participant had been identified, even though a greater need for support existed. The provider worked with health care providers and the local community to identify a further dozen people in need of disability supports and facilitated their introduction to the NDIS. This provider has been able to introduce sustainable services in these regions but the market is unlikely to be large enough for two providers, and the provider is unlikely to be able to invest in developing other new markets without some support for the upfront investment that is required.

Recommendations

3: In very remote/isolated areas, the NDIA should work with other community services and providers to support local workforce development to deliver services in the most efficient way possible. In regions with limited local supply, allow providers to quote on cost of delivering NDIS services in the short term to ensure supply.

The challenges described above are not unique to the NDIS. Many other government services, such as health and education, have faced similar challenges in providing services to remote and very remote communities. While price is one lever that can help encourage supply, a more holistic approach is needed.

The NDIA should prioritise identifying areas and individuals that constitute either thin markets at risk of under-supply or underpenetrated markets with unmet demand. Analysis to identify these markets should leverage data on participant residences and support requirements, provider office locations and support offerings, and plan utilisation. Many of the isolated communities falling into this category will be discrete Indigenous communities (including ATSI participants) that will require a coordinated and culturally sensitive approach to service provision.

The NDIA should then work with other community services and providers to support local workforce development that increases the reliability and quality of care while driving down the cost of supply. This could include working with the Aboriginal Medical Services (AMS) to deliver services in predominantly Indigenous communities. Extending the reach of the AMS

may be preferable to new providers who have little experience working with Indigenous communities.

Whilst development of a local workforce is preferable, there will be some regions where this is not possible in the short term and where cost of service provision is high. In these areas, the NDIA should establish a quoting system by which providers can bid for supplying services to underserved areas. In some regions, it may be feasible to establish panels of providers to quote on service delivery, to streamline the procurement process. While the quoting method is bureaucratically more demanding, other policy options are unlikely to address the lack of supply in these areas. For example, adjustments to the price loadings for remote areas (20%) and very remote areas (25%) are unlikely to cater to the full spectrum of challenges that providers face. The variability in cost of service provision and the non-price challenges that must be overcome (e.g. engaging with local communities) require a coordinated effort from the NDIA, other mainstream services, and providers.

Implications

Participant outcomes and market development will be improved at lower cost if the NDIA successfully works with existing health service providers and communities to develop local capacity. However, this may not be able to be achieved immediately.

In the short term, establishing the operational capacity to manage a quoting process will be important. It is expected that higher prices are likely to result from this process in isolated areas, but given the small proportion of participants in these regions, Scheme expenditure will not increase significantly. This process is likely to lead to more sustainable coverage of these areas and improvement in participant outcomes, including ATSI communities.

4.2.2 Service provision in rural areas

Issues and evidence

Some of the challenges associated with service provision in remote/very remote areas are relevant to providers serving rural areas as well. While price loadings exist for MM 6 and MM 7 areas, providers serving individuals and communities in ‘outer regional’ or ‘rural’ areas, which correspond anecdotally to MM 4 and MM 5 areas, cite geographic spread and high travel costs as contributing to higher costs. As a result, it appears that some providers have terminated services to participants living more than a certain distance away from offices or have expressed plans to withdraw services from rural communities.

MM4 areas are defined as areas in Remoteness Area 2 (RA2) and Remoteness Area 3 (RA3), per the Australian Standard Geographical Classification, that are not in MM3, and are within 10 km road distance of a town with population between 5,000 and 15,000 people. MM5 areas are all other areas in RA2 and RA3. Provider travel times to and between participants in MM 4 and MM 5 areas exceed 20 minutes, the current limit on time that attendant care providers can charge for travel between participants, in a significant number of cases. Providers cite averages that are often closer to 30-45 minutes due to low participant density and geographic spread of rural farms and communities. In extreme cases, providers in rural areas take an hour to several hours to reach the site of support service provision. In practice, many providers absorb all travel costs, inclusive of the first 20 minutes of travel, due to a reluctance

to reduce service levels, as plans are often insufficient to cover travel times while still ensuring that clients receive necessary supports. Participants may also expect to be charged for and receive a full hour of service due to unclear communication and insufficient participant education.

Several providers have instituted policies that stipulate a radius outside of which they are no longer able to provide service. For example, upon transitioning to the NDIS, a provider in regional Victoria has chosen to no longer serve clients located more than 10 kilometres from its office, while a provider in regional New South Wales has chosen to only serve participants located within 30 minutes from an office. Travel costs often compound other challenges of rural service delivery including lack of appropriate facilities and extreme weather, and inefficient staff rostering. Some providers consulted by the IPR team expressed an intent to withdraw from such areas due to these location-specific costs of service. For example, a provider in Queensland identified that supports in the Charters Towers regions (MM 4) were financially unsustainable as it involved costs associated with servicing regional areas which were not adequately recognised by the current NDIS pricing arrangements. These difficulties are currently challenging to identify or diagnose, as travel expenses are not monitored as a separate line item in the NDIA payments system. It is instead included as a part of the care provided. There is therefore no ongoing record of providers' travel times.

It is important to note that as the Scheme matures, development of local workforces will help alleviate this problem. It is expected that participants in rural areas – in particular in MM4, which is defined as being within 10km of a town of 5,000-15,000 people – will be served by local providers. However, the IPR recognises that development of these local workforces takes time, and there needs to be a mechanism to ensure that participants in these areas are not disadvantaged in the short term, by compensating providers for costs incurred.

Recommendations

4: The NDIA should clearly define rural areas and lift travel allowance from 20 minutes to 45 minutes for providers serving a participant located in MM5 (or ARIA equivalent) and MM4 in the short term. Adjust participant plans to account for travel and track travel as a separate line item.

While the NDIA released a Rural and Remote Strategy in February 2016, some providers noted continued ambiguity over the official definition of 'rural'. Thus, 'rural' areas should first be formally defined with reference to a consistent geographical category. This classification could rely on either the Modified Monash Model (likely Levels 4 and 5), or on Remoteness Areas calculated with reference to the Accessibility/Remoteness Index of Australia (ARIA).

Once this definition is in place, adjustment to the provider travel policy would be the most direct and cost-effective way to support supply. To compensate providers for high travel times in rural areas, the NDIA should increase the 20-minute travel cap for providers of eligible supports, and should align this travel policy with that of therapy (see Section 4.6.4 for recommendations relating to travel for therapy supports). The IPR believes a travel cap of 45 minutes is more appropriate.

The IPR team recognises the risk that more generous compensation of travel costs may create an incentive for some providers to use travelling workforces rather than the more efficient model of building local workforces, which is a core aspiration for the NDIA. However,

workforce development in small towns of less than 15,000 people can often be challenging in the short term. Therefore, the IPR recommends that this change in policy be applied to participants in MM4 and MM5 in the near term, but changed in the medium term (3 to 4 years) to apply only to participants in MM5. A travel cap of 45 minutes is unlikely to cover all costs of travel to participants in MM5. Providers will need to look for opportunities to cluster participants and coordinate service provision to reduce travel times.

This policy does not remove the commercial incentive for participants to choose providers who are able to provide services without the additional expense of travel costs. As such, the IPR team believes this travel adjustment is an acceptable balancing of competing priorities In the medium term, the NDIA could explore mechanisms to reduce the incentive for providers to travel, such as planning processes that only allow providers to charge for travel where there are no local alternatives.

An alternative option would be to add a price loading to rural areas, as is done with remote and very remote areas. The Health system, via the General Practice Rural Incentives Program, and Aged Care system, via the viability supplement and home care subsidy rates, currently provide additional compensation for service in MM 4-5 areas. However, it is mainly travel driving the increased cost of service to participants in rural areas. More than doubling the travel time allowed to be claimed by providers would provide a more targeted and effective intervention than a broad price loading, which does not account for the specific amount of travel a provider undertakes.

Travel should be tracked as a separate line item in NDIA payment data. This will allow the NDIA to monitor travel costs and better understand how providers and participants are allocating the costs of travel. Such monitoring will also allow the NDIA to understand whether more generous travel pricing provides a perverse incentive for providers to travel long distances rather than invest in local workforce development, or to encourage participants to attend the provider premises. This monitoring and better understanding of travel behaviour might then pave the way for the deregulation of travel costs. Removing travel caps to allow complete fungibility of travel versus direct service funding would enable providers to charge for any amount of travel (subject to agreement with participants), affording participants maximum choice and control and requiring providers to reduce travel costs to remain competitive. In some areas with high participant density and sufficient supply, travel deregulation may be appropriate provided participants can make informed choices between providers located at varying distances from their residence. Participants, planners, and LACs would require education to understand the availability of supply for each participant as well as the outcome implications of trading off travel and direct service. The NDIA should maintain travel caps in the near term, including an expanded cap for travel in rural areas, with the option of exploring travel deregulation as the NDIS matures.

Service provision in rural areas can also be affected by restrictions on the ability of participants to transport themselves to and from support services. This was an issue highlighted by providers during the IPR team’s consultation process (see Section 2). However, this issue is beyond the remit of the IPR. The NDIA could work with LACs, planners as well as the states and other local authorities to understand if a participant has public transport available to them and the capability to utilise the service. The IPR team recognises that solutions to transport will have implications for the adequacy of supply and support access in remote and rural areas.

Implications

The short-term implications of this change in travel policy for Scheme expenditure is difficult to estimate with precision as the NDIA does not currently track travel as a separate item. For instance, a provider who charges for an hour of service provision may have had no travel, or have used the full travel entitlement of 20 minutes and provided 40 minutes of care.

The IPR has made a number of assumptions to estimate potential costs, based on available information. Assuming a quarter of the participants who receive supports in regional areas (MM 4 and MM 5) are now provided services which attract additional travel entitlements, and that 45 minutes of travel is charged for approximately every four hours of support provided, the additional annual cost to the NDIS would be approximately $75 million.

Increasing the amount of travel time providers can charge will require planning process adjustments. Participants living in rural areas who require providers to travel to them, and who can only be served by providers requiring more than 20 minutes travel, should be given proportionally larger plan allocations to account for the cost of travel within these areas. As with other changes to price caps which affect how plans are constructed, participant education initiatives and additional coordination of support should be offered in parallel, to ensure that participants are able to factor in provider travel times when exercising choice and control.

As the Scheme matures and local workforces develop, the NDIA should review this policy and assess whether other incentives may be more appropriate to encourage local supply and reduce the incentive for providers to travel long distances to deliver supports.

4.2.3 Single national price

Issues and evidence

The NDIA currently has two different price guides, with typically lower prices in Eastern states (NSW, VIC, QLD, TAS) and higher prices in Western states (ACT, NT, SA, WA). For example, the price for ‘assistance with self-care activities during daytime weekdays’ differs by 1.8% between the two guides. In the ACT, NT, South Australia or Western Australia, providers can charge $45.54, while in the remaining states the cap is $44.72. The differences between other prices range from 0-12%. For example, higher intensity group care on Sundays is capped at $57.18 in ACT and the western states and territories, while it is capped at $52.84 in the other states.

There is no clear rationale for maintaining separate price guides. Current disparity between the Eastern and Western price guides appears to be based largely on legacy arrangements between jurisdictions, rather than on a direct correlation with regional costs. Whilst there is currently some minor variation in labour costs between states, it is not correlated to the division of price guides. Analysis of labour costs other than award wages, such as payroll tax, leave entitlements and workers compensation requirements, does not show a consistent difference between the eastern states and western states.[34]

[34] See Appendix C for more details on differences in award rates between States and analysis of other cost differences.

Recommendations

5: The NDIA should converge the two Price Guides and move toward a single national price guide by 2021.

In the absence of stronger justification for differentiated price guides across states, the NDIA should progressively converge prices to promote pricing simplicity, ease of communication, and systems efficiency for providers operating across multiple states. This price convergence should occur by 2021.

It is the IPR team's view that the NDIA should not attempt to capture the price differences between each state through tailored state-specific price guides, as this is likely to lead to significant pricing complexity and may also fracture a national market. Cost differences within states, driven for example by remoteness of a region, are more important factors, and these are accounted for through specific policies (see Sections 4.2.1 and 4.2.2 above).

Implications

Transition to a single national price guide will need to occur over the next three years. This can be done by adjusting the relative rates of annual inflation between the eastern and western price guides such that the two price guides converge over time. Once implemented, providers operating nationally will benefit from the simplicity of one national price guide.

4.3 PRICING OF ONE-TO-ONE SERVICES WITH DIFFERENT LEVELS OF COMPLEXITY

The NDIA recognises participants entering the NDIS will have a range of disability types, levels of functional impairment, and requirements of a support worker to meet their needs. A two-tiered pricing structure is in place to allow a high intensity rate to be charged by a provider. The high intensity rate is set at 5.5% higher than the standard rate, applicable where a participant's complex needs require assistance from a support worker with a higher skill level. Support workers serving participants with complex needs are sometimes exposed to a higher level of safety risk, which can be to a participant or to themselves, and the higher skill levels and pay rates ensure the support worker is fit to provide quality services to participants in these environments. Examples of environments with greater safety risk could include a support worker serving a participant with medical needs where health-related intervention is a core component of service delivery, or serving a participant with behaviours of concern that could result in the participant attempting to self-harm or harm the support worker.

The key concerns raised by providers related to the quantum of the high intensity loading being insufficient to cover the cost of employing a higher skilled worker, and the loading not accounting for the additional time required to service participants with complex needs, including team meetings, report writing, training, and more frequent incident management. Additional concerns included the inconsistent application of high intensity loading across Core Support Items in the Price Guide. Examples include centre-based care having no high intensity rate, and not allowing for increased carer ratios, and the inconsistent allocation of the high intensity loading across participants. Currently, responsibility falls on a provider to agree with a participant that a high intensity loading is necessary for them to receive the level of care that will help them achieve their desired outcomes.

This section covers the following topics:

- 4.3.1 Definition of complexity and quantum of the high intensity rate
- 4.3.2 Participants with extreme behaviours of concern
- 4.3.3 Consistency of pricing for participants with complex needs across core supports

4.3.1 Definition of complexity and quantum of the high intensity rate

Issues and evidence

There is no simple definition communicated to the sector of what complexity means in a pricing context, and as a result, the term complexity is used inconsistently. Providers link complexity to the ratio of care a participant requires i.e. the number of carers, the number of hours of care a participant has allowance for in their plans, also referred to as 'intensity of care', and more subjectively, to how difficult a provider believes it is to serve a participant. There are cohorts of participants that require support workers with specific skillsets above the level of a typical support worker, which cost providers more to employ. Providers are not consistently receiving a high intensity loading to serve these participants due to the lack of clarity in the definition of complexity. The link between a participant's needs, the cost drivers of a provider, and price is not clear, which leads to inconsistent application of the high intensity price loading. The policy placing the responsibility on providers to determine whether a participant should be charged a high intensity rate exacerbates the issue, as providers each have their own definition of complexity.

Provider submissions to the IPR showed that many providers employ support workers serving participants without complex needs between SCHADS Level 2.2 to Level 2.4. This is consistent with NDIA expectations and the responsibilities outlined in the Award for a Social and Community Services Employee Level 2.[35] To serve participants with complex needs, providers often employ support workers at a base wage level between a SCHADS 2.4 and 3.3 to match the workers increased level of skill and experience. There is evidence of some providers employing workers up to and above SCHADS Level 4. For participants classified as having complex needs because of a medical condition, additional skills of a support worker can include the ability to recognise the need for health-related intervention, and administer medication by injection, or feeding through a nasogastric tube. For participants classified as having complex needs because of behaviours of concern, additional skills of a support worker can include the ability to recognise symptoms or presentations of mental illness and intervene to de-escalate violent behaviours. To serve participants with complex needs resulting from medical or behavioural presentations, support workers are required to exercise judgement based on prior knowledge and experience to determine the course of action necessary to

[35] The Award states the responsibilities of a Level 2 employee are: *'(k) implementing client skills and activities programmes under limited supervision either individually or as part of a team as part of the delivery of disability services'* and *'(l) supervising or providing a wide range of personal care services to residents under limited supervision either individually or as part of a team as part of the delivery of disability services'.* The Fair Work Commission: *Social, Community, Healthcare and Disability Services Industry Award 2010 (updated 29 July 2017), p. 52*

address the situation. These attributes closely align to the characteristics necessary of a Level 3 employee.[36]

The high intensity loading of 5.5% is intended to provide additional funds where a participant requires assistance from a support worker with additional skills or experience relevant to a participant's complex needs. The loading provides enough funding to allow an employer to pay a support worker between a SCHADS 2.4 and 3.1, which is at the lower end of the wage level currently being paid by providers, assuming a base level of SCHADS 2.3, which is consistent with the rate paid by many providers for participants without complex needs. This could be adequate in some situations such as feeding through a nasogastric tube in a standard environment. However, where a participant has very serious behaviours of concern, or a combination of medical needs and behaviours of concern, a worker with a higher level of skill may be required.

Many providers raised concerns about the high intensity loading not taking into consideration the incremental ongoing training and development requirements for support workers serving complex participants. Submissions to the IPR indicated providers are conducting approximately 3-4 hours of additional training for these support workers each quarter. These training sessions often bring together groups of support workers and other professionals to discuss individual client situations and techniques that have been used or developed to deliver improved outcomes. As the sessions are often internal, the costs incurred by providers are for support worker time, with no opportunity to recover the cost for the delivery of the training.

Providers serving participants with complex needs reported that they spend more time on incident management and reporting than other providers, due to the nature of the disabilities of the participants cohorts they serve. One small provider estimated spending over 200 hours per year on incident management, with an average of one incident per fortnight, and each incident requiring a review, report, care team meetings, and a response plan. This was estimated to have up to a 2-3% impact on the provider's overall margin. While not all incidents are avoidable, providers are expected to have effective internal processes to prevent and respond to incidents.

[36] The Award states the characteristics of a Level 3 employee include: *'General features of this level involve solving problems of limited difficulty using knowledge, judgment and work organisational skills acquired through qualifications and/or previous work experience. Assistance is available from senior employees. Employees may receive instruction on the broader aspects of the work. In addition, employees may provide assistance to lower classified employees.'* The Fair Work Commission: *Social, Community, Healthcare and Disability Services Industry Award 2010 (updated 29 July 2017)*, *p. 54*

Recommendations

6: The NDIA should develop a definition for complexity linked to the skills required to meet participant's needs, and use its specialised planning resources to classify what skills are required, and which participants require higher skilled support workers.

The NDIA should develop a definition for what complexity means in a pricing context and communicate it to the sector. The definition must create a clear link between a participant's needs and the cost drivers for a provider, that can be translated into price. To serve participants with complex needs, providers employ support workers with additional skills and experience, and are required to compensate them with a higher base wage level. The increased cost of employing these support workers should be translated into the price. The NDIA can leverage most of the existing definition for high intensity supports in the Price Guide, but the focus should be on skill level rather than on qualifications, as in some cases additional qualifications may not develop the specific skills necessary to serve a participant's complex needs.

This revised definition should include a clear link between a participant and their needs, and the relevant and most significant cost driver of a provider being support worker wages. Examples of participants that would be defined as complex in a pricing context include participants that exhibit rapid, severe and frequent escalation of violent or self-harm behaviour, including some participants in the psychosocial and cognitive disability participant cohorts, and participants that require health-related intervention as part of ongoing support. In both situations, participants may require a support worker with additional skills to serve them. The skill level required to service a participant increases with the severity of a participant's complex needs, and there should be different tiers of pricing to match the different levels of skills needed.

The NDIA should use the specialist team of planners it is developing as part of the Participant Pathway project to develop a set of criteria to determine whether a participant's requirements are complex for the purposes of pricing. The objective of the criteria should be to determine whether a participant requires a higher skilled or qualified support worker for their needs.

The NDIA should assign the responsibility of classifying participants with complex needs for the purposes of pricing to the specialist planning team. Planners have visibility into participant records and complexity classifications throughout the participant pathway (see Appendix D – Existing definitions of complexity that exist within the NDIA), and under the revised pathway should have face to face interactions with participants to understand their needs and goals. Each of these sources of information should allow a planner to determine if a participant requires a support worker with additional skills or experience, and hence a price loading.

As the specialist team builds capability, it should develop and refine the service models used for participants with complex needs, both health and behaviour related, to make sure participants receive plans that meet their needs and deliver the best possible outcomes. It may be difficult for the planning team to build expertise quickly, and in the short-term the NDIA should consider leveraging industry experts for support until the team is able to manage most of the cases in-house. The team could continue to reach out to outside experts for advice in very difficult cases which are outside its area of expertise.

7: The NDIA should add an additional tier to the high intensity loading to allow a provider to recover the cost of a support worker with a higher level of skill than can be procured with the current high intensity loading.

The current loading may be sufficient to employ a higher skilled support worker for some complex needs, such as health-related intervention in a standard environment. However, it may be less suitable for situations where a participant has serious behaviours of concern, or a combination of medical needs and behaviours of concern. A third tier classification of 'Very Complex', should allow a provider to employ a mix of support workers at SCHADS Level 3.1 or Level 3.2. The loading should also take into consideration the incremental ongoing training and development necessary for support workers serving very complex participants estimated at 1%. The specialist planning team should be responsible for assessing and classifying participants considered to be Very Complex. The IPR team recognises that there is a small number of participants for whom it is very difficult develop prices due to the nature of their disabilities and the environments necessary to deliver their services, and believe a quoting process is the most appropriate mechanism to ensure they receive the supports required to meet their needs (see Section 4.3.2). TABLE 3 describes the characteristics of participants that would be classified as Standard, Complex, Very Complex, and Quoted.

Incidents are more likely to occur for providers serving participants with complex needs. Providers incur costs associated with incidents such as the time spent on team briefing meetings and incident report writing. Providers are expected to have effective internal processes to prevent and respond to incidents, but it is recognised that not all incidents are avoidable.

The introduction of the NDIS Quality and Safeguarding Framework will have some implications for providers on the scope of incident reporting requirements. Given the operational implications of this are not yet known, the IPR recommends that the NDIA revisits this recommendation in the future to evaluate if providers need to be compensated for the costs of incident reporting – for example by introducing an incident reporting line item in the Price Guide to allow for providers to charge for time spent on this activity.

TABLE 3: DESCRIPTION OF PROPOSED LEVELS FOR PARTICIPANTS WITH COMPLEX NEEDS

Classification	Participant characteristics
Standard (no price loading)	■ No health-related intervention needs (e.g. feeding through a nasogastric tube, ventilation support) ■ None or mild behaviours of concern
Complex (5.5% price loading)	■ Health-related intervention needs (e.g. feeding through a nasogastric tube, ventilation support) ■ Mild-moderate behaviours of concern (e.g. infrequent rapid escalation of challenging behaviour)
Very Complex (10% price loading)	■ Combination of health-related intervention needs and mild-moderate behaviours of concern ■ Severe behaviours of concern (e.g. rapid, severe and frequent escalation of challenging behaviour)
Quoted	■ Extreme behaviours of concern – see Section 4.3.2 for further details

Implications

The NDIA has commenced work to establish specialist planning teams as they develop the new participant pathway. The specialist team will need to be trained to categorise participants with complex needs as informed by the tool/set of criteria defined by the NDIA. It is important that the team monitors the outcomes of their categorisations to help improve accuracy and consistency over time.

An improved definition of complexity and allocation process will ensure providers are able to charge a higher rate to participants that require a higher skilled support worker. This will allow providers to recover the increased cost of direct supports required to service the complex participant cohort. It will be important to engage with the relevant segments of the sector, both participant and provider representatives, when developing the final set of characteristics to be used during the complexity classification. This will limit the number of times providers request the NDIA to review participant categorisations. In a situation where a provider challenges a participant's categorisation, a process needs to be put in place to allow individual cases to quickly be reviewed by the NDIA if a provider can provide evidence to show the categorisation is not correct. It should be noted that it is possible some participants are currently being charged the high intensity rate that would not apply under a new definition. To reduce the financial impact on providers, the definition should be phased in for participants already in the NDIS as their plans come up for review.

The expected cost of the additional tier of price loading for participants with complex needs is between $100m-$140m, which represents 0.5%-0.7% of costs at Full Scheme[37]. The IPR team expects the costs to be at the lower end of the range, as the improved definition and classification process for participants with complex needs will limit the number of participants that receive the price loading to only those that require a support worker with additional skills. It is possible the price increase could be absorbed by the utilisation levels within participant budgets, meaning there could be no impact on the funding envelope. The suggested approach is to fix each of the definition and classification issues related to complexity before adjusting the price. This will ensure price loadings are only applied to participants considered to have complex needs under the improved definition of complexity.

4.3.2 Participants with extreme behaviours of concern

Issues and evidence

Participants with extreme behaviours of concern include participants that are subject to orders under the justice system, also referred to as forensic disability participants, and previous offenders no longer subject to orders. Participants with extreme behaviours of concern are not explicitly recognised in NDIS pricing. Forensic disability participants are typically individuals with cognitive impairments that have committed criminal offences in the past, but are unable to be institutionalised due to their condition. They often fall at the extreme end of the spectrum of behaviours of concern. Providers have historically served this participant cohort with a very

[37] Based on 12% of participants qualifying for the complex level (a 6% loading) and 10% of participants qualifying for the very complex level (a 10% loading), with a margin of error of +/- $20m, and assuming all participant plans are adjusted to compensate for the change in policy

skilled workforce, such as tertiary educated support workers, and it is not possible for them to recover costs at the high intensity rate set in the Price Guide.

There is legislation in place that details the responsibilities of the NDIS to participants that have been offenders under the criminal justice system. The NDIS (Supports for Participants) Rules 2013, made for the purposes of Sections 33 and 34 of the National Disability Insurance Scheme Act 2013, outline that forensic disability services are to be funded and delivered as part of the NDIS.[38] Services to be provided to this participant cohort are legislated under a number of state-based Acts related to the nature of the offence and disability of the participant.[39] A provider requires extensive knowledge of the legislative environment to deliver services to this participant cohort, who often need intensive supports and services, delivered by very skilled and experienced professionals. As the services necessary for a participant can vary significantly from one circumstance to another, it is very difficult for the NDIA to develop pricing schedules and plans that meet the needs of participants while also adhering to state-specific legislation.

Providers serving forensic disability participants, often referred to as forensic providers, are exposed to increased risk compared to providers focused on other participant cohorts. NDIA policy does not allow providers to deliver all support items from the Support Coordination support category, to mitigate the risk of a conflict of interest. There are cases of forensic service providers pulling out of Support Coordination or refusing to provide the services to participants not in their care to minimise risk, where they are not in full control of a participants care. This puts the specific sub-market at risk of supply shortages.

The NDIA has put rules in place for the Support Coordination support category to mitigate the risk of conflicts of interest, specifically for Local Area Coordinators (LACs), which are included in the NDIS Partners in the Community Program: Program Guidelines (August 2016).[40] There are three Support Items within the Support Coordination support category relevant to the discussion: Support Connection, Coordination of Supports, and Specialist Support Coordination. Participants that are classified as Supported or General during the pre-planning phase, meaning it is easier for the planning team to engage with a participant throughout the participant pathway, receive Support Connection. Support Connection is delivered by LACs, and it is not possible for LACs to deliver Support Connection and provide services to the participant. Participants classified as Intensive or Super Intensive during the pre-planning phase, meaning it is more difficult to engage with a participant throughout the participant

[38] Section 7.23 explains the meaning of a person not in custody: '*person not in custody means a person who is subject to the justice system (including relevant elements of the civil justice system), but is not in a custodial setting (for example, a person on bail, a person under a community based order that places controls on the person to manage risks to the individual or to the community, a former prisoner on parole, or a person in home detention)'*. Section 7.24 goes on to explain the NDIS responsibilities for a person not in custody *'The NDIS will be responsible for: (a) in relation to a person not in custody –reasonable and necessary supports on the same basis as all other persons'. National Disability Insurance Scheme Act 2013* (the Act): *National Disability Insurance Scheme (Supports for Participants) Rules 2013, Section 7.23 and 7.24, p. 20*

[39] In Victoria, this can include Supervision Orders under the Serious Sex Offender and Detention Supervision Act 2009 and the Crimes (Mental Impairment and Unfitness to be Tried) Act 1997, Parole Orders (and Bail Conditions) under the Crimes Act 1958 and Corrections Act 1986, and Community Treatment Orders under the Mental Health Act (2014).

[40] Section 4.1.1.3 states 'An Applicant which applies to deliver LAC Services, must not be a Registered Provider of Supports as defined under section 9 of the NDIS Act'. NDIA: NDIS Partners in the Community (Round One) – Program Guidelines, Section 4, p. 9

pathway, receive Coordination of Supports and/or Specialist Support Coordination. These Support Items are delivered by providers, not by LACs. It is possible for a provider to deliver Coordination of Supports and/or Specialist Support Coordination and be a participant's service provider, but the provider must ensure they proactively manage conflicts of interest, as per the Terms of Business for Registered Providers (July 2016).[41]

The NDIA is currently addressing cases of participants with extreme behaviours of concern out of their regional offices, and providers have communicated that in some cases they have been allowed to develop quotes to deliver services to this participant cohort. However, there are examples of providers being advised that they need to follow the Price Guide, and price according to the high intensity rate. There is not yet a consistent approach for addressing the needs of this participant cohort.

Recommendations

8: The NDIA should develop a consistent process for participants with extreme behaviours of concern that acknowledges the specialised needs of the participant cohort, and the environment providers operate in. Providers serving this cohort should quote on the delivery of services to these participants, and be allowed to deliver all services they require to be adequately supported i.e. all Support Coordination items.

The quotes, which would include a detailed support plan for a participant, would be submitted directly to the specialist planning team (see Section 4.3.1) for review and approval. A quoting mechanism will be most effective for this participant cohort given that the number of participants in this cohort is very small, the number of providers servicing the participant cohort is also very small, effectively making it a thin market, and the services necessary to support participants will vary significantly from one individual to another.

Allowing providers to deliver all Support Coordination services will ensure individuals in this participant cohort receive the services they require to be adequately supported, and help to eliminate the risk of supply shortages leading to participants not being able to procure services. Detailed reviews of the quotes submitted to the specialist planning team to ensure participants are only receiving the supports required to meet their needs can help the NDIA protect against conflicts of interest.

Implications

The NDIA will need to set up a quoting process to allow providers to submit quotes for review and approval. For the NDIA to review and approve quotes, the capability of the specialist planning team needs to be place with a clear understanding of the needs of the forensic disability participant cohort as well as of the legislative environment in which forensic service providers operate. To speed up the quoting process and ensure forensic disability participants can move into a care environment as quickly as possible, the NDIA may identify a list of preferred providers in each state that can be contacted at short notice.

[41] The Terms state *'Registered Providers must ensure that they proactively manage perceived and actual conflicts of interest, including through development and maintenance of organisational policies'* NDIA: *Terms of Business for Registered Providers (effective 18 April 2016)*, p. 3

From a participant perspective, allowing forensic service providers to deliver all supports to them could be considered as a conflict that limits choice and control. Considering the legislative environment providers operate in, it is unlikely a participant will receive a range of services from multiple providers. It is a better outcome for the participants to have the services available to them than not at all due to providers not wanting to take on additional risk.

4.3.3 Consistency of pricing for participants with complex needs across core supports

Issues and evidence

There are inconsistencies with the application of high intensity loadings and care ratios across different core supports. Support items including 'Assistance with self-care activities' and 'Assistance to access community, social/recreational activities' allow providers to charge a high intensity loading where assistance is required from a support worker with additional skills or experience relevant to the participant's complex needs. The support items also allow providers to charge different prices dependent on the care ratio necessary to support a participant. This can either be a lower care ratio, such as 1:2 or 1:3, where a single support worker can service multiple participants at the same time, or higher care ratio, such as 2:1 or 3:1, where multiple support workers are required to serve a single participant.

The support item 'Group based activities in a centre', does not allow providers to charge a high intensity loading, meaning providers cannot be compensated for the additional cost they incur for a highly skilled support worker if a participant with complex needs chooses to utilise the service. This support item is also set at a price between the 1:2 and 1:3 care ratio for Assistance with self-care activities and Assistance to access community, social/recreational activities, and does not provide the flexibility to providers to either increase or decrease the price based on the number of participants in the group.

Recommendations

9: The NDIA should update the pricing structure for the core support item 'Group based activities in a centre', to allow providers to charge a high intensity loading where a more skilled worker is required to serve a participant, and set prices consistent with the care ratio required to serve a participant.

The NDIA should ensure pricing for 'Group based activities in a centre' adopts the same approach used for other core supports, including Support Items 'Assistance with self-care activities' and 'Assistance to access community, social/recreational activities'. This recommendation is not designed to encourage a participant to lead a life with a high intensity of support. Rather, it is expected that as the Scheme matures and evidence develops, providers and the NDIA will be able to assess which interventions are most effective in supporting participants with complex behaviours and needs to achieve improved outcomes and, in some cases, no longer require high intensity support.

Implications

Participants with complex needs utilising 'Group based activities in a centre' will be required to pay a higher price for the service. They will need to choose whether they would like to

continue utilising the services at the higher price, or if their funding can be used more effectively with a different mix of services.

4.4 PRICING OF SHORT TERM ACCOMMODATION SERVICES

The NDIA recognises participants may at times have periods where their support arrangements need to be different from the regular level of support they receive. Short-term accommodation (STA), also known as Respite, is a Core Support available to participants to provide third-party care in a group based facility or in-home support. The service is often used by participants whose regular support is delivered at home by family members, allowing family members the opportunity to have some time off from being the primary care giver. It also gives participants the opportunity to socialise with peers in a safe environment.

At the time of the provider consultation phase of the IPR, a flat price of $501.71/day[42] was in place for STA, and most concerns by providers related to the lack of price differentiation. The key concern voiced by providers was that a single price for the STA support item did not reflect variations in the cost of service delivery by the day of the week, or by the care ratio necessary to serve a participant. Providers also raised the issue that there was no allowance in the price to compensate them for the capital invested in the facilities. After the completion of the consultation phase of the IPR, the NDIA announced price changes effective 30 October 2017 to address issues related to the STA price.

Issues and evidence

Under a single price point, many providers found it difficult to operate economically on weekends and public holidays, when they were required to pay penalty rates to support workers, and when participants required higher care ratios such as one-on-one support. As a result, providers began to withdraw services from the market, either by closing their facilities on specific days of the week, by no longer providing services to participants that required high care ratios, or by shutting down their short-term accommodation services completely. Recently, this issue became acute in the ACT, where providers Duo and Carers ACT closed their short-term accommodation services, and Marymead, the only other provider, signalled they were going to follow, having already restricted services to participants that required low care ratios on specific days of the week that did not involve substantially higher labour costs.

The NDIA responded to the market reaction and revised the price of STA, releasing a new price schedule, effective 30 October 2017. The NDIA adjusted the price, basing it on the price of attendant care, to better reflect the variable costs of service delivery on different days of the week and at different care ratios for participants, and capital employed in facilities. The revised pricing schedule includes differentiated prices for weekdays, weekends, and public holidays, as well as for care ratios of 1:4, 1:2, and 1:1 support needs. Each of the prices also includes a capital allowance. The NDIA has established a process for participants who are fully utilising their plans to review participant budgets and ensure participants are not disadvantaged by the price increases.

[42] NDIA: *2017/18 NDIS Price Guide VIC-NSW-QLD-TAS (version release date July 2017)*, p. 40

Recommendations

10: The NDIA should continue to refine the assumptions for high intensity rates, active overnight, and capital allowances used to develop the new STA price schedule, to ensure they reflect the cost of service delivery.

The IPR team agrees with the approach used by the NDIA to develop a differentiated price schedule based on the price of attendant care, that is more reflective of the cost of service delivery for providers. Assumptions around provider operating models have been used to develop the new pricing schedule, and the NDIA should continue to refine each of these to reflect an efficient provider's costs.

The NDIA has applied the high intensity loading to each care ratio to build up the new STA pricing schedule. This high intensity loading should only be used where a participant requires assistance from a support worker with additional skills or experience relevant to the participant's complex needs. Participants with complex needs are less likely to be served under low care ratios. The NDIA should consider using the standard intensity rate for lower care ratios (1:4 and 1:2), and in those special cases have two prices for a 1:1 care ratio, one price based on the standard rate (for participants with high physical disabilities) and one price based on the high intensity rate for participants with complex needs.

For each care ratio, the assumption made in the price is that the support worker will be required to work 8 hours of an active overnight shift, meaning the support worker is required to be awake and active throughout the night. Provider consultation raised the point that this should only be necessary in extreme cases, and it would be reasonable to assume that for participants without complex needs, a support worker works a night-time sleepover shift, with up to two hours of active overnight hours to allow for disruptions during the night. The NDIA should consider using an overnight shift with up to two hours of active overnight for low care ratios, and an active overnight shift only when a high care ratio is required for a participant with highly complex behavioural needs.

An accommodation allowance of $200 per night has been included to cover board and meals throughout the new pricing schedule. The $200 figure is the average cost of i) accommodation costs for a day of respite in aged care facilities ($140), based on rates set by the Australian Government for My Aged Care, and ii) accommodation costs for a day in acute care or a hospital setting ($260), as sourced from the Independent Hospital Pricing Authority (IHPA). The NDIA should continue to refine the capital allowance by reviewing the operating costs of providers. A review of the financials of providers that made submissions related to STA indicated accommodation and other overhead costs could be below $100 per day. This is from a small sample of providers, but it indicates that the operating costs are much less comparable to hospitals, and the aged care comparison of $140 per day could be a more reasonable assumption.

4.5 THIN AND UNDERSUPPLIED MARKETS

A 'thin' or 'undersupplied' market is one in which there is a persistently low level of supply relative to demand. This is often due to structural features of the market that makes it expensive or difficult for providers to compete effectively. Thin markets are a key policy concern for the NDIS as the presence of thin and undersupplied markets can compromise participant outcomes in that region.

While price caps may have an impact on thin and undersupplied markets, other policy considerations can often be more important. Once a market has been assessed as thin or undersupplied, increasing prices can be a way to attract new suppliers and investment. However, some structural features cannot be overcome by price alone. This includes when the suppliers do not have the capacity to cater to some specialised markets, or when the market has structural features such as geographical isolation which make it difficult for providers to operate in these areas.

The NDIA should bolster its market evaluation framework to identify thin markets before they develop, invest in market development infrastructure, and make pricing changes where necessary.

Section 4.5 covers the following topics:

- 4.5.1 Process to identify thin and undersupplied markets
- 4.5.2 Addressing emerging thin and undersupplied markets

4.5.1 Process to identify thin and undersupplied markets

Issues and evidence

The NDIS is too young and the available data too incomplete to make a definitive assessment of whether certain markets are at risk of being thin or undersupplied. The NDIS has only been in operation for more than 12 months in a few geographic regions. 79% of supports committed in the latest financial year were in NSW, ACT and Victoria, with the NDIS yet to be rolled out in much of Queensland, Tasmania and the western states and territories. NDIS expenditure on support services in FY 2016/17 was 15% of the projected annual expenditure by 2021. Not only is the NDIS in its early stage, there are also some limitations to the current data on market supply. For example, comprehensive surveys of participants and providers are limited to the trial sites or have only just been initiated in other parts of the Scheme. More discussion of this evidence is presented in Section 3.1 – Market Development. It is too early to form definitive assessments about which markets are likely to emerge as thin or undersupplied, as any evidence of supply gaps may be a product of temporary transitional pressures, or reflect gaps in data collection.

The NDIA is currently designing a market analysis and intervention strategy to identify thin and undersupplied markets. It is also developing a strategy to maintain critical supports which will support its efforts to identify short-term responses to supply gaps. These strategies are yet to be finalised and implemented. The NDIA does not currently have a framework with clearly identified metrics and data sources to ensure that its monitoring strategies are more comprehensive and transparent.

Recommendations

11: As part of its market intervention strategy, the NDIA should adopt a clear set of metrics to more comprehensively identify and respond to risks of thin markets emerging.

The NDIA should include a clear set of metrics and data sources within a robust evaluation framework to test markets for potential undersupply. The IPR team recommended above the

adoption of a clear and robust market evaluation and decision-making process to set appropriate price levels (see Section 4.1.1). The foundation of this process is a comprehensive understanding of market indicators to understand whether there is sufficient supply in each Scheme market. The following section identifies the key metrics that the NDIA should monitor, the data sources it can rely on, and the teams within the NDIA that should have responsibility for collection and analysis of these metrics.

The IPR team recognises that no single set of Scheme-wide indicators can offer a definitive answer on whether supply challenges are likely to occur in each rapidly changing market. Therefore, the focus of the monitoring framework should be on identifying the markets that most warrant further investigation. The NDIA should err on the side of caution when identifying thin markets. Identifying the markets 'most at risk', rather than whether they are currently undersupplied or not, will position the NDIA well to respond to emerging supply challenges.

Participant survey data

The NDIA should have a regularly updated awareness of the share of participants who are unable to access supports for which they have a budgeted plan, and the share of participants who are satisfied with the quality of supports to which they have access. This can be constructed through a participant survey, as well as by accessing informal information flows from LACs and planners. As NDIS-wide participant surveys may be more difficult to update continuously, the NDIA can target participant surveys in markets that demonstrate other indicators of supply shortages.

The NDIA currently conducts a regular participant survey through its Short-form Outcomes Framework assessment. The NDIA should include in this survey a question as to whether participants were able to access supports for which they had funding, and if not, if this was due to a lack of available providers. The NDIA currently reports on the share of participants who identified having difficulty in accessing health services, but this question is not specific to either NDIS-supported services or difficulty caused by a lack of adequate supply. The NDIA should also collate instances of participants contacting their LACs to report an inability to find providers. The results of these queries should be included by the Provider, Markets and Sector development team in its regular assessment of markets and reported to senior management.

Provider intent

Understanding whether providers intend to expand services to a new market, continue in current markets, or withdraw from the markets in which they provide support services, is a good leading indicator of the adequacy of supply in the future. The NDIA can monitor this intent through provider surveys and regular consultation with providers. Where indications exist of provider exit, more thorough consultation should be conducted to inform the NDIA's understanding of provider economics, participant demand, and Scheme performance in that area. This will inform whether the prices in that market should be changed, including through interim pricing adjustments.

The provider benchmarking initiative currently being developed by the NDIA will give some indirect indication of provider economics and intent.[43] The NDIA also manages relationships with providers through its regional offices and LAC network. However, standardised and regular reporting of provider intent should be part of its permanent market monitoring framework.

Utilisation rate

The utilisation rate is the share of a participant's budgeted plan that has been used to purchase services. It is calculated annually and, since services provided in one year may not be claimed for reimbursement until some months later, updated retrospectively. If a participant were unable to find providers of sufficient quality to meet their needs as specified in their plan, it would be reflected in the utilisation rate, and could signpost a lack of appropriate supply in that market.

Utilisation rates should be used by comparing changes in relative levels to overcome some of the metric's shortfalls. Absolute levels of utilisation rates are less informative because they may be affected by many factors other than supply. The most important of these is the content of the plans themselves; a utilisation rate might appear high simply because the plans catered for inadequate supports in the first place. Similarly, plans that provide for more services than required in a support category may appear underutilised, even though the participants are accessing all the high-quality support they require. Some plan managers who were consulted by the IPR team reported that their participants sometimes had spare allocations for capital equipment in case some of it was damaged and needed to be replaced. Such items are only intended to be used infrequently and could account for low utilisation rates in some support markets.

Despite these alternate explanations for any given level of a utilisation rate, observing the relative rates across markets, and the change in rates over time, will give some indication of which markets may be experiencing supply shortfalls.

The Scheme Actuary currently collects and shares utilisation data quarterly. The IPR team proposes the Provider, Markets and Sector development team should identify quarterly markets in the Scheme with low levels of relative utilisation using more tailored samples of participant utilisation rates, e.g. support type by geography, or a subset of participant characteristics within a geography. Markets with utilisation rates that are persistently lower than other markets can be investigated using surveys and interviews, through working with LACs, regional offices, participants and providers in that market.

Rates of market entry and exit

Rates of market entry and exit are a basic measure of the willingness of providers to supply disability support services in the NDIS at existing price levels. A combination of registration and payment data can help inform this measure. Registration data indicates instances where firms enter or exit the NDIS, but a provider can register while not actively providing supports and stop providing supports without deregistering. Analysis of payment data to identify provider activity offers the most direct observation of market supply. It is recognised that provider entry and exit rates will be affected by many commercial (and other) factors that are

[43] National Disability Insurance Agency: *Overview of benchmarking project,* available at https://www.ndis.gov.au/providers/market-information-useful-links/benchmarking-Project-Overview

not a result of just the price level. However, significant variations in provider entry or exit rates in some markets should serve as a trigger for further investigation.

The Scheme Actuary currently collects and reports payment data which shows rolling averages of provider entry and exit. This should be reviewed monthly by the Provider, Market and Sector development team, who should work with the Scheme Actuary to identify the markets by support type or geography which are experiencing the highest net declines in provider activity. This should be a trigger for further investigation in the relevant markets.

4.5.2 Addressing emerging thin and undersupplied markets

Issues and evidence

Provider submissions to the IPR during the consultation process for this review identified some markets as being at risk of undersupply due to the additional expense and difficulty in catering to them. These included markets for participants in remote regions and those with complex needs. These markets were also identified by the Productivity Commission as potential thin or undersupplied markets.[44]

Remote and very remote areas account for 3-5% of the current committed supports in the Scheme. Provider consultation and market data suggest a risk of undersupply in these markets. The non-financial obstacles to providing services in remote and very remote areas, include insufficient information about the participants in that region, limited Scheme infrastructure such as LACs, and the lack of a local workforce. Providers also revealed difficulties in travel to and from these areas which made service provision unsustainable (see Section 4.2.1).

Participants with very complex needs are defined here to include those that most require assistance from a support worker with additional skills and experience due to a medical need or challenging behaviour (see Section 4.3 for further detail). Based on the current application of ‘high intensity’ loadings, this cohort is estimated to comprise approximately 4% of participants enrolled in the Scheme but 13% of expenditure in the latest financial year.[45] Service provision to these participants is highly specialised and the participant density is low, creating a risk of undersupply that should be monitored and addressed (see Section 4.3.3).

Across all markets, as the Scheme transitions, the current assessment of market supply will change. Participants will change their demand patterns, new suppliers will come online while others leave, and Scheme infrastructure will be developed that helps participants and providers find each other – through LACs, and events at which providers can present their services, for example. These changes can continually affect the adequacy of supply in the market and must be proactively monitored by the NDIA.

[44] Productivity Commission: *National Disability Insurance Scheme (NDIS) Costs* (19 October 2017) , pp. 268 – 270.

[45] Share of participants who have been assessed as Level 13 – 15 according to the Disability Severity Indicator. It should be noted that this current definition of complexity does not adequately capture all participants with complex needs (see Section 4.3.1).

Recommendations

The supply challenges faced by the markets identified above can be addressed in part through changes to pricing and related policies. These changes are briefly outlined below, and discussed in more detail in the relevant other sections of this report:

- In very remote areas, including isolated Indigenous communities, the NDIA can work with providers to develop local workforces, and allow providers to quote on services to ensure supply in the short term (see Section 4.2.1).
- In rural areas, the NDIA can amend travel policies to enable providers to recoup costs associated with delivering services to participants in these areas (see Section 4.2.2).
- For participants with complex needs, the NDIA should more clearly define these participants, and adopt a more appropriate tiered pricing structure to reflect the costs of providing services for these participants (see Section 4.3).

In some cases, thin and undersupplied markets will require immediate intervention to ensure the provision of critical supports. For example, participants with daily care needs may require assistance in locating providers if a major provider in an already thin market were to withdraw. The NDIA is undertaking an initiative to ensure access to critical supports at any time, and facilitating a provider of last resort solution to address this scenario. In these circumstances, a price solution alone may not address the short-term requirements of participants, and LACs will likely play a significant role to help participants find suitable providers.

12: The NDIA should invest in Scheme infrastructure such as an e-market tool, which would empower participants in thin or undersupplied markets to find suitable providers.

One of the priorities for the NDIA as the NDIS has developed has been ensuring participants can connect with providers. To assist in this, the NDIA is establishing a ‘Provider Finder’, which enables a participant to search by postcode for a provider in his or her area. This is a useful tool for identifying providers, but does not yet let participants compare prices or transact directly through the platform. As the market grows, an e-market tool with this functionality will empower participants and increase price transparency and competition amongst providers. In addition to helping the NDIA address thin and undersupplied markets, easier identification of services and prices could support a faster transition towards deregulated prices (see Section 4.7).

An e-market would enable a participant to search by support type or features of the provider, such as location, price-range, or quality rating, and could also allow participants and providers to book support services on the platform. The e-market will not be a suitable solution for all providers and participants, for example where there are difficulties in accessing the internet or navigating an online portal. As such, the NDIA through its regional offices and LAC network should also continue experimenting with other forms of Scheme infrastructure, such as physical market fairs where participants can come to one place to meet providers and compare offerings.

In addition to its own activities, the NDIA can speed up the process of delivering an e-market by allowing private firms to develop and compete on online marketplace platforms. There are firms that are already providing similar products, but some are not registered in the NDIS,

meaning Agency-managed participants cannot access supports on these platforms. The NDIA should explore options to incentivise private providers to build e-market tools.

4.6 PROVIDER EFFICIENCIES AND ADEQUACY OF PROVIDER RETURNS

Section 3 of this report included analysis on provider economics and benchmarking with other schemes. The IPR team found that across all support types there were examples of providers operating profitably, as well as examples of providers struggling (see Exhibit 3). The successful models provide inspiration for how the market can innovate and drive efficiencies, while providing high quality services to participants that meet their needs. However, some providers, particularly those providing attendant care services, are struggling to make the transition to the NDIS.

The IPR team has focused on the adequacy of provider returns for attendant care and therapy. Attendant care was chosen given the large proportion of Scheme spend it represents, and given the recent scrutiny on the price cap for 1:1 attendant care. Therapy supports was chosen because the single NDIS price cap for therapy appeared to be inconsistent with the multiple price levels, and structure, of other comparable schemes.

Section 4.6 covers the following topics:

- 4.6.1 Costs of transitioning to the NDIS that impact provider returns
- 4.6.2 Administrative costs related to operating within the NDIS
- 4.6.3 Attendant care adequacy of provider returns and efficiencies
- 4.6.4 Therapy adequacy of provider returns and efficiencies

4.6.1 The cost of transitioning to the NDIS

Section 4.6.1 provides context for all of Section 4.6 by outlining the transitional costs and organisational challenges providers across all supports face as they move to a unit-funded, consumer-driven environment under the NDIS. It also provides an overview of federal and state and territory government spending to date to support NDIS transition, specifically as it relates to supporting provider readiness.

4.6.1.1 Changes providers must adapt to under the NDIS

Transitioning to the NDIS requires existing providers to develop new organisational capabilities and make significant changes and innovations to their systems and process. This requires significant investment by providers. This was recognised by DSS in a 2015 document.

'A substantial proportion of existing service providers are unlikely to operate effectively in the new environment without significant transformation…Providers long accustomed to block funding will require support to transition to business models responsive to individualised funding, and to diversify their service offerings to meet the support requirements of NDIS participants'.

Anecdotal evidence from provider consultations indicated that the cost of transition could amount to 1.5% of total annual expenditure for a provider.[46] The four biggest transitional changes to which providers must adapt are: a shift from block funding to unit funding; adapting to a consumer-driven service environment; a shift from payment in advance to payment in arrears; and compliance with a new quality and safeguards framework. Many providers have invested in IT, organisational capability, and organisational restructures.

Shift from block funding to unit funding

The shift from receiving and reporting against block funding every quarter, to claiming and reporting against individual units of service, has created challenges for providers.

First, many providers are struggling to manage the additional administrative burden of unit-funding. Anecdotal evidence from consultation suggests many providers have hired new corporate staff to manage payments and invoicing, increasing corporate overhead costs.

Second, providers have had to invest to understand whether they can deliver services under NDIS pricing. The unit costing regime requires providers to accurately measure each component of their service delivery, including on-costs and corporate overheads. Anecdotal evidence suggests many providers of disability support services did not understand their unit cost to serve prior to the NDIS. Nor did they possess data or organisational capability to measure unit costs, and therefore did not understand whether they could deliver services profitably within NDIS price caps. Not understanding whether they could deliver services within the price caps, or whether they had the short-term financial resilience to cope with transition, was a significant source of stress for many organisations. Many larger organisations hired external consultants to help them understand their unit costs to serve, while the federal government and state governments have also funded programs to help develop this capability in the sector.

Adapting to a consumer-driven service environment

In a new consumer-driven, competitive service delivery environment, providers must develop marketing capabilities to attract and retain customers. There is broad recognition amongst providers that this capability is underdeveloped in this sector, and many providers are investing significantly in their direct-to-customer marketing capabilities:

- One industry expert states: ‘There is a low level of sophistication in understanding the marketing funnel and the sequence of events through the activities of reaching, engaging, converting and servicing customers’.
- In transitioning to the NDIS, one provider invested in 10 full-time equivalent (FTE) staff to perform sales and relationship management functions at a cost of $750 000 per year, and incurred marketing and other new costs of $250 000. This represents an increase of over 1% to their total annual expenditure.

[46] Based on data from 3 large providers with revenue of over 50 million in FY16/17. Included spending on IT, new business teams and NDIS transition teams.

The empowerment of participants to choose not only their supports and providers, but also to have a greater say in when these are received, has also been challenging for providers. There is greater pressure to ensure that service times meet the needs of the participant, rather than the rostering requirements of the provider. This means providers are required to manage more peaks and troughs in demand between days of the week and hours of the day, making it more difficult to plan consecutive client bookings. Some providers have introduced a new human resources role to manage these new challenges, while others have invested in workforce rostering systems. Many providers have moved towards more casualised workforces to manage this challenge.

Shift from payment in advance to payment in arrears

Prior to the introduction of the NDIS, most disability organisations were paid by state and territory governments in advance on a quarterly basis. The switch from payments in advance to payments in arrears has represented a short-term cash flow challenge for providers, who now need to fund salaries and other expenses for a period in transition before they receive payments.

Compliance with a new quality and safeguarding framework

The NDIS Quality and Safeguarding Framework, released by the Council of Australian Governments Disability Reform Council in February 2017, introduces a nationally consistent system for regulating the safety and quality of disability services in Australia.[47]

The new framework will, among other things, introduce a new risk-based provider registration system. Registered providers whose registration group is deemed to be lower risk will only undergo a simple, periodic verification process while providers delivering higher-risk supports will be required to gain third party quality assurance certification.[48] In addition, all providers and workers will be required to comply with a new code of conduct, registered providers and their employees will be required to undertake a mandatory compulsory orientation module, and registered providers will be required to have effective internal complaints arrangements.[49]

In the short term, the new framework represents an added compliance cost for providers, who will have to adapt internal systems and processes to comply with these new standards. In the longer term, the framework may represent a cost efficiency for national providers – who will only need to comply with one set of standards, as opposed to one in each jurisdiction.

4.6.1.2 Federal and state and territory government funding for provider readiness to date

To date, federal and state and territory governments have committed significant funds to support the NDIS transition. At the federal level, the Sector Development Fund (SDF), a pool of $146 million administered by DSS from 2012/13-2017/18,[50] has funded provider readiness projects under the primary outcome area of 'building disability sector capacity and service provider readiness'.[51] At the state and territory level governments have also invested significantly in the transition, often over and above the money they have received via SDF funding. For instance, the NSW Government spent over $30 million between 2009-2016 on NDIS sector development and capacity building.[52]

Of the money dedicated to provider readiness, some has been used to fund publicly accessible education tools that give providers practical business advice to assist the transition to the NDIS world, and some has been used to provide direct individualised provider support, financial and non-financial. It is unclear how much of this funding has been provided as funding to support provider education, versus direct financial assistance to providers.

Examples of provider readiness initiatives funded by federal and state and territory governments include:

- **Education tools for all providers:** The SDF funded a 'Unit Costing Tool Project' in New South Wales, which developed a suite of resources to help providers develop the capability to operating in a unit-funded NDIS world.[53]
- **Direct individualised non-financial assistance:** The SDF funded contractors to give providers in South Australia one-on-one support in helping them transform their business models, including assistance with financial and costing analysis, bookkeeping, IT and data management integration, and marketing and communication.[54]
- **Direct individualised financial assistance:** The NSW Government's Round 1 Transition Assistance Program (TAP), launched in 2016, provided over $ 4 million in financial assistance to small and medium providers regional areas. Providers with less than $3 million in annual turnover were offered up to $35,000 to help with readiness activities like updating business plans or purchasing software.[55] In TAP Round 2,

[50] The Fund was administered by the NDIA between 2013-2014.

[51] This is one of five outcome areas funded by the SDF. It is unclear at the time of writing this report, how much of the $146 million to date has been committed to this outcome area. The SDF is now closed for new applications.

[55] NSW Government Department of Family and Community Services: *Funding boost to help regional NSW to get NDIS-ready* (19 July 2016), available at https://www.facs.nsw.gov.au/about_us/media_releases/media_release_archive/funding-boost-to-help-regional-nsw-get-ndis-ready

launched in 2017, the NSW Government awarded a further $600,000 in grants to providers.[56]

The effectiveness of this spending is not yet clearly established. Two audits have noted that these interventions have not been systematically evaluated. [57] Therefore, there is an opportunity for federal and state and territory governments to review the effectiveness of spending on provider readiness to date where possible, to evaluate the effectiveness of future interventions, and to assess whether any further support for provider readiness is required.

4.6.2 Costs of interacting with the NDIA

Issues and evidence

In addition to the expected costs associated with transition to the NDIS, consultation with providers revealed opportunities for the NDIA to improve its systems and processes, and reduce the administrative costs and cash flow risk of providers. Sections 2.2 and 2.4 summarised the provider feedback relating to the portal, NDIA responsiveness and planning raised in consultation, while Section 3.2 quantified the potential impact of these issues on provider financials based on a small sample of provider submissions. This sample indicated that the Agency could reduce provider costs by ~0.5% of total annual expenditure through improvements to its systems and processes.[58]

This section highlights a measures the NDIA should prioritise to address key provider feedback relating to NDIA systems and processes raised in consultation. The focus of the IPR is pricing and these recommendations are made in the context of the relative emphasis placed on these issues in consultation, and through an assessment of relative impact of these issues on provider economics.

The IPR team has been advised by the NDIA that there are multiple initiatives currently underway as part of the Participant and Provider Pathway Reviews that go to addressing the issues outlined in Sections 2.2 and 2.4, or to implementing some of the recommendations below.

[56] Consultation with the NSW Government Department of Family and Community Services.

[57] The Australian National Audit Office's audit of the Management of Transition of the Disability Services Market (November 2016) found *'limited evidence of evaluation of some higher cost projects'* funded by the SDF. Australian National Audit Office: *National Disability Insurance Scheme – Management of Transition of the Disability Services Market* (November 2016), available at https://www.anao.gov.au/work/performance-audit/national-disability-insurance-scheme-transition-disability-services. The NSW Audit Office's performance audit on *'Building the readiness of the non-government sector for the NDIS*' (February 2017) found the overall impact of the NSW Department of Family and Community Services spending on provider capability was not clear, as baseline information on provider capability was not collected and targets for improvement in provider capability were not set. Audit Office of New South Wales: *New South Wales Auditor-General's Report Performance Audit: Building the readiness of non-government sector for the NDIS* (February 2017), available at http://www.audit.nsw.gov.au/news/building-the-readiness-of-the-non-government-sector-for-the-ndis

[58] Based on 45 one-on-one interviews with providers in September 2017, in which three large providers (revenue > 50 million in FY16/17) gave detailed evidence of these costs.

Recommendations

13: The NDIA should prioritise the implementation of measures to continue to improve its portal, responsiveness and communication as part of the Participant and Provider Pathway Reviews.

Portal

- **Allow for automatic notification of plan review commencement, if participant consent is provided:** The NDIA has advised the IPR team that as of December 2017, changes to the portal will allow providers to view relevant sections of a participant's plan, including plan start and end dates, given the participant has a current service booking with the provider and the participant has provided their consent. The IPR team recommends the Agency also consider allowing providers to receive an automatic notification through the portal that a plan review has been triggered, given the participant has a current service booking with the provider and the participant has provided their consent.
- **Provide more detailed descriptions of claim rejection reasons:** The NDIA should consider providing a more detailed description of the cause of payment rejection in the portal.
- **Improve provider education tools:** The NDIA should continue simplifying and improving tools (like the provider toolkit) that educate providers how to navigate and troubleshoot portal issues. In the medium term, the NDIA should consider setting up a dummy portal that peak bodies and the NDIA can use to train providers on how to use the portal. This recommendation should be considered after changes in the provider pathway project have been implemented, and the new portal has been standardised.
- **Consult with providers when designing portal improvements:** The NDIA should consider making future improvements to the portal by consulting with a representative group of providers. The NDIA advised the IPR that this is already underway.

Agency responsiveness and communications

- **Stream call centre inquiries:** The NDIA should upskill call centre staff and stream call centre inquiries to specialist teams, to ensure that most provider inquiries are resolved by staff with the knowledge and the authority to resolve the issue. The IPR has been advised by the NDIA that there are current initiatives underway to address these issues.
- **Improve response times for SIL quote approvals:** The NDIA should aim to further reduce the average time it takes to process a SIL quote, building on its success to date in reducing the time required. The NDIA's current target is 14 days.
- **Improve communication of policy and process changes:** The NDIA should build on recent improvements such as the provider toolkit to clearly communicate all planned policy and process changes to providers, as far ahead of time as possible, and preferably through a single touchpoint. The IPR has been advised that the NDIA is aware of these issues and has recently implemented initiatives to address them e.g. the provider e-newsletter has been recently revised to include more 'need to know' information that is valued by providers.

Planning

The IPR team will not make any recommendations relating to the planning process as this is outside of the IPR's TOR. Moreover, the NDIA has advised the IPR team that most of the planning issues raised in Section 2.4 are being considered and addressed as part of the Participant and Provider Review projects.

4.6.3 Attendant care supports

Attendant care refers to 'Assistance with daily living' and 'Assistance with social and community participation'. 'Assistance with daily living' involves assisting with, and/or supervising personal tasks of daily life to develop the skills of the participant to live as independently as possible. 'Assistance with social and community participation' involves the provision of support to enable a participant to independently engage in community, social and recreational activities. Together these supports account for 45% of committed scheme spend at full Scheme. Attendant care can be provided by one carer to one participant (one to one) as well as by one carer to more than one participant in the case of 'Assistance with social and community participation' (group care).

Pricing for 'Supported Independent Living' (SIL) is derived from the price cap for attendant care. If SIL is included together with all other supports involving attendant care, together they are estimated to account for 75% of committed scheme spend at full scheme.[59]

This section covers the following topics:

- 4.6.3.1 Base price for one to one attendant care
- 4.6.3.2 Cancellation policy for attendant care
- 4.6.3.3 Group price for attendant care

4.6.3.1 Base price for one to one attendant care

Issues and evidence

Attendant care supports are currently subject to price caps. There are different price limits for the provision of these supports:

- At different times of day i.e. daytime, evening
- At different days of the week i.e. weekdays, Saturdays, Sundays and public holidays
- By the complexity of the care required i.e. standard and higher intensity
- By the location of the service i.e. metropolitan, remote or very remote.

The base price of one to one (1:1) attendant care (daytime, weekday, standard intensity, metropolitan location) is subject to a price limit set by the NDIA of $44.72 in the 2017/18 Price Guide for Victoria, New South Wales, Queensland and Tasmania, and $45.54 in the

[59] Source: NDIA Scheme Actuary.

Australian Capital Territory, Northern Territory, South Australia and Western Australia. The NDIA also sets service definitions, payment rules and terms of business that affect the cost of service delivery for this support.

The price of 1:1 attendant care has come under recent scrutiny.

- The price of 1:1 attendant care was the focus of the NDIA's FY2017/18 Price Review. The NDIA published a discussion paper '2017 Price Controls Review' in March 2017 and invited providers to give feedback on questions related to the price setting process and the adequacy of pricing for attendant care.
  - The NDIA found that 'divergent facts and views were presented' with some providers submitting that 'existing prices did not allow for recovery of costs', and some participants submitting that 'providers were overpricing supports in some categories'.[60]
  - In June 2017, the NDIA increased the base price of attendant care by 4.5% to $44.72, reflecting the increase in the national minimum wage, the Equal Remuneration Order and the impact of inflation.[61]
- More broadly, the NDIA's view on the pricing of attendant care is reflected in its March 2017 submission to the Productivity Commission Costs Paper, which states that '*Contradictory views in the provider population might be evidence that some are struggling to adjust to a funding model that is based on market principles. There is also evidence of a wide variety in operating costs under pre-NDIS approaches where efficiency was not a key consideration'*.[62]
- The Productivity Commission in its NDIS Costs Paper (October 2017) noted, based on anecdotal evidence from provider submissions, that attendant care price caps may be too low to achieve safe and quality outcomes, with estimates of the shortfall as a percentage of the current price cap varying considerably.[63]

One objective of the NDIS is to develop an efficient market of providers while providing safe and high quality supports for participants.

In assessing the price of 1:1 standard intensity attendant care, the IPR team examined evidence of supply shortages, benchmarked NDIA price caps against comparable schemes, and consulted with providers about their unit cost to serve. Detailed findings relating to these

60 National Disability Insurance Agency: *Letter from David Bowen to providers outlining the outcome of the FY17-18 Review* (12 June 2017), available at https://www.ndis.gov.au/news/letter-to-ndia-registered-providers.html

61 The 4.5% increase was based on the rise in the national minimum wage (3.3% from 1 July 2017) and the application of the Equal Remuneration Order (1.7% in some disability roles from 31 December 2016) for labour costs, and inflation (2.1% for the 12 months to 31 March 2017) for non-labour costs. Labour costs and non-labour costs were assumed to constitute 80% and 20% of the cost base for attendant care respectively. National Disability Insurance Agency: *Letter from David Bowen to providers outlining the outcome of the FY17-18 Review* (12 June 2017), available at https://www.ndis.gov.au/news/letter-to-ndia-registered-providers.html

are presented in Section 3. The IPR team recognises the limitations of each of these evidence sources.

The IPR team found no conclusive evidence of general supply shortages in the standard intensity attendant care market, with the NDIS price caps for attendant care being comparable to similar government funded schemes. The IPR team also found that some providers with different operating models currently deliver attendant care at a profit, but many providers in the market are struggling to make an adequate return. Based on a sample set of 22 providers who shared detailed operating cost breakdowns with the IPR team, the median cost to serve was ~$49 per hour, or ~10% higher than the current price cap (see Exhibit 4), with some providers stating they are cross-subsiding the loss on this support from other NDIS or non-NDIS funding sources, including state and territory government block funding.[64]

Many providers with profitable operating models in attendant care have recently started their business and specifically designed it to work for the NDIS, or are for-profit organisations, while many providers who are finding it difficult to deliver services under NDIS unit prices are incumbents or more traditional providers.

While there is no single model of care that will work for all providers and participants, and acknowledging the substantial investment providers have already made in transforming their organisations, the significant variation in cost to serve across the market indicates there are opportunities to innovate and lessons to be learned from operating models that are working well in standard intensity attendant care. Providers will generally need to achieve corporate overheads of 10-15% and improve workforce utilisation rates to above 90% to make a profit while complying with SCHADS award obligations. To do this, most existing providers will be required to adjust their operating models, driving efficiencies and innovation through technology and other operational improvements.

While this transformation will be challenging, examples of providers who are delivering quality supports at a profit suggest that it is achievable. Appendix E provides examples of strategies employed by some providers that have operating models that work under current prices. The NDIA's recently announced independent provider benchmarking function will also be a key reference point for providers as they make this transformation. In its first phase, this provider benchmarking project, run by an independent third-party survey manager, will survey providers for detailed information about their input costs for delivering attendant care, as well as for provider (e.g. provider scale, workforce mix, industrial agreements) and client characteristics (e.g. client complexity, location). The customised reports produced for participating providers will benchmark providers' input costs against similar providers in the sector. This will be an important piece of strategic information in helping providers understand how they are performing relative to their peers, potential drivers in variations in their input costs, and in identifying where there are specific opportunities to for improvement.

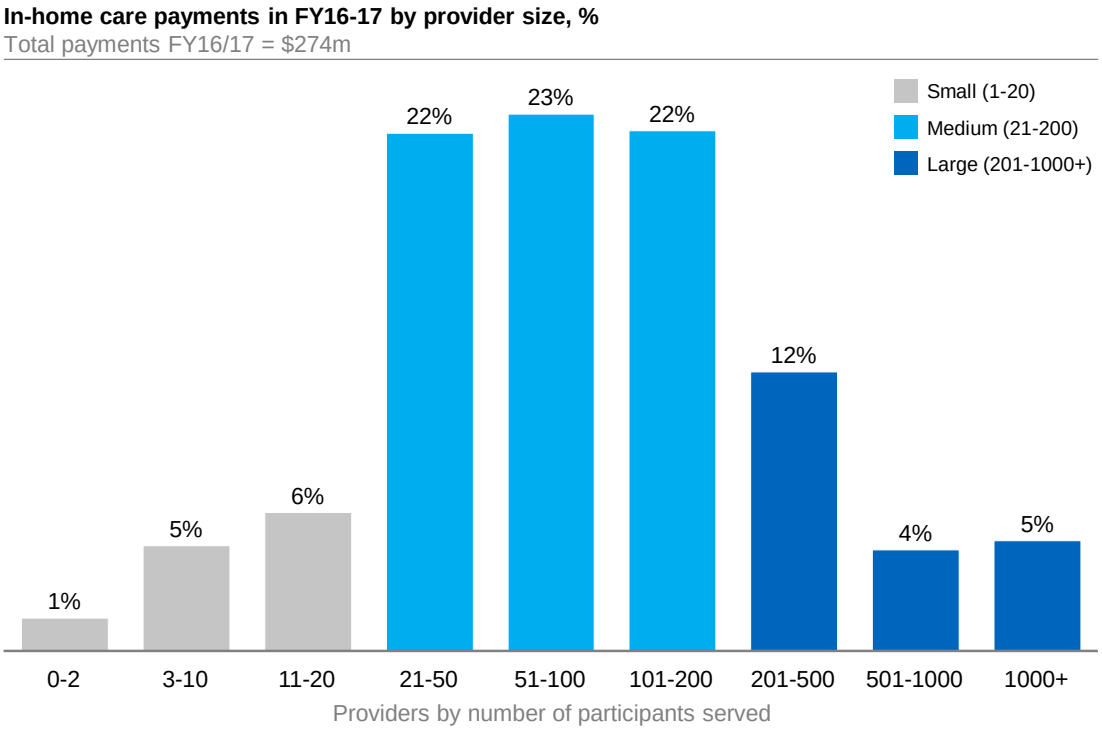
The IPR team also recognises that provider adjustment will take time: 88% of in-home care service volume under the NDIS is delivered by medium and large providers (see Exhibit 8)

[64] Data based on information from 22 providers who provided detailed financial information to the IPR. While the IPR's sample of 22 providers was not comprehensive or representative of the market, the IPR was limited by the information providers were able to provide.

who are less agile by nature of their size, while new entrants – although growing rapidly – have yet to capture a material share of the market.

EXHIBIT 8

Distribution of providers by size for in-home attendant care



SOURCE: Scheme Actuary, distribution of FY17 NDIS payments by provider size (in terms of number of participants served)

Recommendations

14: The NDIA should implement 'temporary support for overheads' (TSO) in the form of a temporary increase to the price cap for standard intensity attendant care. Government should offer business planning support for large providers that would otherwise exit and create the risk of supply shortages.

While the IPR team has not seen evidence of generalised supply shortages in attendant care to date, the IPR team's assessment is that there is a future risk of this occurring given rapidly increasing demand and supply side uncertainty. On the demand side, there will be rapid growth in demand for attendant care, as funding for disability doubles from $11 billion per annum prior to the NDIS, to more than $22 billion per annum at full Scheme. On the supply side, the market is undergoing significant adjustment. Some traditional providers, new technology-based entrants and sole traders can deliver attendant care support profitably under the price cap. However, many existing providers are not at the operating efficiency required to operate at a surplus under the price cap, and achieving the necessary efficiencies will take some more time.

The IPR team also notes the evidentiary difficulty of detecting how quickly the market is adjusting in a timely way, as articulated in Section 3.1. Critically, there is not one or a set of leading indicators that currently conclusively predict future generalised supply shortages.

In this uncertain context, and given the essential daily support that attendant care provides participants, the IPR team believes it is prudent to act cautiously and pre-emptively using a combination of price and non-price instruments to mitigate the risk of market failure.

The IPR team recommends the NDIA implement 'temporary support for overheads' (TSO) in the form of an increase of 2-3% in the price cap of 1:1 attendant care for 12 months. The TSO should apply in addition to ordinary annual indexation of the price. The presumption should be that the TSO is a one-off measure and will not be extended. The IPR believes that 12 months is a reasonable time frame for providers to implement changes to operating models to reduce overhead costs, and for the NDIA to assist and encourage the development of efficient and effective alternative supply options, such as e-marketplaces. At the end of the 12 months, the loading would be removed by reducing the annual indexation of the price by the TSO amount of 2-3%.

Before the end of this 12 months, there should be a review that examines the progress providers have made in transforming their business models and the ongoing risk of supply shortages. The expectation should be that providers have improved their performance sufficiently that they no longer require the TSO. Government should also consider using non-price instruments such as business planning support for providers to address the risk of supply shortages in attendant care, if further funding becomes available for this purpose.

In developing this recommendation, the IPR considered several alternatives including funding providers for specific activities (e.g. training, IT investments) and by-application support for providers. Given there is no legislative mechanism for NDIA to fund providers directly, and that a policy that advantaged one provider over another was unfavourable, the TSO was selected as the most appropriate option.

The specific quantum of the TSO increase should be a policy decision the NDIA makes in view of other more targeted interventions government will undertake to mitigate the risk of supply shortages. Based on current information, a 2-3% TSO adjustment reflects what the IPR team believes are reasonable assumptions for providers to achieve in the short term. While no one model of care will work for the entire market, if a 3% TSO is applied, providers will be able to achieve a ~5 % margin under the price cap if they can meet the following benchmarks:[65]

- **Labour costs (including supervisors):** SCHADs 2.3 support worker; 1:15 span of control, SCHADs 3.2 supervisor
- **Workforce mix:** 80% full-time or part-time workforce, 20% casual workforce

[65] Assumes the midpoint where an assumption range was provided. Analysis assumes labour costs in NSW as of November 2017, and the $44.72 price cap for attendant care in the Victoria, New South Wales, Queensland and Tasmania. The IPR recognises that on 1 December 2017 pay rates under the SCAHDS award were adjusted to reflect an increase from the Equal Remuneration Order (ERO). This will compress provider margins by ~2% for 6 months, until the Agency's July 2018 price increase, which should adjust the new price to reflect the 1 December 2017 ERO increase.

- **Workforce utilisation**: 90-95% utilisation of full-time and part-time workforce, 100% utilisation of casual workforce
- **Corporate overheads:** 10-15% corporate overheads as a % direct of labour costs.

These benchmarks should be achievable, as some providers are demonstrating they are able to operate more efficiently than these benchmarks, as described in Section 3.2. Some of these providers have already reduced corporate overheads to 10% and below. Improvements in utilisation above 90% should be realised as providers improve their rostering and adjust their workforce mix; and, labour costs can be reduced by creating different workforce pools for standard and high intensity participants. While achieving these efficiencies will be challenging for some providers, existing providers demonstrate they are attainable.

The IPR team recommends that the government fund business planning services for large providers who deliver high volumes of service in attendant care that are at risk of ceasing service provision, but who have the willingness to develop and implement an action plan to deliver attendant care profitably in the future. This focus on providers who deliver high volumes of service reflects the fact that the exit of these providers would increase the risk of supply shortages.

The TSO adjustment should not be made available to SIL. The high volume and certainty of demand for SIL allows providers to manage their business and workforce planning more effectively, and reduces the need for SIL providers to undergo large scale business model changes to adapt to the NDIS.

Implications

The quantum and the timing of the TSO balances the need to ensure the market has sufficient support to adjust, with the aspiration to achieve an efficient, high quality market of providers. The TSO will relieve some pressure on providers as they transform their operating models, while any targeted planning support will help protect against identified supply risks.

Implementing the TSO in conjunction with other recommendations relating to attendant care will improve the margins of providers, recognising that the TSO willonly last for 12 months. The other recommendations that will improve margins both in the short and long term, are the addition of a very high intensity rate for the most complex participants, adjustments to travel and cancellation policies, and the NDIA's ongoing work to improve the design of its systems and processes. The aggregate effect of these recommendations is that providers who were previously making a small loss on attendant care will now be able to provide the service at a profit while they adjust and improve their business models.

4.6.3.2 Cancellation policy for attendant care

Issues and evidence

Under the Price Guide, a provider can charge a maximum of 8 booking cancellations a year against a participant's plan for assistance with self-care activities and assistance to access community, social and recreational activities. A provider can only charge a booking cancellation if there are unforeseen circumstances, and the participant agrees that they (the participant), did not comply with the agreed requirements in the service agreement. The

NDIA's Price Guide does not distinguish between cancellations made far in advance and those made at short notice. The Price Guide also stipulates that providers are expected to have business arrangements in place to minimise the risk of participant cancellations, no shows or late changes.

Providers submitted that this policy does not reflect the frequency at which cancellations occur in this sector, particularly for medically or behaviourally complex participants. They submitted that where more than 8 cancellations occur per participant, this policy can be loss-incurring given providers' obligation under the SCHADS award to pay full-time and part-time employees as if they had worked a cancelled shift, if notification is not provided prior to 5pm the day before the scheduled service.

Recommendations

15: The cancellation policy for attendant care should be amended so that up to a certain threshold, providers can charge against a participant's plan for up to 90% of the entire duration of the scheduled service if the participant makes a short notice cancellation. Above this threshold, providers will need to demonstrate they are actively working with participants to minimise the risk of cancellations in order to continue charging for cancellations.

The Price Guide should distinguish between short-notice cancellations and other cancellations.

For short-notice cancellations, the cancellation policy for attendant care should be amended so that providers can charge against a participant's plan for up to 90% of the entire duration of the scheduled service.[66] A short-notice cancellation should be defined as occurring where the participant provides notice of cancellation after 3pm on the day before the scheduled service. This amended policy is designed to bring the NDIA's cancellation policy in line with providers' obligations under the SCHADS award. The 3pm cut-off time recognises that providers need time to redeploy a support worker or to give them notice of a cancelled shift before 5pm on the day before the scheduled service, as required under the SCHADS award for a full-time or part-time employee. Limiting providers to charging 90% provides an incentive to redeploy the worker if possible to recover overheads. It also provides an incentive for the provider to work with participants to reduce the volume of cancellations to the extent possible. If the worker can be redeployed by the provider, the provider should not charge the cancelling participant.

For other cancellations, where the participant has provided notice of cancellation prior to 3pm the day before the scheduled service, no cancellation fee should be able to be charged against a participant's plan. This is because providers are not obligated under the SCHADS award to pay full-time and part-time employees for a cancelled shift if notification is provided prior to 5pm the day before the scheduled service.

Additionally, the NDIA should introduce a new core support line item in the Price Guide for short-notice cancellations. This will allow the NDIA to monitor the volume of short-notice cancellations for two purposes. The first purpose is to provide better information on which participant cohorts have a defensible and higher risk of cancellations from their condition, for

[66] The terms of each provider's cancellation policy should be clearly laid out in the service agreement between the provider and the participant.

example a high risk of hospitalisation. The Scheme Actuary already factors in a level of cancellations into plan packages, but a line item would provide better information and may allow for a reduction in planned cancellations for certain cohorts of participants. The second purpose is that data on cancellations will allow the NDIA to detect anomalies in the volume of cancellations, and work with providers and participants to reduce the level of cancellations as appropriate.

The NDIA should also introduce a policy that above a specific threshold, providers will not be able to charge for short-notice cancellations unless they submit a report to the NDIA outlining the circumstances of each above-threshold cancellation, and actions taken to work with participants to minimise the risk of their short-notice cancellations. This threshold could be defined by the number of short-notice cancellations per participant per provider, or the percentage of short notice cancellations per participant per provider. The NDIA should consult with experienced practitioners in the disability sector to determine what a reasonable threshold should be.

Implications

This revised policy minimises the financial loss incurred by providers on short-notice cancellations and recognises that while providers should work with participants to minimise short notice cancellations, providers should also not bear financial risk for these incidents. It also incentivises positive behaviour by all actors in the market: participants are incentivised to give sufficient notice, while providers are incentivised to work with participants and implement processes to minimise risk of cancellations.

It is not expected that this change in policy will have an adverse impact on participant outcomes or Scheme costs. In most cases, the cost of cancellations will be absorbed by participants' budgets. If the nature of a participant's disability makes him or her more susceptible to cancellations, then the participant's budget should be increased accordingly. It is expected this will be a small proportion of participants.

4.6.3.3 Group pricing for attendant care

Issues and evidence

The NDIS has separate pricing schedules in place for the delivery of group-based community, social and recreational activities; and centre-based group care.

The current price schedule for group-based community, social and recreational activities assumes the price per participant is inversely proportionate to the number of participants in a group. The price per participant for a group of 1 support worker to 2 participants (1:2 care ratio) is half the price of a 1:1 care ratio. The price per participant for a group of 1 support worker to 3 participants (1:3 care ratio) is one third price of a 1:1 care ratio. For example, using the current price for attendant care of $44.72/hr[67], a provider will receive the same total of $44.72 whether a support worker delivers one hour of care to one participant, or a group of two or three participants.

[67] NDIA: 2017/18 NDIS Price Guide VIC-NSW-QLD-TAS (version release date July 2017), p. 29

Some providers believe the pricing of group care in the community does not consider the incremental fixed costs they incur when an additional participant is added to a care setting. These fixed costs include overhead costs for scheduling and invoicing, and the costs associated with completing case notes or outcome journals for a participant. Providers believe that in a 1:1 care setting it is possible to complete case notes during a consultation, however in group sessions this is difficult as there are greater demands on a support workers time due to the increased number of participants they are caring for. Some providers also believe that delivering care in a group setting requires a more highly skilled worker, because they need the skills and experience to manage multiple participants at the same time. For group-based community, social and recreational activities, it is possible to charge a high intensity rate when serving participants with complex needs. However, some providers believe that even for participants without complex needs, a higher skilled worker is required for group settings.

Providers that deliver care to large group sizes believe the Price Guide should include prices for groups larger than 3 participants to 1 support worker. The Price Guide displays prices for groups of up to 3 participants per support worker, but there are no prices indicated for groups of 4 or 5 participants per support worker. Some providers told the IPR team that because they do not believe the prices for group supports are correct, they stopped delivering care to small groups and only deliver care to groups of 4 or 5 participants, and charge them the price for a group size of 3 participants to 1 support worker. This results in their receiving more than $44.72 per hour as each of the 4 or 5 participants pays one third of the hourly rate. The NDIA is aware of this practice by providers, and is allowing it to take place because there is no policy that mandates providers need to charge a price below the 1:3 rate for groups with more than 3 participants.

The pricing schedule for centre-based group care is different to the pricing schedule for group care in the community, and some providers delivering centre-based group care believe it is difficult for them to operate with a surplus at the current price cap. The Price Guide has a flat hourly rate for centre based group care, and providers are not able to vary the price paid per participant based on the number of participants in a group, or to reflect the cost of a higher skilled support worker when they are caring for participants with complex needs (see Section 4.3.2). Some providers also believe the price does not consider the incremental fixed costs incurred when an additional participant is added to a care setting, as discussed for group based community, social and recreational activities, as well as the costs of operating a facility, and the capital providers have invested to make the facilities fit-for-purpose for participants, such as investment in modifications.

Some providers also raised the issue of cancellations impacting their ability to operate with a surplus. When a single participant in a group cancels, it is not possible for a provider to charge a higher rate to the other participants in a group to compensate for the difference in revenue. This results in the provider receiving less revenue than was expected if they delivered the support to the remaining participants in the group.

Recommendations

16: The NDIA should implement a new pricing schedule for group care (both community based and centre based) outlined in Table 4 that allows providers to recover additional costs incurred for groups, while still retaining the incentives and efficiencies of group based care. It should also assess whether a capital allowance should be provided for centre based care based on whether there is demand to increase the number of centres.

The price schedule of group based community, social and recreational activities should reflect the additional overhead costs for scheduling and invoicing, the additional administrative time required to write case notes/populate outcome journals, and consider an allowance for a higher skilled or experienced worker if it is determined to be appropriate for participants without complex needs. The price schedule should maintain high intensity loadings which can be applied above the standard rate for participants with complex needs. Section 4.3.1 includes a discussion on price loadings for participants with complex needs. This recommendation is not designed to encourage a participant to lead a life with a high intensity of support. Rather, it is expected that as the Scheme matures and evidence develops, providers and the NDIA will be able to assess which interventions are most effective in supporting participants with complex behaviours and needs to achieve improved outcomes and, in some cases, no longer require high intensity support.

TABLE 4 shows a comparison of the current price per participant without complex needs for 1:2, 1:3, and 1:4 care ratios compared to price ranges calculated using assumptions for the incremental fixed costs discussed above. Using data from a small sample of providers for the share of overheads scheduling and invoicing account for (10-20%), the amount of time spent per participant writing notes (3-5 mins/hr), and the SCHADS level of support workers for group care ratios (Level 2.3-3.1). The NDIA should conduct further work to refine the cost driver assumptions used to develop the new group prices. Once the assumptions have been refined by the NDIA, it can create a pricing schedule for group sizes larger than 1 support worker to 3 participants, up to a level deemed to be appropriate for a single support worker to be able to manage. This pricing schedule should be included in the Price Guide. TABLE 4 indicates prices for group based community, social and recreational activities for groups of up to 4 participants per support worker.

To support centre based group care, the NDIA should remove the flat pricing schedule that currently exists and adopt the same approach proposed for group based community, social and recreational activities. It should also assess whether a capital allowance is required based on whether there is demand to increase the number of centres. This should involve an assessment of the future demand for these services relative to the current supply.

TABLE 4: EXAMPLE OF PRICING SCHEDULE FOR GROUP BASED COMMUNITY, SOCIAL, AND RECREATIONAL ACTIVITIES

Care ratio	Current price per participant	Price per participant (without complex needs) including incremental fixed costs
1 staff – 1 participant	$44.72/hr	$44.72/hr
1 staff – 2 participants	$22.36/hr	$25.04/hr - $29.07/hr
1 staff – 3 participants	$14.91/hr	$16.76/hr - $19.68/hr
1 staff – 4 participants	No price - providers use $14.91/hr	$12.97/hr - $15.20/hr

Care ratio	Current price per participant	Price per participant (without complex needs) including incremental fixed costs
1 staff – 5+ participants	No price - providers use $14.91/hr	NDIA to determine the largest group size they will set prices for.

Implications

Increasing the price of group based care to reflect the incremental costs of service delivery could result in more supply of group care entering the market. This could be beneficial to participants, particularly for those with higher needs that cannot be cared for in large group sizes. By giving participants greater opportunity to access group care, they could choose to spend more of their budget on group care rather than 1:1 care, giving them more funds to utilise on other supports.

Once the NDIA has finalised a new pricing schedule for group care, they will need to ensure providers adopt the new prices and discontinue the current practice of charging the price of 1 staff to 3 participants for groups of 4 or more. The NDIA should consider including audits of group care delivery in their existing provider audit process to help enforce the use of the updated pricing schedule.

4.6.4 Therapy supports

The NDIA recognises therapeutic supports may be necessary for many participants to help build capacity to participate in the broader community. For example, for young participants (0-6 years), early intervention in the form of medical and disability therapy supports may help build their capacity to become more independent.

In therapy supports, participants, providers and other stakeholders identified an opportunity to differentiate pricing for different types of services to better match market rates for services, and enable the NDIS to provide better value for money to participants. This was supported by the IPR's benchmarking with other comparable schemes described in Section 3.3.2 above. Some providers delivering specialised therapy, for example clinical psychology, believe the price is not adequate for their participants. Other providers also raised the issue that the current description for therapy assistants does not reflect the activities undertaken, and that the price is not adequate to recover their costs, which leads them to serve participants with qualified therapists when the support could have been delivered by a therapy assistant at a lower price. Providers also raised issues relating to travel and cancellation policies, and NDIA-required report writing.

This section provides recommendations and rationale for:

- 4.6.4.1 Differentiated pricing for therapy supports delivered by a qualified therapist
- 4.6.4.2 Pricing for therapy supports delivered by therapy assistants
- 4.6.4.3 Travel policy
- 4.6.4.4 Cancellation policy
- 4.6.4.5 NDIA-required report writing

4.6.4.1 Differentiated pricing for therapy supports delivered by a qualified therapist

Issues and evidence

Providers, participant bodies, and other stakeholders raised issues associated with the single price of therapy. Some providers consider that the current price is more than adequate for many therapy supports, but where more complex therapy is required, for example complex psychological therapy delivered by a clinical psychologist, the price is not adequate. Participant bodies and other stakeholders have raised issues about the single price being too high where standard therapy is required. For example, for a typical physiotherapy consultation, participants are being charged a price higher price than the market rate for the service.

While the NDIA has a single price for therapy supports, other comparable insurance schemes in Australia have differentiated pricing. Examples include the TAC, WorkSafe, Department of Veterans Affairs (DVA), and NSW State Insurance Regulatory Authority (SIRA). Section 3.3, *Benchmarking with comparable schemes*, indicates that there is opportunity to differentiate the price of therapy supports based on the type of therapy being delivered, and level of service a participant requires to meet their needs.

Recommendation

17: The NDIA should develop differentiated price levels for physical therapy and psychological therapy based on price levels being paid in comparable schemes.

Physical therapy should be differentiated across three levels of care, and psychological therapy across two levels of care (TABLE 5 and TABLE 6).

TABLE 5: RECOMMENDED PRICES FOR PHYSICAL THERAPY SUPPORTS

Level of support	Proposed price ($/hr)	Description
Level 1	$110 - $120	The delivery of therapy for a single physical condition (which can result in multiple symptoms) in a low risk environment. An example is occupational therapy to develop the balance of a child with low level cerebral palsy that has a low level of severity on the Gross Motor Function Classification System (GMFCS).
Level 2	$140 - $150	The delivery of therapy for multiple physical conditions where treatment of one condition does not affect symptoms from another condition e.g. occupational therapy for a child with a middle level of severity on the GMFCS that results in multiple physical conditions; can also include treatment of a single physical condition if a participant also has mild-moderate behaviours of concern.
Level 3	$180 - $190	The delivery of therapy to participants with extreme presentations, e.g. occupational therapy for a child with cerebral palsy that has a high level of severity on the GMFCS, that results in physical conditions such as convulsions or spasms or swallowing difficulty such as dysphagia; can also include a combination of physical disabilities and severe behaviours of concern.

TABLE 6: RECOMMENDED PRICES FOR PSYCHOLOGICAL THERAPY SUPPORTS

Level of support	Proposed price ($/hr)	Description
Level 1	$160 - $170	The delivery of therapy focused on treatment of a psychological disability in a low risk environment. Typically administered by a registered psychologist.
Level 2	$210 - $220	The delivery of therapy focused on the treatment of a complex psychological disability where a very skilled and experienced clinical professional is necessary. Often necessary where a participant poses a high risk to themselves or others due to their disability. Typically administered by a clinical psychologist.

For each level of care in physical therapy and psychological therapy, the NDIA will need to define the characteristics of the type of therapy support a participant should expect to receive, and a provider should expect to deliver. The NDIA should work with therapy providers and the broader therapy market to develop these characteristics.

Implications

Providers of Level 1 and 2 therapy will have price caps lower than the current NDIA price cap. Providers of Level 3 therapy will be able to charge prices higher than the existing price cap for participants that require a high level of support due to their disability. When using the increased prices, providers will need to justify that the higher level of service is necessary to serve a participant. The NDIA will need to reflect the changes to therapy prices in the packages developed for participants. These changes should consider a participant's physical and psychological conditions, and reflect their likelihood to need a higher proportion of one level of therapy compared to another.

4.6.4.2 Differentiated pricing for therapy supports delivered by a therapy assistant

Issues and evidence

The current Price Guide describes therapy assistants as *'Program to empower participants & improve interactions between participants & their social networks. Assistance to engage effectively in the community through a group approach to help achieve goals, gain insight into their lives & make informed decisions*' and prices these supports at $41.71/hr[68]. Consultation with providers suggests that this description does not accurately reflect the role of therapy assistants, and that the price for a therapy assistant should be at least the same as the price of attendant care because therapy assistants, at a minimum, require the same level of skill as a standard level support worker. They believe the price of a therapy assistant should reflect the cost of a higher skilled support worker due to the increased difficulty of the support being delivered.

Providers believe they can utilise therapy assistant in two ways. The first is to have a therapy assistant to help deliver therapy supports, for example to help deliver hydrotherapy by

[68] NDIA: 2017/18 NDIS Price Guide VIC-NSW-QLD-TAS (version release date July 2017), p. 61

supporting a participant to stand in the water, while a physical therapist instructs a consultation. The second is in situations where a consultation could be delivered independently and in full by a therapy assistant with adequate qualifications (such as an exercise scientist). This might occur in the case of a physical therapy consultation where a treatment schedule has been developed by a physiotherapist with input from an exercise scientist, but can be delivered independently by the exercise scientist. The Price Guide does not currently allow for these two types of roles, and as a result there are examples of providers serving participants with physiotherapists at $175.57/hr[69] when an exercise scientist could be delivering the consultation at a much lower rate.

Recommendations

18: The NDIA should amend the description for therapy assistants and introduce two tiers of prices for therapy assistants – one that is comparable to the attendant care price, and a second that is for the delivery of therapy supports by a professional with a lower level of skill than a qualified therapist.

A Level 1 therapy assistant could support the delivery of therapy services and be priced in the range of $44.72-$49.20/hr. The activities performed by this type of therapy assistant is comparable to those performed by a disability support worker, but with a focus on capacity building. The relevant benchmark is therefore the attendant care price, and this is consistent with the price set by other similar schemes such as the Transport Accident Commission (TAC). The low end of the price range reflects the current price of attendant care, and the high of the range reflects the price proposed for a highly skilled support worker delivering care to a participant with very complex needs. This is the current price of attendant care plus an additional 10% price loading, and should be the absolute upper bound of the price of a Level 1 therapy assistant. This price is aligned with external benchmarks for a Level 1 therapy assistant. The TAC prices Allied Health Assistants at $37.04/hr and prices therapy supports for Independently Reviewed against Quality Standards (IRQS) Providers at $46.73/hr.

A Level 2 therapy assistant should deliver therapy supports where a qualified therapist has developed a treatment plan with input from an exercise scientist, and a consultation can be delivered by a qualified professional that is not a qualified therapist. This could be an employee with a qualification in exercise science or human movement that has the skill and knowledge to deliver a treatment plan they have helped develop at a high level of quality. The price of a Level 2 therapy assistant should be above the price of a Level 1 therapy assistant ($44.72-$49.20/hr) and below the proposed price of Level 1 physical therapy ($110-$120/hr). The market for the delivery of some therapy supports by professionals such as exercise scientists is new and growing, therefore data on pricing is limited. Discussions with some therapy providers and an observation of a small sample of private market rates suggest the price of a Level 2 therapy assistant should be between $70-90/hr, however the NDIA should conduct further analyses to refine and validate the price, and verify the relevant benchmark.

[69] NDIA: 2017/18 NDIS Price Guide VIC-NSW-QLD-TAS (version release date July 2017), p. 61

Implications

Increasing the price of a standard therapy assistant to be comparable to the price of attendant care will allow providers to recover the costs of employing workers with the same level of skill as a support worker. Introducing a second tier to the therapy assistant price could allow participants to receive some therapy supports at a lower price when the support is not required to be delivered by a qualified therapist, and can be delivered with a high level of quality by a professional with a lower skill level. This could represent value for money for some participants, as they could utilise Level 2 therapy assistants where they were previously seeing a qualified therapist, and redirect the funds they save to other supports.

4.6.4.3 Travel policy for therapy supports

Issues and evidence

Many providers believe the $1000 travel cap for therapy supports and the approach defined by the NDIA to calculate travel costs are appropriate for participants that are located close to a therapist or do not require frequent support. However, when a participant requires a provider to travel a reasonable distance on a frequent basis, the therapy travel policies can make it difficult for some providers to profitably serve participants, even in a metropolitan area.

For attendant care supports, there is no monetary cap on the amount a provider can charge a participant for travel. It is a different case for therapy as a $1000 per annum cap exists, and in situations where a moderate amount of travel is required, the therapy travel cap can run out quickly, as it equates to less than 6 hours of travel that a provider can charge over a year at the current therapy price cap of $175.57/hr[70].

Separating therapy support funding from therapy travel has positive and negative consequences. Placing a limit on the amount a therapist can charge for travel incentivises participants to receive supports from providers where less travel is needed to reach them. However, there are examples of providers ceasing to serve participants that have funds remaining in their plans for therapy supports, because they have exhausted the $1000 allowance that providers can charge for travel.

The policy providers are required to follow to charge for travel is also making it difficult for providers, as the calculation does not allow providers to charge for the first 10km of travel. Beyond 10km providers can charge up to the hourly rate of therapy supports based on the distance travelled, with the assumption being that the average speed of travel is always 60km/hr. For core supports such as attendant care, providers can charge the first 20 minutes of travel between participants (excluding travel to the first participant).

An effective travel policy should encourage participants to find services that require less travel where adequate supply is available, and discourage providers from serving participants where more travel is required if there are closer options available. The policy should also acknowledge that there are situations where travel is necessary, and allow providers to be

[70] NDIA: 2017/18 NDIS Price Guide VIC-NSW-QLD-TAS (version release date July 2017), p. 61

remunerated for a reasonable amount of travel. However, the policy should only apply where the participant cannot travel to the provider.

Recommendations

19: The NDIA should align the travel policy for therapy supports to the travel policy for attendant care by removing the $1000 travel cap, allowing providers to charge up to 20 minutes at the hourly rate when travelling between participants.

The travel policy for therapy should be consistent with the travel policy for attendant care, where there is no travel cap or separate travel allowance, and a provider can charge the first 20 minutes of travel between participants. The policy should also follow the approach suggested in Section 4.2.2, where providers serving participants located in rural areas (MM 4 and MM 5) can charge up to 45 minutes at the hourly rate when travelling between participants.

Implications

The NDIA will need to communicate with participants receiving therapy supports in-home that they will no longer have a separate budget for provider travel, and that a provider will be able to charge travel against their combined therapy budget with no maximum set by the NDIA. Participants will need to take this into consideration when they select a provider. If the preference of the participant is to receive supports from a therapist located far from their home they may receive less supports, as the provider will be able to charge up to 20 minutes in a metro area (45 minutes in rural areas) each time they travel to the participant.

The NDIA will need to communicate with providers that there are limitations on the amount of travel time they can be reimbursed for each time they visit a participant. If a provider chooses to serve a participant located outside of the area they can service based on the time caps set for metro and rural areas, they will not be reimbursed for the incremental travel time.

4.6.4.4 Cancellation policy for therapy supports

Issues and evidence

The therapy cancellation policy limits the number of hours a provider can charge to a maximum of 2 cancelled hours per year, compared to a maximum of 8 booking cancellations per year for core support items including Assistance with self-care activities and Assistance to access community, social/recreational activities. Providers believe 2 hours is insufficient as many participants cancel more than 2 hours of services per year. For example, participants with health-related needs may cancel due to hospitalisation due to their condition, and participants with behaviours of concern may cancel due to sudden escalations of behaviour. Currently providers are often required to absorb the cost of cancellations over 2 hours, even where they are short-notice, as it is typically very difficult to substitute in another patient on short notice, especially when services are delivered in-home.

Recommendations

20: The cancellation policy for therapy should be amended so that up to a certain threshold, providers can charge against a participant's plan for up to 90% of the scheduled service if the participant makes a short notice cancellation. A cancellation line item should be created as a governance mechanism for the NDIA.

The cancellation policy for therapy should follow the same approach as that suggested for attendant care (see Section 4.6.3.2). A short notice cancellation should be defined as occurring where a participant provides notice of cancellation after 3pm the day before the scheduled service. A cancellation line item should be introduced in the Price Guide to enable the NDIA to monitor the volume of cancellation by providers, which will help build an understanding of participant cohorts with higher risks of cancellations, and help detect anomalies in the volume of cancellations. Providers should not charge a cancellation where they have been able to substitute another customer.

The NDIA also should introduce a policy that above a specific threshold, providers will not be able to charge for cancellations unless they submit a report to the NDIA outlining the circumstances of each above-threshold cancellation, and actions taken to work with participants to minimise the risk of their cancellations.

Implications

As discussed in Section 4.6.3.2 the proposed policy minimises the financial loss incurred by providers on short-notice cancellations and recognises that while providers should work with participants to minimise short notice cancellations, providers should also not bear the financial risk for this occurring.

4.6.4.5 NDIA-required reports for therapy supports

Issues and evidence

Some providers indicated they were confused about whether they could be reimbursed for the time they spend developing reports for participants. The NDIA has set the expectation that providers are required to develop progress reports for participants, the Price Guide states *'Therapists will be expected to provide progress reports to the participant and NDIS at agreed times'.*[71] Currently there are some therapy providers that believe they can be reimbursed for report writing, and charge the time against a participant's package. However, there are other providers that do not believe it is possible to charge a participant for report writing, and they are absorbing the cost of the time to develop a report.

There are two types of reports therapists typically write: end-of-session notes and progress reports. Therapists write end-of-session notes to capture what has taken place during an individual consultation. This is a standard activity and should be considered as being included in the hourly rate for the support. Therapists write progress reports upon request, often by a third party, where information is sought to understand how a participant's condition is

[71] NDIA: 2017/18 NDIS Price Guide VIC-NSW-QLD-TAS (version release date July 2017), p51

improving due to their therapy. This is not considered a standard activity and therefore should be reimbursed separately.

Comparable schemes such as SIRA, TAC, and Worksafe each reimburse providers for reports, and have discrete line items in their fee schedules for reports requested by the insurers. SIRA has a single line item for report writing, and TAC and Worksafe have multiple line items for the development of the initial treatment plan, and also for treatment reviews. For each of the schemes, they will only allow a provider to charge for the reports if they have been specifically requested by an agent within insurer.

To provide therapy supports in the NDIS there are two types of reports that a provider must deliver to help the NDIA track a participant's progress: 1) at the commencement of supports, the NDIA requires a report to be submitted including the assessment of a participant, their goals, and the care plan developed to achieve those goals; and 2) as a participant progresses through their care plan, the NDIA requires a therapist to submit one or more reports per year to the NDIS to communicate the progress a participant has made against their goals, including evidence of specific areas of improvement and outcomes that have been achieved. The progress reports also include recommendations from a therapist on what they believe a participant's new or revised goals should be based on their progress at the time, and a proposal for a new or revised care plan to support a participant to achieve those goals.

Recommendations

21: The NDIA should allow providers to charge participants for the time spent writing reports that are requested by the NDIA. A new line item should be introduced for tracking purposes.

The time that a therapist can charge does not include time spent at the end of a consultation writing notes, which is factored into the rate paid for the consultation. However, for additional reports mandated by the NDIA, providers should be allowed to charge for time spent developing these reports at the same rate as a regular consultation, as they are an essential part of the service being delivered to a participant. This should be communicated to the market to ensure there is consistent application across all therapy providers.

Implications

The impact on participants of allowing therapists to be reimbursed for the development of NDIA-required progress reports is expected to be small, as it should occur no more than once or twice a year. Adding a separate line item in the Price Guide for NDIA-required reports will allow the NDIA to track therapists that are charging participants for report writing, to make sure it is only occurring when they have requested a report to be written by a therapist.

4.7 PRICE DEREGULATION

The deregulation of NDIS prices offers some compelling advantages for providers and participants operating in a mature market. The effect of current NDIS price controls is that nearly all transactions take place at the specified price cap. Forcing the market to a single regulated price introduces the risk that the market will be undersupplied (if the price is too low), or that participants will not be able to achieve value for money (if the price is too high). In

a market like disability services, regulated prices also restrict the ability of providers to offer a range of different service types and thereby limit participants' ability to choose the best mix of quality and price that suits their needs for any service. Deregulation also has the benefit of reducing bureaucracy, making it easier for participants and providers to interact with the NDIS. However, price deregulation comes with risks if implemented in an underdeveloped market. In particular, it may result in providers charging higher prices and participants receiving less value for money.

To navigate this choice, the NDIA should collect more information to understand the likely impact of deregulation of prices, prepare participants and providers for deregulation, and undertake trial(s) before deregulating prices across large portions of the market.

This section covers the following topics:

- 4.7.1 Developing more information and insights on self-managed participants
- 4.7.2 Assessing and advancing participant and provider readiness for de-regulation
- 4.7.3 Conducting a deregulation trial

4.7.1 Developing more information and insights on self-managed participants

Issues and evidence

There is currently limited information to understand how the NDIS would operate if prices were deregulated. One source of possible insight is the experience of self-managed participants, who operate in a commercial environment that is broadly comparable to a deregulated market. These participants are allocated a budgeted plan through the same process as all other participants. However, the providers they choose and manage are not bound by the NDIA's price caps in providing support services to them[72]. This is therefore somewhat comparable to the experience of participants in a deregulated market.

According to the latest NDIA data, 18% of Scheme participants have at least partially self-managed plans[73]. Anecdotal evidence from participants who self-manage their supports suggests there are many benefits of self-managing, including much greater flexibility in how funds are used across support categories. However, further analysis is required to understand whether this experience is likely to be replicated across the Scheme as a result of broader price deregulation.

There is currently only partial data available on the experience of self-managed participants. Through auditing processes, the NDIA has the potential to gather data on how self-managed participants allocate funds within their budgeted plans. The NDIA also collects participant outcomes data which can be used to track the performance of self-managed participants against those of Agency-managed or plan-managed participants.

[72] Note: providers serving both self-managed and NDIA-managed participants typically charge both groups of participants at the price cap. Therefore, only a small part of the self-managed market is effectively operating as per a deregulated market.

[73] Source: Scheme Actuary

Recommendations

22: The NDIA should collect and analyse information on the experience of self-managed participants to help inform its assessment of price deregulation.

A better understanding of the outcomes of self-managed participants can help the NDIA understand the opportunities and challenges of potential price deregulation.

The NDIA should collect information on:

- The pricing of support services provided to self-managed participants, including prices relative to the rest of the Scheme, the distribution of prices within the market for self-managed participants, and the responsiveness of prices to competitive pressure.
- Outcomes for self-managed participants.
- The supply response to price changes for supports catering to self-managed participants.

This information can be gathered through existing sources, as well as through new initiatives. Data on outcomes of self-managed participants can be gathered by categorising responses to the Short-form Outcomes Framework survey. Comparing self-managed participants with Agency-managed participants may be affected by some sampling bias, as self-managed participants are likely to have better support structures around them, which could lead to better outcomes. Therefore, it will be more useful for the NDIA to compare changes within cohorts over time, rather than across cohorts.

Some general scheme data, such as utilisation rates, are also already being collected by the NDIA and could be monitored by the participant's type of support management. The NDIA is planning to collect more thorough data on which supports are being accessed by self-managed participants, and for what prices, as part of its assurance process for self-managed participants.

Implications

The NDIA will need to collate the information it has on self-managed participants from the Scheme Actuary, the Provider, Market and Sector Development team, and its quality and safeguards assurance processes.

The NDIA will also need to expand its data collection and analysis efforts in some instances, including amending the Short-form Outcomes Framework survey or other participant consultation as necessary. The NDIA should also include queries specific to self-managed participants in its regular consultation with providers, including through LACs, its annual request for submissions into the pricing process, and ad hoc consultations throughout each year.

4.7.2 Assessing and advancing participant and provider readiness

Issues and evidence

Deregulated markets will allow providers and participants to transact freely without being bound by price caps. The NDIS marketplace is yet to be guided by a clear set of pre-conditions which would need to be satisfied for such transactions to function effectively. Price

controls cannot be relinquished until the NDIA is satisfied that such pre-conditions have been articulated and satisfied.

A broad review of provider and participant capacity makes clear that it remains too early for the Scheme to pursue price deregulation across markets at this point in time. Most providers and participants have spent under a year in the Scheme, and the Scheme continues to grow rapidly from quarter to quarter. As such, there is little stable evidence to evaluate the performance and capabilities of participants and providers in the Scheme. Even in existing competitive and well-supplied markets like those for some forms of therapy, it is important to observe participant and provider behaviour over a longer timeframe.

The NDIA supports the capability development of participants and providers through various initiatives. This ranges from core elements of the NDIS such as LACs, through to the release of market information such as the Market Position Statements. Others, such as support coordinators or online marketplaces, also work to expand the capacity of participants and providers to locate and compare with each other.

Recommendations

23: The NDIA should collect information on and assess the readiness of participants and providers for price deregulation.

The NDIA can test the readiness of the market for price deregulation by considering the commercial and other characteristics required to operate in a deregulated market. Before deregulating a market, the following conditions should be met:

- Participants must first have a thorough awareness of their supports and prices in their market.
- Participants must have the ability to exercise choice and control by switching between providers as required. The development of the e-market would support this by giving participants greater information about alternative providers and greater transparency on the range of prices charged in the market.
- Providers must have the commercial capacity to make efficient pricing decisions.
- Providers must have the ability to provide sufficient supply to drive competition and moderate price fluctuations.

The required information can be collected through participant and provider consultation, analysis of existing market and NDIA data, and by collating NDIA experience from its network of LACs and regional offices. This assessment of the readiness of markets for deregulation should consider specific markets and not just the Scheme in aggregate. Different markets within the Scheme – be they geographic regions or various support types – will be ready for deregulation at different times. Deregulation should, therefore, not be considered as a single event to be rolled out across the Scheme, but rather as a process to be introduced to markets as they become sufficiently mature.

24: The NDIA should provide more comprehensive market data to support the development of provider and participant capacity.

The NDIA should make available more detailed market information on participants' demand for services, and the available supply of support services. In addition to market overviews

presented in its Market Position Statements, the NDIA can provide further evidence of what support services participants are demanding and accessing in each market – defined by support type and geographic region – and the state of supply in those markets. This could take the form of more detailed Market Position Statements, the Provider Finder, or e-markets (see Section 4.5). Market information can also be disseminated through the NDIA's existing LACs and regional office network, as well as through support coordinators. Information on where participants are located, their patterns of demand, and the current state of service provision in a given market are very relevant to providers making pricing or supply decisions. Ensuring that such market data is available will likely lead to increased competition in the market, and improve the readiness for price deregulation.

Implications

Ensuring timely access to detailed market data will promote participant outcomes in the short term. It will also support market development in the medium to long term, with the potential to accelerate readiness for price deregulation across markets.

4.7.3 Conducting a deregulation trial

Issues and evidence

It is essential that price deregulation begins with a trial, given the limited information currently available on how the disability support services market in Australia would operate in a deregulated pricing environment, as well as the lack of directly comparable markets elsewhere.

A trial will allow the NDIA to collect more detailed information on the impact of deregulation. This information can help the NDIA confirm its assessment of the readiness of markets for deregulation, and help refine the design choices to be made in implementing deregulation. A deregulation trial would involve the removal of price caps in a specified market, defined by support type or region.

Recommendations

25: The NDIA should pursue a trial of price deregulation in one market, once the preconditions for deregulation have been satisfied.

The market chosen for deregulation should have well-equipped participants and providers as identified in Section 4.7.2, as well as meet three additional criteria:

- The chosen market should have been active in the Scheme for at least 2 years. This will allow the NDIA to assess whether the information collected about that market reflects a stable state.
- The chosen market should be clearly defined and demarcated from the remainder of the Scheme. For geographies, this would mean that the defined area is aligned to other boundary definitions affecting how businesses operate (e.g. state borders, remoteness thresholds).
- The market should be one in which the NDIA is satisfied that it has monitoring capacity and a good understanding of Scheme and market performance to date.

Some therapy supports and well-defined geographical areas such as the ACT have been identified to the IPR team by providers and other Scheme stakeholders as potential candidates for deregulation. These do not yet appear to be ready for deregulation as the Scheme is still in its early stages and there is insufficient evidence that providers and participants have the capacity to navigate a deregulated market. The NDIA should monitor the progress of these and other markets against the above criteria to identify a suitable market for a deregulation trial.

The NDIA could consider transitioning toward the trial by replacing prescriptive price caps with suggested price ranges as a way of testing market capacity for price competition. To do this, a price guide for that market would identify two prices for a given support item, a lower price which is nominated as the suggested efficient price, and a higher price which acts as the price cap. Even though the current price is only a price cap for most support services, the great majority of providers charge at this price point, and there is no way to indicate an efficient price using a single price cap.

The introduction of deregulated pricing in a chosen trial market should be accompanied by enhanced safeguards and monitoring in that area. The NDIA should be able to identify risks of supply shortages or where providers are charging well above their cost to serve to the detriment of participants' ability to secure plan outcomes.

Implications

Designing and delivering a deregulation trial will require an investment of resources from the NDIA in the medium term. However, a well delivered deregulation trial will provide a lower risk way to test the proposed preconditions for deregulation of prices and ultimately, promote a more innovative and sustainable Scheme.

Appendix A: Differences in cost drivers between attendant care providers

Summary of key differences in cost drivers between attendant care providers

The following table summarises some differences in cost drivers between providers, and explains the significant variation in cost to serve between different attendant care providers.

TABLE 7:

Issue	Provider feedback
Labour costs	■ Some providers found it difficult to manage labour costs under the current price. This was particularly true for providers who had a mix of complex and standard intensity clients, and therefore had more qualified or mature workforces. For instance, for some providers, the average worker had a Cert IV qualification and was paid at SCHADS 2.3. By contrast providers who focus on participants at the lowest end of the complexity spectrum submitted it was neither necessary nor proportionate to pay a highly qualified worker to deliver attendant care; rather it was the support worker's mindset that was important. ■ Under the SCHADS Award, employers pay casual workers a 25% loading on the base salary of an FTE. The more expensive base wage of and fixed cost of onboarding and training a casual worker is offset by a various factors: first, casual workers have lower on-costs as they are not entitled to annual or sick leave; second, it is easier to manage the utilisation rates of casual workers; finally, anecdotal evidence suggests employers with heavily casualised workforces tend to pay lower base salaries. Depending on the difference in utilisation and base salary paid to casual workers vis a vis FTEs, casual workers can be either more or less expensive to hire.
Workforce utilisation	■ Factors that make workforce utilisation difficult to manage include: unchargeable time spent travelling to clients, particularly in regional and remote areas; the frequency of cancellations in the sector; and, the time required for care co-ordination (e.g. team meetings, debriefing) and reporting, particularly for behaviourally and medically complex participants. Utilisation is particularly challenging to manage in areas of lower population density and for providers with less casualised workforces. ■ Utilisation was significantly easier to manage for providers with highly casualised workforces, as staff are only rostered when there is known demand. However, because casual workers are paid a 25% loading under the SCHADs award (which is only partially offset by the lower on-costs associated with casual workers), whether a casual worker is more expensive to employ than a permanent employee depends on how well an employer can utilise its casual workers relative to its permanent workforce.
Supervision structures	■ Some providers had heavy supervision structures, reflecting the complex participants in their client mix. For instance, some providers have 2 layers of supervision consisting of a supervisor and a team leader. Providers who only serviced lower complexity participants with strong informal supports had minimal supervision in their operating models, rather relying on instant customer feedback to detect potential risks to service quality.
Corporate overheads	■ This was a key differentiating cost driver between providers. Traditional providers that had achieved relatively efficient overheads had typically invested in IT and had achieved a degree of scale. Online platform providers also leveraged

Issue	Provider feedback
	technology to minimise overhead costs, while sole traders incurred very low overhead costs.
Other issues	■ *Training:* While there are currently no legislative requirements for disability support workers to undergo specific trainings, some providers, particularly those with complex participants in their client mix, require their staff to complete a mandatory training as a matter of internal policy.[74]

74 Some of these trainings include: First Aid, Manual Handling, Corporate Induction, Medication and infection control; CPR; Epilepsy; Diabetes; Bowel care; Oxygen Training; Management of PEG feeding.

Appendix B: Summary of IPR recommendations

Below is a summary of the IPR team's recommendations, as well as an assessment of the potential impact of these recommendations on the NDIA's three aspirations. Cost estimates have been made on the best information available. Where information is incomplete due to immaturity of the Scheme, the IPR has made a number of assumptions, which has led to wide ranges in estimates. In the aggregate, the IPR team estimates that the recommendations made in this report will have a potential financial impact of ~$250-420m per annum over the next 12 to 24 months, but will alleviate some of the financial pressure currently placed on some providers, and will improve participant outcomes by addressing challenges that are impacting some providers' abilities to deliver quality services.

Beyond the next 24 months, the IPR team believe it is possible to implement the IPR recommendations and manage the Scheme so that it is financially sustainable and within the current budget estimates. Approximately 50% of the total cost implication of the IPR recommendations is temporary and will therefore not have an adverse impact on the Scheme's longer-term financial sustainability. Also, as the Scheme matures, the NDIA should be able to offset any financial impact of these recommendations by appropriately assessing their effectiveness and efficiency. For example, as evidence develops as to which interventions are most effective in reducing costs associated with complexity, it should be possible to reduce the number of complex participants and provider costs and prices. It should also be possible to encourage more local providers in rural and remote areas that will assist in reducing travel costs. There should also be some savings from introducing tiered therapy pricing.

EXHIBIT 9

Summary of recommendations (1/3)

Positive impact
Potential minor negative impact
Neutral/No impact
Potential significant negative impact
E.g. <$50m for Scheme sustainability
E.g. >$50m for Scheme sustainability
Short term = < 1 year
Medium term = 1-2 years
Long term = 3+ years
($Xm) = Value used by IPR team to calculate the total financial impact of recommendations if different from range provided by the Scheme Actuary

	Recommendation	Direct impact on NDIA aspirations: Participant outcomes	Direct impact on NDIA aspirations: Market development	Direct impact on NDIA aspirations: Scheme sustainability	Implications: Implementation timeframe
Price-setting process	1 Include a broader set of indicators of participant outcomes and market development in its price setting process, and clarify the methodology for making price setting decisions.				Short-term
	2 Continue to use an hourly rate approach, but trial outcomes-based pricing.				Medium-term
National vs regional pricing	3 In very remote/isolated areas, work with other community services and providers to support local workforce development to deliver services in the most efficient way possible. In regions with limited local supply, allow providers to quote on cost of delivering NDIS services in the short term to ensure supply.				Medium-term
	4 Clearly define rural areas and lift the travel allowance from 20 mins to 45 mins for providers serving a participant located in MM5 (or ARIA equivalent) and MM4 in the short term. Adjust plans to account for travel and track as a separate line item.			$26-75m[1]	Short-term
	5 Converge the two Price Guides and move toward a single national price guide by 2021.				Long-term
Comp-lexity	6 Develop a definition for complexity linked to the skills required to meet participant's needs, and use specialised planning resources to classify what skills are required, and which participants require higher skilled support workers.				Medium-term
	7 Add an additional tier to the high intensity loading to allow a provider to recover the cost of a support worker with a higher level of skill than can be procured with the current high intensity loading.			$100m – $140m[2]	Medium-term (require definition first)
	8 Develop a consistent process for participants with extreme behaviours of concern that acknowledges the specialised needs of the participant cohort, and the environment providers operate in. Providers serving this cohort should quote on the delivery of services to these participants, and also be allowed to deliver them all of the services they require to be adequately supported (i.e. all Support Coordination items).				Short-term
	9 Update the pricing structure for the core support item 'Group based activities in a centre' to allow providers to charge a high intensity loading where a more skilled worker is required to serve a participant, and set prices consistent with the care ratio required to serve a participant.				Short-term

1 $26m assumes 25% of participants in ARIA-outer regional get the additional loading and the impact of the loading is only 10% (i.e. 45 mins hr travel for every 6.75 hrs of care). $75m assumes 25% of participants in MM4 and MM5 receive a loading and the impact of the loading is 20%. If all participants in MM4 and MM5 received the additional loading (and impact was 20%), this would equate to a cost of $296m. The IPR does not believe this to be a likely scenario.
2 Based on 12% of participants qualifying for the complex level (a 6% loading) and 10% of participants qualifying for the very complex level (a 10% loading), with a margin of error of +/- $20m to account for uncertainty in data, and assuming all participant plans are adjusted to compensate for the change in policy

EXHIBIT 10

Summary of recommendations (2/3)

Positive impact
Potential minor negative impact
Neutral/No impact
Potential significant negative impact
E.g. <$50m for Scheme sustainability
E.g. >$50m for Scheme sustainability
Short term = < 1 year
Medium term = 1-2 years
Long term = 3+ years
($Xm) = Value used by IPR team to calculate the total financial impact of recommendations if different from range provided by the Scheme Actuary

	Recommendation	Direct impact on NDIA aspirations: Participant outcomes	Direct impact on NDIA aspirations: Market development	Direct impact on NDIA aspirations: Scheme sustainability	Implications: Implementation timeframe
STA	10 Continue to refine the assumptions for high intensity rates, active overnight, and capital allowances used to develop the new STA price schedule, to ensure they reflect the cost of service delivery				Short-term
Thin markets	11 Adopt a clear set of metrics to more comprehensively identify and respond to risks of thin markets emerging.				Short-term
	12 Invest in Scheme infrastructure such as an e-market tool, which would empower participants in thin or undersupplied markets to find suitable providers.				Medium-term
Relative provider efficiencies and ade-quacy of provider returns	13 Prioritise the implementation of measures to continue to improve the NDIA's portal, responsiveness and communication as part of the Participant and Provider Pathway Reviews.				Long-term
	14 Implement 'temporary support for overheads' (TSO) in the form of a temporary increase to the price cap for standard intensity attendant care. Government should offer business planning support for large providers that would otherwise exit and create the risk of supply shortages.			$130-190m[1]	Short-term
	15 Amend the cancellation policy so that up to a certain threshold, providers can charge against a participant's plan for up to 90% of the entire duration of the scheduled service if the participant makes a short notice cancellation. Above this threshold, providers will need to demonstrate they are actively working with participants to minimise the risk of cancellations in order to continue charging for cancellations.				Short-term
	16 Implement a new pricing schedule for group care (both community based and centre based) that allows providers to recover additional costs incurred for groups, while still retaining the incentives and efficiencies of group based care. Also assess whether a capital allowance should be provided for centre based care based on whether there is demand to increase the number of centres.				Short-term
	17 Develop differentiated price levels for physical therapy and psychological therapy based on price levels being paid in comparable schemes.				Short-term
	18 Amend the description for therapy assistants and introduce two tiers of prices for therapy assistants – one that is comparable to the attendant care price, and a second that is for the delivery of therapy supports by a professional with a lower level of skill than a qualified therapist.				Short-term

1 $130m assumes 2% TSO for the 12 months in FY18/19, $190m assumes 3% TSO for the 12 months in FY18/19. Assumes TSO is applied to attendant care supports only (excludes SIL).

EXHIBIT 11

Summary of recommendations (3/3)

Positive impact
Neutral/No impact
Potential minor negative impact
Potential significant negative impact
E.g. <$50m for Scheme sustainability
E.g. >$50m for Scheme sustainability
Short term = < 1 year
Medium term = 1-2 years
Long term = 3+ years
($Xm) = Value used by IPR team to calculate the total financial impact of recommendations if different from range provided by the Scheme Actuary

	Recommendation	Direct impact on NDIA aspirations			Implications
		Participant outcomes	Market development	Scheme sustainability	Implementation timeframe
Relative provider efficiencies and adequacy of provider returns	19 Align the travel policy for therapy supports to the travel policy for attendant care by removing the $1000 travel cap, and allowing providers to charge up to 20 minutes at the hourly rate when travelling between participants.				Short-term
	20 Amend the cancellation policy for therapy so that up to a certain threshold, providers can charge against a participant's plan for up to 90% of the scheduled service if the participant makes a short notice cancellation. Create a cancellation line item as a governance mechanism for the NDIA				Short-term
	21 Allow providers to charge participants for the time spent writing reports that are requested by the NDIA. Introduce a new line item for tracking purposes.				Short-term
Price deregulation	22 Collect and analyse information on the experience of self-managed participants to help inform NDIA's assessment of deregulation.				Medium-term
	23 Collect information on and assess the readiness of all participants and providers for deregulation.				Medium-term
	24 Provide more comprehensive market data to support the development of provider and participant capacity				Medium-term
	25 Pursue a trial of price deregulation in one market, once the preconditions for deregulation have been satisfied				Medium-term

Appendix C: Variation in attendant care cost drivers across jurisdictions

EXHIBIT 12

SCHADS awards are broadly comparable across states and territories

STATE	Relevant Award (adjusted to 2016/17 per Equal Remuneration Order)	Hourly pay rate of full or part time worker at Level 2.3	Hourly pay rate of full or part time worker at Level 3.2
NSW	Social, Community, Home Care and Disability Services Industry Award 2010 [MA000100] and Social and Community Services Employee (State) Award [AN120505] (NSW)	$25.52 (Grade 1) $25.97 (Grade 2)	$28.21
ACT	Social, Community, Home Care and Disability Services Industry Award 2010 [MA000100] and Social and Social and Community Services (ACT) Award 2001 [AP808334]	$25.52	$27.68
Victoria	Social, Community, Home Care and Disability Services Industry Award 2010 [MA000100] and Social and Community Services – Victoria – Award 2000 [AP796561]	$25.52 (Youth or welfare worker) – $26.11 (Community development worker)	$27.35 (Youth or welfare worker) $27.59 (Social worker)
South Australia	Social, Community, Home Care and Disability Services Industry Award 2010 [MA000100] and Social and Community Services Award [AN150140] (SA)	$25.71	$27.68
Western Australia	Social, Community, Home Care and Disability Services Industry Award 2010 [MA000100] and Social and Community Services – Western Australia Award 2002 [AP815319]	$25.52	$27.35 – $27.68 (Depending on experience)
NT	Social, Community, Home Care and Disability Services Industry Award 2010 [MA000100] and Social and Community Services Industry – Community Services Workers – Northern Territory Award 2002 [AP817216]	$25.75	$27.76
Queensland	Social, Community, Home Care and Disability Services Industry Award 2010 [MA000100] and Social and Community Services (Queensland) Award 2001 [AP808848]	$25.52	$27.35

Source: Social, Community, Home Care and Disability Services Industry Award 2010, accessed in November 2017.

Labour costs make up 80% of the costs of attendant care services (which account for approximately 75% of NDIS expenditure)[75]. There is currently some variation in labour costs between states, but they are not correlated to the differences in prices between the Eastern Price Guide and Western Price Guide. For example, New South Wales and Victoria are covered by the same Price Guide but include Award provisions for Level 2.3 workers with slightly different pay rates. Similarly, the ACT and Western Australia have the same Award rate for Level 2.3 workers despite being covered by different Price Guides.

Analysis of other labour costs such as payroll tax, leave entitlements and workers compensation requirements does not show a consistent difference between the eastern states versus the western states. For example, the payroll tax rate in South Australia and Victoria (which are administered by different price guides) is similar at just under 5% annual rate and annual threshold of approximately $600,000. Meanwhile, the ACT and Western Australia are

administered by the same guide but the former has a payroll tax rate 1.35 percentage points higher and an annual threshold $1.15 million higher. Similarly, the qualifying period for long service leave is 15 years in Victoria and WA (again, there are different price guides), while it is 10 years in NSW which is regulated by the same price guide as Victoria. Finally, workers compensation premiums are higher in the ACT and Tasmania, while Western Australia has much lower premiums than South Australia. Non-labour components of cost such as utilities, rent, and cost of goods vary within states as much as they do vary between states.

Appendix D: Existing definitions of participant complexity within the NDIA

The NDIA currently uses three discrete approaches to categorise participants with complex needs through the pre-planning, planning, and plan implementation phases of the participant pathway. There is no relationship between any of the three approaches, and they are used in isolation. This means specific characteristics relating to a participant's level of need that surface during pre-planning or planning phases are not always used to inform whether they receive a high intensity loading during plan implementation.

During the pre-planning phase participants are segmented based on 'streaming factors' that are designed around workflow, to help the NDIA understand the amount of time required to keep a participant engaged in the participant pathway. These factors include behaviours of concern, involvement in multiple service systems (e.g. the justice system or Child Protection), and the level of informal supports. Participants are streamed into four categories – General, Supported, Intensive, and Super Intensive, with the greater the intensity the more time/effort required to be spent on participant.

As participants progress to the planning phase, they are assessed using a Disability Severity Indicator, which measures of the impact of the disability on the participant's day-to-day life, to determine their level of functional impairment. The level of functional impairment, together with to the participant's age and location, are used to determine the level of funding a participant receives. Participants are allocated a rating between 1-15 describing their level of functional impairment, as follows: 1-5 Low level of disability-high functional capacity; 6-10 Medium functional capacity; (11-15) High level of disability-low functional capacity.

Once a participant receives a plan and selects the providers to deliver their services, providers assess the participant based on a range of additional factors, such as disability type, budget, personal/family situation, to determine if they should be charged at a standard intensity rate or a high intensity rate. The Price Guide notes that a provider can charge a high intensity rate where a participant requires assistance from a support worker with additional qualifications or experience relevant to the participant's complex needs. High intensity rates can be considered when assistance is required to manage challenging behaviours, or when active support is required due to high medical support needs, such as unstable seizure activity or respiratory support.

Appendix E: Opportunities for attendant care providers to innovate

The IPR team has identified three broad areas where traditional providers of attendant care can innovate and drive efficiency, based on the information it received in provider consultation.

Going forward, the new benchmarking project should provide tailored and strategic information to providers to help them understand how their input costs benchmark against their peers, and where there are specific opportunities to drive efficiency. In the longer term, the aspiration of this benchmarking project is to link data collected on provider input costs, to information about service quality and participant outcomes. This will build a more wholistic picture of how the sector can drive better participant outcomes with greater efficiency.

A. Achieve efficiencies in corporate overheads

The significant variation in provider cost to serve from the sample of cost inputs submitted to the IPR team indicates that, there is significant opportunity for some providers to improve their corporate overhead efficiencies.

Medium to large providers should be investing in technology (for attendance, online booking, automation, rostering) to achieve efficiencies in indirect overheads, while smaller providers should consider using shared services.

B. Optimise staff mix and staff rostering

Workforce planning and support worker utilisation is critical under the NDIS now that providers are only for funded for units of direct client service. Providers are facing a heightened need to maximise the time staff spend performing-chargeable activities. In response, providers should improve their ability to predict demand for services, and use this information to optimise their workforce mix (e.g. full-time, part-time and casual workers) and workforce rostering.

The IPR team notes that predicting and optimising staff mix and staff rostering may be particularly difficult in the current NDIS context for a number of reasons: first, providers may not have the data and capability to analyse historical demand for services; second, even if providers had this data, the transition to full Scheme will means historical demand may not be the best predictor of future demand; finally, in rostering staff, providers of disability staff need to optimise for many variables (including participant needs, participant preferences, staff skill, staff available, staff preference, and staff geography) to ensure it can supply adequate and high quality services.

While these workforce utilisation challenges exist in many other industries, the relatively fragmented nature of disability care means many traditional providers do not have the financial capacity or the scale to justify investing in digital solutions that could assist providers improve workforce.

C. Segment service lines based on participant needs

Many providers currently maintain the same staff pool and supervision structures across all their participants. This is often driven by rostering, which is easier to do if all staff are

capable of serving the most complex participants the provider serves, that is they are trained to the highest common denominator.

Providers should identify participant segments and design customer-centric operating models to ensure staffing and supervision structures are commensurate with the participant segment's needs.

The level of staff qualification, training, experience, and supervision, and therefore the labour costs involved in delivering safe and high quality care varies significantly between participants at different points on the complexity spectrum: At the lowest end of the spectrum, soft skills rather than formal certifications are more important to delivering a high quality service; At the highest end of the spectrum, formal qualifications and experience are needed to deliver supports safely to medically and behaviourally complex participants. This was recognised by the Quality and Safeguarding Framework.

These changes will be easier to implement for smaller providers with defined customer segments and new entrants into the market who focus on specific customer segments. Large providers should also have sufficient scale in a geography to better design service models around different participant segments, although the challenge and time taken for transformation is not underestimated.

Glossary and Abbreviations

TABLE 8:

Abbreviation	Meaning
AMS	Aboriginal Medical Services
ARIA	Accessibility/Remoteness Index of Australia
Assistive Technology	Any device or system using a device that allows individuals to perform tasks that would otherwise be more difficult, unsafe or not possible. It does not include items for treatment, mainstream technology without modifications.
ATSI	Aboriginal and/or Torres Strait Islander
Attendant Care	Refers to all supports which are either assistance with daily living or assistance with social and community participation.
Award	Regulatory instrument which outlines the minimum pay rates and conditions of employment for a particular industry and/or occupation.
Board	The corporate governing board of the National Disability Insurance Agency
CALD	Culturally and linguistically diverse
CEO	Chief Executive Officer of the National Disability Insurance Agency
COAG	Council of Australian Governments
DIDO	Drive-in, drive-out; refers to services provided by non-local workforces who are required to drive to/from a separate town or region.
DVA	Department of Veterans Affairs
DSS, or 'the Department'	The Commonwealth Department of Social Services
Eastern Price Guide	*NDIS Price Guide Victoria, New South Wales, Queensland Tasmania* released by the NDIA, the latest of which is valid from 1 July 2017
EBA	Enterprise Bargaining Agreement
ECEI	Early Childhood Early Intervention [x]
NDIA Aspirations	The three external aspirations of the NDIA as identified in its *Corporate Plan 2016 – 2021*: better participant outcomes, a growing market with innovative supports ('market development'), and a financially sustainable scheme ('Scheme sustainability').
FIFO	Fly-in, fly-out; refers to services provided by non-local workforces who are required to fly to/from a separate town or region.
FTE	Full-time equivalent
Full Scheme	Refers to the fully implemented state of the NDIS, estimated to operate from 2020.
FY	Financial Year
IAC	Independent Advisory Council
ICT	Information and communication technology
IHPA	Independent Hospital Pricing Authority
IPR	Independent Pricing Review
IT	Information Technology

Abbreviation	Meaning
LAC	Local Area Coordinator
Modified Monash Model, including 'MM 4', 'MM 5' etc.	A geographical classification system predominantly used to estimate health workforce needs, based on the population size and proximity of each geographical region.
NDIA	National Disability Insurance Agency
NDIS	National Disability Insurance Scheme
NILS	National Institute of Labour Studies
Participant and Pathway Review	A review of the process by which participants are enrolled into and managed within the NDIS, finalised in late 2017.
Price cap or price level	The applicable maximum price that can be charged by a provider registered under the NDIS for a particular support service, as identified in the relevant Price guide.
Price guide	One or all of the Eastern price guide, Western price guide, *NDIS Price Guide Very Remote* or *NDIS Price Guide Remote*
Portal	A secure website that enables registered providers to transact online with the NDIA.
QSC	Quality and Safeguards Commission
Quality and Safeguarding Framework	Refers to the content in the following document – Department of Social Services: *NDIS Quality and Safeguarding Framework* (9 December 2016)
Quoting	A price-setting process by which the supplier of a good or service states the price required to supply a particular support service to be assessed by the purchaser.
SCHADS Award, or SCHADS	*Social, Community, Home Care and Disability Services Award 2010* [MA000100] or its applicable state or territory equivalent
Scheme Actuary	A Board-appointed person whose duties are set out in section 180B of the *National Disability Insurance Scheme Act 2013* (Cth)
SDA	Specialist Disability Accommodation
SDF	Sector Development Fund
SIL	Supported Independent Living
SIRA	NSW State Insurance Regulatory Authority
STA	Short term accommodation
TAC	Transport Accidents Commission
TAP	Transition Assistance Program
TOR	Terms of Reference
TSO	Temporary Support for Overheads
Western Price Guide	*NDIS Price Guide Australian Capital Territory, Northern Territory, South Australia, Western Australia* released by the NDIA, the latest of which is valid from 1 July 2017

Acknowledgements

NDS gratefully acknowledges the expert advice and guidance of Dr Ian Watson in the development of Workforce Wizard, and the innovative work of software company Mozzler.

This data for this report was collected in part through the NDS Disability Workforce Innovation Network project 2014-16 which took place with the assistance of funding provided by the Australian Government. NDS also recognises the significant contribution of the industry in embracing Workforce Wizard, helping shape it and making it the successful tool it is today.

About this report

This is the second edition of a twice yearly publication. It was prepared by Dr Ian Watson, Freelance Researcher and Caroline Alcorso, NDS. The next edition will be published in July 2018.

About National Disability Services

National Disability Services ('NDS') is the peak body for non-government disability services. Its purpose is to promote quality service provision and life opportunities for people with disability. NDS's Australia-wide membership includes more than 1000 non-government organisations, which support people with all forms of disability. NDS provides information and networking opportunities to its members and policy advice to state, territory and federal governments.

National Disability Services

Contents

Executive summary

The second edition of **Australian Disability Workforce Report** revisits the issues first identified in our mid-2017 edition. The richness of nine quarters of Workforce Wizard data covering between 35,000 and 38,000 people each quarter significantly deepens our understanding of front-line disability and allied health professional work.

The analysis presented confirms the distinctive character of the of the disability workforce: a majority female, mainly part-time group of workers, over two-fifths of whom are casually employed.

Trends and features that appear to be associated with the way the sector is responding and adapting to the National Disability Insurance Scheme are also becoming clearer as the rollout gathers pace.

Changes in support worker employment as the NDIS rolls out

Since 2015, casual work has been increasing slightly, and now accounts for 42 per cent of all workers. Most employment gains appear to be coming from casual employment growth. This trend is mainly driven by small and medium organisations, where casual employment at the end of 2017 formed close to half of their workforce.

Two potential downsides to this high casual employment, however, are revealed elsewhere in the data analysis. First is the very high turnover rate of casual workers – a two-year average of nearly 9% per quarter (equal to 35% per annum). This is a significant cost and administrative burden for providers. Second, detailed investigation of NDS carecareers job board data shows job applicants have a clear preference for permanent over casual roles. In the competition for talented people, offering casual jobs only or mainly is likely to be a liability.

Part-time work has also been growing; but unlike casual employment large organisations are also contributing to this tendency. It appears that both large and small/medium organisations are seeking to achieve flexibility in their staffing, but have chosen different strategies. Again, the NDS carecareers job board data offers useful insights. Most job applicants want part-time rather than full-time work, so this growth in the sector is partly driven by worker preferences.

Allied health professionals facing an uncertain environment

Allied health professional employment offers a stark contrast to that of disability support workers. Instead of being majority part-time, the allied health workforce is split almost evenly between people who work full and part time. Three-quarters are permanent workers. But around 16% of applied health professionals were employed as fixed term (on short term contracts) over the last two years and this rose to above 20% during some quarters.

Again, different strategies to minimise risk in an uncertain environment are being used with this young, mainly female professional workforce.

Spotlight topics of interest suggested by Workforce Wizard users

The two spotlight topics featured in this edition of **Australian Disability Workforce Report** are staff absences and industrial instrument coverage.

This is the first time we have reliable data on the use of personal and carers' leave in disability: well over ten days per year. The data is important to achieving fair prices since these figures run counter to the figures assumed by the NDIA.

The disability sector also has an above-average proportion of workers on enterprise agreements than the labour market average, although we know that many of these are due to be renegotiated.

Workforce Wizard and carecareers data continue to fill a major gap

Despite government's legitimate concern about the sector's capacity to scale up as quickly as NDIS participants need, no publicly funded workforce data collection process exists. ABS classifications continue to merge disability workers with other groups, making it impossible to obtain regular labour force analysis.

NDS thanks the many regular Workforce Wizard users whose quarterly data entries allow us to fill this pressing information gap.

1 Introduction

This is the second edition of the **Australian Disability Workforce Report**, an NDS publication that documents current trends in the disability workforce. The features of this workforce is a key question for the sustainability of the National Disability Insurance Scheme (NDIS), and the disability sector as a whole.

Disability's key workforce metrics are reported and discussed in this and every edition. A primary focus is how the workforce is changing (or not) with the introduction of the NDIS.

Australia's capacity to provide a workforce that is of sufficient quantity and quality to meet the increasing workload that the NDIS demands will be crucial to the success of the scheme.

Where does the data come from?

Since ABS labour force data is not classified in a way that allows us to pinpoint the disability workforce, the **Australian Disability Workforce Report** relies on data from NDS's purpose-built two-way workforce metrics application, Workforce Wizard.

Workforce Wizard (www.workforcewizard.com.au) is a free online tool into which disability service providers enter data quarterly. An important design element of Workforce Wizard is that it is short and simple, making it convenient for users. Once the data period closes, benchmark reports are quickly generated showing the organisation's workforce characteristics benchmarked against the sector.

Organisations enter data based on workforces of their own defining. For the purposes of this report, if an organisation entered data for more than one workforce, those workforces were consolidated into one organisational result. This is to avoid multiple counts of a single organisation with more than one (and sometimes duplicate) workforces. When the unit 'organisation' is used in this report, it needs to be understood that the real life organisation may have other streams of activity, such as aged care, plus other staff (eg back office staff) who are not included in our analysis.

The data sample used in this report is nine quarters of data entered up to the end of the September quarter in 2017. Roughly 35,000 to 38,000 disability support workers and allied health professionals data were entered each quarter, from across Australia. Considering the significant coverage of the sector that Workforce Wizard provides, aggregate results have been mainly used.

A longitudinal 'balanced panel' has also been created of organisations that have entered data across the seven consecutive quarters between March 2016 and September 2017. The longitudinal nature of this panel means the disability support worker results from each quarter are more truly comparable to each other, and can confirm trends.

There is no separate longitudinal analysis for the allied health workforce, as most participants of this sample are consistently engaged with Workforce Wizard and therefore constitute a longitudinal panel.

Data on jobseekers

The second major source of data used in this report comes from carecareers (www.carecareers.com.au). This is NDS's job board where employers advertise for disability sector and aged care staff. The data from this job board spans about five years, from the end of 2012 to the beginning of 2018, and is a rich source of information on what is happening in the disability job market. Around one million people use this site every year to find disability and aged care jobs.

A more detailed discussion of Workforce Wizard and carecareers data and our methodology can be found in the first edition of the **Australian Disability Workforce Report**, which can be found at www.nds.org.au/workforce-hub.

What's in this report

In the next three chapters, the Report presents data on the key metrics Workforce Wizard collects about disability support workers:

- types of employment
- organisation growth
- turnover rates
- working hours; and
- age and gender distribution.

Chapter Six analyses these same workforce trends among allied health workers.

Chapter Four reports on our newly introduced special topics, so-called Spotlight Topics, which shed light on important policy issues in the sector. These issues are generated by users and reflect their concerns and interests. One or two additional questions are asked each quarter about these subjects, on a one-off basis.

In this edition, the topics covered are:

- Number of staff absences
- Industrial instrument use in the organisation.

carecareers data analysed in Chapter Five concerns the number of views and applications made by jobseekers for each advertisement.

Throughout the report there are hyperlinks (in blue) to various other parts of the text, to all the figures, and to the tables in the appendix. These tables provide the data which sit behind all the figures. Clicking on these links will take you directly there, and clicking on the Back Button in your PDF Reader will take you back to where you were reading.

2 How are workers employed?

The disability workforce is quite distinctive. About 70% of disability support workers are women, compared to a figure of 46% in the wider Australian workforce.[1] Disability support workers are also slightly older than the Australian workforce: some 44% are aged 45 years or more. In the workforce more generally, the figure is 39%.

Over time, as the disability sector grows strongly, these features may change. More men and more younger workers may enter the sector. At present these features pose challenges that many services are overcoming as they broaden their recruitment targets. On the other hand, there are two areas where the characteristics of the sector pose considerable ongoing challenges. These arise around the forms of employment—whether workers are permanents or casuals—and the hours of work.[2] The disability sector is quite unique in both these areas and the steady growth of casual employment and the increased use of part-time hours raises important issues about the viability of the sector's workforce. Will the disability workforce of the future be a stable, highly-skilled and well-motivated workforce? Or will we see the emergence of pockets of heavily casualised and part-time work, where high turnover, low morale and inconsistent standards prevail?

It is still early days in the rollout of the NDIS, but the sector needs to be alert to developments in the disability workforce which may undermine the positive outcomes promised by the scheme. By focusing on changes in forms of employment and hours of work, NDS is drawing attention to issues that industry, government and service users need to solve collaboratively.

1. It is important to stress that this gender characteristic is shared by other community sector workers, such as carers and aides (the group which includes child-care aged-care workers) where the proportion is 85%.
2. See the discussion of these concepts in the Appendix, on page A1.

Overview

Most disability support workers are employed as permanent or casual workers. Very few are fixed-term workers.[3] In September 2017 the proportion of permanent workers in the disability workforce was 55%; the proportion of fixed-term workers was 3%; and the proportion of casual workers was 42%. Figure 1 shows these proportions in each of the quarters over last two years.

The largest group in the disability workforce are permanent workers ...

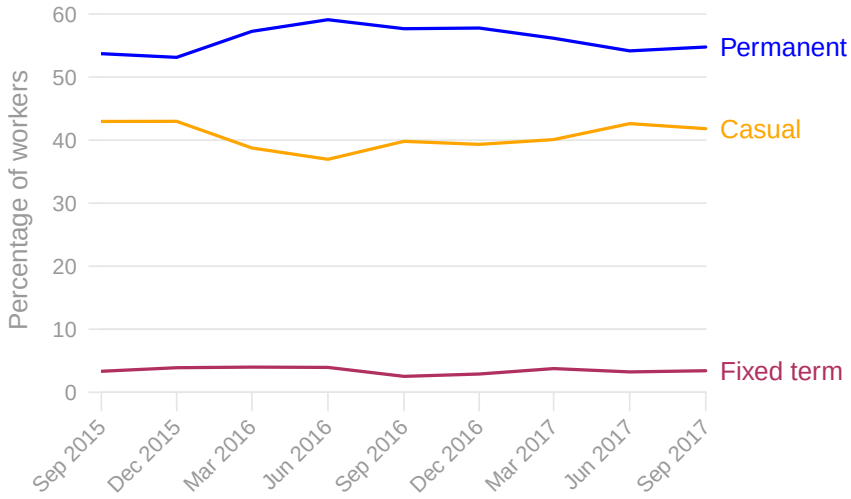

Figure 1: Forms of employment

Notes: Details in Table A10

The figures for September 2017 are close to the overall averages for this two-year period, though the permanent proportion is somewhat lower and the casual proportion somewhat higher, suggesting that the share of casual employment may be slowly increasing. The analysis of workforce growth (page 14 onward) does indeed suggest that casual employment is increasing in the sector.

... but casual workers make up two-fifths of the workforce, a share which has been increasing over the last 18 months

3. Permanents are employed with an expectation of on-going employment; fixed-term workers have a termination date in their contracts; and casuals have no expectation of any ongoing employment and can, in theory, be terminated at short notice.

Does organisational size make a difference?

While the overall trend towards increased casualisation is only slight, when we look more closely at the different organisational sizes in the disability sector, it becomes apparent that small and medium organisations are definitely engaging more casuals. This is shown in Figure 2. In both cases, the proportion of casuals among their disability support workers is now greater—or about to become greater—than the share of permanents. Only for large organisations is the gap between the share of casuals and permanents not closing.[4]

Permanent employment is increasingly the preserve of large organisations ...

In the September 2017 quarter the proportion of permanent disability support workers in large organisations was 57%, while the proportion of casuals was 40%. By contrast, in small organisations permanents made up just 44% and casuals had reached 47%, while in medium organisations the figures were 49% permanents to 48% casuals.

... and casual employment is becoming dominant in small and medium size organisations

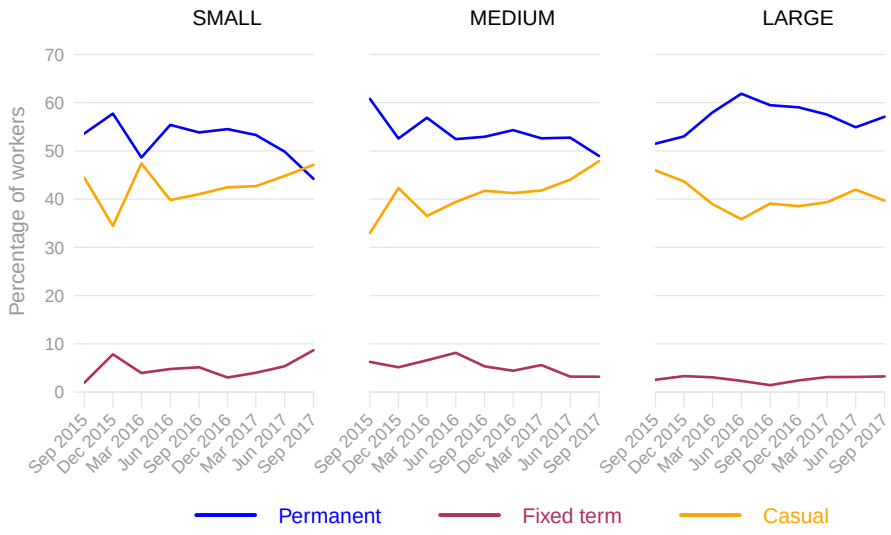

Figure 2: Forms of employment by size of organisations

Notes: Details in Table A11

4. We categorise organisational size on the basis of the number of disability support workers in the organisation: Small: less than 50 workers; Medium: 50 to 199 workers; and Large: 200 or more workers.

Is there a gender story?

There is also a striking pattern according to the gender of the workforce. We saw in the last chapter that women make up the majority of the workforce—averaging around 70 percent—so this makes it difficult to define organisations by their gender proportion. Nevertheless, by pooling the data from all quarters, we have a sufficient number of observations to define four categories based on the ratio of female to male staff, that is, the percentage of women within each organisation's workforce.[5]

By comparing the forms of employment across these four categories we find a distinctive result: organisations with higher female-to-male ratios have higher levels of casual employment and lower levels of permanent employment. Indeed, there is an almost linear relationship: as the proportion of women increase in organisations, so too does the proportion of casuals (see the red line in Figure 3.)

> As the proportion of women increase in organisations, so too does the proportion of casuals

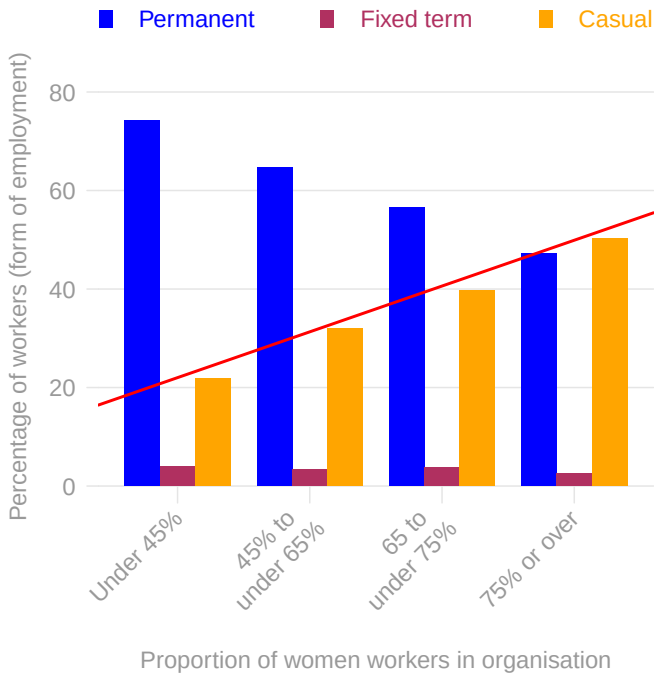

Figure 3: Forms of employment by the proportion of women employed

Notes: Note that data is pooled over all quarters. Details in Table A12.

In organisations which are clearly majority male—that is, where

> Permanent employment is dominant in organisations where there are a large majority of male workers

5. These categories are: Under 45% women; 45% to under 65% women; 65% to under 75% women; 75% or over women.

male workers make up 55% or more of the staff—the proportion of permanents in those organisations is 74% and the proportion of casuals is just 22%. By way of contrast, in organisations where women make up three quarters of the staff—only slightly above the overall average—we find almost equal proportions of permanents (47%) and casuals (50%).

The growth in the workforce

One of the most striking aspects of the disability workforce is the strong growth taking place. As the NDIS rollout proceeds, new organisations have arisen and existing organisations have expanded their staff to cope with the increased demand for services. During 2016 the Australian workforce as a whole increased by about 1.6% per year, but the workforce in the broader social assistance / personal assistance / residential care sectors grew much more strongly, by 9.5% per year.[6] In the case of the disability sector the growth, as measured by Workforce Wizard, has been even stronger: 11.1% per year (averaged over the two year period).

It is possible to examine workforce growth in the disability sector by analysing the numbers of workers who leave an organisation and the numbers who are recruited in each quarter. The difference between these is a measure of 'net change' in the workforce. These figures are collected by Workforce Wizard for permanent and casual staff, and an overview of these data are shown in Figure 4.

Employment losses come from permanent workers leaving ... and the gains come from increased recruitment of casuals

It appears that employment losses in the sector tend to come from permanent workers departing and that most of the employment gains are, in absolute terms, from increased employment of casuals. Given that casuals make up just under half of the disability support workforce one might expect that the net change would also reflect a similar ratio. Clearly, this is not the case, and the increased propensity for organisations to recruit more casuals is evident in Figure 4.

If we want to look at this in percentage terms, the permanent growth rate was 1.3% per year. The casual growth rate, on the other hand, was 26% per year.[7]

6. Figures from Australian Bureau of Statistics, *Characteristics of Employment*, 2016, Cat. No. 6333.0.
7. There is considerable quarterly variability in these percentages, so the figures given here are averaged over the two year period. A different approach to calculating growth rates, based on a balanced panel, is discussed below on page 18.

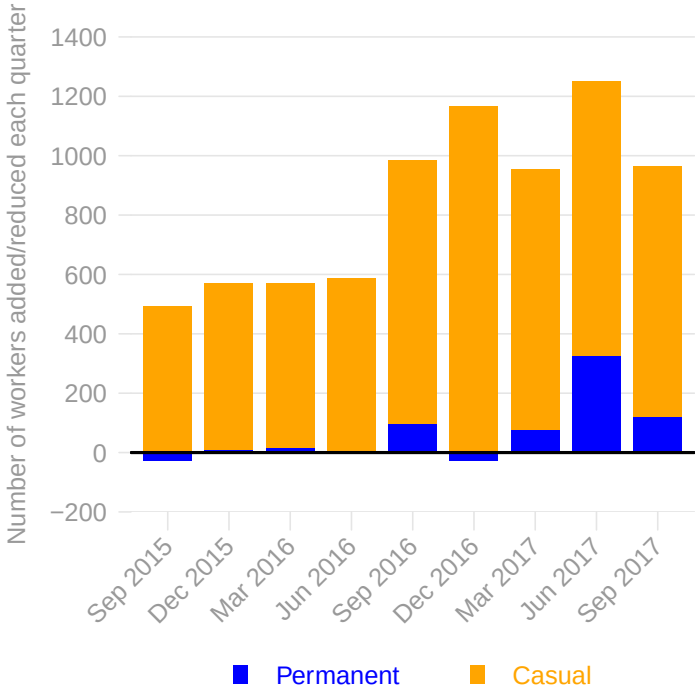

Figure 4:
Net change in permanent and casual staff

Notes: Details in Table A13

We saw earlier (page 12) that in both small and medium size organisations the proportion of casual staff was growing strongly, and becoming the dominant form of employment. For medium size organisations, this picture is confirmed in Figure 5, which shows the net change in permanent and casual staff across medium and large organisations (with trend lines shown in black). In large organisations the **ratio** between permanent and casual net changes in staff appears reasonably stable over time—both are growing together at the same rate.

In large organisations permanent and casual employment are growing at the same rate ...

By contrast, in medium size organisations, the net change in casual staff is growing rapidly, while the net change in permanent staff shows a downward trend.

... but in medium organisations casual employment is growing strongly while permanent employment is declining

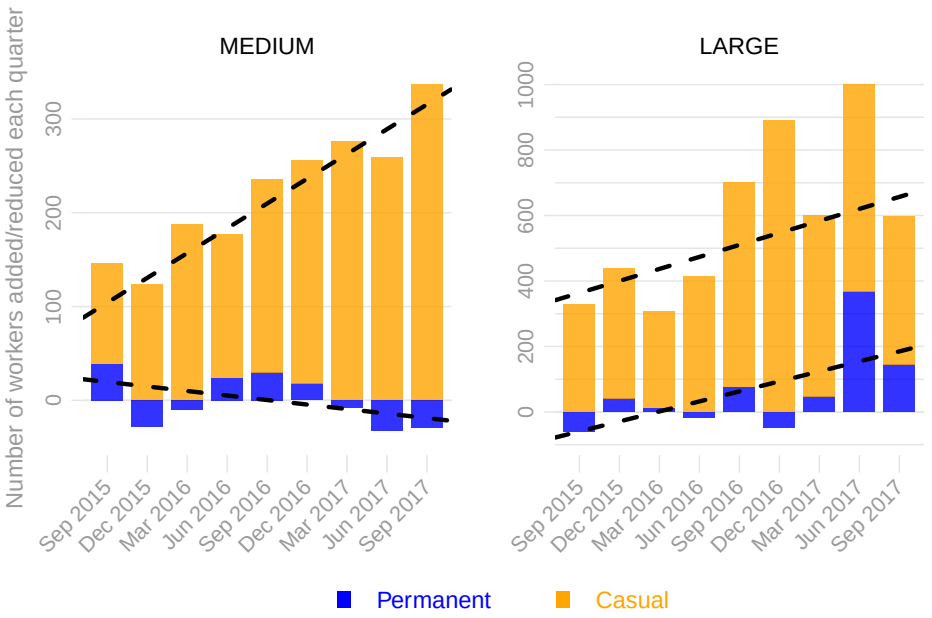

Figure 5:
Net change in permanent and casual staff, by organisational size

Notes: Details in Table A14

What do these changes mean? Essentially, over time a downward trend in the net change of permanent staff means that the sector is diluting its permanent workforce, and that in the long term the share of jobs in the sector held by casual workers will steadily increase. While large organisations are 'holding the line' and not contributing to this potential problem, the drivers of this transition lie in the medium size organisations.

Another perspective on these changes in employment entails categorising organisations by how their permanent and casual staffing profile changed during the quarter. We can define three categories: where a particular type of workforce is declining, where it is stable, and where it is increasing. (The definitions of these categories, and the detailed data for them, are shown in the appendix, see Table A17).

Looking first at the casual staffing profile, about 71% of organisations have had a stable casual workforce in each quarter. Only a small proportion of organisations—an average of 3%—had seen their casual workforce decline during the quarter. By contrast, 25% of all organisations experienced an increase in their casual workforce.

25% of all organisations experienced an increase in their casual workforce ...

... but the majority of organisations maintained a stable permanent workforce

In the case of permanent workers, about 85% of organisations had a largely stable workforce during the quarter. Another 7% of organisations had seen their permanent workforce decline. The remaining 8% of organisations had seen their permanent workforce increase. This organisational approach to the issue of forms of employments is important because it emphasises the **stability**, as well as the changes, in the sector.

As the sector grows rapidly, more of the increased recruitment of workers takes place through the creation of casual jobs

While the losses in employment which do take place are largely in permanent jobs—as we saw earlier—the magnitude of this is relatively small. The strong growth in casual employment may not represent a 'conversion' of permanent work into casual work. Rather, it suggests that as the sector grows rapidly, more of the increased recruitment of workers takes place through the creation of casual jobs.

Workforce turnover

Workforce turnover is an important measure of the amount of 'churn' in an organisation. High levels of labour turnover lead to instability, as experienced workers with good organisational knowledge depart and are replaced with less experienced workers. High labour turnover can signal problems with the organisation, such as low worker morale, or uncompetitive wages or working conditions. On the hand, turnover rates which are too low may leave an organisation without fresh ideas, and the organisations may suffer from routines which reflect old habits no longer suited to the organisation. For the clients, turnover which is too high disrupts continuity in their access to supports; turnover which is too low may leave them deprived of the new ideas which new recruits might bring.

About one quarter of the disability workforce changed jobs every year

The turnover rate is measured as the number of workers who leave an organisation during a quarter, expressed as a percentage of the average total number of workers for that quarter and the previous quarter. Thus the all-worker turnover rate, shown in Figure 6, was 6.5% in the September 2017 quarter; the permanent turnover rate was 4.9% and the casual turnover rate

was 8.6%. In annual terms, about one quarter of the disability workforce changed jobs every year.

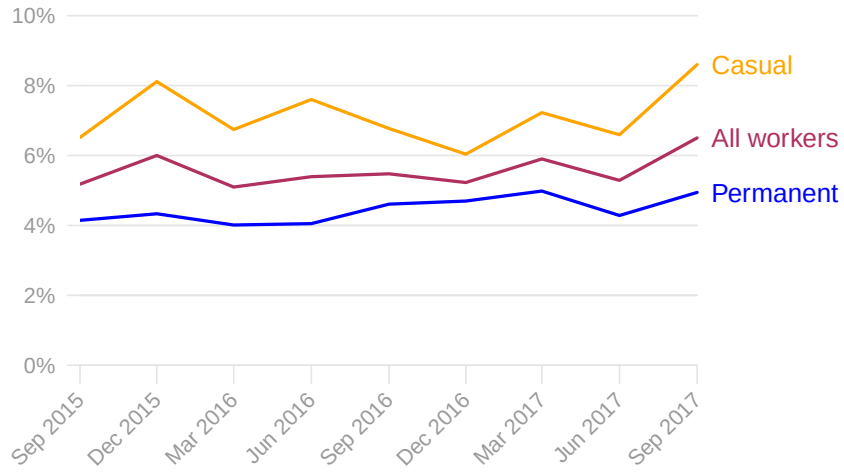

Figure 6: Quarterly turnover rates by forms of employment

Notes: Details in Table A18

The turnover rate for all workers averaged 5.6% per quarter over the last two years, so the 6.5% figure for September 2017 represents a small rise. The turnover rate for permanent workers has fluctuated between 4.1% per quarter and 5% per quarter over the last two years, and has averaged 4.4% per quarter for the period. In the case of casuals, the turnover rate has been even more erratic, ranging from a low of 6% per quarter through to a high of 8.6% per quarter, with the average for the last two years being 7.1% per quarter. The rate for the last quarter—at 8.6%—is above this longer-term average.

Casual workers have 1.6 times the turnover rate of permanent workers

In summary, the turnover rate for casuals has averaged about 1.6 times as high as the permanent rate over the last two years and appears to be increasing. This reinforces the observation made at the start of the chapter: organisations gain apparent flexibility by employing more casual staff but the cost is a greater increase in labour turnover in their workforce, and a consequent drop in the quality of the service provision for their clients.

Another look at growth in the workforce

The information provided by Workforce Wizard on departures and recruitment is valuable in looking at growth and turnover rates. There is, however, an issue around compositional change in the Workforce Wizard sample. As new organisations join the Workforce Wizard, and others drop out, the composition of the workforce

represented by all these organisations may change. To capture a more enduring picture of the workforce we can create what is called a 'balanced panel', a longitudinal sample made up of the same organisations.[8]

Using this balanced panel, we look at where the growth in the workforce came from with respect to forms of employment (see Table A15 for details). In overall terms, most quarters saw growth in numbers (with the exception of the March 2017 quarter) with the strongest growth taking place in the June and December quarters of 2016 (Figure 7).

We can also look at these data in terms of growth rates, that is, the percentage change in numbers in each quarter. Figure 8 shows that the quarterly growth rate for the permanent workforce is consistently lower than the growth rates for casuals (except for the last quarter). In annual terms, and averaging across all quarters, the growth rate for permanents was about 4% percent and for casuals it was 15.2%. The growth in the workforce overall was 8.4%.[9]

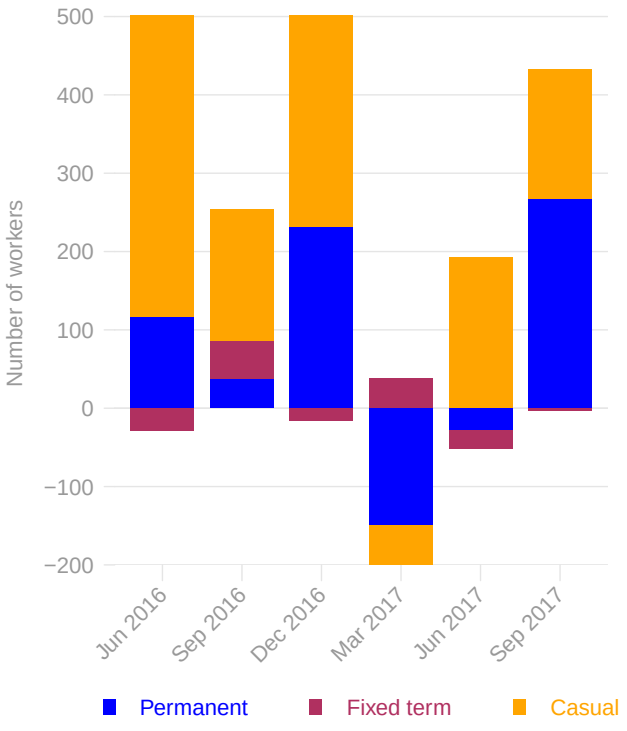

Figure 7: Growth in disability support workforce by forms of employment (counts)

Notes: Details in Table A15

8. In this case, we have selected only those organisations with complete data in Workforce Wizard for all of the seven previous quarters. While this reduces the size of the sample considerably, the numbers are still adequate for our analysis.
9. Growth rates for fixed-term workers are not shown because they are so erratic, based as they are on very small counts. The average growth rate across all quarters for fixed-term workers is 1.1%.

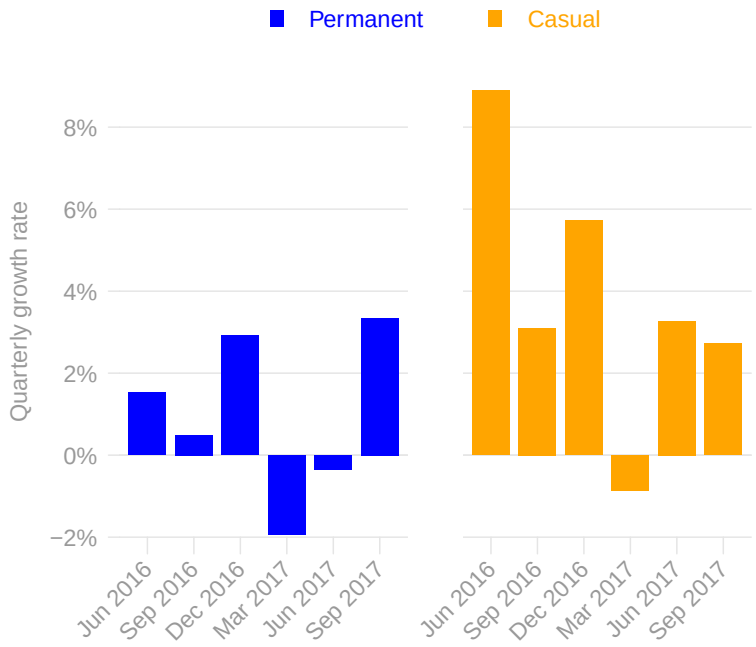

Figure 8: Growth in disability support workforce by forms of employment (quarterly growth rates)

Notes: Details in Table A16

Both these figures show that the majority of the growth in the sector's workforce was through the increased employment of casuals, with only the most recent quarter breaking from this pattern. This analysis confirms the overall picture shown earlier: that casual employment is overwhelmingly driving employment growth in the sector but that in the last quarter (September 2017) permanent employment fared much better. Additional quarters of Workforce Wizard will indicate if this is the beginning of a new trend.

Casual employment has driven employment growth ... but permanent employment has begun to fare better

How does the sector compare?

In 2016 the proportions of casuals, permanents and fixed-term workers in disability, compared with the labour market more generally were as follows:

Permanent: 58% (disability) to 67% (in general);
Casual: 40% (disability) to 23% (in general);
Fixed term: 3% (disability) to 10% (in general).

This comparison shows that casual employment in the disability sector is considerably higher than in the labour market more generally. At the same time, fixed-term employment is much lower.

Casual employment in disability is much higher than in the labour market more generally

If we look at the ABS category of ‘carers and aides’—which includes child care, aged care and disability—this difference in casualisation rates shrinks considerably: some 33% of carers are casuals. The full details of these comparisons can be found in the appendix (Table A6).

In summary, casual employment is much higher in the disability sector than in the Australian workforce more generally. But if we compare the sector to other similar sectors, then the comparison is less stark, though these higher casualisation rates are still exceptional.

3 What hours are worked by disability workers?

Overview

Flexibility in the hours of employment is important for both employers and workers. The former often need to manage varying demand for staff, while workers often need flexibility to juggle their work and non-work lives. In this chapter we look at the hours patterns in the permanent workforce: mainly the split between part-time (under 38 hours per week) and full-time (38 hours or more). We also look at the average hours worked each week.

The disability sector shares in what has been a national trend towards increased part-time work. Within the disability sector, part-time work is dominant and also increasing (see Figure 9). In the September 2017 quarter, the proportion of the permanent workforce who worked part-time was 81%. Full-time workers made up the remaining 19%.

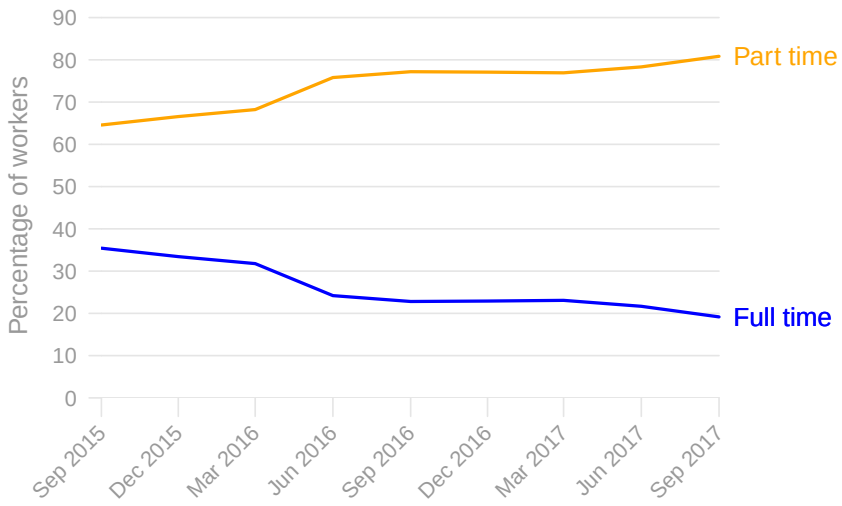

Figure 9: Full-time and part-time workers: overview (%)

Notes: Details in Table A19

The permanent workforce is dominated by part-time work, and this is growing strongly

Over the last two years part-time work has grown strongly among permanent disability support workers. In September 2015 part-time workers made up 65% of this workforce (with full-timers making up the remaining 35%). The part-time workforce (among permanent workers) has thus grown by 16 percentage points in just two years.

Does organisational size make a difference?

Large organisations have increased their part-time workforce ... and now have the highest proportion of part-time workers

Over the last two years large organisations have been steadily increasing their part-time workforce. As Figure 10 on page 24 shows, at the start of the period part-timers made up 62% of their workers. By the end of the period the figure was 83%, an increase of 21 percentage points. From being behind small and medium organisations in their employment of part-timers back in 2015, by late 2017 large organisations now have the highest proportion of part-timers.

In both small and medium organisations the proportion of part-timers has remained reasonably stable over the period (with more volatility in small organisations). By the end of the period medium organisations had slightly higher proportions of part-timers than did small organisations (74% to 68%).

Both large and small/medium organisations aim for workforce flexibility ... but have chosen different strategies

Because the analysis discussed here applies to the **permanent** workforce, a number of inferences can be drawn. First, this high proportion of part-timers in large organisations is predominantly **permanent part-time**. Secondly, the slightly lower proportion of part-timers in small and medium organisations needs to be seen in the context of higher levels of casual workers in those organisations. In other words, both large and small/medium organisations have sought to achieve flexibility in their staffing, but have chosen different strategies.

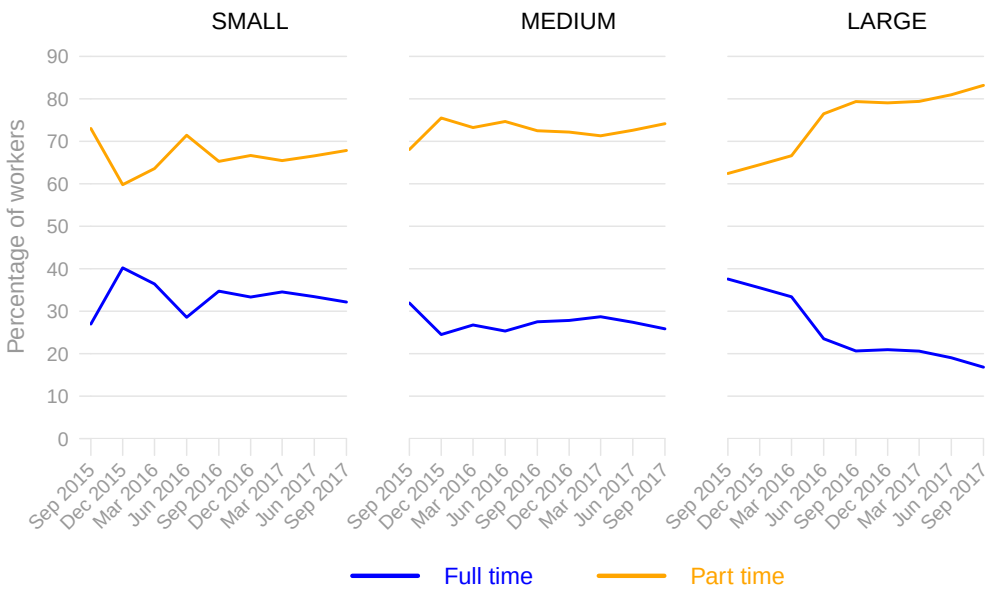

Figure 10:
Full-time and part-time workers by size of organisation

Notes: Details in Table A20

Average hours worked by each worker

Does the increased use of part-time workers also mean a reduction in the average hours worked by each worker within the disability sector? In general, the answer appears to be yes. There is a downward trend over the last two years in overall average hours of work, as shown by the red line in Figure 11.

There is a long-term downward trend in average hours of work ...

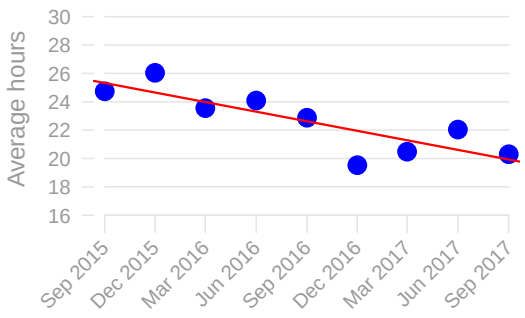

Figure 11:
Average hours of work per week per worker

Notes: Details in Table A21

If we look at the size of the organisations we can see that this is driven by the medium and large organisations (see Figure 12). In small organisations, average hours of work are stable whereas in both medium and large organisations they are declining steadily. This last result is not surprising: given

... and this is most pronounced in medium and large organisations

the increased use of part-time workers by large organisations, it follows that their average hours per worker will be declining.

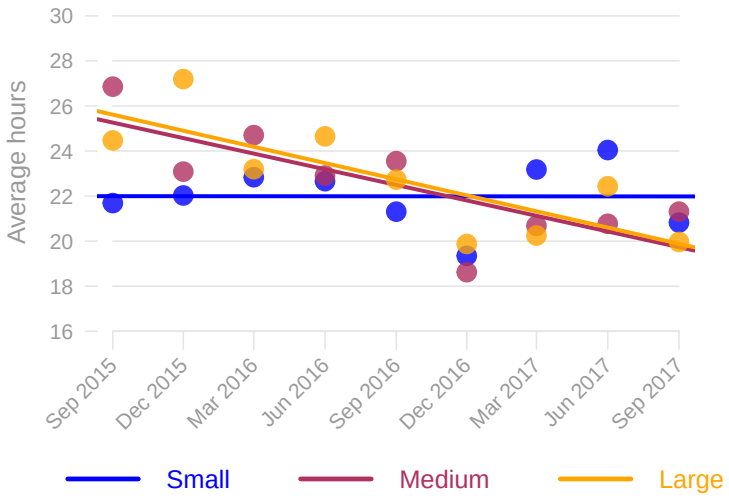

Figure 12:
Average hours of work per week per worker by organisational size

Notes: Details in Table A22

Both the level and the decline in average hours worked are a cause for concern. The decline appears unusual, and departs from the general pattern in the labour market. The level—averaging 22.6 hours per week over the last two years—is considerably lower than elsewhere in the labour market. For example, in workforces with similarly large proportions of part-time workers the figure is closer to 26 hours per week.[10] In the last quarter, the average hours worked by disability support workers had actually fallen to just 20 hours per week. Such low average hours raise important questions about sustainable growth for the sector's workforce: how does one earn a living wage without taking on a second job, or leaving the sector for a better paid position elsewhere?

Gender and hours of work

Is there a gender effect with full-time and part-time work, as there is with forms of employment? Using the same definitions as before, we look at whether organisations with higher concentrations of female disability support workers are also more likely to have higher proportions of part-time workers.

10. This is a ten year average for the general category of 'carers and aides', which includes aged-care workers as well as disability workers. Based on HILDA data.

There is no clear linear relationship between gender and hours of work

Figure 13 suggests that unlike forms of employment, there is no clear linear relationship. Until one looks at those workplaces with the highest concentrations (three quarters or more women) the proportion of part-time workers shows no distinct pattern. However, in those organisations with these large concentrations of women, there is a distinctly higher proportion of part-time workers: some 84% working part-time compared with an average of about 75% across the other categories.

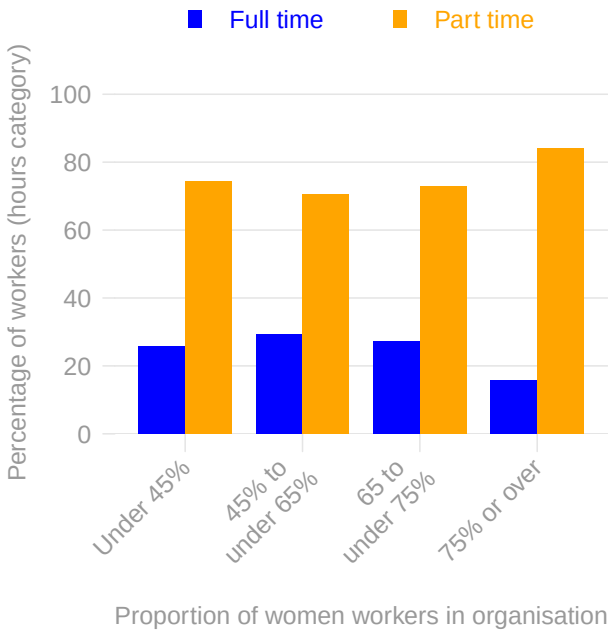

Figure 13: Full-time and part-time workers by the gender composition of the organisation

Notes: Note that data is pooled over all quarters. Details in Table A23.

Hours of work and workforce growth

Employment gains come from increases in part-time workers ... job losses are from declines in full-time workers

We saw earlier that workforce growth was strongly driven by an increased employment of casual workers. Using the same approach, with a balanced panel (see page 14), we analyse the composition of workforce growth according to the full-time and part-time status of the workers entering and leaving organisations. While the totals are smaller—because this full-time / part-time analysis is restricted to the permanent workforce—it seems clear that the growth in employment is largely driven by the increased employment of part-time workers. At the same time most of the job losses have been for full-time workers. Only in the September 2016 quarter did growth in full-time workers exceed growth in part-time workers. Figure 14 illustrates these findings.

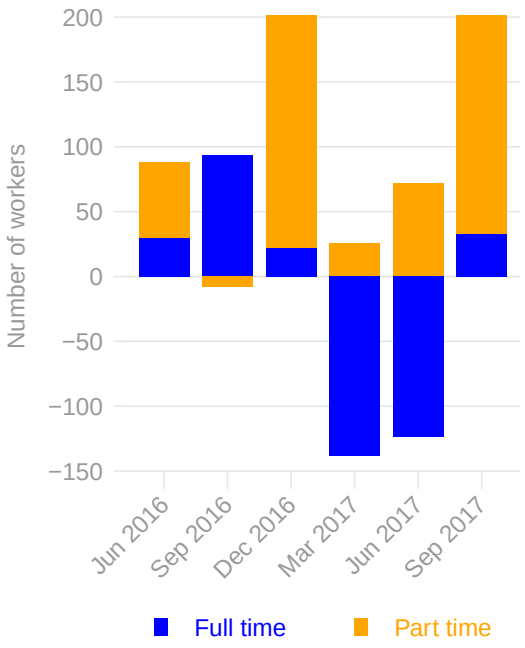

Figure 14: Growth in disability support workforce by full-time and part-time work (counts)

Notes: Details in Table A24

How does the sector compare?

We conclude this chapter by looking at how disability support workers compare with other workers. A more detailed comparison is in the appendix (see Table A7). It needs to be kept in mind that the population here is the permanent workforce and the comparisons are for September 2016.

The high levels of part-time employment in disability appear exceptional

In the September quarter of 2016 about 23% of disability workers within the permanent workforce were full-time; the remaining 77% were part-time. By comparison, the figures for the labour market as a whole are vastly different: 69% full-time and 31% part-time. In other words, in its use of part-time employees, the disability sector appears quite exceptional. However, this seems to be a feature of this type of sector, since the occupational category of 'carers and aides'—which includes the aged-care sector—has similar proportions: here some 30% are full-time and 70% part-time.

The strong growth of part-time work in disability over the last two years is a departure from the general trend

Is the growth in part-time employment which this chapter has illuminated part of a wider development in the labour market, or is it

somewhat unique to the disability sector? Over the last 15 years, part-time employment has grown steadily among permanent employees, rising from 26% of the workforce in 2001 to 30% in 2016. However, this growth has been uneven: and the figure of 30% has been largely stable since 2011 suggesting that the strong growth of part-time work in disability over the last two years is a departure from the general trend, and is likely to be NDIS-related.

If we again look at the broad category of 'carers and aides'—keeping in mind that it includes aged-care workers as well as disability support workers—the 15 year-trend is largely static: 72% were part-time in both 2001 and 2016. However, in the period since 2011, the proportion has been dropping, from a high of 75% down to 72%. While these figures need to be treated with caution (given the small sample size on which they are based), they confirm the earlier impression: the increasing use of part-time work in the disability sector is not shared more widely in the labour market.

4 Spotlight topic: absences

Introduction

Each quarter the Workforce Wizard contains an additional 'spotlight topic', a topic which throws light on important policy issues within the sector. It is not essential that these topics be collected every quarter. They will be repeated every two years and thereby provide the sector with a long-term perspective on these crucial issues.

In the March 2017 quarter the topic was recruitment trends and difficulties, and the results for this topic were discussed in the previous **Australian Disability Workforce Report**. In June 2017 the topic was workforce absences, specifically personal and carers' leave and leave without pay. Since these conditions were only available to the permanent workforce, they were only collected by Workforce Wizard for workers engaged as permanent or fixed term.

Personal and carers' leave and leave without pay

The Workforce Wizard collected the actual **number** of days workers were absent, but to take account of the fact that large organisations have a larger numbers of workers, we need to analyse leave as a **ratio**: the number of days taken per worker per quarter. Using this figure we compare averages across the states (with some of the smaller areas grouped with their neighbour to make the numbers adequate for analysis).

Workers took an average of about 6 days of personal and carers' leave per person per year

During the June quarter of 2017 disability support workers took an average of 1.8 days of personal and carers' leave per person during the quarter (see Table 1). Using the median, which removes more extreme values, the average was 1.2 days. Based on these figures, an annual estimate is that workers took about 6 days of personal and carers' leave per person per year.[11]

11. This is based on multiplying by 4 the mid-point figure of 1.5 days.

Personal and carers' leave was highest in Queensland (2.9 days per quarter) and New South Wales / ACT (2.5 days per quarter), and lowest in Victoria / Tasmania (1 day per quarter) and in organisations that were spread across states (0.8 day per quarter).

Leave without pay was much less common. The national average was 0.5 day, which in annual terms equated to 2 days of leave without pay. The highest figures were just 0.7 day per quarter in Queensland and South Australia / Northern Territory. The lowest figures (0.3 day per quarter) were again in the multi-State organisations.

> Workers took an average of 2 days of leave without pay per person per year

While there is no discernible pattern in the leave without pay figures according to the size of the organisation, there is when it comes to personal and carers' leave. Those disability support workers employed by large organisations accessed about half of the amount of leave compared to those employed by small and medium organisations. Those in large organisations took 1.1 days per quarter, while those in small organisations took 2 days and those in medium organisations took 2.1 days.

Table 1: Average number of days per worker per quarter, personal and carers' leave and leave without pay, by State

	Personal and carers' leave		Leave without pay		
State	**Mean**	**Median**	**Mean**	**Median**	**n**
Queensland	2.5	1.3	0.4	0.0	33
Multi-state	1.0	1.1	0.5	0.2	47
Victoria / Tasmania	2.9	1.8	0.7	0.0	31
Western Australia	1.3	1.2	0.7	0.0	30
New South Wales / ACT	1.6	1.2	0.4	0.0	34
South Australia / NT	0.8	0.4	0.3	0.0	18
National average	1.8	1.2	0.5	0.0	193

Notes: Population is permanent and fixed term workers only. n is number of organisations in the sample. *Source*: Workforce Wizard

The National Employment Standards for a full-time employee provide for 10 days per year for personal and carers' leave. This minimum figure feeds into the pricing assumptions of the NDIS. Yet the disability sector figure of 6 days for each worker, in a workforce where over 80% of workers are **part time**, equates to a much higher number, well over 10 days. While it is well-known that workers in stressful and emotionally demanding jobs have higher sickness rates, this is the first time we have data on the actual use of personal and carers' leave entitlements in disability.

Industrial instruments covering the workforce

In the September quarter of 2017 the spotlight topic was the type of industrial instrument which covered the workforce for which that organisation was entering data. The industrial instrument provided the basis for wages and conditions for a defined group of employees. There were two main instruments:

1. Awards: which are negotiated by trade unions and often operate at an industry level. They usually provide a 'floor' to both wages and conditions in that industry, though individual organisation may sometimes provide 'over-award' pay or conditions.
2. Enterprise agreements: these are based on bargaining outcomes within the organisations between the union or workers and the management. They usually provide better pay and conditions than the award, but may also involve 'trade-offs' on the part of the workers in return for these advantages.

Traditionally, many disability organisations have undertaken enterprise bargaining, but this may be changing in the new market environment and this spotlight topic will assist in monitoring such changes.

Nearly 60% of organisations were covered by awards, about 40% by enterprise agreements

Overall about 59% of organisations were covered by awards and the remaining 41% were covered by agreements. However, the variation across states was considerable. As Table 2 shows, the coverage of awards was much higher in New South Wales / ACT and Queensland: 87% and 73% respectively. It was lowest in South Australia / NT (just 25%) and somewhat lower in Victoria / Tasmania (49%).

Table 2: Industrial instruments operating in organisations, by state (%)

State	Award	Agreement	Total	n
New South Wales / ACT	87	13	100	30
Victoria / Tasmania	49	51	100	37
Queensland	73	27	100	22
South Australia / NT	25	75	100	16
Western Australia	54	46	100	26
Multi-state	56	44	100	16
Total	59	41	100	147

Notes: Population is organisations and coverage refers to disability support workers. n is number of organisations in the sample. *Source*: Workforce Wizard

These figures for industrial coverage are for **organisations** in the disability sector, but it is also possible to calculate coverage for the **workforce** by taking account of the number of workers in each organisation. Table 3 shows the patterns in industrial coverage for some 31,000 disability support workers in Australia.

Workers are split evenly between award coverage and enterprise agreements

Overall, workers are split almost evenly between award coverage (51%) and enterprise agreements (49%). The state patterns, however, are quite diverse. New South Wales / ACT and Queensland are again the States with the highest proportion of workers under the award (82% and 63%), and South Australia / NT is again much lower. An interesting difference is evident in the figures for Victoria / Tasmania. Award coverage for organisations is 49%, but for the workforce the figure is half this at 25%.

Table 3: Industrial instruments for the workforce, by state (%)

State	Award	Agreement	Total	n
New South Wales / ACT	82	18	100	6,658
Victoria / Tasmania	25	75	100	5,008
Queensland	63	37	100	2,911
South Australia / NT	17	83	100	3,429
Western Australia	44	56	100	5,999
Multi-state	58	42	100	6,819
Total	51	49	100	30,824

Notes: Population is the disability support workforce. n is number of workers covered by the organisations in the sample. *Source*: Workforce Wizard

Historically, enterprise bargaining has been more common in large organisations, while smaller organisations have often stayed on the award. To some extent, this pattern is confirmed in the Workforce Wizard data, particularly for the workforce figures. In the case of organisational coverage, some 46 percent of large organisations have enterprise agreements, slightly higher than the average (41%) but considerably higher than small organisations (35%). Turning to workforce coverage, some 53% of workers in large organisations are covered by enterprise agreements compared with just 35% of the workforce found in small organisations.

Table 4: Industrial instruments for organisations and for the workforce, by organisational size (%)

	Organisations				Workers			
Org size	Award	Agree-ment	Total	n	Award	Agree-ment	Total	n
Small	65	35	100	40	65	35	100	1,083
Medium	59	41	100	66	61	39	100	6,757
Large	54	46	100	41	47	53	100	22,984
Total	59	41	100	147	51	49	100	30,824

Notes: Population in first panel is organisations; in second panel the workforce. n in first panel is number of organisations; in second panel, number of workers covered. *Source*: Workforce Wizard

The disability sector has a higher proportion of workers on enterprise agreements than the labour market average

How do these figures compare with the industrial relations situation more generally? The Australian Bureau of Statistics collects workplace information on methods of setting pay and it's data for May 2016 provides an overall estimate of 37% of employees[12] on enterprise agreements, with the balance split between award coverage and individual arrangements.[13] This suggests that the disability sector has a higher proportion of workers (49%) on enterprise agreements than in the labour market more generally.

However, if we look at the broad industry category of 'health care and social assistance', the figures are much closer to the disability sector figures in Workforce Wizard. These ABS estimates show that 53% of employees were employed on enterprise agreements. This industry finding mirrors the findings in other chapters, where if we focus more closely on occupational groups such as carers and aides, the disability sector appears much less exceptional.

12. The data come from ABS, *Employee Earnings and Hours*, Australia, May 2016, Cat.No. 6306.0 (Spreadsheet: 63060DO007_201605). Note that the population for these estimates is full-time non-managerial employees. The all-employee data combines awards and collective agreements and is therefore of no use in this particular comparison.
13. The ABS has always distinguished between award coverage and individual arrangements but this overlooks two issues. First, individual arrangements are 'underpinned' by the award, so the low figures given for award coverage are mislead-ing. Secondly, the number is further reduced because 'over-award' payments are also classified as individual arrangements. For these reasons, it is best to just focus on the figures for enterprise agreements, which the ABS terms collective agreements.

5 What are workers looking for?

The job market is where employers in the disability sector look for workers and where people interested in working in the sector seek out jobs. The **carecareers** website which is run by NDS accepts advertisements for jobs ('job ads') from employers where they currently have vacancies. People who land on the website scan this 'job board' looking for suitable employment, and when they find a position which interests them, they may click on the 'view details' button and continue by clicking on an 'apply' button.

The data from this job board spans about 5 years, from the end of 2012 to the beginning of 2018, and is a rich source of information on what is happening in the disability jobs market. In this chapter we look at the job applications posted by individuals who transact with the carecareers job board. These people—termed 'job seekers'—may be already working, and looking around for a different job; they may be unemployed; or they may be outside the labour force and contemplating entering or returning to the workforce. We don't have information on their situation, but we can look in some detail at the kinds of jobs for which they are looking.

We use the data from 2013 to 2017 because it is complete for each year. Through to end of June 2016 NSW employers (accounting for over 50% of the total advertiser base) were able to list ads for free, so there is a steady growth in jobs over the period. However, during 2017—once employers were required to pay a (modest) amount for listing ads—the number of job ads declined. It is important to keep this decline in mind. It does not imply a decline in the availability of work in the sector and the decline in ads does not weaken the useful of the various comparative measures used here.

All the jobs examined here are only those applying to the disability sector (carecareers posts a much larger range of jobs in other areas of the community sector) and we also analyse the occupational groupings which apply to these jobs.[14]

14. The definitions of the occupational groupings used here are to be found in the appendix. See Table A26. The combined disability sector jobs include some health professional, and allied health professional jobs, but for sampling reasons the occupational groupings omit all of the health jobs.

What interests job seekers?

One measure of what people look for when they transact on the jobs board of carercareers is whether they click to find out more details about the job. We calculate **the ratio of views to each listing** to gauge the 'popularity' of listings over the period from 2013 to 2017. These data are shown in Figure 15 and suggest that in the first full year of operation, each listing on the jobs board for direct support workers was 'viewed' on average by more than 450 potential workers.[15]

These popularity ratios fell in 2014, but then grew steadily from then on, and the pattern was generally repeated across most occupational groups. One interpretation of these data is that the initial year represented heightened interest in a new job-seeking platform available on the internet, and that subsequent years reflected the underlying growth of interest in these jobs. What seems particularly notable about the listings for direct support workers is the reduction in listings during 2017 did not lead to a diminishing level of interest by job seekers. The ratio (of over 400) held up during 2017, despite fewer jobs on offer on the platform.

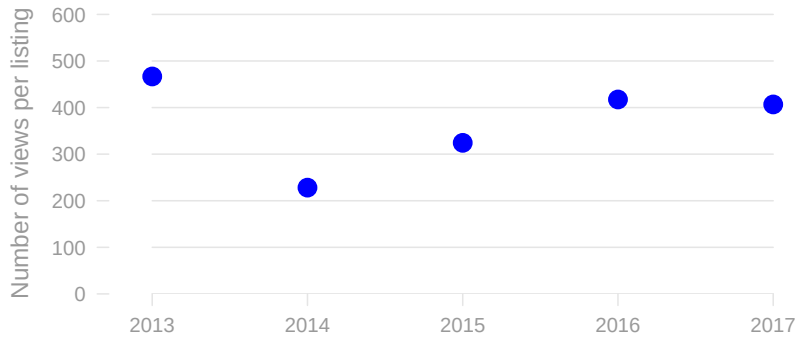

Figure 15:
Views of job listings for direct support workers

Source: carecareers job board

15. We need to keep in mind that actual job listings were only shown for a month, so this figure is an average based on dividing the total number of views in a year by the total number of listings, broken down by the occupational grouping.

Job applications

A much stronger measure than viewing the details for job ads is making an application. While there are some difficulties in knowing whether job seekers follow through completely with their online applications, there is no reason to assume that systematic patterns will influence this outcome. With this in mind, we examine information on forms of employment and hours of work to see what kinds of jobs disability workers are looking for. We plot the data as monthly counts and then fit trend lines to illuminate the overall pattern. As we did in earlier chapters, we focus on both forms of employment (permanent and casual jobs) as well as hours of work (full time and part time jobs). The latter distinction is only applicable to job ads for permanent positions.

As Figure 16 shows, most job seekers preferred permanent jobs over casual jobs. The growth in the latter category remained almost flat from 2016 onward, whereas growth in applications for permanent jobs grew strongly until early 2017, when applications began to fall.

Most job seekers preferred permanent over casual jobs ...

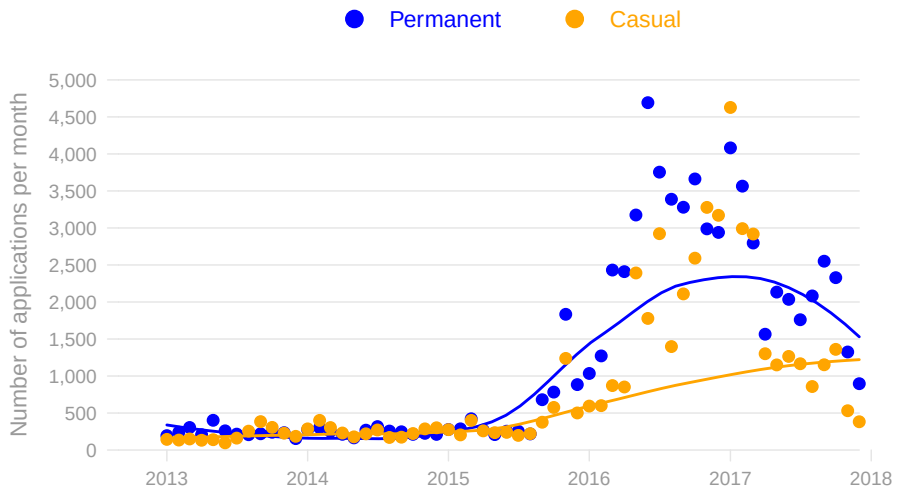

Figure 16: Monthly applications for disability jobs, by forms of employment

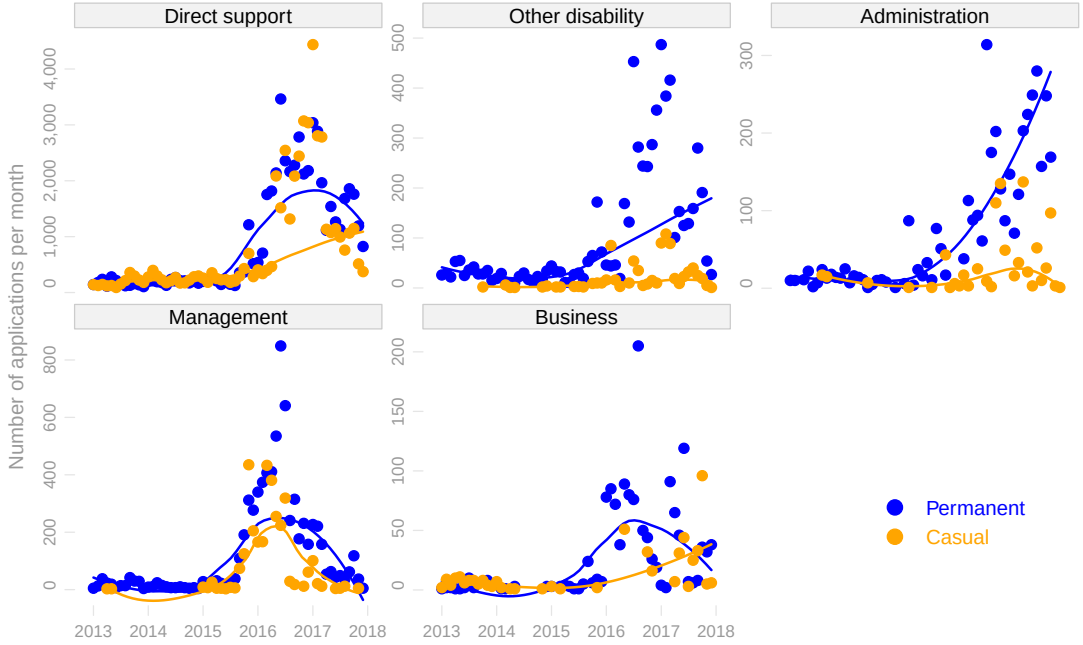
Source: carecareers job board

Because 80% of the applications were for direct support workers, the occupational breakdown for this group closely matched the overall patterns. That is, direct support workers had a much stronger preference for permanent jobs over casual jobs (see Figure 17). This carried through to the other occupational groups with some minor variations. For example, while casual jobs barely

featured in administration, they were more common in the management occupations, with applications split evenly between permanent and casual jobs during the middle of 2016.

Figure 17: Number of job applications per month, by forms of employment and by occupational grouping (*Source:* carecareers job board)



When we turn to hours of work, a very different picture emerges. Not only did part-time applications outnumber full-time applications across the period, but they continued to grow strongly during 2017 when full-time applications were falling away (Figure 18). This is quite a striking difference to the picture which emerges with forms of employment. Again, because of the dominance of direct support workers in this population, the breakdown by occupational groups reinforces this general pattern of a strong preference for part-time work. There is, however, is one interesting variation. While full-time applications were more common than part-time ones in administrative occupations, the numbers were very close and there was strong growth in both during 2017 (Figure 19).

... but workers preferred part-time jobs over full-time jobs

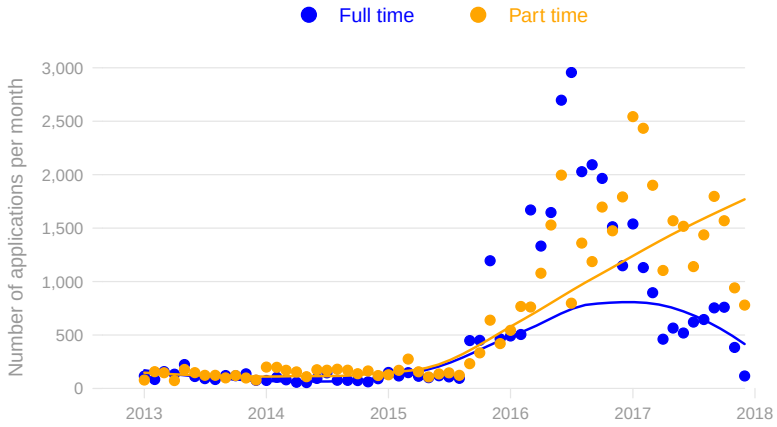


Figure 18: Monthly applications for disability jobs, by hours of work

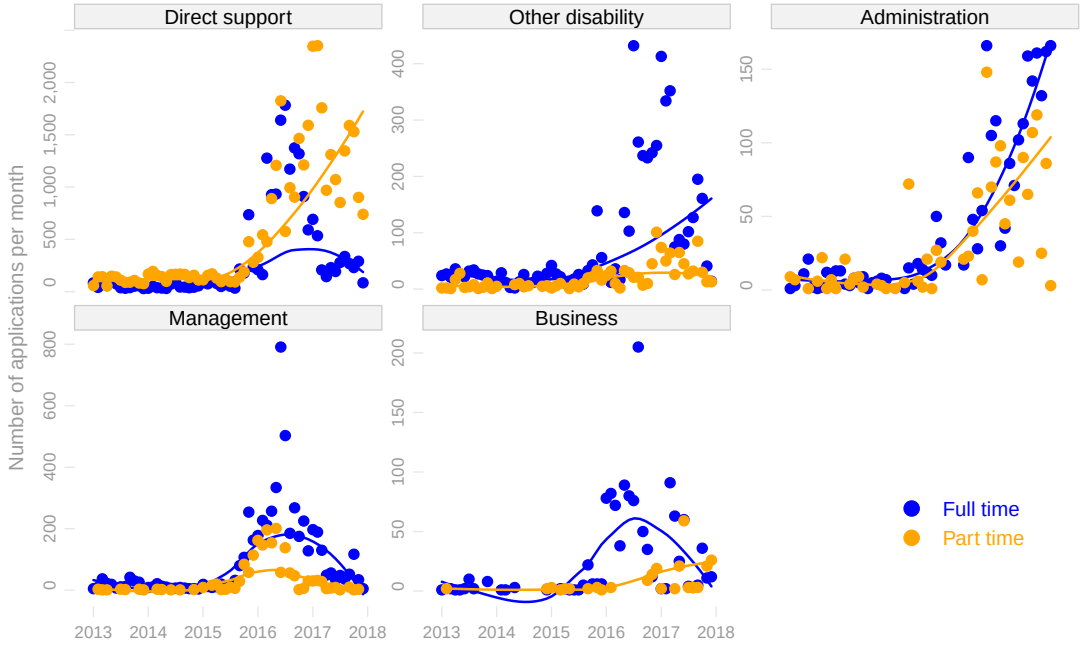
Source: carecareers job board

Figure 19: Number of job applications per month, by hours of work and by occupational grouping (*Source:* carecareers job board)



One of the enduring questions posed by the growth of part-time employment in the Australian labour market is whether this growth is mainly driven by what employers offer, or by what workers are looking for. The high levels of **underemployment**[16] in some sectors of the labour market suggests that many of the part-time jobs are all that is on offer. Nevertheless, some sectors have large numbers of female workers and students who seek out part-time work because of its suitability for work-life balance.

16. This is where part-timers wish to work more hours than are provided by their employers.

The job applications data for the disability sector provides some insights into this enduring question. When it comes to offering jobs for direct support workers, carecareers employers appear to be offering both permanent and casual jobs in roughly comparable numbers. Similarly, when it comes to whether the permanent jobs on offer are full-time or part-time jobs there is some variability over the period, but the overall pattern in the proportions are also close to even.

Most job seekers want permanent jobs in preference to casual jobs, and part-time jobs in preference to full-time jobs

However, when we turn to look at the data on what interests job seekers, we find that workers are more interested in applying for the permanent jobs. And within those permanent jobs, they are more interested in the part-time positions. This is particularly so among workers looking for direct support jobs and for jobs in administration.

6 What does the allied health workforce look like?

Demographic aspects

The allied health workforce in the disability sector is much smaller than the disability support workforce, but is quite a distinctive group of workers. It is made up of allied health professionals such as occupational therapists, physiotherapists and speech pathologists, as well as nurses.

The workforce is overwhelmingly made up of women. In the September quarter of 2017, 92% of allied health professionals were women. In very few organisations (about 12%) is the female-to-male ratio of the allied health workforce less than 80%. Indeed, in more than one fifth of disability organisations, the whole of their allied health workforce is female. These figures compare starkly with the disability support workforce, where the female proportion in the September quarter of 2017 was 70%.

Similarly, the age profile of allied health workers stands out: they are a much younger workforce. Some 65% were in the middle years of 25 to 44, compared with a figure of 44% among disability support workers. As we saw earlier, the latter group had more older workers—about 21% were older than 55 years—whereas in the allied health workforce only 11% were in this age group.

Forms of employment

Three quarters of the allied health workforce were permanent workers

Unlike disability support workers, an important aspect of employment among allied health workers is the dominance of permanent employment and the relatively larger role played by fixed-term appointments. Whereas casual employment is a striking feature of the disability support workforce, among allied health workers it is

insignificant: only about 7% of workers were employed in this way over the period.[17] By contrast, some 16% were employed as fixed-term and this figure had moved above 20% during some quarters. Most importantly, an average of three quarters of the allied health workforce were employed as permanent employees.

If we look at this in terms of workforce density within organisations, we see that both casual and fixed-term employment is not prominent. As Table 5 shows, 47% of organisations with allied health workers employ none of these worker as casuals, and 44% employ none as fixed-term workers. Only about 10% of organisations had densities of more than 30% for these forms of employment, and these were overwhelmingly the smaller organisations.

Table 5: Organisations by casual and fixed-term density: allied health workers

	Casual employment		Fixed-term employment	
Density	**No.**	**%**	**No.**	**%**
None	91	47	85	44
10% or less	46	24	31	16
Between 10% and 30%	35	18	58	30
More than 30%	23	12	21	11
Total	195	100	195	100

Notes: Data has been pooled over all quarters. *Source*: Workforce Wizard

Hours of work

The allied health workforce is split almost evenly between full-time and part-time workers.[18] In the September quarter of 2017 49% were employed full-time and 51% were employed part-time. This situation is, however, the culmination of a steady increase in part-time workers over the two year period. At the start of the period part-time workers made up 45% of the workforce.

Consistent with this development, the average hours of work seem to have been declining over the period. As Figure 20 shows, despite the fluctuations, the longer-term trend appears to be downward.[19]

17. The data for the last quarter shows a threefold increase in the proportion of casuals (from 6.6% to 18.7%), but because of the small number of organisations in the Workforce Wizard sample, one needs to treat this figure with considerable caution. The average of 7% for the period excludes this outlier. Including it only moves the average higher by one percentage point.
18. The population for this is both permanent and fixed-term workers. Unlike the situation with disability support workers, fixed-term employment is significant in allied health, and is thus included in the analysis.
19. One needs to be cautious with these quarterly figures for the allied health work-

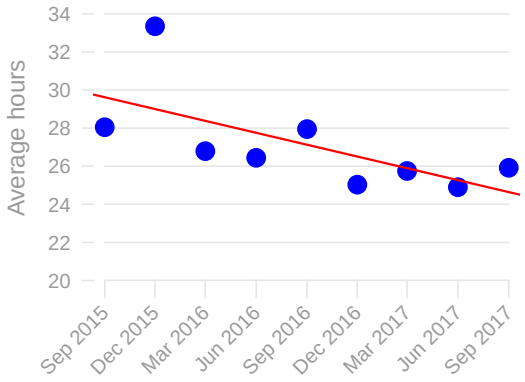


Figure 20: Average hours per week: allied health professionals

Notes: Details in Table A25

Spotlight topics

Like the disability support workers, the allied health professionals also answered question about absences and industrial relations. In the case of personal and carers leave, allied health professional took an average of 2 days leave per person during the quarter. This was a slightly higher figure than that taken by disability support workers (1.8 days).

Allied health workers use of leave without pay was low: 0.7 days per quarter. Again, this figure was slightly higher than the comparable figure for disability support workers (0.5 days).

In nearly two-thirds of organisations the industrial coverage for allied health professionals was an industrial award, with the remainder of organisations using enterprise agreements (63% to 37%). This figure for award coverage was slightly higher than for organisations with disability support workers (59%).

force because the number of observations are quite small. See Table A25 for these counts.

Appendix

Important concepts

Workers may be engaged by employers as permanent, fixed term, or casual, a mode of engagement referred to as the **form of employment**. The first two categories are characterised by the workers having access to holiday and sick leave, while those in the third category have neither of these. Permanents are also employed with an expectation of on-going employment; fixed-term workers have a termination date in their contracts; and casuals have no expectation of any ongoing employment and can, in theory, be terminated at short notice.[20]

Fixed term workers are often used to fill a gap, such as when staff are on parental leave or long service leave. Because the number of fixed-term disability support workers is very small, we mostly combine permanent and fixed-term workers and refer to them as the permanent workforce. Only in Chapter 2, the chapter which deals with forms of employment, do we report on all three categories.

One of the key issues for workforce planning in the disability sector is the extent of casualisation. As we will see, the sector has a higher proportion of casual workers than most other sectors in the workforce and it is growing over time. There are a number of important policy issues raised by this development. While casuals offer apparent flexibility to employers in meeting their staffing needs, the downside is the higher staff turnover which results, and a more uneven mix in their workforce when it comes to quality (such as skills, experience and qualifications). For workers, these jobs offer a 'casual loading' in their wages, which they may be reluctant to forgo in favour of the increased security which permanent jobs might bring. The main downside for workers is that casual employment is insecure: there is no guarantee of the job continuing, nor how much income they may earn and institutions such as banks will often not make large loans to those in casual employment.

20. The casual category is a complicated one, since industrial tribunals have modified the rights of employers to terminate casuals at short notice. The labour market is also characterised by large numbers of 'permanent casuals' who have worked in that form of employment with the same employer over many years.

The **hours** an employee works, whether full-time or part-time, is a different matter to the **form of employment**, but in popular usage the term 'casual' is often taken to mean part-time. In the case of the disability workforce, we distinguish full-time and part-time only for the combined permanents category (that is, permanents and fixed term workers). In the case of casuals, disability services do not systematically record data on their hours of work, so we are not in a position to discuss levels of part-time work among the casual workforce.

Comparisons

In this section of the appendix we look in more detail at how disability support workers compare with other workers, and how the Workforce Wizard data compare with other data sources (in this case the HILDA data).[21] The comparison for forms of employment is summarised in Table A6. We need to keep in mind the difficulties of lining up disability support workers with occupational and industry categories available in other data sources.[22] There is no clear one-to-one correspondence. The occupational category which is the closest analogy for these workers is **carers**, so this comparison is the best one for comparing the data as such.[23] The other comparisons in this table illuminate how the workforce in this sector differs from other workforces.

Table A6: Comparisons for forms of employment (%)

Category	Casual	Fixed term	Permanent
Disability service workers (Workforce Wizard)	40	3	58
Carers (HILDA)	33	9	58
Community Sector (HILDA)	19	11	70
All males (HILDA)	20	9	70
All females (HILDA)	25	11	64
All persons (HILDA)	23	10	67

Notes: The data for Workforce Wizard come from the September quarter of 2016, the closest period in time to when the HILDA data was collected. *Source*: Workforce Wizard and unpublished data from HILDA, Release 16

21. The Household, Income and Labour Dynamics in Australia (HILDA) Survey is a longitudinal survey of Australian households which has been conducted annually since 2001. It is carefully sampled to be representative of the Australian population and collects information on households, and on individuals living in those households. It is managed by the Melbourne Institute of Applied Economic and Social Research.
22. For more details see NDS and Windsor and Associates 2014, *Roadmap to a Sustainable Workforce: Improving the quality of disability workforce data*, Report for DSS Project Report 1, Sydney: National Disability Services.
23. Carers are defined as ANZSCO [42] Carers and Aides. This category also includes childcare workers, education aides and aged care workers.

The most notable difference shown here is the remarkably high incidence of casual employment among organisations in the Workforce Wizard. The comparison with carers has the smallest gap: 40% compared to 33%. Compared to the community sector as an industry category,[24] the difference is stark: 40% compared to 19%. A similar gap is evident for the workforce more generally: 40% to 23%.

However, part of the explanation for these differences lies with the category of fixed-term employment. What is notable about the occupational comparison is that the incidence of permanent employment is identical between Workforce Wizard and carers, at 58%. The difference in casualisation is solely due to the differences in fixed-term employment: Workforce Wizard organisations have a far smaller proportion of fixed-term workers than is the case for carers. A similar difference is evident with the community sector. Here the gap in permanent employment between that sector (70%) and the disability sector (58%) is narrower than is the gap in casual employment between that sector (19%) and the disability sector (40%).

Turning now to a comparison with hours, Table A7 summarises the results. It needs to be kept in mind that the population here is the permanent workforce, and this applies to the HILDA data as well as to the Workforce Wizard figures.

Table A7: Comparative split between part-time and full-time permanent workers (%)

Category	Part time	Full time
Disability service workers (Workforce Wizard)	77	23
Carers (HILDA)	70	30
Community Sector (HILDA)	56	44
All males (HILDA)	16	84
All females (HILDA)	47	53
All persons (HILDA)	31	69

Notes: Population is non-casual workforce for both Workforce Wizard and HILDA data. The data for Workforce Wizard come from the September quarter of 2016, the closest period in time to when the HILDA data was collected. *Source*: Workforce Wizard and unpublished data from HILDA, Release 16

As with forms of employment, Workforce Wizard organisations are closer to the category of carers: about 7 percentage points difference in the incidence of part-time workers: 77% to 70%. As noted earlier this occupational category is probably the closest match for disability support workers so these similar figures suggest

24. The community sector is defined as ANZSIC [86] Residential Care Services and [87] Social Assistance Services.

the Workforce Wizard data is reasonably representative of the sector.

The broader comparison is quite stark. For all the other comparisons in this table the gap is particularly large. There is a 21 percentage point gap with the community sector more broadly, and a 46 percentage point gap with the general workforce. Given the high incidence of female employment in the sector, a fairer comparison for the latter would be with the female workforce more generally and the gap here is 30 percentage points: 77% to 47%. Clearly, the incidence of part-time employment within the permanent workforce in the disability sector is remarkable.

Acknowledgements

This report uses unit record data from the Household, Income and Labour Dynamics in Australia (HILDA) Survey. The HILDA Project was initiated and is funded by the Australian Government Department of Families, Housing, Community Services and Indigenous Affairs (FaHCSIA) and is managed by the Melbourne Institute of Applied Economic and Social Research (MIAESR). The findings and views reported in this report, however, are those of the author and should not be attributed to either FaHCSIA or the MIAESR.

A FREE WORKFORCE BENCHMARKING TOOL FROM NDS

Can you afford NOT to use it?

More than 200 organisations use Workforce Wizard every quarter to understand where their workforce is heading and how it compares to the sector.

Without Workforce Wizard you wouldn't know:

- Is your turnover higher than everyone else's?
- Do your workers have above-average absences?
- What is the common rate of unfilled vacancies?

Disability providers use Workforce Wizard to:

- Benchmark staff retention
- Compare client and workforce profiles
- Meet clients' expectations with sufficient capacity
- Produce informative reports for their Boards

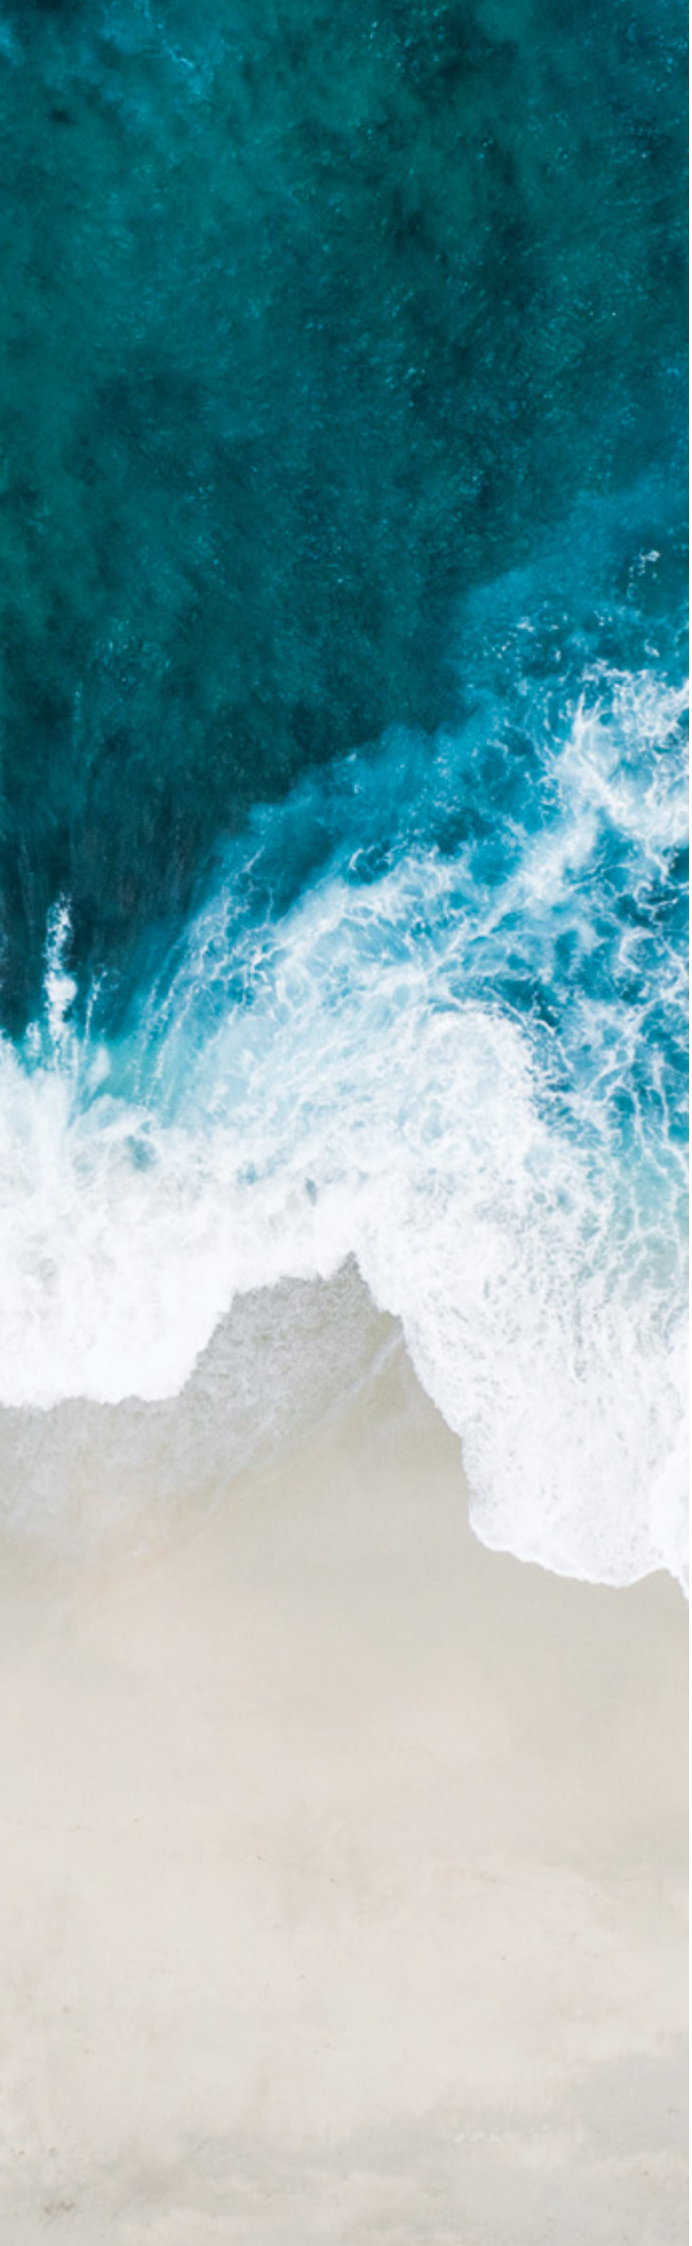
NDS National Disability Services

National Disability Services

STATE OF THE DISABILITY SECTOR REPORT 2018

The NDIS has ushered in a new era for disability service providers. It can be like an ocean; sometimes stormy, with a dangerous undertow; at other times extending our horizons and carrying us forward. The challenge before us is how we navigate this journey of change and collectively create the best possible NDIS.

Centre for Applied Disability Research
An Initiative of National Disability Services



Contents

2/

The State of Play

The disability sector is immersed in complex, difficult and large-scale reform. The major part of that is the National Disability Insurance Scheme (NDIS), but Disability Employment Services (DES) – which sit outside the NDIS – are also in the midst of significant change.

Disability service providers support the NDIS reform principles. They welcome the major boost in funding in response to the chronic unmet need for services, the expansion of choice and control for people with disability and their families, the investment in early intervention, and the goal of equitable access to services across Australia.

However, the road to reform is rough, and many service providers are under stress. Their sense of uncertainty is exacerbated by frequent process changes, inconsistent advice, new regulations and difficulty getting the market data they need to make growth decisions.

At the core of NDS's 2018 State of the Disability Sector Report are findings from a survey of 626 service providers. They include providers of all sizes, from every state and territory, that collectively span the full range of disability service provision.

Providers' experiences of the NDIS are mixed, but more than half see the operating conditions in the disability sector as worsening: 80 per cent say that the disability policy environment is uncertain.

NDIS red tape imposes costs

Providers are frustrated with NDIS systems and processes. Over the past year, many have experienced long delays in payments; the NDIS portal is not user-friendly; and the quality of NDIS plans is uneven.

Providers are expending unpaid effort on untangling red tape, resolving payment issues and helping people with disability to get plans that properly reflect their needs and goals. All of this imposes costs on providers at a time when they are under pressure to reduce their costs.

The impact of very tight NDIS prices on service quality is a significant concern. Some of the prices stretch supervision ratios and don't allow for investment in staff training. They impede the recruitment and retention of experienced and qualified staff.

Some solutions are emerging

NDS is working with the National Disability Insurance Agency (NDIA) on solutions to these problems, and incremental improvements are occurring. While we remain critical of inadequate NDIS prices, the price increases announced following the Independent Pricing Review provided some relief. Further work is under way to set higher prices to support people with complex needs. Having been a strong critic of the planning process and the NDIS portal, we are pleased to see improvements coming to the planning process (albeit gradually) and fixes to the portal (although more are needed).

Accelerating these and other solutions should be a priority. While problems persist, the NDIS will not deliver on its great promise to Australians with disability.

Employment is lagging

Many Australians with disability want to work, yet the employment rate of Australians with disability is low and static. This must change. The exclusion of people with disability from the workforce is bad for the Australian economy and a cause of poverty and social isolation.

Economic participation is a goal of the NDIS, but only a tiny proportion of participant plans currently include employment supports. In NDS's view, all participants of working age should have employment in their plan unless they specifically refuse it.

Stronger disability employment support is a key part of the answer to the low employment rate of people with disability. Reforms to Disability Employment Services, introduced in July 2018, expand choice and competition; but they also apply a new and untested funding model that appears to be disadvantaging some cohorts of job seekers. Whether the new DES program boosts employment outcomes for job seekers is yet to be seen.

Disability Enterprises provide employment to 21,000 Australians with significant disability. Their future depends on resolving the financial uncertainty they face. This will require a satisfactory outcome to the long-running dispute over wage-setting before the Fair Work Commission, a viable funding and pricing model under the NDIS, and

increased commercial income boosted by government procurement of goods and services.

Social inclusion strategy requires renewal

The National Disability Strategy is due to expire in 2020. It is a 10-year strategy, signed off by the heads of all Australian governments, that is designed to give practical effect to the United Nations Convention on the Rights of Persons with Disabilities. The Strategy's ambitions are admirable, but its capacity to drive change has been very limited. The Strategy is a critical companion of the NDIS and it needs reinvigoration.

As well as bringing issues, such as those outlined above, to the attention of government, NDS is committed to working with government to find answers. We are determined to do all we can to make the NDIS work for all stakeholders, to increase employment opportunities for people with disability, and to inject new life into the National Disability Strategy.

Solutions must include drawing more on the great passion, expertise and experience that lies in the disability community among service providers, people with disability and their families and carers. This should extend to policy advice, the identification and testing of process changes before they're introduced, and the provision of some key functions. For example, we believe the quality of plans would improve if participants and their families could choose to construct their plans with service providers and with Disabled Persons Organisations, not just with Local Area Coordinators.

A Federal Parliamentary report on the NDIS released in October 2018 recommended additional resources to assist the disability sector to implement the large-scale reforms that are under way. NDS agrees. Increasingly, governments are turning to the non-government sector to deliver disability services, and there are good reasons for this. Boosting the capacity of the sector to deliver services when and where they are required – and in ways that are responsive to people's needs, goals and differences – is an essential investment.

THE WAY FORWARD

Proposals we'd like to see implemented

1 A fully-funded NDIS
Governments have committed funding to the NDIS, but this must be renewed annually and reflect evolving evidence of costs of disability support.

2 Prices to stimulate growth and quality
Prices set by the NDIA are insufficient to sustain some services and threaten quality. Prices should reflect realistic costs and be progressively deregulated.

3 Market stewardship that responds to warning signals of market failure
Pricing, workforce shortages and uncertainty are impeding growth of NDIS supports. To prevent market failure, improved data, clarity about market interventions and a systematic response to emergencies are needed.

4 NDIS processes informed by experience
Providers are under pressure to reduce costs, but they can only be as efficient as NDIA systems allow. Participants should be able to develop their plans with people who have knowledge of disability supports.

5 Flexibility that reflects national diversity
NDIS planning, funding and service models must respond to local conditions, particularly in rural and remote Australia.

6 Complex design problems resolved
The NDIS is struggling with complex design problems, such as employment, transport and the interface with other service systems. Solutions can be found by working closely with the sector.

7 Sector development that supports transition and progress
A reform as large as the NDIS needs significant investment in workforce development and service capacity, including an industry assistance fund.

8 Investment in quality and safeguarding
Investment in organisational cultures and staff development is critical to complement the new NDIS quality and safeguarding regulations.

9 More open employment opportunities
Action should be taken to ensure that no job seekers are disadvantaged by the new Disability Employment Services model of risk-adjusted funding.

10 Extended school-to-work support
Connecting young people at school with jobs vastly improves their chances of working post-school. NDIS School Leaver Employment Supports should be open to people before they finish Year 12.

11 More jobs in supported employment
The government must work with the sector to resolve the wage determination dispute, develop a viable supported employment funding model, and expand procurement from Disability Enterprises.

12 Renew National Disability Strategy
A renewed National Disability Strategy must have strong performance measures, access to resources, a prominent public profile and ownership across government and the disability community.

6/

The State of the Operating Environment

About the Annual Market Survey

The following data is produced from the sixth wave of NDS's Annual Market Survey. The survey was conducted by the Centre for Social Impact at the University of New South Wales in partnership with NDS's Centre for Applied Disability Research (CADR).

Who responded to the survey

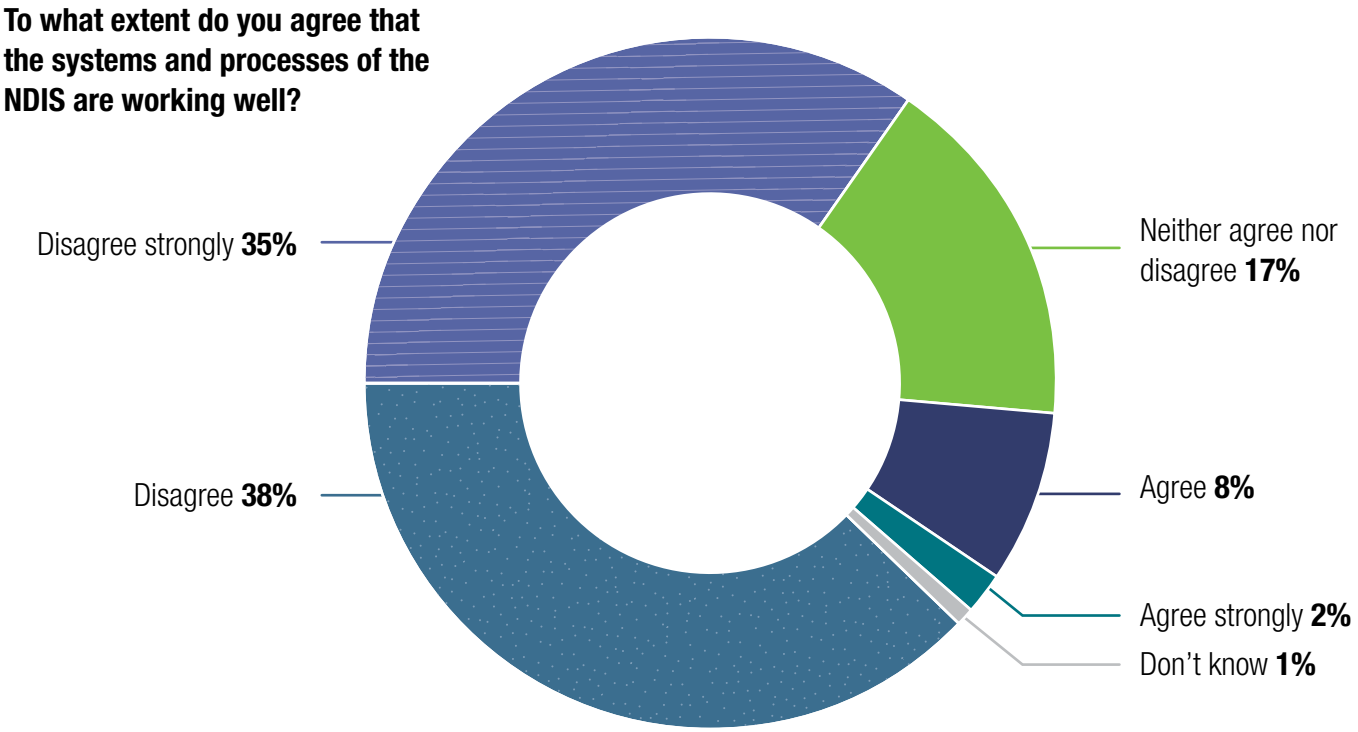
626 disability service providers responded to this wave of the survey. Forty-two per cent had income of less than $1M, 23 per cent between $1M and $5M, 20 per cent between $5M and $20M and 14 per cent had income of $20M or more. Twenty-three per cent were sole traders, up from 12 per cent in 2017. The inclusion of this cohort did not skew results, except where noted. Seventy-three per cent of respondents were not-for-profit organisations and 24 per cent were for-profit organisations. Three per cent were not classified.

Ninety-seven per cent of respondents were registered NDIS providers and 90 per cent were registered and currently provide services under the NDIS.

NDIS policy environment remains uncertain

Service providers continue to be frustrated with NDIS systems and processes. Nearly three quarters (73 per cent) of respondents either disagreed or strongly disagreed that the systems and processes of the NDIS were working well.

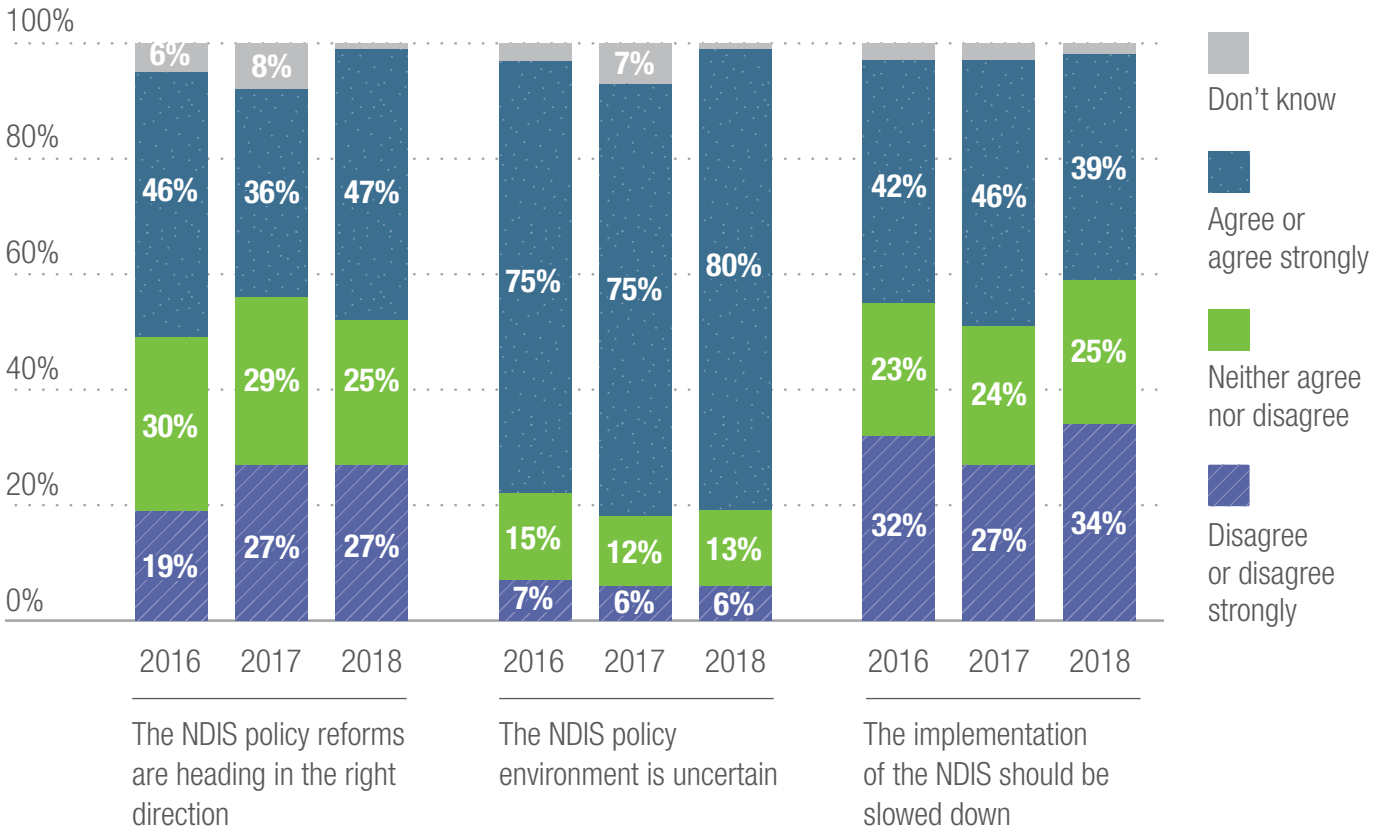
Figure 1 NDIS systems and processes



Comments about NDIS systems and processes reflect key concerns about policy uncertainty, lack of meaningful service provider engagement by government, and pricing and administrative burdens. Provider views on NDIS policy directions and implementation remain consistent. This year, responses were split over whether NDIS implementation should be slowed down – 39 per cent agreed or strongly agreed and 25 per cent were neutral. This represents a decrease from the 2017 survey, where 46 per cent of the providers who responded felt implementation should be slowed. As NDIS implementation proceeds, nearly half (47 per cent) feel that policy implementation is heading in the right direction. However, a significant majority (80 per cent) continue to agree that the NDIS policy environment is uncertain. This number has increased since 2016 and 2017.

Figure 2 Satisfaction with policy and implementation

To what extent do you agree with the following statements?

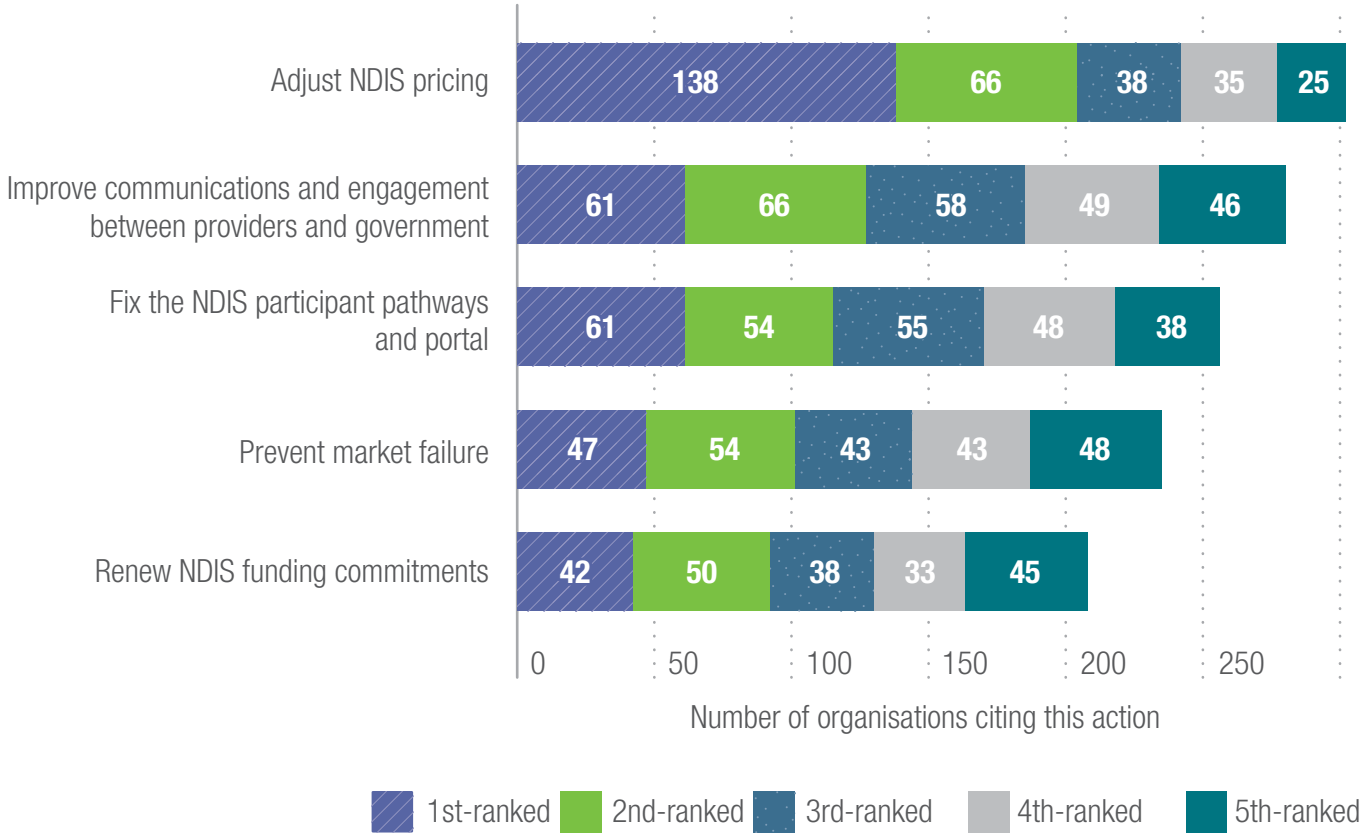


There is consensus among providers about which actions by the government would have the greatest positive impact on their organisation's capacity to deliver good services in the next year:

1. Adjust NDIS pricing
2. Improve communications and engagement between providers and government
3. Fix the NDIS participant pathways and portal

Figure 3 Top five market stewardship priorities for government

Which of the following actions by government would have the greatest positive impact on your organisation's capacity to deliver good services in the next year?



Pricing concerns generated the most comments and 46 per cent ranked 'Adjust NDIS pricing' as their top action for government. Two major themes emerged from the survey: providers' views that central price setting is disconnected from service delivery realities; and concern that financial losses will lead to market failure.

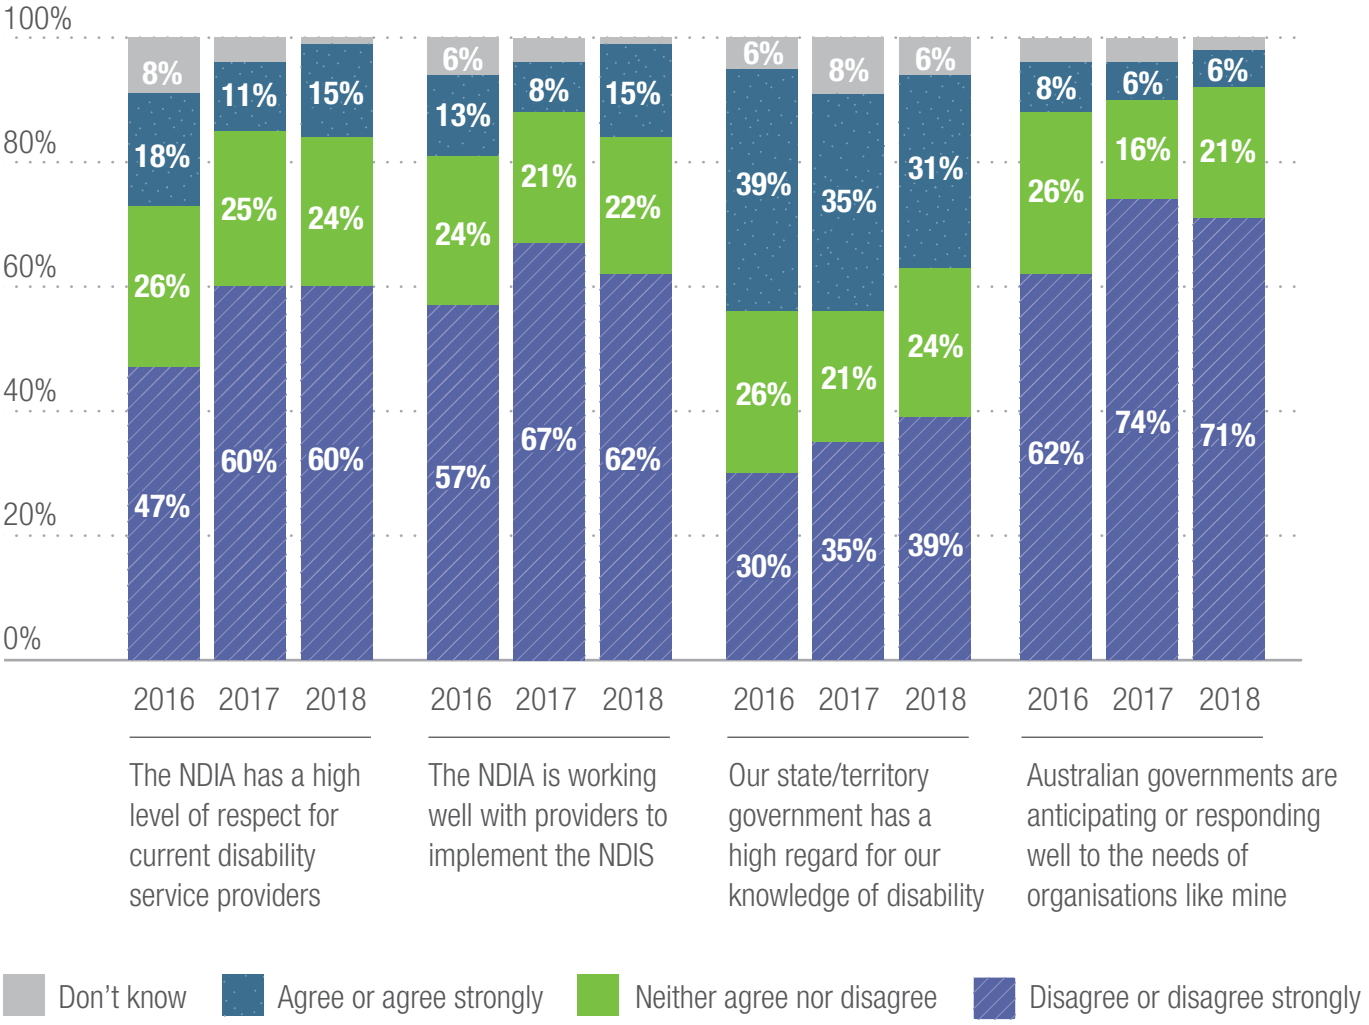
> "It is challenging to continue to conduct a profitable enterprise when [the NDIS] sets the fee for our company's services – particularly without any prior knowledge of the services we provide and associated costs involved. Not all services are created 'equal'."

> "No matter the size of a [participant's care] package there is significant time invested into case development, review, maintenance, and provision which is in excess of an hour's support for capacity building."

Service providers appeared to be largely dissatisfied with their relationship with the NDIA. Only 15 per cent said they agreed or agreed strongly that the NDIA is working well with the sector to implement the NDIS. Similarly, 15 per cent agreed or agreed strongly that the NDIA has a high level of respect for service providers. Most (71 per cent) said they disagreed or disagreed strongly that Australian governments are anticipating or responding well to the needs of organisations such as theirs.

Figure 4 Provider views on government relations

To what extent do you agree with the following statements?



> "NDIS keep changing the rules and there is no consistency between planners, areas and local offices."

> "Incorrect information given to participants by planners and LACs is compromising service delivery and problems are then blamed on providers."

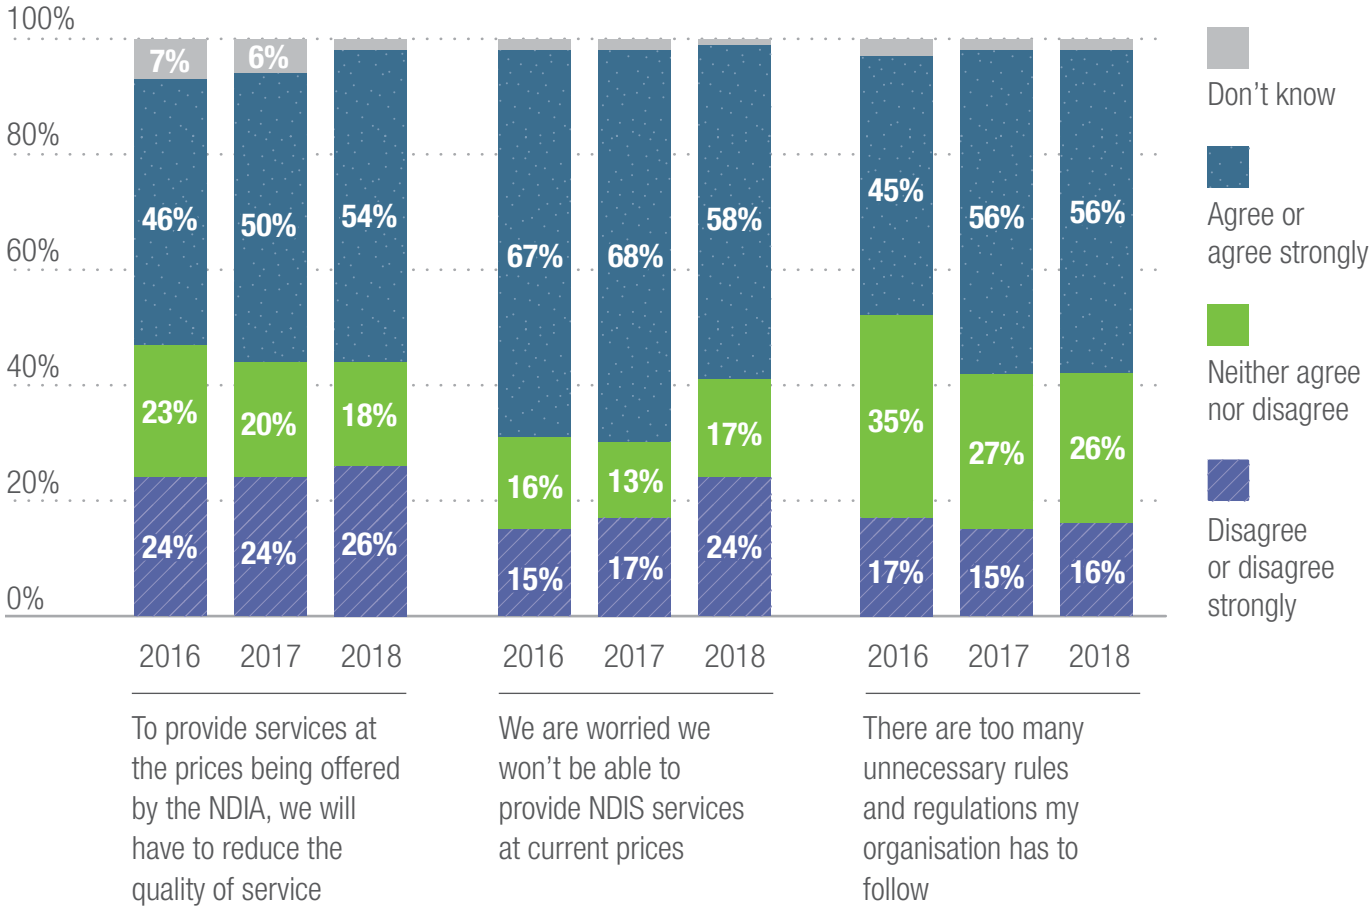
> "Despite the length of time we have been delivering services via NDIS funding there is still an incredible inconsistency in the planning processes that clients/families are attempting to manage."

Fifty-eight per cent of disability service providers agreed or agreed strongly that they were worried they wouldn't be able to provide NDIS services at their current prices. Just under one in four respondents (24 per cent) disagreed or disagreed strongly with this statement. Service providers expressed concern at the costs of compliance with regulation and costs to properly support families and clients beyond the funded service transaction:

> "It costs money to be able to meet all the requirements of government, but we aren't able to set the actual pricing to be able to recover the true cost of support. We are a price taker, and government set all the rules and processes that are administratively burdensome … Providers can't actually charge what it really costs to deliver good services."

Figure 5 Pricing, service quality and administrative burden

To what extent do you agree with the following statements?



Over half of respondents (54 per cent) said that they either agreed or agreed strongly with the statement 'In order to provide the services at the prices being offered by the NDIA, the quality of care would have be reduced'. For some services, prices were regarded as being too low to continue service delivery.

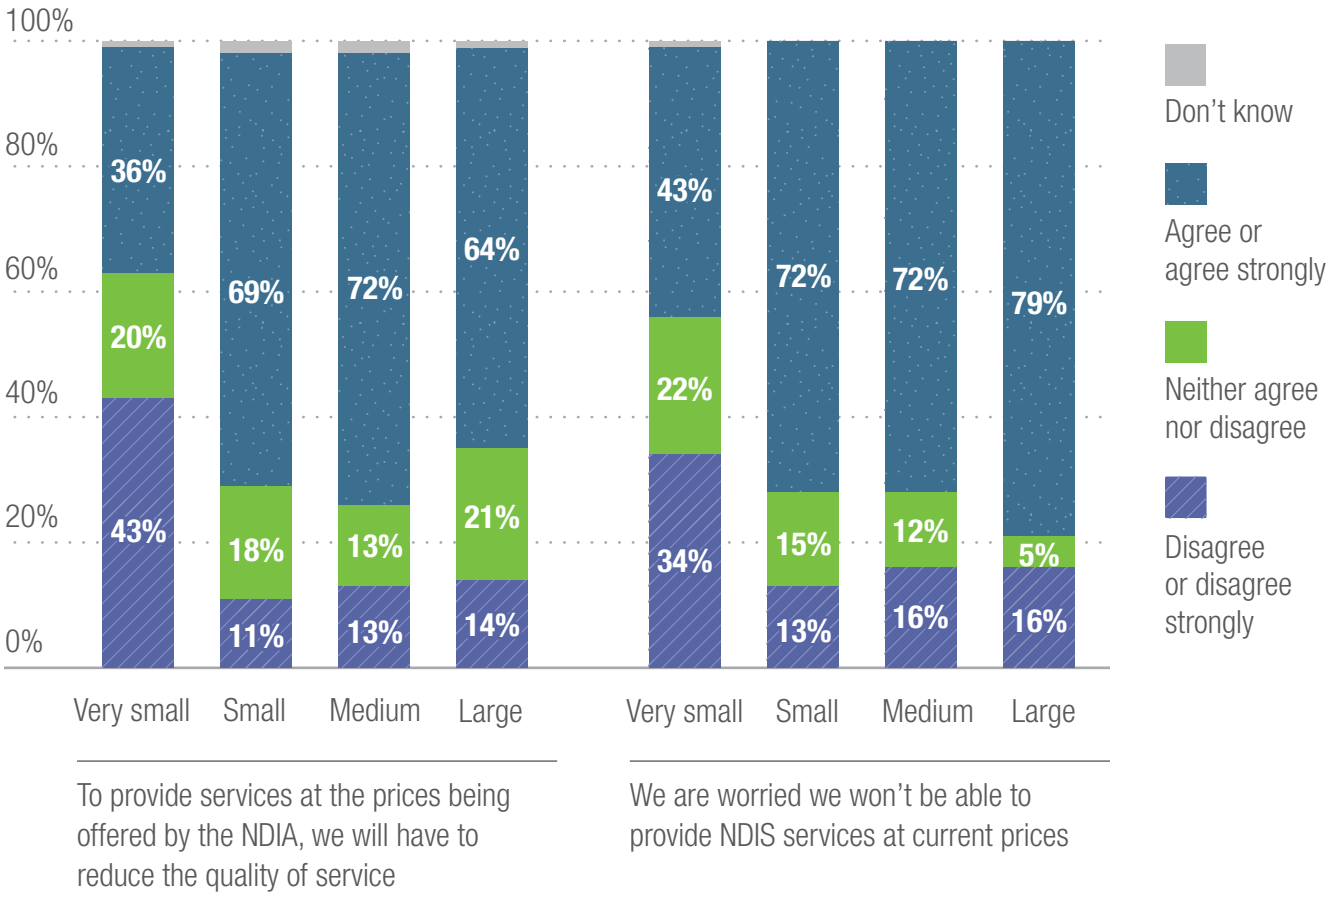
Respondents were acutely concerned with the emergence of thin markets and the impact for NDIS participants, noting this posed a particular threat for groups with complex needs.

> "Market failure is a current reality. We are having to restrict community access services delivered one-on-one, even though demand is growing. Some participants are only being offered supports in groups with a 1:5 support ratio, even though they could benefit from supports delivered in smaller groups or 1:1. This is undermining choice and control."

Concerns about pricing and its impact on services varied by provider size (financial turnover). Very small service providers (less than $1M last financial year - including a high proportion of sole traders) were significantly less likely to agree that they would have to reduce the quality of service to provide services at the prices being offered by the NDIA.

Figure 6 Concerns about NDIS pricing by organisation size (financial turnover)

To what extent do you agree with the following statements?



Organisational size classified by annual income:
Very small* – Less than $1M
Small – Less than $5M
Medium – Less than $20M
Large – More than $20M

*These results could reflect a high proportion of sole traders.

Disability service providers were asked to identify operational areas for improvement or where additional support and investment are required. Key areas for improvement were consistent with previous years and related to administration (information, communications and technology; HR strategy; costing and pricing; and market research). Providers continue to struggle with costing and pricing (and related financial controls); back office systems and data about opportunities to make a difference.

Table 1 Business capability areas for improvement

Which of the following business capability areas does your organisation need to improve most in the next 12 months?

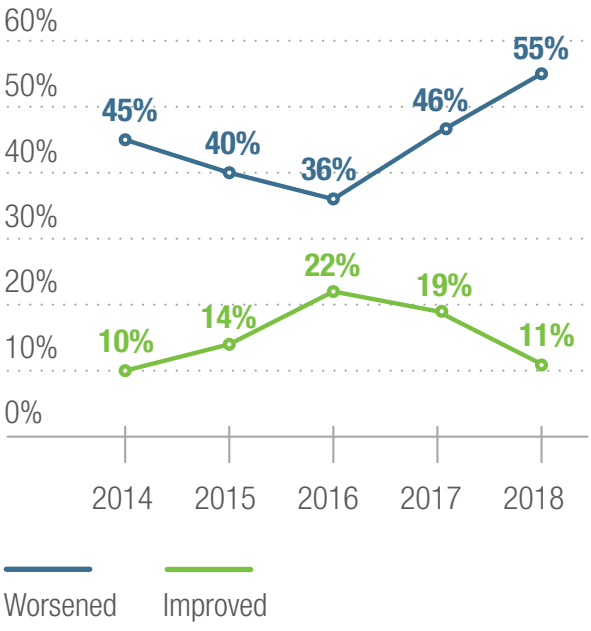
2016	2017	2018
1. Costing and pricing	1. Costing and pricing	1. Information, communications and tech strategy
2. Information, communications, and tech strategy	2. Marketing practice	2. Costing and pricing
3. Marketing practice	3. HR strategy and workforce planning	3. HR strategy and workforce planning

Operating conditions remain tough

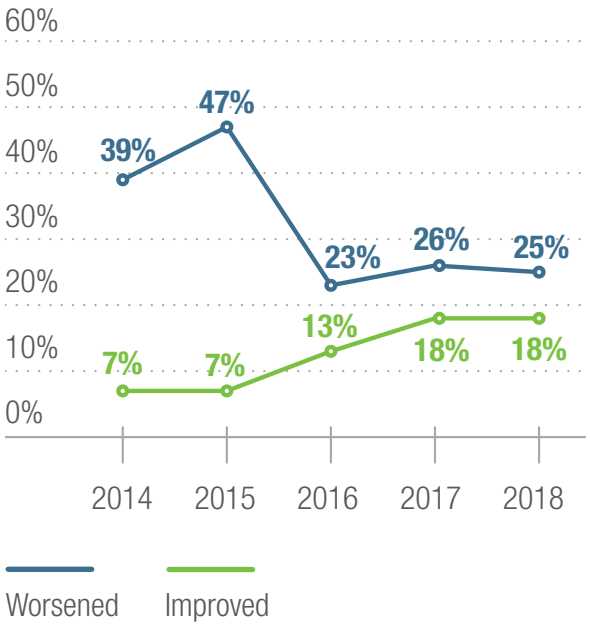
Since 2016, there has been a sharp decrease in the perceived operating conditions of the disability sector – in 2018, 55 per cent of respondents said that they perceived conditions to have worsened. In contrast, the broader economic environment was seen as stable for the past two years.

Figure 7 Perceptions of disability sector operating conditions and wider Australian economy

Over the last 12 months, do you believe that the overall operating conditions of the disability sector have changed?



Over the last 12 months, do you believe that the overall operating conditions of the Australian economy have changed?



As in previous years, providers were asked to indicate whether they had any plans to change the range and scale of services offered. The overall picture remains one of growth, with most providers indicating an intention to increase their service volume.

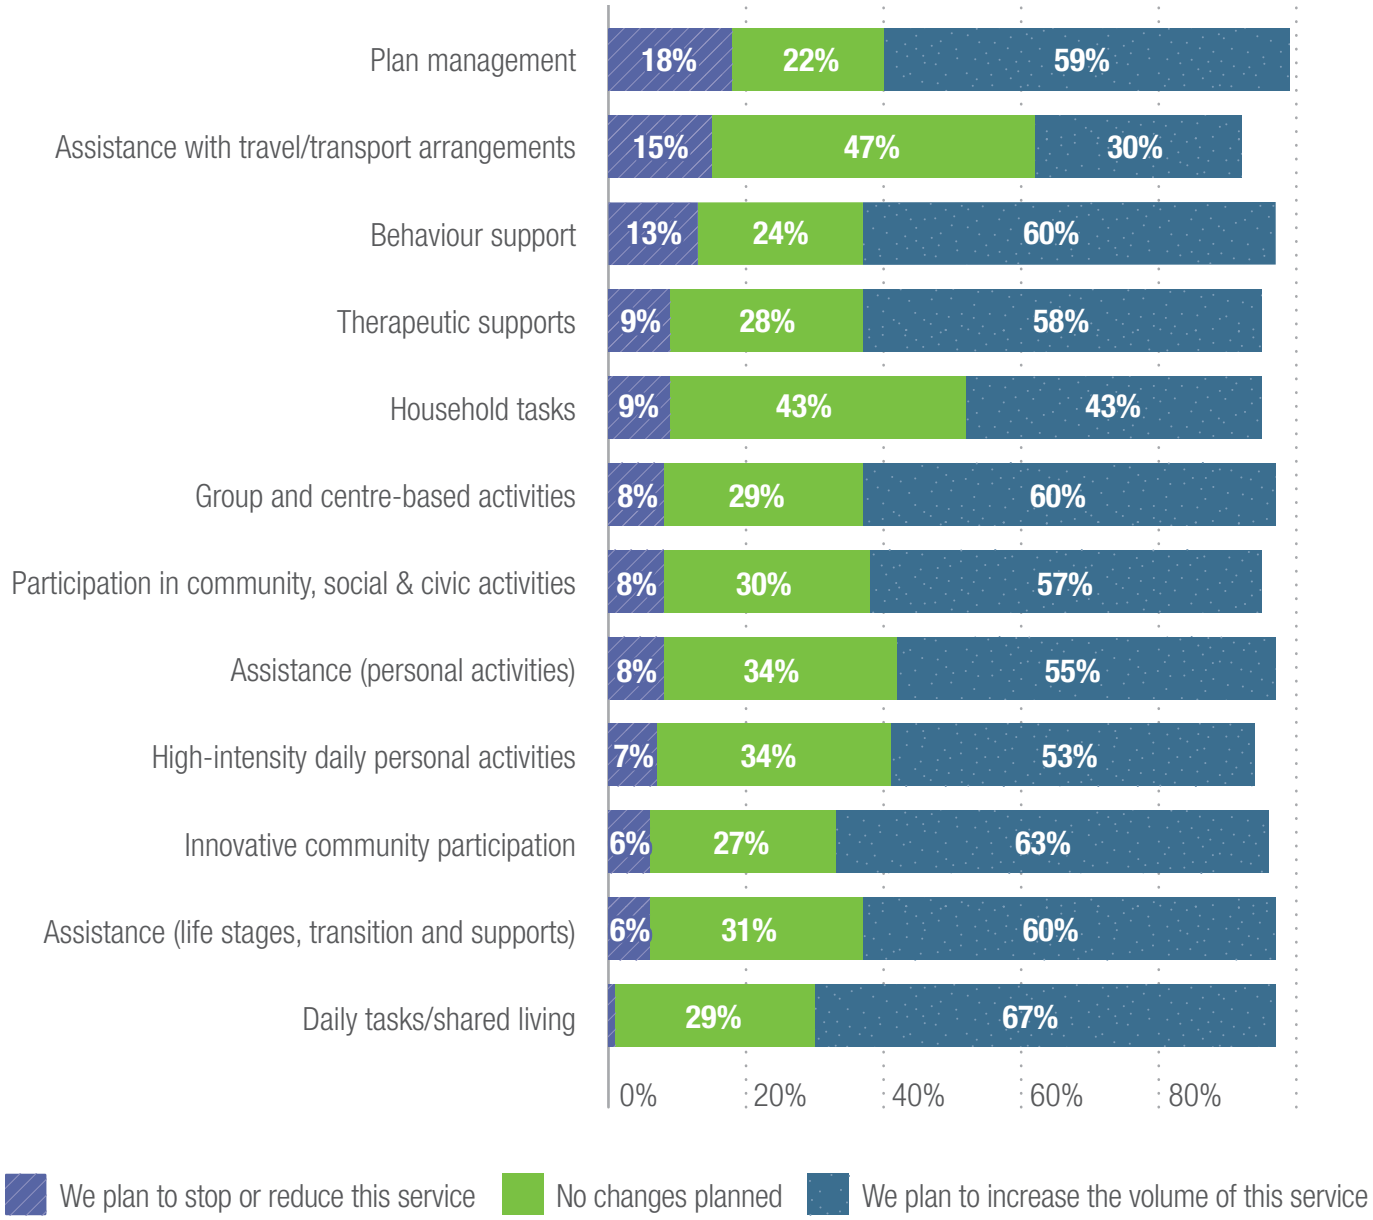
> "NDIS has provided opportunities for clients who could not manage to fund their needs before the NDIS."

> "While the NDIS can at times be difficult to navigate, our experience is that if you establish positive working relationships you can generally get a positive outcome for participants."

The most commonly-cited service types that service providers indicated they were planning to reduce or stop providing were plan management, assistance with travel and transport arrangements, and behaviour support.

Figure 8 Intentions to change service volume

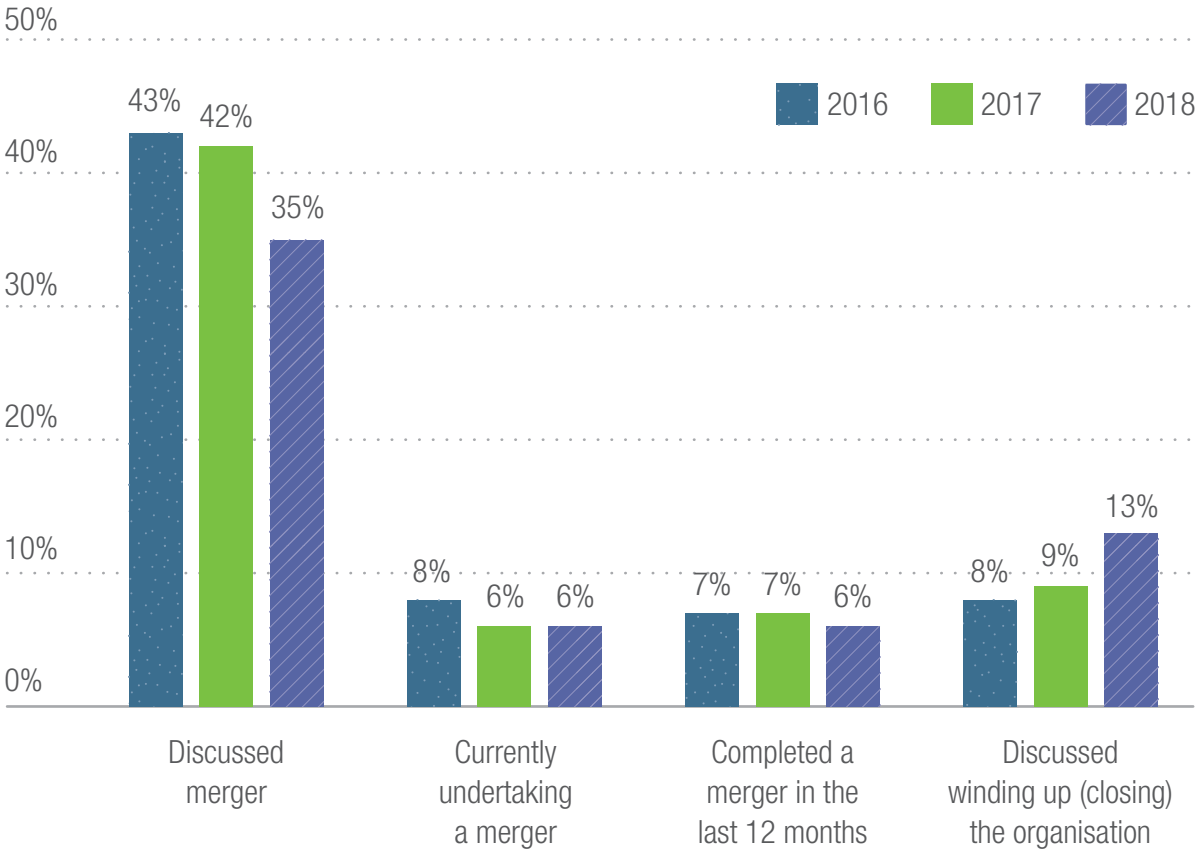
In the next 12 months, do you plan to stop providing, reduce, increase the volume of services or make no changes to your services?



Providers were asked to indicate plans to introduce new NDIS-funded services in the next 12 months. Less than 10 per cent of the providers that responded indicated they planned to do so.

Merger activity remains significant over the three-year period for which data has been collected. Of the providers that responded, close to three in 10 organisations indicated that merger discussions had occurred in the last 12 months.

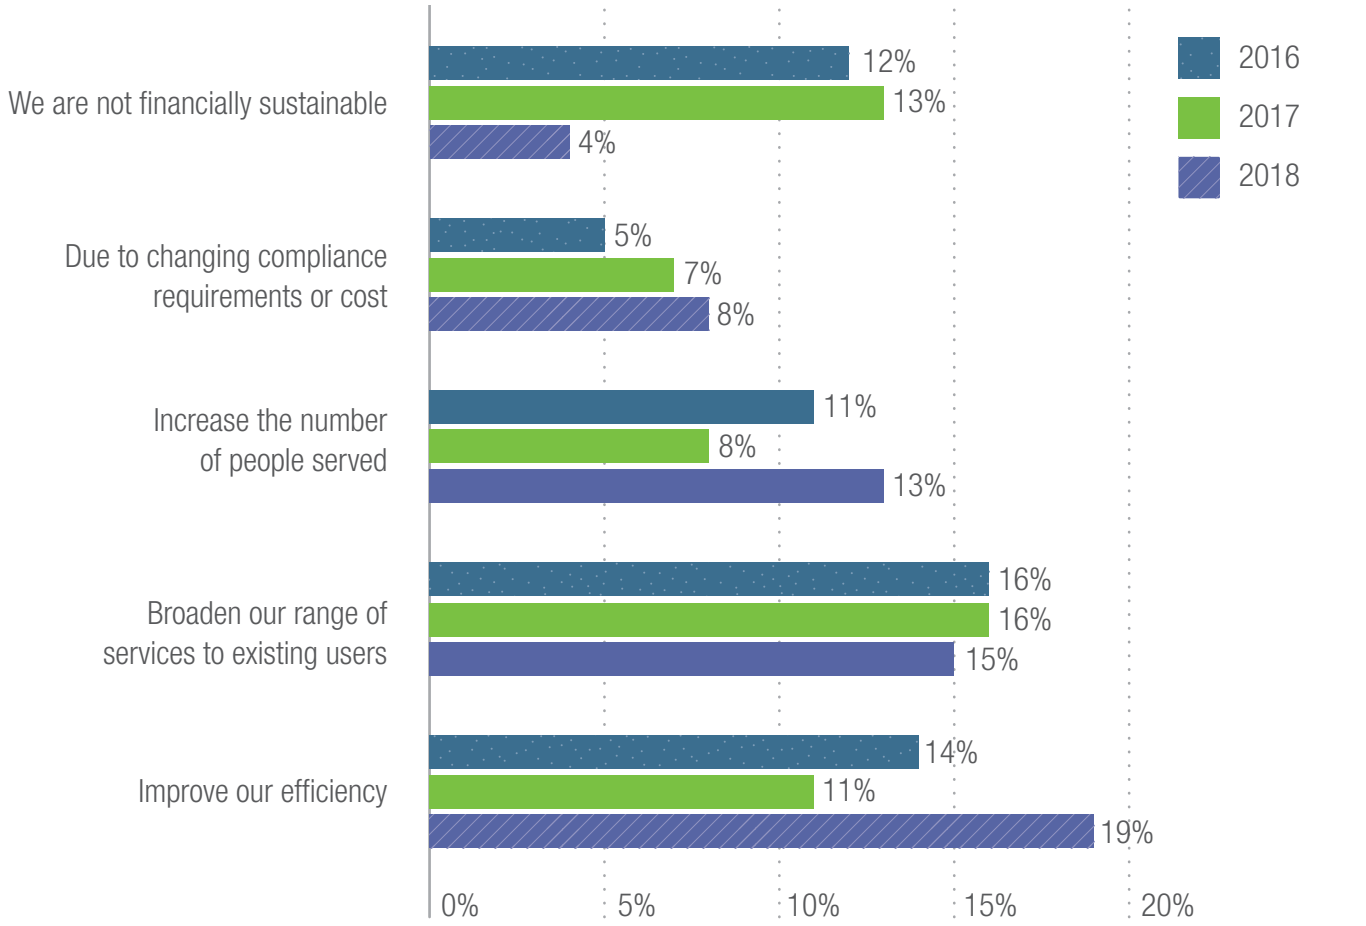
Figure 9 Mergers and market exits



Of the providers that had indicated they had discussed or were currently undergoing a merger, their most-cited reasons for doing so include improving service efficiency and broadening the range of services available to clients.

Figure 10 Reasons for mergers

Why did your organisation choose to merge? Or why might it choose to merge?

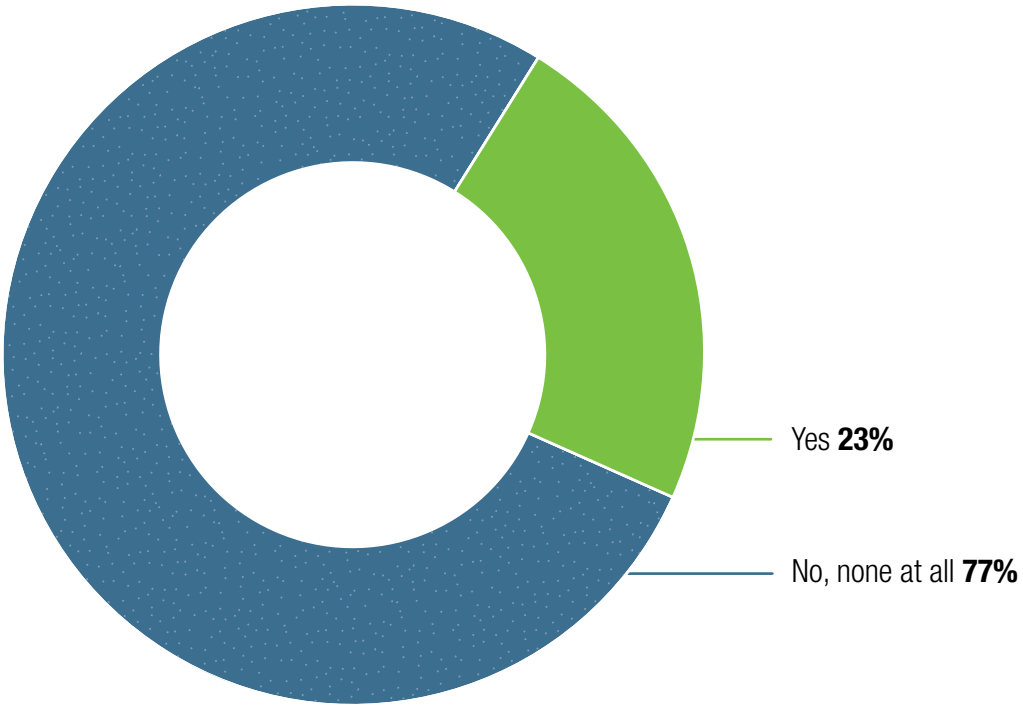


Close to 80 per cent of providers reported that they were not receiving any monetary, organisational, or other help from other disability service providers. This could reflect a lack of connection and collaboration with other services – consistent with international research which shows that as competition for services increase, collaboration across services decreases. Providers seem to be disconnected from each other rather than working together for mutually-agreed goals.

This also reflects research on changes to the sector since the implementation of the NDIS. A recent report from the Centre for Social Impact on collaboration in the sector found that organisations were collaborating and sharing information less as implementation rolled out. This warrants further investigation.

Figure 11 Are disability service providers helping each other?

In the last 12 months, have you received any help (monetary, organisational) from other disability service providers?



According to our survey, 28 per cent report operating at a loss, up from the previous year, and close to half (48 per cent) reports operating at a profit. However, for many, this profit was not meaningful in terms of its relation to Consumer Price Index or CPI (2.1 per cent according to the Australian Bureau of Statistics between 2017-18).

Figure 12 Financial sustainability

In the most recent financial year, did your organisation make a loss, break even, or make a profit?

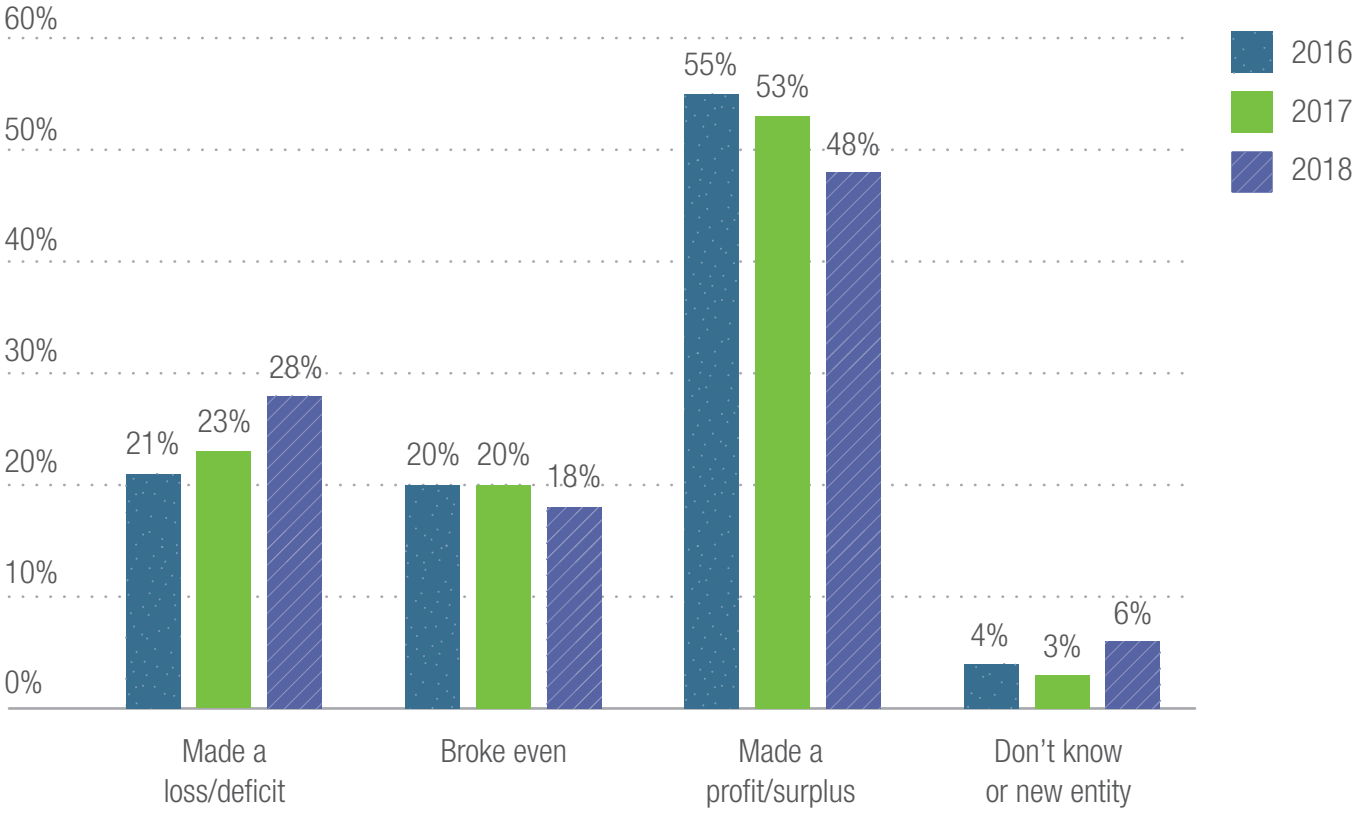


Figure 13 Past year financial performance

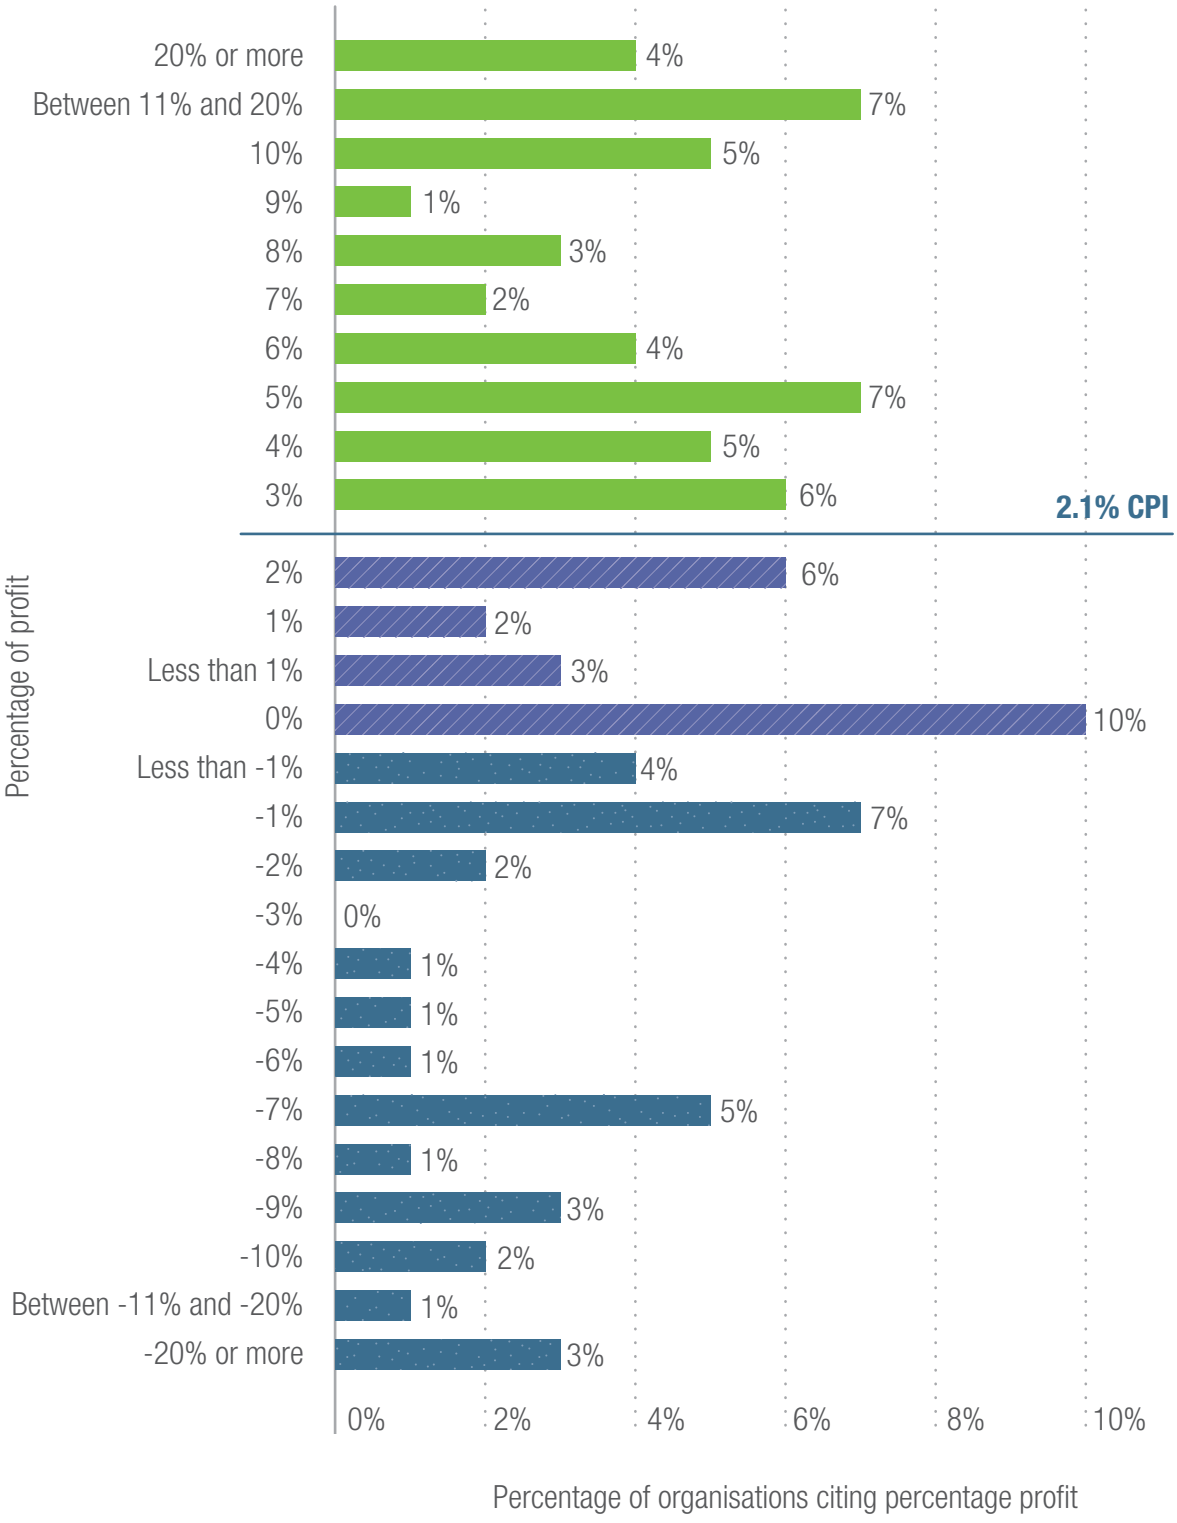
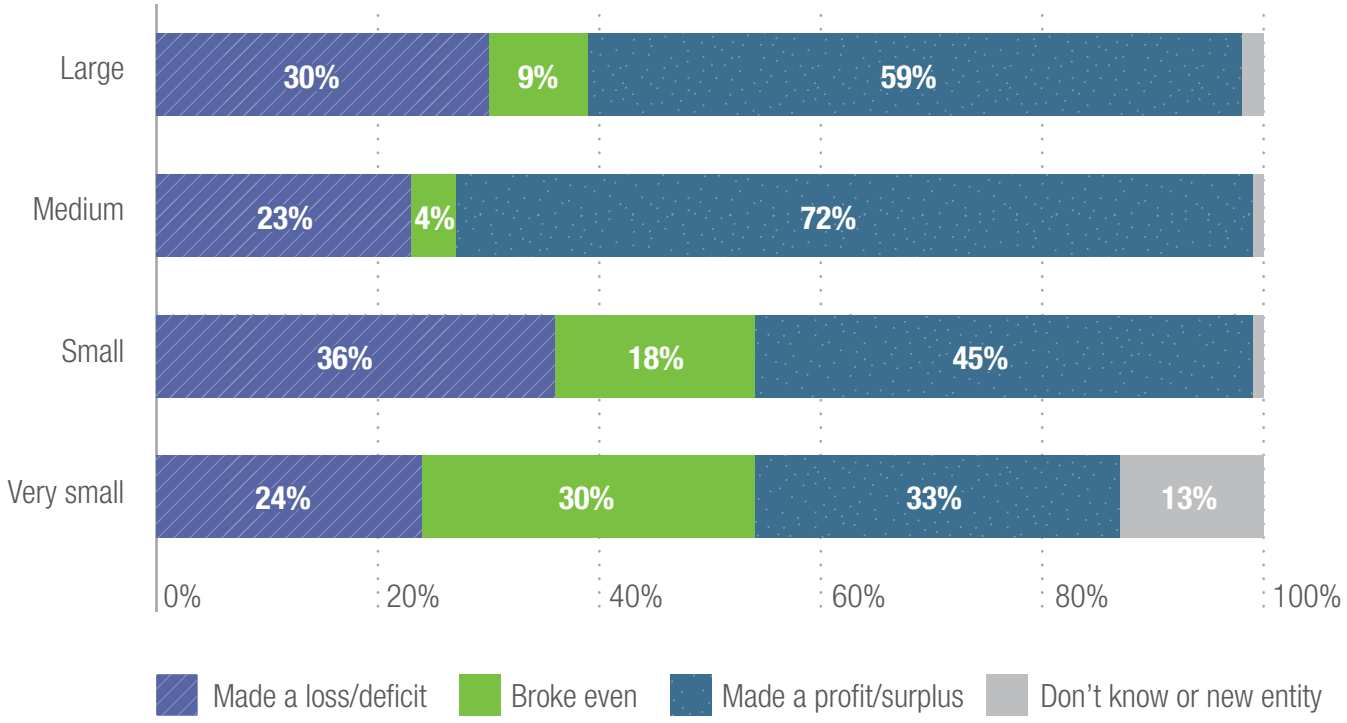
In the most recent financial year, did your organisation make a loss, break even, or make a profit?



Looking at profit margins by organisation size, significantly more medium and large organisations reported making a profit with their disability services in the last 12 months compared to very small and small organisations. A higher proportion (13 per cent) of very small organisations responded that they don't know/were a new entity, which likely reflects the growth in small organisations offering disability services.

Figure 14 Financial sustainability by organisation size

In the most recent financial year, did this organisation make a loss, break even, or make a profit?

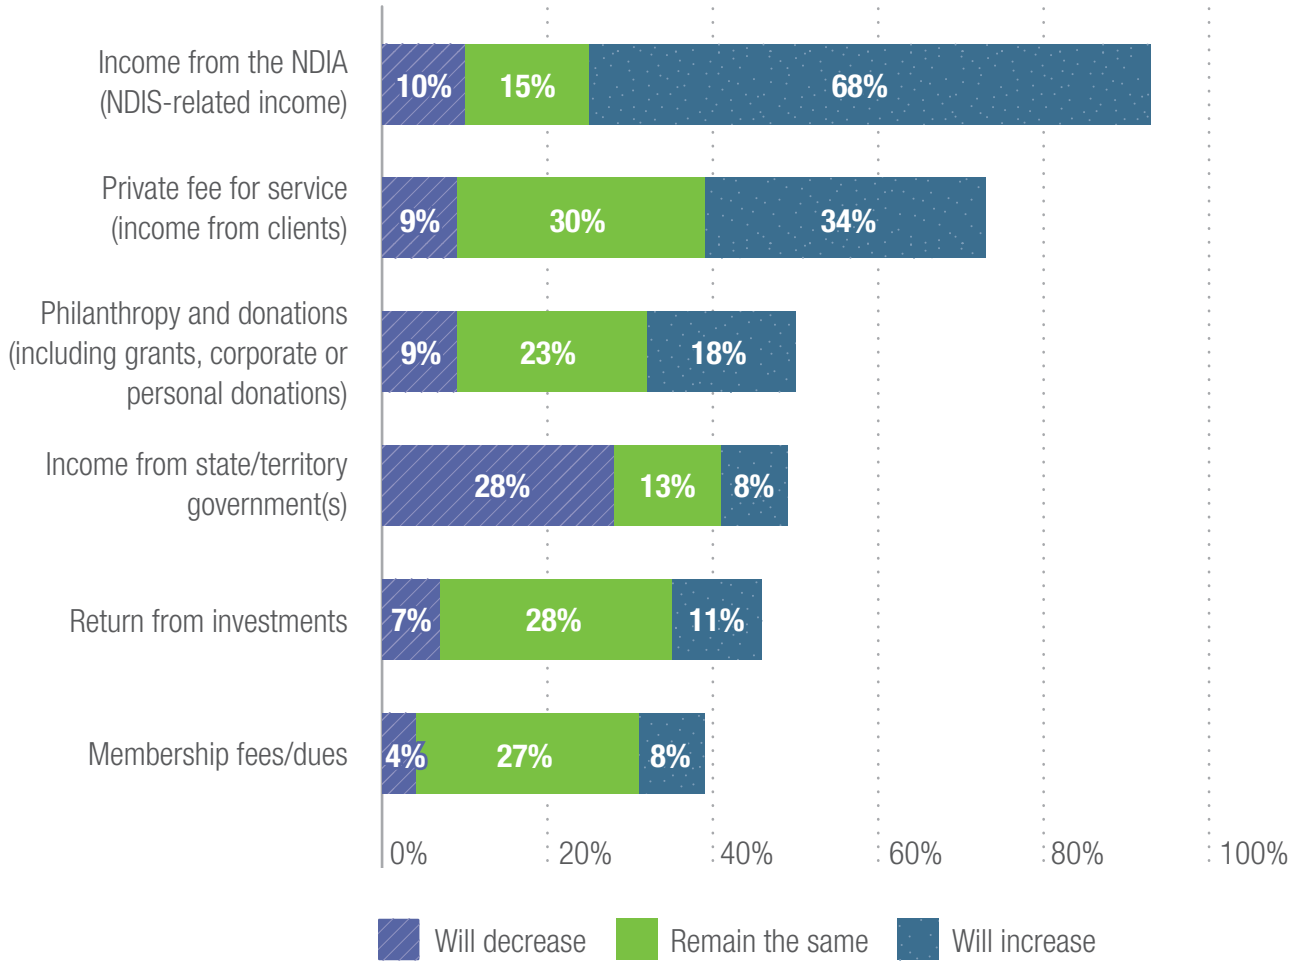


Change in net assets in the last financial year varied by organisation size. Very small providers (less than $1M) were significantly more likely to indicate that their organisation's net assets had not changed in the last year, while significantly more medium-sized organisations reported that their net assets had increased.

With regards to changes in organisational income, the majority of providers (68 per cent) anticipated that their income from the NDIA would increase in the coming financial year. Thirty-four per cent of providers anticipated that their income from private fees for service would also increase.

Figure 15 Income expectations

In this current financial year do you expect your organisation's income from these sources to change or remain the same?



Although sources of funding were not predicted to change drastically, disability service providers are concerned about the costs of their organisation's service provision. Close to half (42 per cent) of providers said that they thought direct labour expenses would grow at a rate faster than service volume growth, and 50 per cent said the same about administration expenses.

Tasmania

Case study

Mark Jessop

CEO, Nexus

Tell us a bit about Nexus.

Nexus started out because of the wave of deinstitutionalisation in Tasmania in the late 1980s. It was formed in 1998 when two smaller services merged. We then perfected our craft of running group homes and introduced things like Active Support in the mid-2000s. This was all in a fairly traditional model of accommodation and day service providers 'sharing' support of people with disability within a tightly-managed block funding model. Most of our clients had congenital conditions with strong intellectual and physical support needs.

How has the NDIS transition affected your operations?

I joined Nexus as CEO in 2013, just as the NDIS trial for younger people started in Tasmania. I've been hanging onto the dragon ever since and we are slowly coming to an accommodation on how to ride it! We went from a static group of 36 clients for 15 years to ending up with close to 200 clients today – and the NDIS is not yet fully rolled out here. I remember saying to the Board that we'd need to try hard not to grow over the next few years, but I didn't really think it would be quite the ride we are having.

What's been your greatest achievement this year?

Transitioning all of our group homes into Supported Independent Living (SIL). The sector had been planning on a gradual age-based roll out, but at the beginning of the year, we were told by the state that it was all in this year! Not only did we have to wait for the SIL quoting tool to be rolled out by the NDIS, but we really needed to accelerate the knowledge of our key workers and team leaders. It was a great opportunity to go back to person-centred planning principles and look at what people needed and what evidence we had. It was a bit of a scramble, but we got there with a week to spare and all were approved with only minor negotiations. At the end of the process, we were able to offer over 1,000 hours a month extra support under NDIS funding than under the state model – a great win for clients. My role was making sure I had the team ready to 'think NDIS' and put together really meaningful SIL quotes – a great team effort.

What's the most valuable lesson you've learned?

There are so many. All the lessons about change and managing staff reactions to change have been really important. I was lucky to have spent a few years consulting in this area so I've seen a lot of good and bad change processes. Lesson one has been: "Take staff on your journey, too." The other big lesson has been about corporate decision-making and backing your well-researched judgment. There is no doubt that the changes with the introduction of the NDIS have forced providers to make high-risk decisions. At the end of the day, I looked into the crystal ball, got as much insight as I could, and then just made the decision. (There are still people looking into the crystal ball waiting for the fog to clear.) A good example of this decision-making was moving to a new integrated client management and finance IT package. Had we not done that, we would be absolutely stuck now, but when I did it, I was committing to a best guess of least $250K when I knew we had less than $100K in equity.

If you could go back in time, what would you do differently?

From one perspective, we've done reasonably well, but it's been such a rollercoaster ride, with changing models and systems – I don't think there's any wrong way of doing it! It's such a dynamic change in the sector. To think that there's one path to go down would be a mistake. I think we've taken each day at a time, we've anticipated what we could and we've adjusted on an ongoing basis.

Can you share a case study where you achieved a positive outcome for one of your service users?

During the trial, we were approached by the NDIS and Housing Choices Tasmania who had some units they wanted to fill. Because only younger people had come into the NDIS at this stage, we developed a model to support young people moving out of home, who would have been destined for SIL or group home models. We were able to work with this group, and, of the original four who came into the program, two moved to more independent living models and two moved into low support shared housing. We have since expanded the model to different sites and achieved about 15 units for people wanting to make a transition to a more independent lifestyle. It's been full of challenges, but great to take the journey to adulthood and independence with people.

What are your NDIS goals for the next few years?

There are four main goals. We still need to grow to have a sustainable business, particularly with the Quality and Safeguarding costs. Tasmania has had a fairly laissez-faire standards model so many in the sector here will need to ramp up our evidentiary processes, and this will cost. We still need to reduce our transactional costs – doing business with the NDIS is still clunky, much better than 12 months ago, but still too expensive. We need to become a more visible organisation in the new NDIS marketplace, which is a skillset many not-for-profits struggle with, so a bit of thinking is needed for it. Finally, I really want to push the NDIS's potential to its limits. The Agency talks about fostering innovation, but it seems that, whenever you try to be innovative, they struggle to fit it into a line item. We are just not clicking with the Agency in this innovation area, so I want to come up with lots of examples to give my colleagues in the Agency a headache!

3,879 NDIS plans approved in Tas

8% NDIS participants are Indigenous
2% Culturally and linguistically diverse

1,159 registered disability service providers

Key issues

Providers struggling under centralised payment centre of the NDIS

Providers in Tasmania are now joining long queues with other, larger states (notably New South Wales and Victoria). Where payment delays were improving in Tasmania comparatively, they have begun to blow out again, causing service providers to carry the costs of continuing to provide supports without being able to claim for their provision. This must be addressed to ensure their ongoing financial viability.

Inadequate prices for travel

Given the limited number of allied health professionals in Tasmania, funding the travel of workers continues to be a problem for providers. The introduction of up to 45 minutes of travel for therapists to provide services in MM4 and 5 regions assists but does not cover all travel costs. This issue requires urgent resolution so that people with disability living in regional and remote areas are not disadvantaged.

Addressing the housing crisis

Shortages of accommodation mean that even those who receive funding for supported living need to join the community housing queue. The State Government has committed $20M to disability housing for Tasmania. Unfortunately, that is projected to be inadequate. Considerable work is still required to improve the supply and diversity of accessible and affordable housing for people with disability.

Western Australia

Case study

Marina Re

CEO, IdentityWA

Tell us a bit about IdentityWA.

IdentityWA has been providing services to people with disabilities in Western Australia for over 40 years. We provide a range of services including Supported Independent Living, family support, and a whole range of other individual supports.

How has the NDIS transition affected your operations?

The Western Australian experience has been a little different. We've had both the national NDIS and the WA NDIS. At one stage, we had two pilot programs operating with trial sites, so that added a level of complication, because we were working with the national, working with the state, and we had the existing disability services that were provided through the state government.

Transition to the NDIS has been quite challenging in terms of that level of complexity. We're now involved in the roll out of the national NDIS across WA, and also the transfer of people involved in the WA NDIS to the national program. There are challenges around financial arrangements, reporting requirements, providing individuals and families with good, clear information – that hasn't always been available – and then, of course, working with our staff to ensure that they're well-trained and up-to-date to be able to deliver what they want to deliver.

What's been your greatest achievement this year?

One of the most important things for service providers is workforce, and ensuring that we have a workforce that's able to deliver what individuals and families want. We're currently in partnership with LaTrobe University, delivering a series of research projects around person-centred active support, and that's been very successful in improving the ability of our staff to be focused on achieving great outcomes for the people we support.

What's the most valuable lesson you've learned?

The most valuable lesson is that our support workers are great people with really good values. With exposure to excellent training opportunities, they're able to move from being good support workers to excellent support workers.

If you could go back in time, what would you do differently?

I don't know that we'd do anything differently. The environment has been so full of change that all we can aspire to do is be responsive and continuously looking at our operations to ensure that we're offering the best opportunities to the people we support. From a WA perspective, it's really only been in the last 12 months that we've had any clarity on how the Scheme would roll out here.

Can you share a case study where you achieved a positive outcome for one of your service users?

The work that we're doing around citizenship, in particular, is really important. We're implementing a citizenship framework throughout the organisation, which draws on Simon Duffy's key principles. That means that we're challenging our staff to look at all of those domains when

they're working with individuals. [Simon Duffy's keys to citizenship include: freedom, direction, money, home, help, life and love.] There are a number of examples within that of people being supported to access TAFE, get their driver's licence, be able to live independently – a whole range of things. That support has further developed the culture of the organisation, and the way that framework is being implemented is having a much broader impact on the lives of the people we support rather than just focusing on any one aspect.

What are your NDIS goals for the next few years?

As an organisation, we think the NDIS provides lots of challenges but also lots of opportunities. The goal is to look at how we go forward, particularly around how we develop some partnerships both within the sector and across sectors to further benefit the people we support. Our goal is to maintain high-quality services while being able to scale up to meet the future demands coming through the NDIS.

> "At the end of the day, service providers work in partnership with families, so the emphasis on co-design and being responsive to what individuals and families are telling us they want is absolutely critical."

For many agencies, there's a huge focus on maintaining operations and being able to sustain the quality of services they're providing within a very tight financial framework. What I think is equally important, going forward, is trying to maintain the focus on innovation. Those relationships with universities and industry partnerships and whatever else are absolutely key in terms of building up that capacity, moving forward.

At the end of the day, as service providers, we work in partnership with families, so the emphasis on co-design and being responsive to what individuals and families are telling us they want in terms of future design of services is absolutely critical.

4,508 NDIS plans approved in WA
78% of bilateral estimate

4% NDIS participants are Indigenous
7% Culturally and linguistically diverse

1,048 registered disability service providers

Key issues

NDIS transfer and transition

In December 2017, a Bilateral Agreement was announced for WA to transition to the nationally-administered NDIS. The challenge of transfer and transition is compounded by geographical issues associated with regional, remote and very remote communities. It is critical that service disruption and detrimental outcomes for people with disability are minimised and that sustainable support services are delivered and built over the bilateral transition period.

Rural and remote communities

WA has distinct characteristics that mean regional strategies in other locations may not be readily transferable. This includes very long distances between communities, diverse language groups, competition for staff from diverse sectors and significant regional differences in the availability of other services or infrastructure. NDIS pricing for disability supports must be based on the current costs of delivering supports in regional, remote and thin markets and also consider the cost of delivering supports to people with high and complex needs.

Building workforce capacity

While the State Government's funding of $20M for NDIS transition announced in May 2018 is a welcome down payment, more investment is needed in workforce development, given that the sector workforce is expected to double over the next three years. Additional investment should focus on implementing strategic initiatives of the WA Disability Services Sector Industry Plan.

The State of the NDIS

Transition to the full NDIS started in mid-2016 and is due to be completed by 2020. Now – more than half way through the transition period – disability service providers are still bearing a heavy burden associated with systems that are not well-designed for the large volume of plans and payments that the NDIS must process.

Inadequate prices are threatening the supply of some supports and there is a paucity of information on some critical services such as providers of last resort.

Ongoing negotiation between NDS and the NDIA has resulted in progress on a range of issues, but more is needed.

Pathways and portal developments

After frequent feedback about the shortcomings of NDIS plans, the participant pathway was redesigned and trialled in three regions of Victoria. The revised pathway, now being implemented progressively across Australia, offers all participants face-to-face planning meetings and increases the focus on pre-planning and on post-plan implementation. An increase in the NDIA's staffing cap is supporting this initiative.

For providers, pathway improvements have included the establishment of a National Provider Payments Team to try to resolve payment delays; the introduction of an improved quoting tool for Supported Independent Living; and enhancements to the Provider Finder function.

Over recent months, a number of improvements to the portal have eased some of the pain experienced by providers. NDS anticipates further changes over the coming year.

Pricing progress amid the pain

Some NDIS prices have improved over the past year. From July, the price limits for standard intensity assistance with daily personal activities and community access increased by 7.64 per cent. This welcome increase included a 2.5 per cent loading as a temporary support for overheads (TSO), which reduces to 1.25 per cent in 2019-20.

The TSO is a welcome but insufficient addition to the prices for standard intensity supports and partial recognition of the high costs of operating within the NDIS. Substantial improvements to NDIS systems and processes must be seen over the next two years. NDS is urging the NDIA to apply the TSO to higher-intensity supports.

The NDIA has not yet completed its research on defining complexity and pricing supports for participants with the most complex support needs.

NDS continues to argue that a substantial and permanent increase to the one-to-one attendant care support price is necessary (and the group prices that flow from it). There are worrying signs that a growing number of providers are reducing – or not growing – their provision of community access supports. The possibility of some market failure is emerging.

A pilot project on pricing and service delivery in remote areas has begun and a review of pricing in Western Australia is planned.

From July, the price limits for standard intensity assistance with daily personal activities and community access increased by 7.64%.

Market stewardship is lacking

In two reports over the past year, the Federal Parliament's Joint Standing Committee on the NDIS has been critical of the flawed approach taken by the Department of Social Services (DSS) and the NDIA to support transition to the NDIS and the lack of market stewardship. Drawing heavily from NDS's input, the reports call for the immediate development of an NDIS market stewardship strategy, the establishment of a disability sector assistance fund and the transfer of responsibility for NDIS price-setting to an agency that is independent of the NDIA.

The Committee was concerned to hear of the inability of many service providers to operate at even modest profit levels and that inadequate pricing was resulting in providers discontinuing services to some participants. As argued by NDS, the Committee called for the

immediate release of information on provider of last resort arrangements.

The lack of a systematic approach to market stewardship should be a concern to all NDIS stakeholders – governments, the NDIA, the NDIS Quality and Safeguards Commission, disability service providers, and participants and their families and carers. Over the coming year, stewardship activities need to be implemented and their effectiveness ensured.

Participant transport and provider travel are inadequately supported

Assisting participants with moving around in their communities is a support that many providers are struggling to sustain. Portal limitations mean that some participants are not able to use their core funds flexibly to purchase additional transport support, even if that is their wish. Removing this portal limitation is one of several recommendations that NDS has issued in a policy paper on transport and the NDIS.

A welcome development is the new travel guide that allows providers to charge up to 45 minutes of travel time between clients in rural areas (up from 20 minutes). While this is an improvement, NDS has continued to alert the NDIA to situations where provider transport is inadequately covered (such as being the sole provider of a specialist support located in a major city but having a participant residing hundreds of kilometres away). Providers in remote and very remote areas are still not adequately compensated for the travel they incur.

The new travel guide allows providers to charge up to 45 minutes of travel time between clients in rural areas (up from 20 minutes). While this is an improvement, NDS has continued to alert the NDIA to situations where provider transport is inadequately covered.

Work in progress: The NDIS Quality and Safeguards Framework

The NDIS (Quality and Safeguards) Commission commenced operations in NSW and SA in July 2018. Its main aim is to achieve a nationally consistent approach to quality and safeguards. Until the NDIS Commission is in place in their jurisdiction, NDIS participants, providers and workers will continue to be covered by their state or territory's existing quality and safeguards systems, and providers remain registered with the NDIA. Early feedback from service providers in NSW and SA highlights the following issues:

- The unknown cost of compliance associated with the quality and safeguards framework. Until national consistency is achieved, this is the case especially for providers that are operating across multiple jurisdictions.
- There will be additional costs in ensuring that all workers are familiar with the new NDIS Codes of Conduct and the mandatory worker orientation program.
- Ensuring that there is a sufficient supply of suitably trained and experienced quality auditors that are familiar with the new NDIS Practice Standards, especially the new emphasis on proportionate treatment of evidence.
- Lack of clarity on the arrangements for the reduction and elimination of restrictive practices. The NDIS Commission confirmed in early October that the national competency framework for behaviour support remains under development.

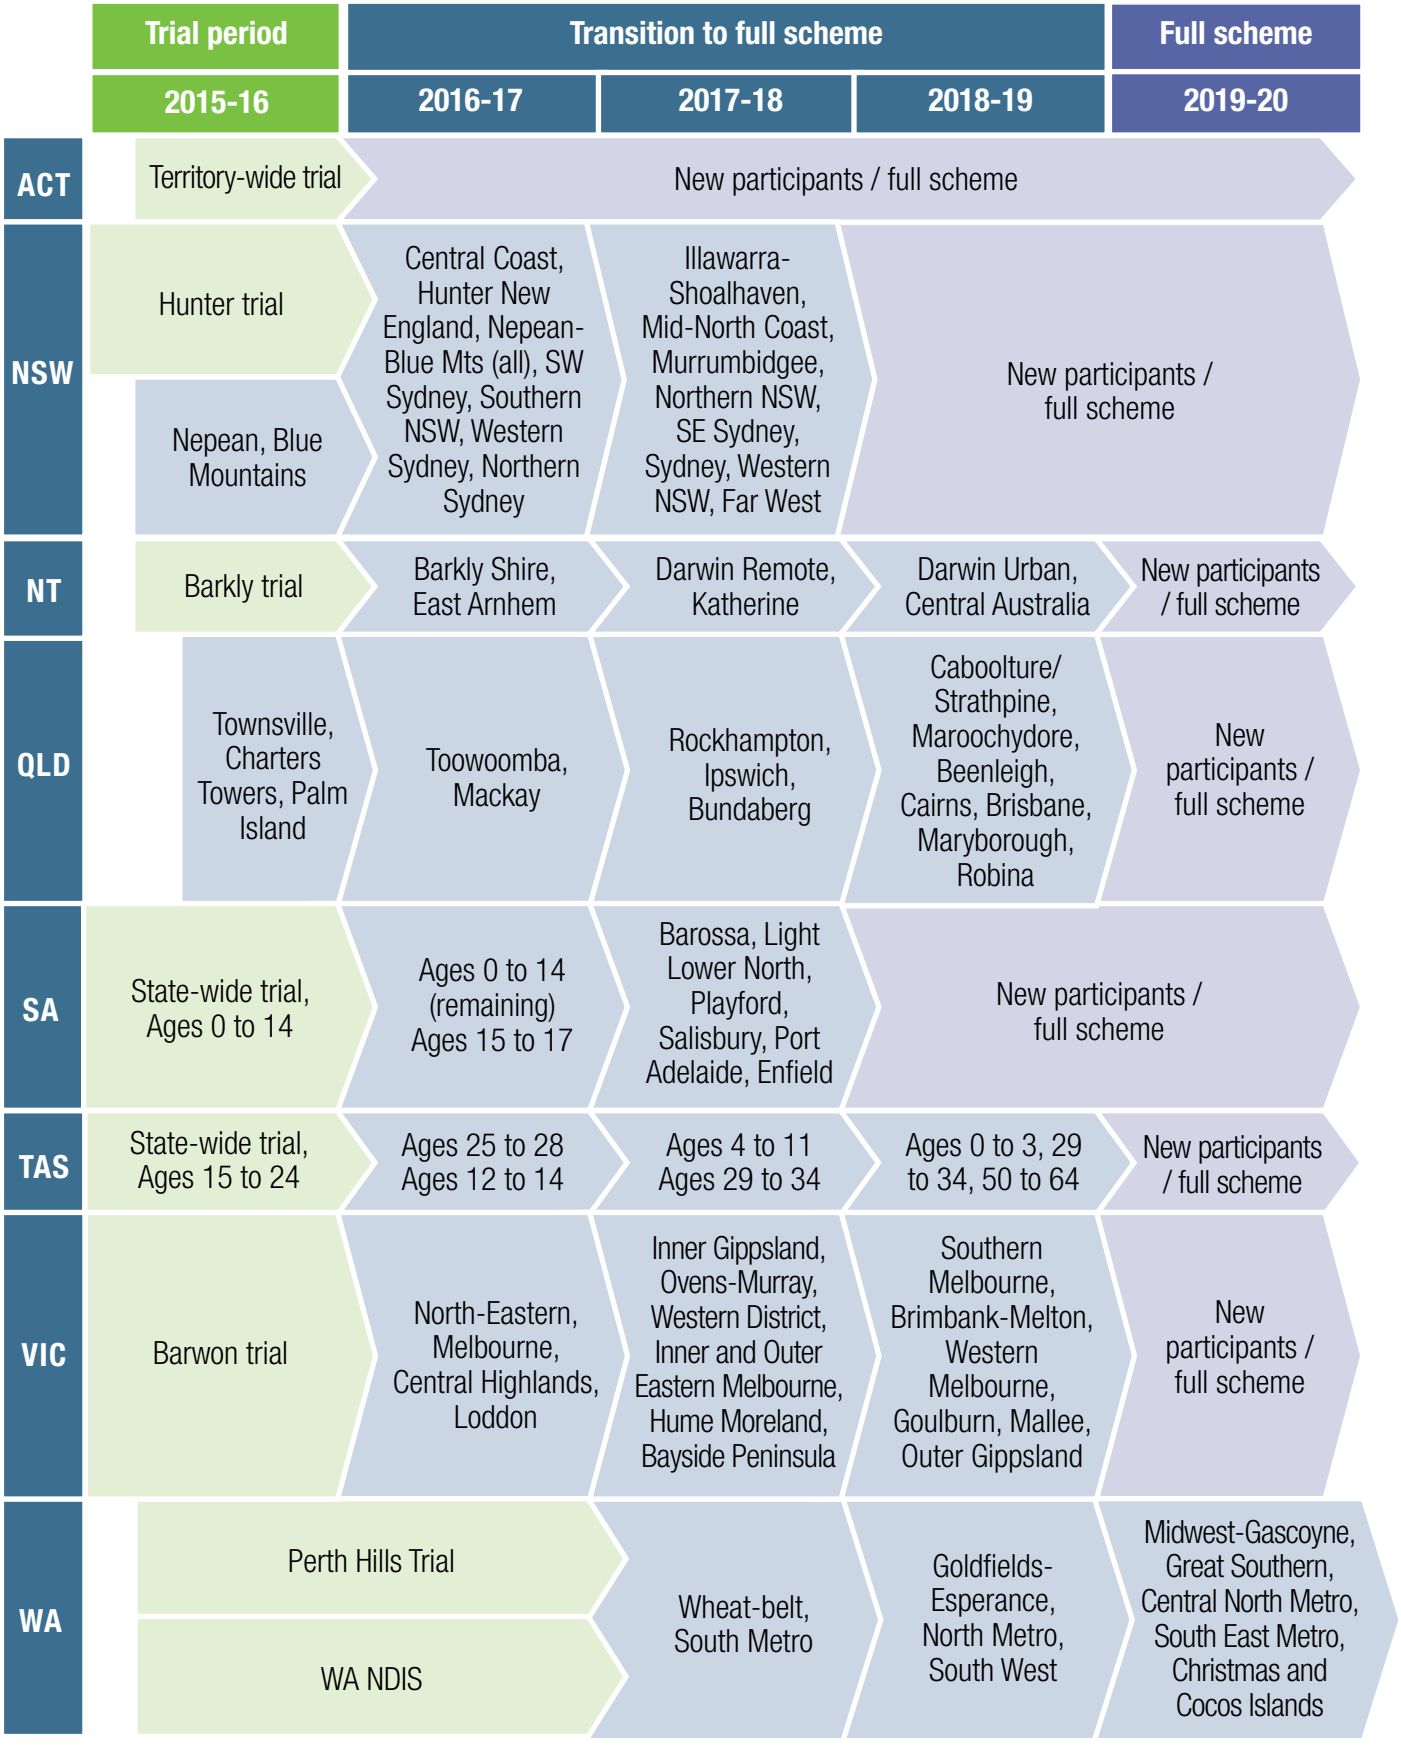
In order to build confidence in the new arrangements, the NDIS Commission must move quickly to assess the efficacy of its regulatory instruments, ensure consistent advice and guidance are available to service providers, and engage all key stakeholders – especially NDIS participants, their families and carers – in an assessment of the impact of the Quality and Safeguards Framework.

Until the NDIS Commission is in place in their jurisdiction, NDIS participants, providers and workers will continue to be covered by their state or territory's existing quality and safeguards systems, and providers remain registered with the NDIA.

How NDS is taking action:

- Presenting arguments to government about the critical need for market stewardship
- Advising the NDIA on how complexity should be defined and funded
- Assisting providers to understand the requirements of the NDIS Quality and Safeguards Commission
- Collecting and analysing workforce data through the NDS Workforce Wizard survey
- Raising sector concerns about inadequate funding for worker travel and participant transport by providing examples to the NDIA
- Negotiating portal enhancements with the NDIA
- Informing the NDIA about providers exiting parts of the market
- Giving providers, people with disability and their families an opportunity to voice concerns at the Make It Work community forums in partnership with Every Australian Counts
- Hosting provider forums and communities of practice to share information and support the spread of good practice in quality and safeguarding
- Launching an ongoing series of webinars, webcasts and podcasts on matters relating to quality and safeguarding
- Providing tools and resources to support effective and efficient quality management systems, including the Standards and Performance Pathways standards assessment tool
- Established the national NDS Helpdesk to accelerate answers to questions about the NDIS
- Submitted a paper to the Joint Standing Committee on the NDIS inquiry into the ICT system
- Urged the NDIA to streamline quoting for Supported Independent Living
- Published ‘Getting Transport on Track’ and ‘Making Employment a Priority’; the first in a series of NDIS Essential Issues papers
- Provided information to disability service providers at the NDIS Essential Briefing series in every capital city
- Put forward evidence for re-pricing community access (for one-to-one and group supports)
- Establishment of positions at NDS at the national and state level with specific focus on building organisational capability on quality and safeguards

NDIS transition arrangements



Australian Capital Territory

Case study

Mary-Ann Kal

Program Manager, Sharing Places

Tell us a bit about Sharing Places.

Sharing Places is a specialist organisation in the ACT that provides services to adults with high and complex support needs to participate in community, social and recreational activities. We assist people to work towards their personal goals and improve their quality of life through the development of daily living and life skills, communication strategies and positive behaviour supports, promoting a person-centred culture.

We are currently supporting around 160 people across the ACT, ranging in age from 18 to 65 years.

How have you found the NDIS so far?

In the ACT, with the transition from trial to full Scheme, there has been less flexibility, and the reality of 'reasonable and necessary supports' has decreased funding in many people's plans. There are still inconsistencies in the plans.

The back office pressure has increased to capture all the information for invoicing, processing claims and ensuring we stay within budgets as agreed in the individual's Service Agreement; keeping on top of outstanding payments and chasing payments from the NDIS. There are still gaps between plans and shortfalls in funding.

> "We have seen a growth in our service, welcoming many new people who previously didn't have funds for social and community participation, as well as young adults who have graduated from school."

What has been the greatest challenge in the NDIS?

The people we support have lifelong disability and many were told they would only need to tell their story once. However, we are asked over and over again to provide evidence for the supports they need in order to access community, social and recreational activities. As a result, the annual reviews were often very taxing for families – constantly having to identify deficits in people to justify funding. The fact that this process doesn't focus on a person's strengths is very tough.

What has been your greatest achievement this year?

Maintaining the level of high-quality service, and remaining financially viable. We have seen a growth in our service welcoming many new people who previously didn't have funds for social and community participation, as well as young adults who have graduated from school.

What's been a valuable lesson for your organisation?

The resilience of families and the people we support, and the commitment and dedication of our staff through changing and often uncertain times. [We have also learnt that] the operating environment continues to change, so you can't become complacent. We are constantly reviewing our financial position and making adjustments accordingly.

Looking back, is there anything you would do differently?

Even with organisational pre-planning and implementation of safeguards and strategies with sound business practices, the impact on our resources such as maintaining our vehicle fleet and our capacity to continue to provide home transport and a range of programs was under threat. We should have realised sooner that our fleet of vehicles could not be maintained once all the subsidies we previously had were gone. Now, we have 100 per cent cost recovery for vehicles and activities.

"Now, it's great to see that the students have their own resources, such as their own walking or standing frames. They're also having therapies introduced much sooner. Previously, waiting lists could be years-long."

Can you share any positive stories that have come about since the NDIS?

There are many positives. Before the NDIS, there were a lot of people with undermet needs sitting in accommodation. That has been addressed. In addition, many people graduating from school used resources that were owned by their schools. Now, it's great to see that the students have their own resources, such as their own walking or standing frames. They're also having therapies introduced much sooner. Previously, waiting lists could be years-long.

What are your NDIS goals as an organisation?

We need to continue to watch the vital signs of the organisation and actively adjust resources. Although we are a not-for-profit organisation, we need to look at how to continue to cost recover and monitor non-claimable absences and work within our budget. Being one of the only organisations that provides supports to people with high and complex needs in the ACT, we also need to consider how big we can grow. We need to gather regular data of school leavers with disability and review our capacity. Something we'd like to do is expand services into the Gungahlin area, which is in the outskirts of the ACT. Finally, we need to keep actively engaging with the NDIA, NDS and other stakeholders.

6,759 NDIS plans approved in ACT
134% of bilateral estimate

4% NDIS participants are Indigenous
10% Culturally and linguistically diverse

1,352 registered disability service providers

Key issues

Inadequate pricing

As the first jurisdiction to fully transition to the NDIS, the cumulative impact of inadequate pricing is increasingly being felt by ACT providers. A closer examination of service types that require additional funds in order to remain viable is required. Inadequate NDIS prices pose a risk not only to individual disability service providers, but to the Scheme as a whole.

Better data to track participant movement away from areas of market stress

Participants requiring one-to-one and community access supports are increasingly unable to access these services and may be substituting them with other service types (e.g., in-home day supports) that do not meet all the needs identified in their plans. Better tracking of participant movement between service models is required to identify areas where the current market can not deliver on participant plan outcomes.

NDIS payment portal

Ongoing process issues and inefficiencies in the NDIS claiming system continue to create an unnecessary administrative burden for providers. Response times from the NDIA need to be shorter if providers are expected to absorb these costs. A co-design approach – with providers and participants – needs to be adopted to ensure that portal improvements are user-centred and tested prior to roll out.

New South Wales

Case study

Monique Cardon

CEO, Fairhaven

Tell us a bit about Fairhaven.

Fairhaven was established in 1962. We have three major streams of business. The majority of our service users work in supported employment. We also have a residential and active business community unit.

How has the NDIS affected the way you work?

Individuals now have money to spend on things they didn't before, which has opened up new opportunities and new worlds to them. We are having great fun trying to help them realise this. Our aim at the moment is to make sure we offer enough variety in our supported employment. Our major Australian Disability Enterprise (ADE) is CoPack, a packaging facility, but we also have ReCreate, an upcycling furniture and homewares-making social enterprise, as well as opportunities to work in our cafe and op-shop. We really want to provide people with choice.

Do you have a positive NDIS case study to share?

One of our guys who works at our Point Clare site wanted to learn to drive a forklift. He used his Coordination of Supports money to have somebody work with him to understand the questions on the driver's licence test. He could already drive a forklift, so it was about getting support to complete the test. I saw him recently after he got his license and he pulled it out of his wallet to show me with such pride. It was wonderful to see. Without that funding, he wouldn't have been able to access the people he needed to make that happen. We also have a similar story from someone from Tuggerah, who really wanted to learn to drive. He also used his Coordination of Supports money to arrange driving lessons and organise people to support him to complete the test. He ended up getting his provisional licence.

What have you learned by working through the transition process?

Understand your unit costs and understand your margins. When you're in human services, it's easy to keep delivering – but you just can't. The most difficult transition for us was to go from block funding where you had a certain amount of money and staff, to a new situation of understanding individual budgets and making Service Agreements based on those. It's tough on staff who have come from that old case management model, especially because you still want to help everybody.

Your entire leadership team recently went on a residential course. How was this experience?

It was an NDS event called 'Leading the NDIS Transformation'. My General Manager and I looked at it and saw that it was two days in the Hunter Valley, which is really close by and very cost-effective, so we went along. We really liked that it followed a peer-support model and involved other organisations. It was fantastic and we really enjoyed ourselves. We got to know people we wouldn't ordinarily connect with. When the course was run again

"Understand your unit costs and understand your margins. It's easy when you're in human services to keep delivering – but you just can't."

in Ballina, we decided to send the rest of our leadership team so that they would be exposed to the same sort of thinking and ideas.

We all really enjoyed getting insights into our own leadership practices, and came back with a great phrase: "You're either on the dancefloor or on the balcony." It was a nice reminder that, when you're busy with the day-to-day, you also need to spend time looking at your organisation in order to work on it – not just in it. It taught us to be really agile, and that you just can't do things using the old ways anymore. It's about choice and control for [the people we support]. I think everybody's starting to get that now.

"When you're busy with the day-to-day, you also need to look at your organisation in order to work on it – not just in it."

Is there anything you would do differently if you could go back in time?

I've been with Fairhaven less than two years, but I think we could have focused more on staff education. I think we've also taken the focus off what our families understand. A lot of work was done with families before the NDIS came in, but once it came in, there was an assumption that they knew what they were doing. As an organisation, we're still working through things but have probably taken our eye off what our families understand. So we are planning to do some 'NDIS 101 information' sessions so families are not left in the dark. I run a family reference group meeting which is always really interesting because there's great peer support and opportunities to help each other.

What's something you're proud of having achieved at Fairhaven?

We went through an important rebranding exercise. Fairhaven is a 56-year-old organisation with a strong local history, but also legacy issues. The rebrand has given everyone a sense of renewal and hope that we are a contemporary and exciting organisation that can attract new people. If we can touch more people and give them opportunities to live an ordinary life, we'll know we have done our job.

86,044 NDIS plans approved in NSW
78% of bilateral estimate

6% NDIS participants are Indigenous
9% Culturally and linguistically diverse

8,485 registered disability service providers

Key issues

Interface between the NDIS and mainstream services

It remains unclear how the NDIS will interface with mainstream services. There are many examples of participants and providers being stuck between the NDIS and mainstream service providers. Provider consultation is essential to resolving these complex cross-service system issues.

Role of Community Partners in NSW

The lack of capacity of Local Area Coordinators to provide plan implementation is concerning. In many cases, the burden of assisting participants is falling on providers. The Early Childhood Early Intervention (ECEI) approach was rolled out very late and quickly in NSW. There are concerns that eligible families have been waiting significant periods of time for plans to be developed.

Leasing arrangements

The leasing arrangement proposed by the NSW Government for providers operating properties under licence from Family and Community Services (FACS)/ Land and Housing Corporation assumes every property will be fully occupied by participants eligible for Specialist Disability Accommodation (SDA). This fails to take into account that many of the properties will be unsuitable for participants eligible for SDA or that there will be participants requiring Supported Independent Living (SIL) who are not eligible for SDA.

The State of Broader Policy Environment

Few DSP recipients are in work

The number of Disability Support Pension (DSP) recipients reporting wage earnings has continued to decline. The number of DSP recipients decreased from 758,911 to 756,960 over the 12-month period to 30 June 2018. The proportion of DSP recipients reporting wage earnings was 7.95 per cent in June 2018, down from 8.2 per cent in June 2017.

Other four pillars of policy need work

While the NDIS dominates the disability policy environment, it is only one of five pillars designed to support the social and economic participation of Australians with disability. The other pillars are the National Disability Strategy; the National Arts and Disability Strategy; the Disability Discrimination Act; and the National Disability Agreement.

The 10-year National Disability Strategy, signed by the heads of all Australian governments, focuses on six areas:

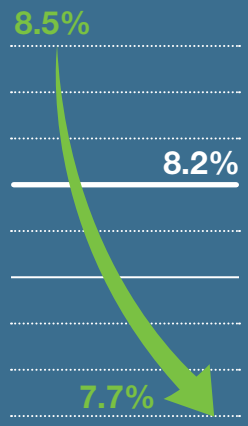
1. Inclusive and accessible communities
2. Rights protection, justice and legislation
3. Economic security
4. Personal and community support (which includes the NDIS)
5. Learning and skills
6. Health and wellbeing

Progress in most of these areas has been uneven and slow. The Strategy is currently under review and NDS believes that a renewed one should include annual reporting to parliaments on key measures to give it visibility and stimulate investment in the changes needed.

The National Arts and Disability Strategy, due to expire next year, is also under review. Arts and cultural ministers from across Australia have agreed to develop a new strategy to assist people with disability to participate in cultural life.

The Disability Discrimination Act protects people with disability against discrimination in public life. Standards have been made under the Act in relation to Public Transport, Education, and Access to Premises. In general, the standards are well-crafted, but their effectiveness is weak. National auditing of compliance with the standards should be strengthened. The Public Transport Standards are under review.

The National Disability Agreement is a high-level Council of Australian Governments (COAG) agreement that defines the roles and responsibilities of the Commonwealth and the states and territories in relation to disability services. The NDIS has rendered parts of this Agreement redundant. However, in NDS's view, a revised Agreement could better connect the other pillars of disability policy and define responsibilities for key policy areas. We have made this point to the Productivity Commission's review of the National Disability Agreement.



In June 2011, the proportion of DSP recipients reporting wage earnings was 8.5%. The March 2018 figure of 7.7% was the first time the proportion of wage earners on DSP had fallen below 8.2% over that period.

How NDS is taking action:

- Advising governments on interface issues between the NDIS and mainstream services, based on the experience of members
- Providing submissions and evidence to national policy reviews
- Developing resources, such as the Zero Tolerance initiative, to help prevent abuse and neglect
- Hosting information sessions on the NDIS Quality and Safeguarding system
- Urging governments to develop continuity of support arrangements for people with disability who are ineligible for the NDIS

South Australia

Case study

Maggie Dowling

CEO, Bedford Group

Tell us a bit about the Bedford Group.

Bedford has been in operation for nearly 70 years. We currently support around 1,500 people with disability, 1,300 of whom access supported employment. The balance is day options and a small amount of residential services. I've been at Bedford for around eight months [as of October 2018].

What is Bedford's furniture business and how has it been adapted to suit your supported employees?

Bedford is known for its flat pack furniture that is marketed throughout Bunnings stores. It has our own branding and is available nationally. The offering includes wardrobes, bedside cabinets and laundry furniture, and we are currently looking at an outdoor kitchen range to be launched into Bunnings very soon. It's one of our largest commercial businesses that our supported employees work in and generates about 44 per cent of our non-funding revenue. Our revenue is about $72M and around $18M of that is funding and the balance is revenue generated by our commercial businesses. We have five furniture manufacturing sites across South Australia, which includes metro and regional areas.

Work, Health and Safety (WHS) is a very strong focus of ours. A lot of companies that don't have supported employees look at what we do and consider it a good idea as we provide a very safe environment for manufacturing.

"Employment isn't just having a job – it's about quality of life. It is waking up in the morning and knowing that you are contributing to society like anyone else. [It provides] socialisation, social inclusion, economic benefits from income, improved health and wellbeing, independence and respite and support for families."

How has the NDIS transition affected your organisation?

The cost of transformation is very evident. Just to transition our 1,500 existing clients, we've had to invest significant resources of around $1.8M in additional staff to have pre-planning meetings with families to ensure they understand the need to put 'finding and keeping a job' in plans. A lot of families are getting a first plan and it's not complete as they haven't understood what the categories are. That extra investment is only to retain our existing funding, without generating any additional revenue, so it's significant. And like other organisations, we are still in the long, arduous journey of systems modifications to suit the new business model.

What's something you're proud of having achieved?

We have some residential accommodation, where about 80 clients live. Because there are a lot of people in one place, it's the sort of housing that the State Government didn't deem as 'independent living'. Because of this, we were getting very marginal funding. My team there worked really hard with the NDIS. The Supported Independent Living (SIL) funding we now have for those clients is

amazing. The team at the NDIA were really helpful and worked through it with us. There's one family in particular, whose son would always send his washing home and get home-cooked meals as he didn't like the cooking at his accommodation. SIL funding has given him much better flexibility. We have numerous stories like this where we've seen very positive outcomes.

What's the most valuable lesson you've learnt through overcoming NDIS challenges?

I came as a relatively new CEO into a risky financial environment. I've seen the move from systems that didn't have to be single-client dependent under the block funding model, to something that needs to identify client-specific data across a range of services. That integration of information about clients is an administrative task that can cause serious financial issues. I think we need to be down in the weeds in relation to transition. Once we're through to the other end of it, we won't need to operate at that level. But I think there's a need in the meantime at the executive, CEO and board level to be driving deep into transition challenges as that's where financial risk is high.

What do you think Bedford has done well through the transition process?

I think the support we've put in to support families absolutely returns value. That won't stop though. While families are still in transition, there will be a continuing requirement for support. It certainly won't be a short-term resource investment – I can see it will be ongoing for some time. High-quality client services where families and people with disability feel supported are going to be key to success as we go through the transition process.

What are your NDIS goals in the coming years?

We want to maintain our focus on ensuring that there is an employment-first focus in NDIS plans so people have the opportunity to work. Supported employment is what we are and we strongly believe in it. Employment isn't just having a job – it's about quality of life. It is waking up in the morning and knowing that you are contributing to society like anyone else. Being employed gives benefits of socialisation, social inclusion, economic benefits from income, improved health and wellbeing, independence and, of course, it provides respite and support for families.

18,460 NDIS plans approved in SA
72% of bilateral estimate

4% NDIS participants are Indigenous
6% Culturally and linguistically diverse

1,960 registered disability service providers

Key issues

Pace of NDIS roll out

Providers are finding that the full roll out of the NDIS in South Australia, which has already been delayed by six months, is proceeding very slowly and is almost at a standstill in some regional centres. The slowdown means that some providers continue to operate with two funding models, which adds to the complexity and cost of administration. It will continue to impact on the growth plans of organisations.

The speed of transition for people with disability is also of concern, with many disability service providers finding that participants who should have transitioned over 12 months ago are still waiting for approved plans.

Inconsistent advice on SIL

Local advice is at times inconsistent with national advice on Supported Independent Living (SIL) from the NDIA. Consistent, prompt and transparent messaging is needed.

High cost of Quality and Safeguarding audits

There is a growing concern in SA around the cost of Quality and Safeguarding audits, with some disability service providers receiving quotes of around $5,000 per day. This needs to be addressed to ensure that audits are cost-effective and not a financial burden for providers.

Queensland

Case study

Brett Adams

Manager Partnership and Performance
– Community Solutions Subsidiary, Endeavour Foundation

Tell us a bit about Community Solutions.

Community Solutions, which is predominantly an employment and workforce-funded not-for-profit, amalgamated with the Endeavour Foundation around five years ago. The biggest part of my role is to connect government-funded services with industry. We work mainly in the employer space so we can support organisations with their workforce issues and get employment outcomes. We also look after mental health and NDIS services which are all growing. However, 75 per cent of our revenue comes from employment and workforce-related services.

How has the NDIS affected what you do?

It's been interesting. The employment services space had already started to move to a market-driven model prior to the NDIS being rolled out. Fortunately, this meant that we were already very much in the NDIS space five to 10 years ago, and our staff were already in the mindset of what the NDIS would bring. As the NDIS has been rolled out, we've been able to position all of the employment services to align with the needs of the Scheme.

Can you explain the concept of a shared labour pool and how it works?

Sure. We've had access to existing funded services such as disability employment services, Jobactive and Group Training for a while. All of this helped us take that step into trying a shared workforce model. What we're trying to achieve is to be a one-stop shop for providers and employers. We want to help them employ the workforce they need through our various pipelines, including a unique labour hire and mainstream recruitment offering. It's still relatively early days, but we're trying to position ourselves for the disability and human services market.

What's the main benefit of a shared labour pool?

We believe that a shared model is how the market needs to work together. The idea is that, through sharing a workforce, there's efficiency of costs (recruitment, training, HR and admin), better ways of getting people into the sector, and any employers that are accessing that shared workforce can handpick the best people and eventually make decisions to permanently employ those people. Ultimately, we are specialists at maximising government-funded services, getting new people into the sector, and doing it smarter.

> "We want to see more collaboration, which I believe can go beyond traditional employment models to a more contemporary and future-proofed model of workforce strategy and management."

What has the response from providers been?

They typically like the idea. When it comes to the nuts and bolts of making it work, it can be more challenging. Using a contingent workforce is new to the sector, but other industries have proven the effectiveness and need in a market-driven environment. It takes a bit of time to understand everyone and how their services are different,

but we can always overcome this. The key will be cost savings from the services we offer.

Can you share a positive outcome from working with a provider?

We worked with a disability provider where we accessed both state and federal funding. We created a program called 'Host to Hire' which allowed providers to trial new workers in the industry through our shared workforce model. We were able to cover recruitment and training costs to get people into jobs whilst engaging successful job seekers through our third party and host candidates with interested providers. The cost savings for employers were significant, and they were able to trial new staff for six months at a heavily-subsidised rate. The job seekers got training, experience and confidence within the disability industry as support workers.

In one particular region in Queensland, there was a cost saving of over $100,000 in recruitment, training and wage costs in six months. The provider went on to employ over 80 per cent of the people that went through the program on a permanent employment basis. One candidate went from being unemployed as a single mother to successfully gaining a management position. This is something we were extremely proud of. And the disability provider had a whole new way of thinking about their workforce and how they attracted and employed staff.

Looking ahead, what are your NDIS goals?

We've had some great successes of organisations being able to collaborate using our services. We want to see more collaboration, which I believe can go beyond traditional employment models to a more contemporary and future-proofed model of workforce strategy and management. We want to continue being proactive problem solvers around NDIS workforce issues. We need to continue using technology too. As an example, we use video interviews for support workers to make the hiring process more efficient for both hiring managers but also the customer experience. We are proud that we can bring these sorts of ideas and solutions to the sector, and we will continue to support the future workforce and community engagement opportunities that the sector will bring.

16,524 NDIS plans approved in Qld
55% of bilateral estimate

10% NDIS participants are Indigenous
3% Culturally and linguistically diverse

3,559 registered disability service providers

Key issues

Delay in NDIS roll out

Under the bilateral agreement between the Commonwealth and Queensland, two thirds of the state's NDIS participants are scheduled to enter the Scheme in 2018-19. The transition process for partners in community contracts, including Local Area Coordination and Early Childhood Early Intervention, was planned to take place prior, but ended up being delayed. This has caused confusion, inconsistency and uncertainty for both Scheme participants and service providers. To ensure successful transition, greater certainty around timelines is required.

Responding to the needs of remote and regional communities

The challenges of thin markets, inadequate pricing and lack of a local workforce have made it difficult to cater to the needs of remote communities. These challenges are even more acute in Indigenous communities. A local and targeted response is needed to ensure that these communities are not further marginalised.

Lack of market data

To date, the NDIS roll out has not met the volume of participants forecast in Queensland's Market Position Statement. Lack of data by location is hampering evidence-based planning and the ability of both existing and new organisations to meet market need in an effective and efficient manner. In addition, providers may be unable to meet participant needs without winding up in precarious financial positions.

The State of Disability Employment

Make employment a priority

Increasing the rate of employment participation of people with disability should be a key objective of the NDIS. The NDS policy paper, Making Employment a Priority, identifies constructive measures that would ensure that the NDIS actively supports participants to enter the workforce.

Recent data demonstrates the urgent need to enhance and streamline the provision of employment supports. As of June 2018, only 2.0 per cent of NDIS supports for people over 25 years and 5.2 per cent of supports for people 15 to 24 years were for employment.

The NDIS should make 'finding and keeping a job' an NDIS core support, rather than a capacity building support, for participants of workforce age. This employment-first approach should also allow participants to automatically receive ongoing funded supports when a participant can commence work. This would alleviate the need for a plan review and the attendant delays that may prevent a participant gaining a job.

Job seekers with disability who are testing their eligibility for a Disability Support Pension (DSP) should have access to supported employment and/or Disability Employment Services (DES). This is currently restricted as they are ineligible to be paid pro rata wages.

Transition to work programs for school students with disability should be provided from age 15 and assist them to gain work experience and build their workforce confidence and career aspirations.

Finally, the interface between DES and the NDIS should be simplified, and the latter allowed a wider brief to provide complementary supports that will sustain employment for participants.

Open employment undergoing significant change

From 2010 to December 2017, DES providers assisted 415,543 people to start a job and 249,282 people to keep a job for at least 26 weeks.

The new DES contract commenced on 1 July 2018. Providers are experiencing a number of challenges as the new arrangements are bedding down. It is an extremely competitive market, with the number of contracts expanding from 800 nationally to over 2,000 licences nationally. Competition in each Employment Service Region is tight, with providers competing for the same participants and employment opportunities.

The new risk-adjusted funding model was designed to improve outcomes for job seekers who have more barriers to employment; through clearer fee differentiation and a higher level of support. However, the model – which is based on the probability of somebody achieving employment – does not account for the support required. Some cohorts of DES participants that require extensive levels of upfront support in order to be placed and supported in employment are not receiving adequate funding at the front end of the program. This affects, in particular, Eligible School Leavers, job seekers aged under 25, individuals with an intellectual or learning disability, and people on the Autism spectrum.

Job placements for people in these cohorts were previously at relatively high levels due to the extensive supports that could be provided with greater funding. A reduction in the levels of funding for these participants will inevitably lead to poorer job placement rates.

In addition, providers have expressed concern about the introduction of additional compliance obligations when assisting participants that require ongoing support. Providers are adamant that these compliance obligations misallocate their resources and the program's funding and reduce the amount of support that can be provided to

> Sixty-nine per cent of DES providers that responded to the Annual Market Survey said that the introduction of the new DES framework had increased the administrative burden on their organisation either a little or a lot. At least half also expressed dissatisfaction with the current DES policy and operating environment. They disagreed that the policy reforms were heading in the right direction, that the Commonwealth processes were working well, and that the operating environment for DES is more certain.

ensure people with disability maintain their employment.

The problems with the risk-adjusted funding model and the new ongoing support obligations are exacerbating the decline in participants with intellectual disability being placed and supported in jobs. As at June 2018, only 7,634 of DES/ESS (Employment Support Service) participants had an intellectual disability, barely seven per cent of the current caseload.

Only **2%** of NDIS supports for people over 25 years and **5.2%** of supports for people 15 to 24 years are for employment.

Supported employment design discussions continue

The Fair Work Commission (FWC) made an important and very welcome decision in April 2018 following the review hearings for the Supported Employment Services (SES) Award. The application by the advocates and several unions that sought the abolition of all wage tools except the Supported Wage System (SWS) was rejected. The decision proposed a new wage assessment method that factors in both the complexity and scope of a job and an employee's productive output. Existing wage assessment tools (including the SWS) are to be phased out of the Award.

The FWC requested that parties involved in the Award review provide input into the development of a new Classification Structure for Grades 1, 2 and 3 of the Award, specifically covering supported employees.

NDS convened a wage determination working group and has completed some important preliminary work including a set of definitions and a description of the methodology that might be used to assess the complexity and scope of a supported employee's job. The FWC's final decision is expected to provide further guidance on the design of the classification structure. A member of the Full Bench will also preside over a conferral process assisting the Award review parties to design the classification structure.

In another welcome development, the Federal Government made a further strong commitment to the Disability Enterprise sector, announced by then Social Services Minister Dan Tehan at NDS's Disability at Work Conference 2018. The package provides $5.3M in support for organisations paying their employees under the SWS, and $1.5M for sector consultation and trials to inform the development of the new wage assessment mechanism. A key consideration for government will be whether to provide an ongoing subsidy for wage increases that may arise due to decisions made by the FWC, the rate of any subsidy and how it would be administered.

Following the initial round of public consultations by the Department of Social Services, NDS will continue its active involvement in the future design of supported employment, including assisting in the design of longer-term pricing and funding arrangements, to be implemented under the NDIS from mid-2019. NDS has recommended that any sustainable model of supported employment pricing must include the cost of ongoing support, the cost recovery shortfall arising from employees with reduced rates of productive output, and a capital replacement subsidy. NDS is of the view that any wage increase subsidy should be indefinite and paid by DSS, as it is not a reasonable and necessary support as defined by the NDIS.

NDS's BuyAbility initiative continues to promote the social and economic benefits of supported employment. The BuyAbility Social Impact Measurement Tool (independently-verified) shows that, for every dollar of funding expended by government on disability enterprises, the net economic benefit is $3.66.

In the Annual Market Survey, 52 ADEs provided feedback on the current operating environment. More than half of these services disagreed or strongly disagreed that policy reforms were heading in the right direction, that Commonwealth processes impacting ADEs were working well, that the operating environment for ADEs was more certain than 12 months ago, and that the transition to the NDIS had enhanced their performance.

School-to-work transition remains a crucial area of focus

Young people with disability continue to be severely underrepresented in the Australian workforce, however work is being done to change this.

Connecting young people at school with jobs vastly improves their chances of working post-school. NDS's Centre for Applied Disability Research (CADR) has released a Research to Action Guide that identifies the six key elements of effective transitions from school to work for young people. These include building work expectations, stakeholder collaboration, meaningful work participation, skills development, family involvement and early transition planning. All of these elements have been successfully utilised in NDS's Ticket to Work initiative, which is assisting significant numbers of students with disability to achieve their work and career aspirations.

Ticket to Work recently conducted a pilot designed to support students to participate in after-school jobs. An after-school job is a rite of passage for many adolescents and students with disability should be no exception. Ticket to Work uses a longitudinal approach to measure the benefits of work for school students and its positive impacts on their economic and social participation. Ticket to Work networks recently celebrated the creation of over 1,000 jobs for young people with disability. The Ticket to Work traineeship/apprenticeship completion rate is well above the general population.

How NDS is taking action:

- Negotiated supported employment design and providing informed advocacy to government on its future
- Shaped a number of the policy directions – in particular, the granting of an invitation to treat for 3-star and above providers – in the design of the new DES program
- Calling for an employment-first approach that makes 'finding and keeping a job' an NDIS core support
- Securing $33.492M in contracts, with 1,511 supported employee roles engaged across 62 disability enterprises, since the launch of the BuyAbility initiative in 2017
- Supporting 2,000 young people with disability to access career development opportunities while at school through NDS's Ticket to Work initiative
- Influencing the review of the Performance Framework, including determining which data would be incorporated in the 2018 Star Ratings
- Releasing a policy paper, Making Employment a Priority, which identifies constructive measures that would ensure the NDIS actively supports participants to enter the workforce
- Development of the The BuyAbility Impact Tool V2.0; now the pre-eminent social and economic impact measurement tool for supported employment

Victoria

Case study

Ross Coverdale

CEO, Araluen

Tell us a bit about Araluen.

Araluen is based in three local government areas in metro Melbourne. We've been a fairly traditional service, with strong loyalty from our participants and their support networks. We've enjoyed a strong 10 years leading into the NDIS, in which we've been able to attract good staff. We're the only adult day service in the country that has the international gold standard of Autism Accreditation. We support people aged over 18 in the traditional day service model, but also other innovative support initiatives including creating vocational opportunities; individualising support; skills development and the like. We provide group housing, and we're specialising in moving people out of the family home, where they typically live with ageing carers, and into community integrated living.

How has the NDIS transition affected your operations?

We've found ourselves in a growth phase. Our income has gone up significantly since the NDIS started in our area, and more participants now want more support from us. We went through a period in which we thought we might struggle to stay in business, but we've comfortably done that. Our issue now is to have the internal capacity to respond to participant demand and probably double in size. We're forever recruiting. We have to invest in Araluen's structure and people to grow it, and to grow the quality. We're not interested in growing just for the sake of numbers. It has to be about impact, and we have to impact people's lives in a positive way. We exist to help people have great lives. How do we improve growth, quality and culture? That's a different struggle to staying afloat, but it's a struggle. That's our struggle now, and it's not the one we thought we were going to have.

What is the most valuable lesson you've learned?

What we've done best is had good managers and we've sat together and asked: "What do you understand?" and "How does this work?" We've been honest and open with each other. Initially, we believed everything the NDIA told us... But what we found is that we know our business better than anybody. We've had consultants come in, we've listened to a lot of different advice, but we've got a good idea of our business operations, what our capacity is, and what our systems are. And we've sat down together with blank pieces of paper and asked: "How can we make this work?"

The second thing is that we've listened very closely to our customers. We've put a lot of effort into pre-planning. Before families go and have their planning meeting with the NDIA, they've met with us and we've discussed what they'd like and how we can support them through that process. That's gone very well. So we're enjoying high trust levels from participants and their families.

What has been your greatest achievement this year?

One of the best things we've done – which was more than a year's work – is becoming a leader in Investigating Housing Solutions (IHS), moving people with disability out into the community. We've developed a process

and a housing roadshow, and moved 32 people into community living. We've got research partners and a process, and I think that's been some of the most exciting work that we've done. We also started our third café. And that's funded through individualised support and skills development.

Can you share a case study where you achieved a positive outcome for one of your service users? Who were they and what happened?

There's a young man – Fred [not his real name] – who lives with his mum, who has other children. Fred's behaviour was becoming difficult for the family, and his mum wasn't coping. So we began to plan the process for Fred to move out of home. Fred has Autism and doesn't always enjoy the company of others. So rather than put him in a group home that may have resulted in conflict, we were able to upskill Fred and move him into his own unit, and find him a volunteer role in the community. He doesn't have paid support during the day, but has visiting support at home that assists him to live the life that he chooses. Fred has an IHS coordinator that has really helped him out. He has had to work through issues of resilience and expressing appropriate relationships, and we've helped him with those. With the NDIS, we're spending a fraction of what it would have cost in a group home.

If you could go back in time, what would you do differently?

I think we would have worried less. I would say that a lot of the information we gleaned about the NDIS was actually wrong, or wasn't relevant to our context. When we ran all of our pricing scenarios, the actual outcome was far more positive than what we were being told. The thing we should have done is believe in our own abilities and our own capacity more.

What are your NDIS goals for the next few years?

What we now know is that, at this stage, we're still able to attract good staff. So our big goal right now is to embrace the growth. In Melbourne, we're on the edge of what's known as the Whittlesea growth corridor. We're seeking to become a premium provider in that municipality. In that context, we're going to develop all sorts of new models for supporting adults. They won't be traditional models. And that will probably lead us to double our organisation.

4,923 registered disability service providers

Key issues

Ongoing support from NDS's Sector Development Program

With funding from the Victorian Government's Transition Support Project, NDS will continue providing disability service providers with the advice they need to support their transition to the NDIS throughout the 2018-19 year. We are keen to ensure that funding to support sector transition continues to be available after June 2019.

A voluntary Disability Worker Accreditation and Registration Scheme

NDS was successful in making the case for a voluntary rather than mandatory Victorian Disability Worker Accreditation and Registration Scheme in the 2017-18 year. We were concerned that a mandatory scheme would act as a barrier to workers entering the sector at a time when it needs to grow. NDS continues to undertake project work and advocacy to support the growth of, and quality of services provided by, the Victorian workforce.

Disability transport difficulties

NDS members report challenges in providing transport services under NDIS prices. NDIA restrictions around provider travel claims and scarcity of funding for participant transport in NDIS plans exacerbate this. NDS continues to work with the Victorian Government to address these issues, including advocating for the Victorian Mobile Passenger Transport Program to be extended to NDIS participants beyond June 2019.

Northern Territory

Case study

Kim McRae

Tjungu Team Manager, NPY Women's Council

Tell us a bit about NPY Women's Council.

NPY Women's Council provides a range of services and advocacy for people living in the remote cross-border region of the Northern Territory, Western Australia and South Australia. In the disability space, we've been receiving disability funding under the Tri-State Disability Agreement since 2005 – providing case management, flexible respite, and transport associated with that respite. We work with people with disability and their families and we support people to continue living on country, with kin, connected to culture, for as long as they are able to. Our big focus is keeping people on country, and we do that by supporting the whole family, because the family provides the care out there.

How has the NDIS affected your operations?

It's been incredibly time-consuming trying to attend all the NDIA information sessions; trying to get staff trained to move away from the case management model that we have previously used for people out in communities and more into the support coordination model… There are quite significant differences there, so it's been a big issue in terms of advocacy.

The amount of time we've had to spend advocating to the NDIA about what people in remote communities actually want in terms of disability supports has been significant too. Material poverty is a huge issue for people out there… Often food, shelter and safety are the big issues for our families. The NDIS can't particularly purchase food, or swags and blankets for people – which is what our families often ask for because they're highly-mobile and often don't have a bed. The NDIA has an Aboriginal and Torres Strait Islander Communities Engagement Strategy, but the reality of how that's being applied out in community is different. How can we support the whole family to maintain the care for that person? Those kinds of concepts aren't really supported well by the current structure of services through the NDIS.

What's been your greatest achievement this year?

I think one of our biggest achievements has been maintaining stable staffing in an environment where there's no guarantee what's going to happen tomorrow; and where we're dealing with declining levels of block funding because of the NDIS. We've invested heavily in trying to maintain our existing staff. And that's important, because working in Aboriginal communities, the work you do is based on having trusting relationships with clients and families. Those relationships take a long time to build. We want those staff members to stay here and continue those relationships.

What's the most valuable lesson you've learned?

We have to be very careful to look after ourselves, because burnout is a huge risk in the environment we're in. Also, trying to reassure our clients and families that they'll continue to receive supports even though there are going to be changes. I've become more focused on what it is we're going to be able to provide for people with disabilities and their families under the NDIS – focusing on trying to maintain the quality of services despite the

cost pressures. That remains the most important issue for us. We don't want to compromise on that because of NDIS pricing. What that might mean is that the range of supports we provide might decrease, because we're trying to focus on what we can do well, within that pricing structure.

I've also learned how important it is to keep raising issues and negotiating with the NDIA around things like remote travel. The cost of remote travel in our communities is very high, and we have to be upfront about that. We've had to be prepared to say 'no' if they don't come to the party. If they're not willing to pay what it costs, we can't do it. We've had to stand up and speak out about what's required, and be prepared for the fact that we may have to stop doing some things.

If you could go back in time, what would you do differently?

Because we've come from an environment of block funding, you kind of felt obliged to go along with the NDIA and try and accommodate the way they do business. But what I've realised – particularly in the past 12 months – is that I just need to challenge that at every opportunity. You've got to be upfront. If you don't get the answer you want from one person in the NDIA, try 10 others that you know. You have to be really frank and fearless, because the issues are so important for people with disability living out in those remote areas. To keep those people out there, we're going to have to fight a very good fight. Otherwise, a lot of people are going to be forced to live in town in supported accommodation because of the lack of services out in the community. And with a little flexibility on the part of the NDIA, they could have the choice to continue living out on country.

What are your NDIS goals for the next few years?

We've kind of lived in a survival mode for the past few years where we're not sure when our block funding is going to end. The big picture, in my mind, is people still living out on country; still with their families; in their communities; doing the things that they want to do every day; being part of the culture and the community, with better services than are available now – because the services out there need to improve.

843 NDIS plans approved in NT
52% of bilateral estimate

78% NDIS participants are Indigenous
38% Culturally and linguistically diverse

602 registered disability service providers

Key issues

Thin and failing markets

Thin and failing markets are continuing areas of concern in the Northern Territory. Of the $197M that has been committed in participant plans to June 2018, only $67.3M has been paid. This represents around 34 per cent; significantly lower than the national average of 64 per cent. Investment in industry development is needed, as well as access to a quarterly market opportunity report by region from the NDIA.

Workforce challenges

Difficulty accessing qualified and experienced staff is already being felt in the NT during NDIS transition, particularly in regional and remote areas. There is anticipated required growth of around 1,300 additional staff to meet the demand at full Scheme in the NT. Investment in workforce planning and development is urgently needed to support continued market growth.

Transport shortages and challenges

Transport in the NT is very limited and expensive. In the place of current funding tiers, an alternative approach to funding remote transport is required to address the challenges and to enable Indigenous participants to return to country without impacting on their core supports. It is imperative that both NDIS prices and engagement models are sufficiently flexible to reflect the cultural norms and costs of delivering services in isolated and Indigenous communities.

The State of the Workforce

Economic and labour market conditions have been improving in most parts of Australia over the past year.

Recent Australian Bureau of Statistics (ABS) data reveals a more vibrant labour market, with more people employed and higher labour force participation. Job vacancies have increased significantly across all industries. Seventy-eight per cent of 15 to 64-year-olds are now in the labour force; the highest rate on record (ABS, August 2018).

In the disability sector, growth has been particularly rapid. NDS workforce data for June 2018 showed a net growth rate for disability support workers of 2.5 per cent, which is equivalent to 10 per cent annually. This compares to an all-industry figure of 2.5 per cent over the past year.

Recruiting disability support workers is becoming more difficult

The challenge of recruiting disability support workers has become greater this year.

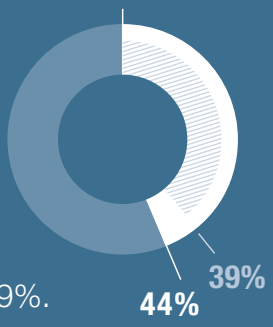
- Nearly two thirds of respondents (63 per cent) reported extreme or moderate difficulty in recruiting disability support workers, up from 42 per cent in 2017.
- Managers and supervisors moved into the 'difficult-to-recruit' category this year for over half of respondents, compared to around one third in 2017.

The most acute recruitment difficulties reported in 2018, as in the two previous years, were for allied health positions.

- Psychologists, physiotherapists, speech therapists and occupational therapists were the top four hardest-to-recruit occupations, with a majority of those responding to this question reporting 'extreme' or 'moderate' difficulty. (See table on p56.)
- Although these were also hard-to-recruit professions in 2016 and 2017, it has become more difficult to recruit as the NDIS rolls out.

Specific skill shortage occupations identified this year include music therapists, pedorthists, custom medical grade shoe-makers, people with a mental health speciality, social workers and, as in 2017, psychologists.

Disability support workers are slightly older than the average Australian worker: Some 44% are aged 45 years or more. In the workforce more generally, this figure is 39%.



Providers getting better at facing challenges

At the same time, nearly two fifths of providers said that it was 'easy' or 'not hard to recruit' support workers. Comments suggested that some organisations feel they are getting better at meeting the challenges of attracting and retaining suitable people:

> "We have very actively tackled our workforce issues. We have been able to recruit and retain better than other organisations in our sector … but it's still difficult, especially for our rural locations."

> "Our workforce is older and, to retain, we are having to reduce hours and offer greater flexibility."

Retention difficulties may also be lessening, with the number of respondents saying they were finding it 'extremely or moderately difficult' to retain disability support workers falling by nearly 10 percentage points from 2017, suggesting employers may be learning what it takes:

> "We have a very high emphasis on the non-financial benefits of working with us - great culture, passion, flexible working, etc."

The hardest-to-retain groups were again the major allied health professionals.

Recruiters tailoring to demand

Providers consistently emphasise that, as the NDIS roll out vastly increases demand, recruitment and selection have become more challenging.

Employers say that they are now recruiting more reactively

to demand, seeking to match new clients to staff with:

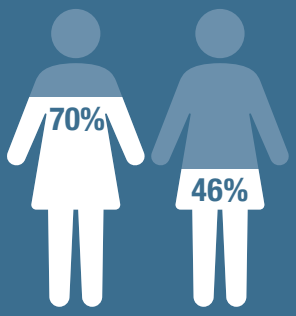
- specific job skills or experiences (e.g. behaviour support)
- personality or demographic characteristics that match customer preferences
- the ability to work flexible hours in order to fit the shifts clients want

> "Finding the right skills and competencies of support workers to match client interests/needs is becoming more difficult, particularly in regional areas where the pool of good and available staff is smaller."

> "The rate of pay and security of employment (guaranteed hours) make it difficult to recruit and retain support workers."

> "Stress has escalated due to the constant cycle of helping families prepare for planning (they are stressed), getting inappropriate plans and poor/ incorrect advice about managing them … and then trying to provide a decent service with insufficient funding. This makes working in this field so much less interesting and sustainable."

About 70% of disability support workers are women, compared to a figure of 46% in the wider Australian workforce.



Remote, rural and regional areas the hardest

As in previous years, recruitment and retention difficulties are exacerbated in remote rural and regional areas. Organisations that cover both metro and rural areas commented on the contrast:

> "It's completely different in rural areas. We simply do not have the numbers to keep up with demand. Too isolated from bigger areas to access some professionals. Transport limited to travel to other services for provision."

Providers see risks associated with workforce pressures

In addition to recruitment, Annual Market Survey respondents highlighted several ongoing workforce issues of concern. Foremost are risks to clients and safety, and risks associated with insufficient time to induct, train and facilitate staff development, undermining the principles of the NDIS:

> "The inability to provide more than very basic training for staff represents a huge risk to the entire sector."

> "We are having to employ people with lower skill and competency levels than we would like due to the low payments from the NDIS. This means less choice for the participants."

How NDS is taking action:

- Offering job board and recruitment tools specifically for the disability sector via carecareers.com.au
- Providing training programs and modules via NDS Learn and Develop
- Offered online workforce benchmarking tool, Workforce Wizard, to help disability organisations track workforce trends
- Providing a one-stop-shop of disability workforce tools and resources at the NDS Workforce Hub
- Launched 'Purpose and People', a national network which meets regularly to support service providers interested in self-organising teams to re-design their workforce
- Managing The Innovative Workforce Fund, an Australian Government-funded initiative designed to encourage the development of innovative workforce practices to support the roll out of the NDIS. So far, NDS has supported 30 projects nationally to identify new ways to engage, develop and use their workforce.
- Developed 'People Search', a searchable database available on carecareers.com.au that enables job seekers to post their profiles and employers to find potential employees
- Publishing the Australian Disability Workforce Report, which documents trends in the disability support and allied health workforces

Table 2 In the past financial year, how easy or difficult has it been to **recruit** competent staff in the following categories?

Occupation category	Percentage of respondents that answered 'extremely or moderately difficult'
Psychologist	83%
Physiotherapist	76%
Speech therapist	75%
Occupational therapist	73%
Local Area Coordinator/ Planner	64%
Disability support worker	63%
Dietitian	63%
Managers/supervisors of disability support	55%
Support Coordinator	50%
HR/Workforce Development	38%

About National Disability Services
National Disability Services is Australia's peak body for non-government disability service organisations, representing about 1,100 service providers. Collectively, NDS members operate several thousand services for Australians with all types of disability.

The Productivity Commission

The Productivity Commission is the Australian Government's independent research and advisory body on a range of economic, social and environmental issues affecting the welfare of Australians. Its role, expressed most simply, is to help governments make better policies, in the long term interest of the Australian community.

The Commission's independence is underpinned by an Act of Parliament. Its processes and outputs are open to public scrutiny and are driven by concern for the wellbeing of the community as a whole.

Further information on the Productivity Commission can be obtained from the Commission's website (www.pc.gov.au).

Foreword

The National Disability Insurance Scheme (NDIS) is a new scheme designed to change the way that support and care are provided to people with permanent and significant disability.

This study is a review of NDIS costs. The Heads of Agreement between the Australian and State and Territory Governments on the NDIS stated that the Productivity Commission would undertake a review of NDIS costs in 2017, to inform the final design of the full scheme prior to its commencement.

The Commission, and this study, benefited from discussions and submissions from people with disability, advocacy groups, peak bodies, disability care and support workers and government. We are grateful for the valuable contribution of all those who contributed to this study.

REVIEW OF NATIONAL DISABILITY INSURANCE SCHEME COSTS

I, Scott Morrison, Treasurer, pursuant to Parts 2 and 4 of the *Productivity Commission Act 1998*, hereby request that the Productivity Commission (the Commission) undertake a study into the National Disability Insurance Scheme (NDIS) costs.

Background

The Heads of Agreement between the Commonwealth and the States and Territories (States) on the NDIS stated that the Commission would undertake a review of scheme costs in 2017. This review is intended to inform the final design of the full scheme, prior to its commencement.

Scope of the study

The Commission should address the following issues identified in the Heads of Agreement for the review of scheme costs:

- the sustainability of scheme costs;
- jurisdictional capacity;
- cost pressures (including wages pressures);
- changes in the agreed escalation parameters;
- if efficiencies have been achieved within the scheme;
- whether there has been any impact on mainstream services; and
- examine the most appropriate levers to manage any potential cost overruns.

In addressing these issues, the Commission should consider:

1. Commonwealth and State funding and governance arrangements for the NDIS, including financial contributions and risk-sharing;
2. the interaction with, and role of, other services in meeting reasonable and necessary support for people with severe and profound disability; and

3. whether there are any issues with the scheme's design, including the application of market and insurance principles, in ensuring the best possible outcomes for people with severe and profound disability.

In conducting the analysis, the Commission should take into account its 2011 report into disability care and support and subsequent agreements between governments for the implementation of the NDIS. The Commission will be provided with all the data on scheme rollout it considers necessary for the analysis.

Process

The Commission is to consult broadly, including with the Australian, State and Territory Governments.

The Commission will report within eight months of receipt of the terms of reference, or by 15 September 2017, whichever is later.

Scott Morrison
Treasurer

[Received 20 January 2017]

Letter of extension

TREASURER

Peter Harris AO
Chairman
Productivity Commission
Locked Bag 2, Collins St East
Melbourne VIC 8003

Dear Mr Harris Peter

I agree to your request to extend the final reporting date of the Productivity Commission's study on National Disability Insurance Scheme (NDIS) Costs from 20 September 2017 to 11 October 2017.

I trust that the extension will give the Commission enough time to incorporate feedback from stakeholders, and refine the Commission's recommendations on the areas outlined in the terms of reference and any issues identified in the consultation process.

Yours sincerely

The Hon Scott Morrison MP

OVERVIEW

Key points

- The National Disability Insurance Scheme (NDIS) is a complex and highly valued national reform. If implemented well, it will substantially improve the wellbeing of people with disability and Australians more generally.
- The level of commitment to the success and sustainability of the NDIS is extraordinary. This is important because 'making it work' is not only the responsibility of the National Disability Insurance Agency (NDIA), but also that of governments, participants, families and carers, providers, and the community.
- The scale, pace and nature of the changes that the NDIS is driving are unprecedented in Australia. To reach the estimated 475 000 participants in the scheme by 2019-20, the NDIA needs to approve hundreds of plans a day and review hundreds more. The reality is that the current timetable for participant intake will not be met. Governments and the NDIA need to start planning now for a changed timetable, including working through the financial implications.
- Based on trial and transition data, NDIS costs are broadly on track with the NDIA's long-term modelling, but this is in large part because not all committed supports are used. While some cost pressures are emerging (such as higher numbers of children entering the scheme), the NDIA has put in place initiatives to address them. The benefits of the NDIS are also becoming apparent. Early evidence suggests that many (but not all) NDIS participants are receiving more disability supports than previously, and they have more choice and control.
- In the transition phase, the NDIA has focused too much on quantity (meeting participant intake estimates) and not enough on quality (planning processes), supporting infrastructure and market development. For the scheme to achieve its objectives, the NDIA must find a better balance between participant intake, the quality of plans, participant outcomes, and financial sustainability.
  - Greater emphasis is needed on pre-planning, in-depth planning conversations, plan quality reporting, and more specialised training for planners.
- A significant challenge in the transition phase is developing the supply of disability services and growing the disability care workforce. It is estimated that 1 in 5 new jobs over the next few years will need to be in disability care, but workforce growth remains way too slow.
  - Emerging shortages should be addressed by independent price monitoring and regulation, more effective coordination among governments to develop markets (including intervening in thin markets), a targeted approach to skilled migration, and equipping participants to exercise choice.
- The interface between the NDIS and other disability and mainstream services is critical for participant outcomes and the financial sustainability of the scheme. Some disability supports are not being provided because of unclear boundaries about the responsibilities of the different levels of government. Governments must set clearer boundaries at the operational level around 'who supplies what' to people with disability, and only withdraw services when continuity of service is assured.
- NDIS funding arrangements should better reflect the insurance principles of the scheme. Governments need to allow flexibility around the NDIA's operational budget and commit to establishing a pool of reserves.

Overview

1 About the National Disability Insurance Scheme

The National Disability Insurance Scheme (NDIS) is a new scheme designed to change the way that support and care are provided to people with permanent and significant disability (a disability that substantially reduces their functional capacity or psychosocial functioning). The NDIS is currently being rolled out across Australia. At full scheme, about 475 000 people with disability will receive individualised supports, at an estimated cost of $22 billion in the first year of full operation.

The NDIS is based on the premise that individuals' support needs are different, and that scheme participants should be able to exercise choice and control over the services and supports they receive. The scheme differs from previous approaches in a number of ways:

- it adopts a person-centred model of care and support
- it is an insurance-based scheme — it takes a long-term view of the total cost of disability to improve participant outcomes and to meet the future costs of the scheme (box 1)
- funding is determined by an assessment of individual needs (rather than a fixed budget)
- it is a national scheme.

The NDIS funds reasonable and necessary supports for Australians with permanent and significant disability. Reasonable and necessary supports are those that help participants live as ordinary a life as possible, including care and support to build their skills and capabilities, so they can engage in education, employment and community activities.

The NDIS also funds supports for people who meet early intervention criteria. This covers cases where early intervention can significantly improve an individual's outcomes and is cost effective. The focus on early intervention reflects the lifetime approach of the scheme (which is consistent with insurance principles, box 1).

Individuals eligible for the scheme are assessed, and individualised support packages are developed and funded for them. NDIS access, planning and payments are managed by the National Disability Insurance Agency (NDIA). (In Western Australia, arrangements are different, but intended to be consistent with the NDIS.)

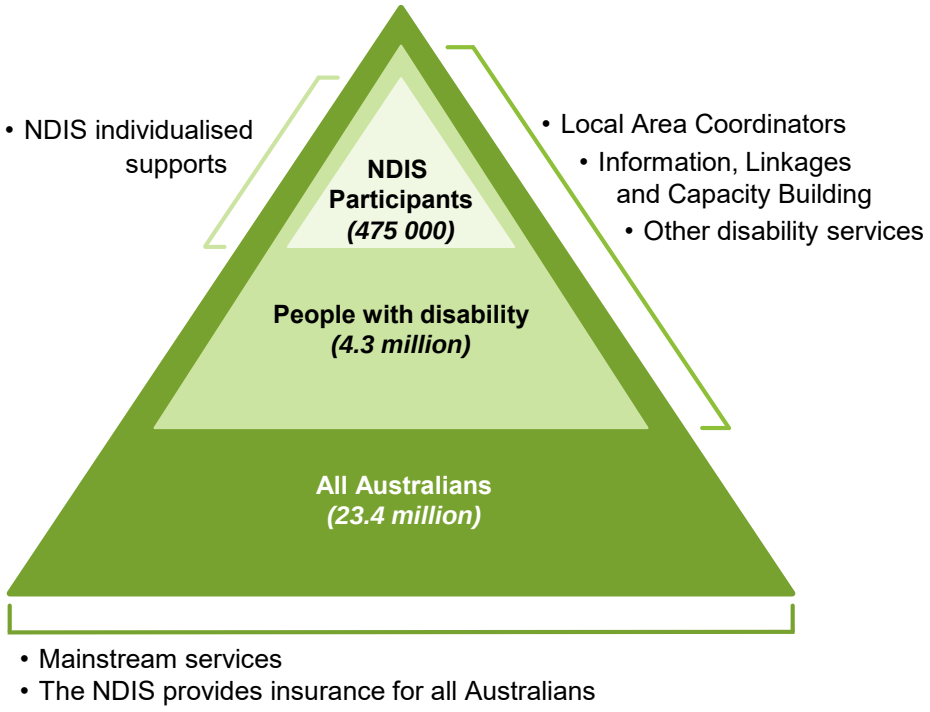
Information, Linkages and Capacity Building (ILC) services are also provided under the NDIS. ILC services provide information about, and referrals to, community and mainstream services (including health, education, employment, transport, justice and housing). These services are available to the 4.3 million people with disability in Australia (figure 1).

Box 1 The NDIS is based on insurance principles

The National Disability Insurance Scheme provides universal coverage by pooling risk across all Australians and taking the risk of disability support costs away from individuals. It is based on four insurance principles.

1. Actuarial estimates of long-term costs — updated to reflect the experience of the scheme, and used to help ensure the scheme is financially sustainable and continuously improved.
2. A long-term view of funding requirements — takes a lifetime view of participant needs and seeks early investment and intervention for people in order to maximise their independence and social and economic participation, and reduce their long-term support requirements.
3. Investment in research and innovation — to encourage and build the capacity and capability for innovation, outcome analysis and evidence-based decisions on early intervention.
4. Investment in community participation and building social capital — to make the community accessible and inclusive for people with disability, and provide participants and non-participants with necessary supports outside the scheme, through: mainstream services; Information, Linkages and Capacity Building initiatives; and education programs.

Figure 1 The NDIS is part of a broader system of supports[a]



[a] Number of Australians and those with disability are based on 2015 data. NDIS participants are the projected number of people eligible in 2020.

The governing legislation for the NDIS is the *National Disability Insurance Scheme Act 2013* (Cwlth) (NDIS Act). The Act establishes the NDIA, the independent statutory agency responsible for administering the NDIS. The NDIS Rules and Operational Guidelines set out the operational details of the NDIS. Funding for the NDIS is shared by the Australian, and State and Territory Governments.

Some background to the scheme

The Commission's inquiry in 2011 on *Disability Care and Support* found that Australia's system of disability support was inequitable, underfunded, fragmented, inefficient, and gave people with disability little choice and no certainty of access to appropriate supports. The Commission recommended a new national scheme to provide insurance cover to all Australians in the event of significant disability. This recommendation was based on the finding that such a scheme would generate substantial net benefits, including:

- improved wellbeing of people with disability (and their families and carers)
- better options for people with disability for education, employment, independent living and community participation
- efficiency gains and cost savings in the disability support system and savings to other government services.

The Commission's recommendations on the national scheme were largely accepted by Australian governments. The *Intergovernmental Agreement for the NDIS Launch* was signed by the Australian and State and Territory Governments in December 2012.

2 What we were asked to do and our approach

In the Heads of Agreement on the NDIS signed by the Australian and the State and Territory Governments in 2012 and 2013, it was agreed that the Productivity Commission would review NDIS costs in 2017 to inform the final design of the full scheme prior to its commencement.

The terms of reference for this study ask the Commission to look at:

- the sustainability of scheme costs, including current and future cost pressures, and how to manage any potential cost overruns
- whether jurisdictions have the capacity to deliver disability care and support services as the scheme expands
- how the NDIS impacts on, and interacts with, mainstream services
- whether efficiencies have been achieved within the scheme

- whether there are any issues with scheme design, including the application of market and insurance principles, in ensuring the best possible outcomes for people with profound or severe permanent disability
- funding and governance arrangements, including escalation parameters.

What factors drive scheme costs?

The majority (about 90 per cent) of NDIS costs are for individualised supports, but there are also the costs of operating the scheme and funding ILC activities. Key factors driving scheme costs include the:

- number and characteristics of participants
- scope of supports covered by the scheme
- quantity of supports received by participants
- proportion of supports in a plan that is utilised by a participant
- price paid for supports under the scheme
- costs associated with operating the scheme.

Scheme culture is also an important driver of costs. Moving away from the welfare culture of current disability systems to one of providing reasonable and necessary supports, and managing down the total cost of disability over a participant's lifetime, will be critical for the financial sustainability of the scheme.

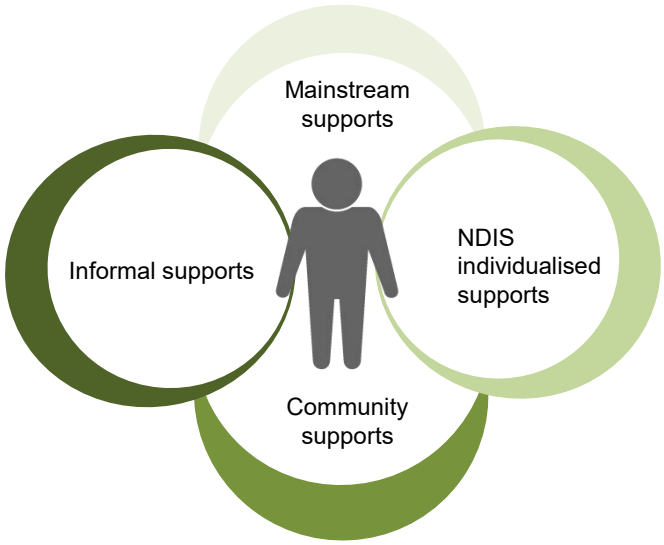
Other support systems can also affect scheme costs. The NDIS, as a person-centred approach to providing disability supports, relies on supports and services outside the scheme, including informal supports (family, friends and neighbours), community supports (sporting, social and interest groups), and mainstream supports (public transport, health and education), to help people with disability to live ordinary lives (figure 2). If these supports are not available, people with disability could seek NDIS funding to fill the gap, and this could pose a risk to scheme costs.

Costs are one side of the equation — benefits are just as important

While the focus of this study is on scheme costs and the financial sustainability of the scheme, the Commission examined costs in light of the benefits and impacts of the scheme on the lives of people with disability, and Australians more generally, using a wellbeing framework.

The NDIS was introduced because it has potential to improve the lives of people with disability and the community more generally (by providing insurance for all Australians and lowering future costs of providing disability support). It is therefore essential that the costs to the community are considered in the context of scheme outcomes.

Figure 2 **A person-centred approach relies on supports beyond the NDIS**



Taxpayers' willingness to fund the NDIS will depend on their perception of value for money, in terms of:

- people with disability experiencing better lives as a result of the scheme
- the scheme making it easier for families and carers to play a supporting role
- the way the scheme invests in people with disability
- the confidence taxpayers have that the NDIS will be available to cover their care needs (or those of their loved ones) should a disability be acquired in the future
- the supports that are funded (and the evidence base to support what is funded)
- efficiency gains and cost savings in the disability support system and other government services.

While the NDIS is sometimes described as an 'uncapped scheme', the ultimate cap — and test of financial sustainability — is taxpayers' continuing willingness to pay for it. In line with this, the NDIA defines financial sustainability for the NDIS as:

- the scheme is successful on the balance of objective measures and projections of economic [and] social participation and independence, and on participants' views that they are getting enough money to buy enough high-quality goods and services to allow them reasonable access to life opportunities — that is, reasonable and necessary support; and
- contributors think that the cost is and will continue to be affordable, under control, represents value for money and, therefore, remain willing to contribute.

The NDIA's actuarial estimates of long-term costs (which reflect the experience of the scheme and management responses to cost pressures) play an important role in

demonstrating to the Australian community that the scheme is sustainable. Governments also need to demonstrate that the NDIS funds are dollars well spent.

Financial sustainability of the NDIS also needs to be considered in the context of the efficiency and effectiveness of the NDIA, the readiness of participants and providers, and the integration of the scheme with mainstream and other disability services. Only a system that is integrated and holistic in its focus will bring the benefits that the scheme is expected to deliver.

3 An enormous challenge

The NDIS is a major, complex national reform — the largest social reform since the introduction of Medicare. It will:

- involve a shift away from a block-funded welfare model of support, to a fee-for-service market-based approach
- increase funding in the sector from about $8 billion per year to $22 billion in 2019-20
- involve assessing the reasonable and necessary needs of about 475 000 people
- require about 70 000 additional disability support care workers (or about 1 in 5 of all new jobs created in Australia over the transition period)
- substantially improve the wellbeing of people with disability and Australians more generally (if implemented well).

It is therefore no surprise that the NDIS is described as ‘ground-breaking’ and a ‘once-in-many-generation reform’.

The level of commitment to the NDIS is extraordinary

There is an extraordinary level of commitment to the success and sustainability of the NDIS (and to preserving the core principles of the scheme) shared by governments, people with disability and their families and carers, providers of disability services and disability advocates (box 2). As the Australian Disability Discrimination Commissioner said:

> Yes — the NDIS is big, it is complex, and it changes everything, but it is the change that we need. And when we think about what life might be like for people with disability without the NDIS, I think it becomes clear that it is the change we cannot afford to prevent. … If we want real and lasting change for people with disability, we cannot absolve ourselves of our responsibility to make the NDIS work.

Box 2 **There is overwhelming support for the NDIS**

NSW Council for Intellectual Disability:

> … we have been strong supporters of the development of the NDIS and we continue to see [the] scheme as having a fundamental capacity to improve the lives of people with disability around Australia.

Flourish Australia:

> … strongly supports the NDIS and the opportunity it provides for greater certainty, choice and control, and economic and social participation for people with disability who require life-long support.

JFA Purple Orange:

> … the NDIS is a major, once-in-many-generations opportunity to invest in the life chances of people living with disability, to achieve a fair go, so that people living with disability take their rightful place as … valued active members of Australian community life and the economy.

National Disability Services:

> The principles on which the NDIS is founded remain compelling and inspiring.

Australian Federation of Disability Organisations:

> We want to begin … by emphasising our unwavering support for the NDIS. AFDO and its members regularly hear from people with disability and their families about the difference the NDIS is making to their lives. People who now have the dignity of appropriate and timely support, the opportunity to be more involved in their communities, the chance to move out of home, the economic freedom of a new job. These are the kinds of differences the NDIS is making.

Anglicare Australia:

> … strongly believes that the establishment of the NDIS is a major achievement. Our member agencies are already witnessing the transformative power of the scheme for participants, and finding that reconfiguring services to reflect their needs and aspirations is creating opportunities to reimagine and create better outcomes in people's lives.

New South Wales Government:

> The NSW Government is a strong advocate of the National Disability Insurance Scheme (NDIS). The improvement in the lives of people with disability, as outlined by the Productivity Commission (PC) in its 2011 inquiry report into Disability Care and Support, is a goal embraced by NSW.

The rollout schedule

The NDIS was trialled from 2013 in different jurisdictions across Australia in four trial sites (including two whole-of-state age cohort trial sites, table 1). The Bilateral Agreements between the Australian and the State and Territory Governments set out the timeframes, and the estimated number of people who will become participants in the scheme, for the transition to full scheme in each jurisdiction. The full scheme is scheduled to be rolled out nationally by 2019-20, but some jurisdictions are scheduled to move to full scheme earlier.

Table 1 **NDIS transition arrangements by jurisdiction**

	Trial period			Transition to full scheme			Full scheme
	2013-14	2014-15	2015-16	2016-17	2017-18	2018-19	2019-20
NSW	Hunter area trial			Transition to full scheme (by region)		Full scheme	
			Early Transition in Nepean Blue Mountains area (children aged 0–17 years)				
Vic	Barwon area trial			Transition to full scheme (by region)			Full scheme
Qld				Transition to full scheme from July 2016 (by region). Early Transition from January 2016 in Townsville, Charters Towers and Palm Island			Full scheme
SA	Statewide trial (children aged 0–14 years)			Transition to full scheme (by age and region)		Full scheme	
Tas	Statewide trial (people aged 15–24 years)			Transition to full scheme (by age)			Full scheme
NT		Barkly region trial		Transition to full scheme (by region)			Full scheme
ACT[a]		Territorywide trial		Full scheme			
WA[b]		Perth Hills area trial		Transition to locally administered NDIS			
		MyWay trial					

[a] The Bilateral Agreement for the NDIS launch between the Australian Government and the ACT Government notes that from 2016-17 the ACT will be in 'transition to full scheme'. This transition has been categorised as 'full scheme' because all residents who meet the eligibility criteria will have access to the scheme. [b] In February 2017, the Australian Government and Western Australian Government signed a Bilateral Agreement for a nationally consistent, but locally administered, NDIS.

Transition — a unique and challenging period in the life of the scheme

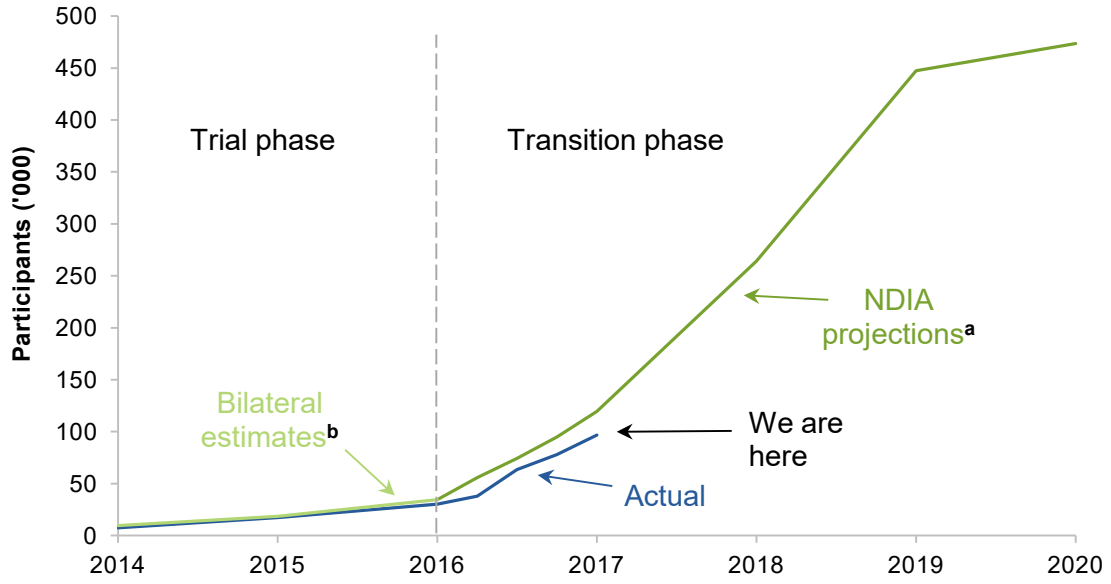
The transition period is a unique period in the life of the scheme. Never again will:

- the number of new participants be entering the NDIS over such a compressed timeframe
- so many disability support service providers be facing the challenge of transitioning from a block-funded model of support to a fee-for-service market-based approach
- so many new scheme participants be learning how to navigate a new scheme where they have choice and control over disability supports (making the change from passive recipients of supports to informed consumers).

Participant intake

The NDIA has been given an extremely difficult task — the rollout schedule is highly ambitious given the magnitude of the reform. To reach the estimated 475 000 participants at full scheme by 2019-20 (figure 3), the NDIA needs to approve hundreds of plans a day.

Figure 3 **Participant numbers will increase substantially over the next three years[a]**



[a] Scheme participant projections are based on projections prepared by the Scheme Actuary for the NDIA's 2015-16 Annual Financial Sustainability Report using data at 30 June 2016. The Commission adjusted the projected number of participants for the four quarters of 2016-17 to be consistent with the bilateral estimates reported in the latest NDIA quarterly report. [b] Bilateral estimates based on the NDIA's quarterly reports.

In the June 2017 quarter, the NDIA approved about 15 000 plans, or roughly 165 plans a day. In 2018-19 (the final year of transition), the NDIA will need to approve about 500 plans a day, while also reviewing hundreds more.[1]

One study participant described the transition arrangements as 'a tsunami of new participants' that will need to be processed into the scheme over the next two years. A number of study participants questioned whether the intake timetable could, or should, be met. And many raised concerns about the NDIA's focus being on participant numbers with little attention on planning processes. House with No Steps, for example, said:

> … the Scheme has aggressive ramp-up targets. These are putting pressure on the NDIA's capacity to develop quality plans for participants. Unfortunately, the need to achieve high growth in participant numbers appears to be outweighing considerations of plan quality and consistency.

The intake of participants with approved plans is already falling behind the expected pace. If the trend of delivering about 80 per cent of the bilateral estimates continues (figure 3), it will take an additional year before all eligible participants are in the scheme. (And this delay could be longer if the scheme falls further behind when the participant intake ramps up in 2017-18.)

1 Based on NDIA modelling.

The reality is that the rollout timetable for participant intake will not be met.

This means that 'full scheme' (the time when everyone eligible to enter the NDIS will be able to do so and have an approved plan) will be delayed beyond 2019-20 — that is, beyond the date anticipated in the Bilateral Agreements. Governments need to start planning now for a new participant intake timetable, including working through the financial implications.

NDIA's focus on participant intake has compromised the quality of plans and participant outcomes. Quality plans are critical, not only for participant outcomes but also for sending the right signals to providers about demand for supports and containing long-term costs of the scheme. The Commission makes several recommendations in this report on the quality of planning and participants' experiences with the NDIA (section 7). Implementing these recommendations will increase the NDIA's workload, at least in the short term, making the timetable even more ambitious. But without these changes the objectives of the scheme will not be achieved.

Supply of disability supports and demand pressure from participants

Another significant transition challenge is developing the disability support market — both in terms of the scale and scope of services — so there are enough providers and workers to meet the increased demand for disability supports (section 9). The large increase in funding and considerable unmet need in the disability support sector means that the number of workers and providers will need to grow quickly over the transition period.

Prices are critical for market development and participant outcomes. But there is a risk that demand for disability supports will exceed supply, creating inflationary and quality pressures in the market. The Commission recommends independent price monitoring and regulation, as well as more effective coordination among governments to develop markets (including intervening in thin markets).

It will also take time for scheme participants to exert the influence and control over their supports that will bring about the kind of competitive pressures that characterise mature markets. Participants need the skills and information to exercise informed choice. It is essential that participants get the supports they need to navigate the scheme (section 9).

Ensuring continuity of support

There is also evidence of service gaps (section 8). Some disability supports are not being provided because of unclear boundaries. Clearer boundaries must be set at the operational level around 'who supplies what' to people with disability, and services only withdrawn when continuity of service is assured. All governments need to work together to better manage the integration of the NDIS and other services.

Transitional issues, if not addressed, will pose risks to the scheme

Each of these transitional issues is challenging in its own right, but in combination, the task as currently planned, becomes even more difficult. And all this is against a backdrop of significant change in governance and funding arrangements (with some arrangements still to be bedded down). The arrangements are also tied to insurance-based principles that do not fit easily within the existing model of government oversight. The newly established Agency also needs to find and skill staff, while developing operational guidelines from scratch under circumstances where legislation is untested.

The transition period is going to be more protracted than previously expected. Based on evidence to date:

- the participant intake will not match the estimates in the Bilateral Agreements — adjustments need to be made now on a state-by-state basis
- supply shortages will persist for some time
- many participants will need more time and assistance to be equipped to exert the influence and control over their supports that will bring the kind of competitive pressure that characterises mature markets
- underutilisation will continue for some time — while this will keep scheme costs in check, it will mean poorer outcomes for some participants.

Recommendations made by the Commission to deal with the challenges and risks are outlined in table 2 and discussed in more detail in the sections below.

Scheme costs are discussed in the next section.

Table 2 **National Disability Insurance Scheme rollout challenges**

	The change	*The challenge*	*PC recommendations*
	Move from block-funded welfare model of support to a fee-for-service, market-based approach. Give scheme participants choice and control over disability supports.	Build the capabilities of providers and participants to engage in a market-driven scheme. Some participants do not have the capacity to navigate the new market. Some providers can struggle to adapt to a market-driven scheme.	Ensure participants get the supports they need to navigate the scheme, including information about providers and services. Provide stronger price incentives to encourage providers to deliver supports.
	Assess the reasonable and necessary needs of 475 000 people with disability based on insurance principles and individualised planning.	Assess eligibility and develop plans for a large number of participants within short timeframes (to meet bilateral estimates). Build a planning workforce with sufficient skills to administer the plans over scheme transition. Plans will be rushed or completed by planners without experience in disability – leading to a lack of supports for participants.	Rebalance the focus from numbers to better quality plans (the right plans will lead to the correct signals to the supply side of the market). Greater focus on pre-planning. More specialisation of planners. Allow NDIA more flexibility over its staffing arrangements.
	Increase funding to the sector from $8 billion per year to $22 billion in 2019-20.	Ensure funding arrangements do not create incentives for cost-shifting by jurisdictions. Ensure funding arrangements are based on insurance principles.	Clearly delineate what supports are provided to participants, and what are not. Establish clear boundaries around ‘who’ provides ‘what’. Establish a reserve fund to allow the scheme to take a long-term approach to participant needs.
	Build the supply side of the scheme — both in terms of the scale and scope of provider services, and the size of the workforce to deliver supports.	The supply side of the scheme may not respond fast enough to meet participant demand.	Implement independent price monitoring and regulation to get the right price signals to encourage supply. Bolster market stewardship through better collaboration among governments, providers and the NDIA.

4 Modelling the costs of the scheme

In 2011, the Commission estimated that a national disability insurance scheme would cover 411 000 participants and cost $13.6 billion (gross) at maturity. The NDIA's current projections are that the NDIS will cover 475 000 participants and cost $22 billion at full scheme commencement.[2]

The NDIA's estimates are based on a more refined costing methodology than that used by the Commission in 2011, and are broadly consistent with the Commission's 2011 modelling after accounting for wage and population growth. Of the $8.9 billion difference between the Commission's original estimates and the NDIA's current estimate, $6.4 billion is due to pay rises awarded to social and community services employees by the Fair Work Commission in 2012. Adding population changes and the cost of participants aged over 65 years (who were not included in the Commission's estimates), the estimates come within one per cent of each other (table 3).[3]

Table 3 **Comparing the Commission's and the NDIA's costings**

	Participant numbers	*Scheme costs ($ billions)*
Productivity Commission estimates 2011[a]	**411 250**	**12.82**
Population projections to 2019-20	49 544	1.54
Inflation in disability sector (wages)	..	6.38
Participants aged 65 years and older	15 285	1.09
Updated Productivity Commission estimates 2017	**476 079**	**21.84**
The NDIA's projections for participants 2017[b]	**473 653**	**21.76**
Difference (%)	2 426 (0.5%)	0.08 (0.4%)

[a] Excluding operating costs and offsets associated with the National Injury Insurance Scheme and assumed efficiency dividends. [b] Excluding operating costs ($1.5 billion), offsets associated with the National Injury Insurance Scheme ($0.7 billion) and assumed efficiency dividends ($0.3 billion). .. Not applicable.

It is too early and the data are too limited for new cost projections

In terms of reliable cost data, it is still very early days in the transition to full scheme. And while the transition experience should inform estimates of full scheme costs, the NDIA has decided that, at this early stage, the data have too many limitations to update the prevalence and package cost assumptions. Important limitations include small and unrepresentative trial

2 While the gross cost of the NDIS is estimated to be $22 billion in 2019-20, the scheme is expected to reduce the funding required for a range of government programs. A review by the Australian Government Actuary in 2011 estimated that these offsets were about $11 billion.

3 Participants must be aged under 65 years to *enter* the NDIS but can remain in the scheme after they reach 65 years.

populations, and concerns about the integrity of transition data. Approaches to planning and assessments were also changed at the beginning of the transition period (July 2016).

The Commission supports the NDIA's approach to projecting scheme costs, including the decision to delay integrating data from the trial and transition. We therefore did not revise the projections of scheme costs for this study. However, it is imperative that new data are incorporated into the NDIA's assessment of longer-term costs as soon as possible. The Commission's assessment is that, in the absence of major new data reliability issues, there should be sufficient data for the NDIA to update the estimates of scheme costs based on scheme experience for the 2017-18 Annual Financial Sustainability Report.

5 Insights from the trial and transition period

Costs in the trial phase aligned with expectations

Given the uncertainties around the costings of the scheme before it commenced, an important rationale for trial sites was to inform more reliable estimates of full scheme costs (and for testing and refining the scheme). At the end of the trial phase:

- the number of participants with an approved plan (30 281) was 83 per cent of bilateral estimates (36 307) (there were 35 695 people who had been determined eligible but who did not necessarily have an approved plan)
- the average annualised package cost was $36 049.

The scheme, at the end of the trial, also came in under budget — there was a surplus of about 1.5 per cent of the funding envelope over the three years. However, this was in large part because not all committed supports were used — in 2015-16, 76 per cent of committed supports were used.

Transition — the latest data

Post-trial data are also available. At the end of June 2017, an additional 86 000 people were eligible for the scheme, taking the total number of participants to 122 065. About 90 000 participants are currently active[4] and have an approved plan. Some insights from the transition data are presented in figure 4.

4 Participants who have not exited the scheme.

Figure 4 **Key insights from the transition data**
Data at 30 June 2017

[a] Psychosocial disability is the next most common disability, accounting for about 6 per cent of participants. [b] The annualised average level of committed support for packages after 1 July 2016. For participants with multiple plans over the time period, the latest plan is used. [c] NDIA modelling projects that the percentage of scheme participants who are aged 14 years and under will decrease to 30 per cent by 2019-20.

Emerging cost pressures

The Commission compared trial and transition data with the assumptions in the NDIA's modelling. Noting the limitations of the data, scheme costs are broadly on track compared to expectations.

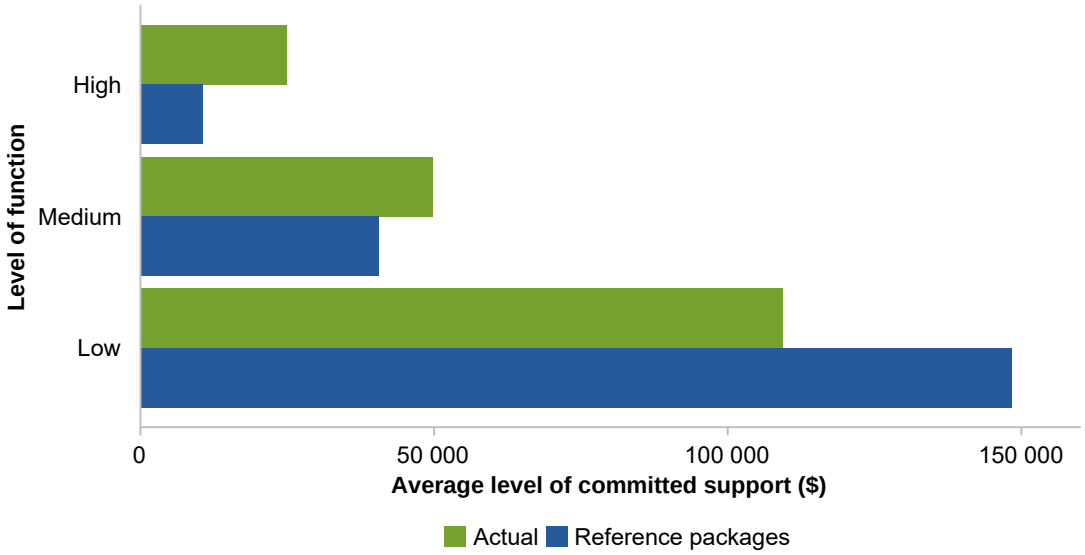
- For most disabilities, participant numbers broadly match the modelling assumptions for all but the largest disability groups. However, there are more children with autism and intellectual disability than expected.
- Average package costs (for plans effective from 1 July 2016) are broadly in line with modelling assumptions (after accounting for disability, age and level of function).[5] However, there are differences when the data are disaggregated by level of function. The average package cost for participants:
  - with low levels of function is $40 000 less than expected
  - with medium levels of function is $9000 higher than expected
  - with high levels of function are higher on average by $14 000 (figure 5).

5 For the position paper, the Commission conducted the same analysis with data from the first three quarters of transition, and found that package costs were higher than modelling assumptions.

- Utilisation rates — the proportion of committed supports that are used by participants — are lower than expected. Underutilisation is currently more than offsetting the increase in scheme costs attributable to higher prevalence rates for children.

Figure 5 **Average annualised committed support compared with reference packages, by level of function[a,b]**

Plans effective from 1 July 2016



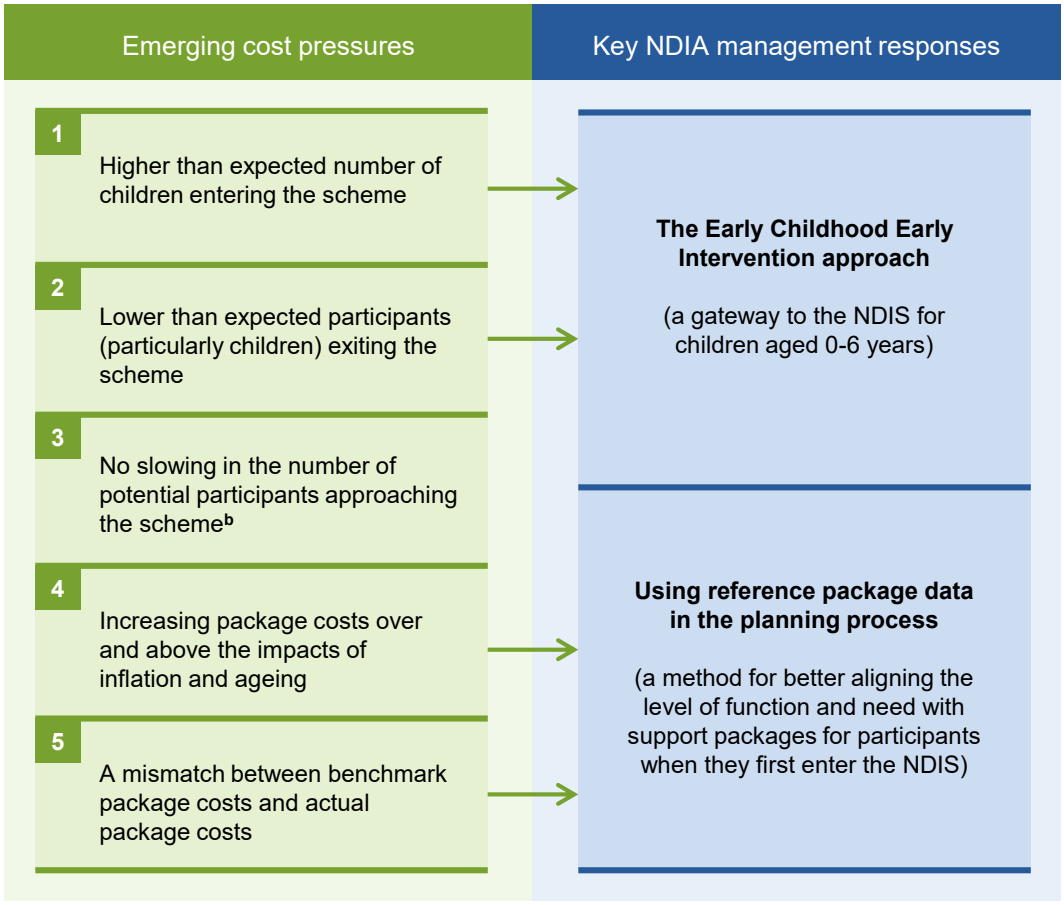
[a] Reference packages are the average package cost assumed in the NDIA's long-term modelling based on age, disability and level of function. They *are not* what an individual should expect to receive in an individualised funded package at any given time. [b] For participants with multiple plans over the time period, the latest plan is used.

The NDIA is tasked with ensuring the NDIS is financially sustainable. The insurance approach involves identifying and managing emerging cost pressures. The NDIA has identified five early cost pressures that need to be managed for the full scheme going forward (figure 6).

- The number of children entering the scheme is higher than expected.
- The number of people approaching the scheme in trial sites that have been operating the longest (since 2013) is higher than would be expected if only people with newly acquired conditions were approaching the scheme.
- The number of participants exiting the scheme is lower than expected (particularly for children entering under the early intervention requirements).
- Levels of committed support tend to increase as participants move to their second and third plans (over and above the impacts of inflation and ageing).
- There is greater than expected variability in package costs for participants with similar conditions and levels of function (suggesting inconsistencies in planners' decisions).

While the NDIA has not updated its baseline cost projections to reflect these cost pressures, it has put in place initiatives to address them. These include the Early Childhood Early Intervention (ECEI) approach for children aged 0–6 years (section 6, box 3), and the use of reference package data in the planning process to reduce variability in the level of support provided to participants (section 7, box 4).

Figure 6 **The NDIA's responses to emerging cost pressures**[a]



[a] The NDIA's two main responses to emerging cost pressures. The NDIA has also initiated several smaller projects to address emerging cost pressures, such as an analysis of reasonable and necessary costs across the lifespan of participants. [b] Potential participants continuing to approach the scheme is not a cost pressure that can easily be addressed by the NDIA.

While it is too early to conclusively assess the effectiveness of these initiatives, there are some signs from 2016-17 data that the new planning process may be helping to alleviate cost pressures related to package costs.

Benefits are already being realised

Realising the benefits of the scheme is critical for the wellbeing of people with disability and for ensuring that the community continues to be willing to pay for the scheme. However, at this early stage, only some of the benefits are being realised.

The NDIS Outcomes Framework and a National Institute of Labour Studies evaluation of the NDIS provide some early insights (based on trial data) into the scheme's benefits. Both find that the NDIS has:

- increased supports — more hours of support, a wider range of supports and greater access to equipment — than under the previous system
- on average, improved wellbeing of NDIS participants and their families and carers
- given people more choice and control over their supports
- increased social participation for some scheme participants and their carers.

The Commission also received numerous submissions supporting these findings. As one disability advocate said:

> … I have seen the life changes in people with disability who now have NDIS funding. They are now accessing community, having a good life and have hope for their futures. The burdens are off the family, some aged carers, and there is job creation. Broken wheelchairs are now being replaced and people who never had wheelchairs, now have and can access the community. I now see happy people.

However, not all are reporting improved outcomes under the NDIS. The groups at risk of having a less positive experience include those with psychosocial disability, complex and multiple disabilities, and language and cultural barriers, as well as people with disability transitioning into the community from the criminal justice system, the homeless and the socially isolated.

Participants reporting that they were satisfied or very satisfied with the scheme has also fallen since the scheme entered the transition phase — from 95 per cent in 2015-16 to 84 per cent in 2016-17. This could be linked to the speed of the rollout, and changes to the planning process (discussed below).

6 Scheme eligibility

The eligibility criteria are the main instrument available to influence how many people will be able to access individualised supports through the NDIS. It is important that these criteria are clear, aligned with the objectives of the scheme, and rigorously upheld.

When the Commission designed the national disability insurance scheme, it recommended that, to be eligible for the scheme, individuals should:

- have a disability that is or is likely to be permanent
- have significantly reduced functioning in self-care, communication, mobility or self-management and require significant ongoing support, or be in an early intervention group where there is good evidence that the intervention is safe, significantly improves outcomes and is cost effective
- meet residence and age requirements.

The eligibility criteria for the NDIS are broadly in line with what the Commission recommended, with two exceptions — the inclusion of supports to undertake activities of *learning* or *social interaction*, and the inclusion of developmental delay in the early intervention criteria. Both these criteria allow more people to qualify for individualised supports under the NDIS than the Commission included when costing the scheme.

Adding learning or social interaction — what effect?

The Commission was unable to assess the effect of adding learning or social interaction to the eligibility criteria, because the NDIA does not collect data on which (or how many) of the six activity domains are relevant to each participant when they enter the NDIS. Speech Pathology Australia, however, said that their members who are NDIS providers are not providing services to children whose *only* disability relates to learning and literacy.

The NDIA should collect data at entry on the domains to provide information on the impact of each part of the eligibility criteria on participant numbers (and therefore scheme costs). This information would also allow for more granular analysis of who is in the scheme and what their needs are likely to be (and could also be used by the NDIA in its monitoring and forecasting roles).

Adding developmental delay — what effect?

The evidence suggests that providing individualised supports for children with developmental delay can improve outcomes for individuals and reduce costs — it is therefore consistent with the early intervention insurance principles of the scheme.

A review undertaken for the Department of Social Services (DSS) estimated that about 11 600 children with developmental delay or global developmental delay would be eligible for support under the scheme at a cost of $155 million each year. While no definitive data are available to test this estimate, trial site data (which may not be reflective of full scheme prevalence rates) suggest higher prevalence rates than the estimate provided to the DSS.

For children with developmental delay to be eligible for individualised supports, they need to have a delay across multiple domains. This suggests that the eligibility criteria set an

appropriately high hurdle. However, the NDIA tested a sample of children who entered the NDIS during trial with the PEDI-CAT assessment tool and found that 40 per cent of the children did not have any identified deficits compared to the normal range for their age.

The NDIA's recently introduced ECEI approach (box 3), put in place in response to the higher than expected number of children entering the scheme in the trials, should tighten the entry pathway for children aged 0–6 years, and help ensure that only children who meet the eligibility criteria receive supports through the scheme. The NDIA is also developing an early intervention approach for the 7–14 years cohort.

Box 3 Early Childhood Early Intervention

The Early Childhood Early Intervention (ECEI) approach is designed to be a 'gateway' to the National Disability Insurance Scheme for children aged 0–6 years. It aims to ensure that only those children who meet the eligibility criteria of the NDIS become participants of the scheme. Under the ECEI approach, families meet with an early childhood intervention service provider to discuss the needs of their child. The provider then identifies appropriate supports for the child and family, and whether the supports should be provided through the NDIS or through mainstream services. As the National Disability Insurance Agency put it, 'the ECEI approach aims to ensure children are provided with the right level of support at the right time for the right length of time'.

The ECEI approach is also aimed at ensuring early intervention supports are effective and result in the exits expected in the 0–6 years cohort. The National Disability Insurance Agency plots a child's progress against development milestones and supports the child to access mainstream supports when NDIS supports are no longer required.

It is too early to gauge the success of the ECEI in upholding the eligibility criteria of the NDIS and to assess its effectiveness in supporting children who are not eligible for individualised supports. However, given that children receiving early intervention supports are one of the largest groups in the scheme, it is critical that the NDIA builds an evidence base to inform the types of intervention that are most beneficial and should be funded. The NDIA has developed an evaluation and monitoring framework for the ECEI approach, but the effectiveness of this framework is yet to be tested.

The role of diagnostic lists

The NDIA maintains a list (List D in the latest NDIA operational guidelines) that allows for streamlined entry into early intervention supports for children who have a condition on this list. List D contains about 130 conditions, including Global Developmental Delay.

Maintaining such a list represents a trade-off. The appeal of such a list is that it places less onus on families to demonstrate eligibility, reduces the administrative burden on the NDIA and provides a degree of certainty for the families of children with these conditions. However, the list can also affect incentives, and can be an overly-generous entry gateway if set too expansively. Also, if diagnosis forms the basis of early intervention, a child would remain eligible for early intervention supports so long as their condition is present, even if

the expected benefits from early intervention have been realised (or are unlikely to be realised).

The NDIA also maintains a list of conditions (List A) that allows for streamlined entry into the NDIS through the disability requirements.

While there is little evidence that these lists are resulting in people entering the scheme who would not meet the wider eligibility criteria, the NDIA did point to Autism Spectrum Disorders as potentially representing a difficulty for List A:

> … there is evidence to suggest that use of the diagnosis process for autism may differ from the process's intent (resulting in access to the Scheme where eligibility requirements would not otherwise be met).

Because the lists are a key entry pathway, monitoring them is essential to ensure they work as intended. A process for quickly changing the lists as new information comes to light is necessary, as is transparency about what is on the lists and why changes are made.

Psychosocial disability and the NDIS

In 2011, the Commission recommended that people with psychosocial disability (the term used to describe disabilities that can arise from mental health issues) be supported through the NDIS. This was on the basis that:

- the day-to-day support needs of people with significant and enduring psychosocial disability are often the same as people who have an intellectual disability or an acquired brain injury
- some important parts of the care requirements of people with psychosocial disability — namely community supports — are best met through the NDIS
- providing supports to people with psychosocial disability through the NDIS provides them with the wider benefits of the scheme, including individualised supports and more choice in what supports are provided, when and by whom.

These points remain salient, and lend support to people with psychosocial disability being supported through the NDIS. And, while the Commission heard a range of views about whether the NDIS is the 'right' vehicle to provide support to people with psychosocial disability, most stakeholders supported its inclusion.

Concerns were also raised about the need for permanency under the NDIS Act being incompatible with the recovery models used in supporting people with psychosocial disability. However, the investment approach of the NDIS and the recovery model of mental health are both about building capacity, and appear to be well aligned. The NDIS Rules and operational guidelines accept that a permanent condition may be episodic requiring different levels of support at different times.

Scheme participant numbers suggest that people with psychosocial disability are able to demonstrate that their condition is, or is likely to be, permanent. At the end of June 2017, about 6000 people with psychosocial disability received individualised supports. And data to December 2016 shows just over 80 per cent of people with psychosocial disability who lodged an access request to the NDIS were eligible for the scheme.

While the Commission does not support changing the eligibility criteria to relax the definition of permanency and how it relates to psychosocial disability, it does recommend a change in the way that people with psychosocial disability engage with the scheme. A psychosocial gateway, involving specialised staff, designed in consultation with experts in mental health, has the potential to improve how the scheme engages with people with psychosocial disability at an operational level.

Estimating the number of people with psychosocial disability eligible for the scheme is difficult because a robust and comprehensive database from which to draw is lacking. While there are estimates by a number of stakeholders and agencies, they vary greatly. It would be beneficial for the different methodologies to be made transparent, so they can be used to better project the numbers of participants with psychosocial disability at full scheme.

Concerns about gaps in support for people with psychosocial disability not eligible for the NDIS are discussed in section 8.

7 Supports and plans

Scope of supports

The NDIS is designed to cover specialist disability supports that are reasonable and necessary. This includes supports that help people with disability to:

- pursue their goals and maximise their independence
- live independently and be included in the community as fully participating citizens
- participate in the community and in employment.

The extent of support coverage directly impacts the costs and benefits of the NDIS — too little will result in lost benefits within the scheme, but too much could create cost pressures and pose a risk to the financial sustainability of the scheme.

The scope of supports covered by the NDIS is governed by legislation, rules and guidelines and, over time, will be shaped by court and tribunal decisions. What legislation and case law say about reasonable and necessary supports is important because it sets parameters for how the NDIA can operationalise support allocation. It also provides future courts and tribunals with a framework for evaluating whether decisions about supports have been properly made.

Ongoing monitoring and evaluation can help ensure that the body of law around reasonable and necessary supports is operating in a way that is consistent with community expectations and the objectives of the scheme. The review of the NDIS Act scheduled for 2021, agreed to by COAG, should look at the impact of court decisions on the content of the law as well as other issues raised in this study relating to the drafting of the NDIS Act.

About plans and the planning process

The planning process is about matching scheme participants with supports. It involves conversations between the participant and the NDIA to ascertain each participant's goals and aspirations, level of function and appropriate supports. The NDIS Act requires that a plan is developed and, where possible, is individualised, directed by the participant, and maximises participant choice and control.

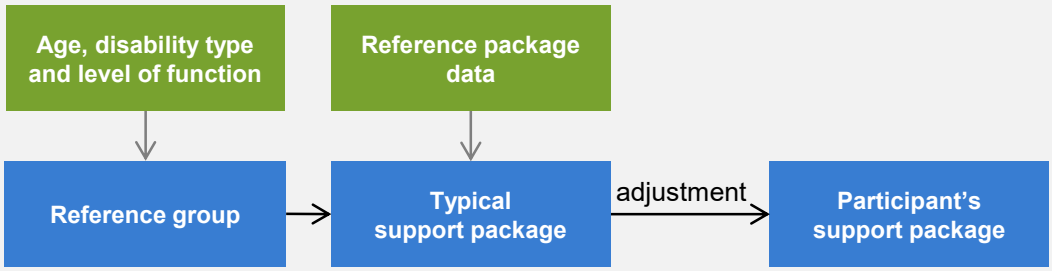
The quality of planning processes is a key determinant of the success and long-term sustainability of the NDIS — it influences what costs are incurred; the predictability of costs; the market for disability supports; outcomes for participants; and the integrity of, and community support for, the scheme.

Participants need to understand the planning process

The planning process has changed significantly since the NDIS commenced in 2013. At the beginning of the transition period the NDIA introduced a new process for determining participants' support packages, using reference package data (box 4). This approach has resulted in more plans being in line with benchmark costs (compared to the trial period). As with all insurance-based schemes, the tools and processes for handling claims and assessing entitlements are a matter of ongoing refinement. This is necessary to ensure that the insurance scheme remains 'on track' and is viable in the long term. Dynamic processes are also important to allow the scheme to adapt to changing circumstances or incorporate information that becomes available over time.

Box 4 **Using reference package data in planning**

Participants are first allocated a 'typical support package', based on their reference group (which is determined by their age, disability type and level of function). The typical support package may include funding across the following eight core domains: daily activities; social participation; consumables; transport; home modifications; assistive technology; capacity building; and support coordination.



For each participant, the level of funding is adjusted according to the participant's circumstances. This is done using a questionnaire, which asks the participant about each of the domains, including what supports they already have in place, and whether these are sufficient and sustainable. For example, where it is reasonable that sustainable informal, community or mainstream supports continue to assist the participant, or where the participant believes that other informal, community or mainstream supports may provide a better outcome, funding is adjusted in the participant's support package.

In light of this, it is important that stakeholders can access accurate and up-to-date information about planning processes. Clear messaging about how and why things are changing is also important to maintain the credibility of evolving planning practices.

The NDIS planning process is complex and confusing, and often lacks clarity and transparency. It is difficult to access information about assessment tools that are used by the NDIA and how support allocation is determined. There is also limited information to help scheme participants and their families, carers and advocates navigate the planning system. Scheme participants are often not aware of their rights and options, such as their entitlement to request a face-to-face meeting or have an advocate present during the planning meeting.

There needs to be greater transparency and clarity around the NDIA's planning processes. There also needs to be clear and up-to-date information about what participants should expect during the planning conversation, when it will occur, and how the information gathered during the conversation will be used.

Phone planning

The move to transition saw a shift from face-to-face to phone planning. The NDIA adopted this approach to allow people to enter the scheme as quickly as possible, with the intention of adjusting and improving plans over time. During trial, people indicated that they wanted to join the scheme as soon as they could. The speed of the transition placed a lot of pressure on the NDIA to finalise plans quickly and phone planning was part of the solution.

But there is a lot of dissatisfaction with phone planning (box 5). A number of participants said they felt rushed during their planning meetings. As one study participant put it:

> … the transition time pressures [appear] to have resulted in a reduction in the time available to assist people to resolve their plan; in some cases this is reported to have reduced to a 30 minute phone call. This could not be further removed from the feature of a 'person centred model of care and support' that is meant to distinguish the NDIS from previous approaches.

Box 5 Dissatisfaction with phone planning

Social Support & Precarious Workforce Research Discussion Group:

> … some participants are not fully aware that the phone conversation occurring with the NDIS staff member is actually their planning process occurring. This confusion is also evident in the NDIS marketing of phone-planning as a 'planning conversation', where the suggestion is you will 'talk-about' the plan whereas the reality is that it is a full and structured assessment and plan procedure.

The Disability Services Commissioner:

> Planners are not providing clear and accessible information about the planning process including when and how planning will take place. A sister of a participant said that someone from NDIA had rang her while she was in the car. They advised that they were 'only collecting answers' and it would 'only take a minute'. Following that conversation, her sister received a plan for approval from the NDIA, with less funds than she had previously received.

Alzheimer's Australia:

> Annie called the Parkinson's 1800 support line as she worried about an over the phone NDIS planning session that had taken place earlier that day. Annie's volume and quality of speech has been impaired due to Parkinson's and she also requires longer to respond to questions. She felt rushed and because her response is delayed she felt that the assessor didn't get a clear indication of her needs. Annie and a Parkinson's Nurse Specialist were able to take the time [to] put information together in order to apply for a review for Annie's plan.

Blind Citizens Australia:

> [Phone planning] severely compromises the ability of people who are blind or vision impaired to demonstrate the difficulties they may face with completing tasks like reading, navigating the environment or household chores.

The Commission also heard (on numerous occasions) that participants were called with no forewarning of the planning conversation, or were not informed that the call was a planning conversation (so the person was not prepared and could not have an advocate present).

An individualised approach to planning is a key feature of the NDIS and sufficient time is required to match participants with the supports that are right for them. Phone planning can mean that planners do not 'get the full picture'. For example, the living environment of participants may not be adequately reviewed (which means issues such as accessibility, safety and appropriate assistive technology can be difficult to identify).

Phone planning is not appropriate for some participants, including those with particular accessibility requirements, mental illness, cognitive impairment and neurodegenerative diseases, and people of culturally and linguistically diverse backgrounds. However, it may be appropriate for others, particularly if there is adequate pre-planning. The Commission

recommends that the NDIA review its protocols relating to phone planning. The NDIA recently said that, in response to feedback from scheme participants, it intends to use face-to-face planning as a default approach.

Pre-planning

The pre-planning phase of the planning process has not received adequate attention. As a result, many participants are ill-prepared for planning, and this is affecting the quality of plans. The NDIA acknowledged that, because of the speed of the transition, it was not able to engage Local Area Coordinators (LACs) in time to provide participant and community development during the pre-planning stages.

A greater focus on pre-planning should make phone planning suitable for a larger pool of participants. LACs need to be in place six months in advance in the areas in transition to assist with pre-planning. This is a better (and potentially less costly) approach than trying to 'fix' plans over time. It will also mean that participants are better able to exercise choice and control (and this is more likely to induce a provider response).

Planners need more disability knowledge

Planners' limited disability knowledge is a real concern (box 6). Many advocacy groups said that planners do not have sufficient knowledge of particular disabilities or the impact that particular conditions have on people's lives, and they often do not know what supports are most effective for the participant's disability. Alzheimer's Australia, for example, reported that a person with Multiple Sclerosis (MS) was asked by the LAC at a planning meeting, 'How long will MS last?'.

Planners should, at a minimum, have a general understanding about different types of disability. There should be specialised planning teams for some types of disability, including psychosocial disability. The NDIA should also make better use of expertise from within the industry, including by getting specialist disability organisations or service providers more involved in the planning process. A risk-based approach to managing potential conflicts of interest that could arise from such arrangements should be adopted by the NDIA. This would also mean that the NDIA would not need to compete with others in an already thin market to recruit planners with specialist qualifications or experience.

Box 6 **Planners — not enough disability knowledge**

MND Australia:

> LAC's do not have the expertise to support people with [motor neurone disease]. … They have no understanding of MND and the disability it creates. They attempt to plan via a telephone conversation, when speech and communication can be one of the early losses created by MND.

Alzheimer's Australia:

> Peter, the carer of a woman with younger onset dementia, felt unprepared when he and his wife attended their first NDIS planning session. … The NDIS planner had no understanding of dementia and the needs of people living with dementia and as a result the planning session focused on physical needs and solutions … Feedback from people with progressive neurodegenerative diseases has revealed that [LACs] have also shown insufficient knowledge of their disease, the impact of that condition on their lives, the most effective service interventions and the degenerative and fatal nature of their disease.

Amaze:

> Amaze's 2017 survey found: 65% of respondents rated their planner's knowledge and understanding of autism as none to moderate a level (with the remainder rating the planner's knowledge as high). … given 30% of participants identify autism as their primary diagnosis, a high level of ongoing training in autism will be a necessity to developing and maintaining their capacity to reliably develop plans.

New South Wales Government:

> … planner knowledge and capability is highly varied, as is their interpretation of reasonable and necessary supports and understanding of interim working arrangements with mainstream services. Approved supports are less likely to be based on a participant's needs and more on a planner's knowledge of the disability and/or how effectively the participant or their carer advocate for certain supports.

8 Boundaries and interfaces — the NDIS and services outside the scheme

People with disability, their families and carers rely on a wide range of services — including mainstream services, specialist disability services and community supports. For the NDIS to work efficiently and effectively, the interface of the scheme with these other services must be as seamless as possible.

While the level of funding provided to the NDIS recognised that the aggregate level of funding available to people with disability was inadequate, it was not expected that the NDIS would fill *all* the service gaps that predated the scheme. Providing services to people with disability remains a shared responsibility between all levels of government.

The interface between supports for people with disability will take time to clarify, but in the meantime it is important that governments do not prematurely withdraw from services, as any gaps that emerge will place added burdens on people with disability and their families. As the interface issues become clearer, it is important that incentives do not exist for individuals to prefer one system over another. Most critically, the NDIS should not be seen as an oasis of support, surrounded by a desert where little or nothing is available.

While there is much detail yet to be worked through, establishing clear and robust boundaries (and appropriately tailored supports) is essential to the fiscal sustainability of the NDIS, and for the surrounding network of supports.

Linking people to the right services

The Commission's 2011 report recommended a bridging and capacity building service for people with, or affected by, a disability (known as Tier 2 supports). The ILC program is a key component of the NDIS. It is designed to provide information, linkages and referrals to people with disability, their families and carers, with community and mainstream supports. The focus of ILC is on individual development and community inclusion.

ILC will be important for scheme sustainability. It is expected to reduce reliance on NDIS funded support over time by:

- reducing the demand for individualised supports and the need for supports within funded packages
- making supports more effective at helping people achieve their goals.

In July 2017, the NDIA began rolling out the ILC program. Funding for ILC will gradually increase over transition (from $33 million in 2016-17 to $131 million in 2019-20). The timing of ILC funding is determined by governments (it starts with a small budget that increases over time) and has prevented the NDIA from investing in ILC activities and rolling out a national ILC framework. At the same time, State and Territory Governments are withdrawing from existing ILC-type activities.

It is a false economy to have too few resources for ILC activities in the transition period — it is critical to have structures in place to ensure that people eligible for the NDIS can access the scheme, and those who are not eligible can access supports and services outside the NDIS.

ILC funding should be increased to the full scheme amount ($131 million) for each year during the transition and be focused on national ILC activities. The effectiveness of the ILC program in improving the outcomes for people with disability and its impact on the sustainability of the NDIS should be assessed as part of the 2023 review of NDIS costs, when data on ILC activities will be available.

Interface with mainstream services is not clear at an operational level

The Australian Government has entered into bilateral agreements with State and Territory Governments to delineate the types of services to be provided and funded by the NDIS and mainstream services. Schedule 1 of the *National Disability Insurance Scheme Rules (Supports for Participants) 2013* (Cwlth) sets out the rules to determine whether the NDIS or another system is most appropriate to fund specific supports for individuals.

COAG has accountability for the NDIS and the *National Disability Strategy,* and through its Disability Reform Council (DRC), receives reports and advice on progress and risks. While the principles agreed to by COAG on the boundaries between the NDIS and mainstream services are clear, greater clarity is required at the operational level. This will prevent duplication, gaps and cost shifting by the NDIA, and the Australian, State and Territory Governments.

The boundary issues are yet to be tested. However, the *National Disability Strategy* should be strengthened to include more detail around boundaries (based on challenges faced when seeking to operationalise boundaries), and greater accountability. At review points of National Agreements and National Partnership Agreements under the Intergovernmental Agreement on Federal Financial Relations, parties should agree to specific commitments and reporting obligations that are consistent with the Strategy. As the DSS said:

> Translating the National Disability Strategy into tangible results for people with disability, their families and carers is a major factor in successful implementation of the NDIS.

Adding a standing item to the agenda of each COAG council that is responsible for services that interface with the NDIS to discuss any gaps in service provision would also help build clarity around what services governments will provide, and ensure ongoing monitoring and solutions for potential future gaps. The Councils should put forward issues to be resolved and suggested actions to the DRC.

Concerns that some people with disability may be left without services

Many are concerned that, as disability support programs are rolled into the NDIS, people using these services (including those not eligible for the NDIS) may no longer receive continuity in support. This is a key risk to the financial sustainability of the NDIS — and one that the NDIA has little control over.

Mental health services are an area of particular concern. The National Mental Health Commission's report on Mental Health Programs and Services estimated that about 700 000 Australians experience a severe mental illness in any one year. According to the NDIA, about 64 000 people with primary psychosocial disability are expected to be eligible for individual packages in the NDIS at full scheme.

Clearly, there needs to be support for people with mental health illnesses outside of the scheme — a responsibility that remains (largely) with State and Territory Governments. However, governments are withdrawing their funding for a number of mental health support programs and using this funding to offset part of their contribution to the NDIS. At this stage, it is unclear what supports will be available for people with a mental illness who do not meet the NDIS eligibility criteria. This should be clarified as a matter of urgency.

The implications of this are significant. Not only is uncertainty distressing for those with mental illness, any gap in support places an additional call on the generosity of informal support. Gaps could also place pressure on the financial sustainability of the NDIS if they

encourage scope creep, or force those who are unlikely to meet the eligibility criteria to test their access for fear of having few supports should they not qualify for the scheme. Mental health and psychosocial disability are a key priority of the DRC, but more clarity is required.

While the Australian and State and Territory Governments have agreed to provide continuity of support for disability services outside the NDIS, in practice there is confusion and uncertainty about what services will continue to be provided and/or funded. Governments need to be clearer about how they will approach continuity of care, and transparent about what disability services they will continue to provide for people who are not eligible for the NDIS.

Gaps in disability services need to be quickly identified (possibly with the assistance of ILC and LACs) and managed, to ensure the sustainability of the overall scheme. The NDIA and the Australian and State and Territory Governments should report regularly to the DRC on boundary issues.

9 Market readiness

The market-based approach of the NDIS means that there will be significant changes in the way that supports are demanded by, and provided to, participants. This disruption of the disability supports market is designed to maximise the choice and control of participants, while also giving providers incentives to efficiently and effectively deliver the supports that participants want and need.

While the scheme will drive efficiencies, the increase in funding and considerable unmet need in the disability support sector means that the number of workers and providers will need to grow quickly over the transition period. For example, the NDIS workforce will need to more than double from 2014-15 to 2019-20. The scale, scope and capacity of providers will also need to expand substantially. As the success of the NDIS relies on providing the right supports to participants, market readiness will affect costs during transition and beyond.

Providers face challenges to be ready for the NDIS

To meet the needs of NDIS participants, there must be a significant increase in the quantity, quality, range and responsiveness of disability supports.

In making the transition to a market-based system for disability supports, providers are facing the prospect of workforce shortages and coming to grips with operating in a market that will, for some time, be characterised by price caps. The shift in the business model, from a block-funded to a fee-for-service environment, is highly challenging for many.

Prices are critical for market development and participant outcomes

Participants exercising choice and control will increasingly drive the price of disability supports. And these prices will drive providers to supply the supports that participants most value, and encourage competition and innovation among providers. Allowing the market to determine the price of supports is an important tenet of the NDIS — it will contribute to both participant outcomes and the financial sustainability of the scheme.

However, prices are currently regulated. The NDIA sets maximum prices ('price caps') for many of the supports provided by NDIA-registered providers to:

- ensure value for money for participants — as the price of supports may be bid up too quickly before the sector grows sufficiently to meet the increased demand
- encourage the market supply of disability supports.

In practice, the NDIA must balance these two objectives. If prices are set too high, this will encourage the supply of supports, but reduce the purchasing power of participants. If prices are set too low, this could lead to a shortage of particular supports. Striking the right balance is difficult. From a long-term perspective, price regulation should not linger for years, have excessive scope, nor skew the market (such as by benefiting some providers or participants over others).

The Commission heard from many stakeholders that the NDIA's pricing methodology has, in some cases, led to perverse incentives, poor participant outcomes and hindered market development — especially for supports required by participants with complex needs. According to the NDIA, existing providers (many who previously relied on block-funding) are finding it difficult to adjust to the fee-for-service model.

The NDIA, on completing its 2017-18 price review, commissioned McKinsey & Company to review its pricing approach. The report will be completed at the end of 2017.

The Commission agrees with the NDIA's findings from recent reviews that the communication, transparency and timeliness of the pricing process needs to be improved. Price regulation of NDIS supports should be administered by a body with relevant capabilities and necessary resources. Prices of supports should be regulated as narrowly and for the least time possible, as well as be:

- transparent, with wide public consultation and publicly available information, including all assumptions used in any pricing models
- more granular and targeted by setting prices for supports at the state and territory level, with an expectation that price signals could be set at a more disaggregated regional level where possible
- evidence-based, with the collection of data and public reporting on providers' characteristics and costs
- supported by clear and limited legislative authority

- timely (giving providers sufficient time to phase in changes and be responsive to market conditions) and reviewed on a regular basis
- used only when there is clear evidence that unregulated prices are likely to lead to inflation that would harm participants.

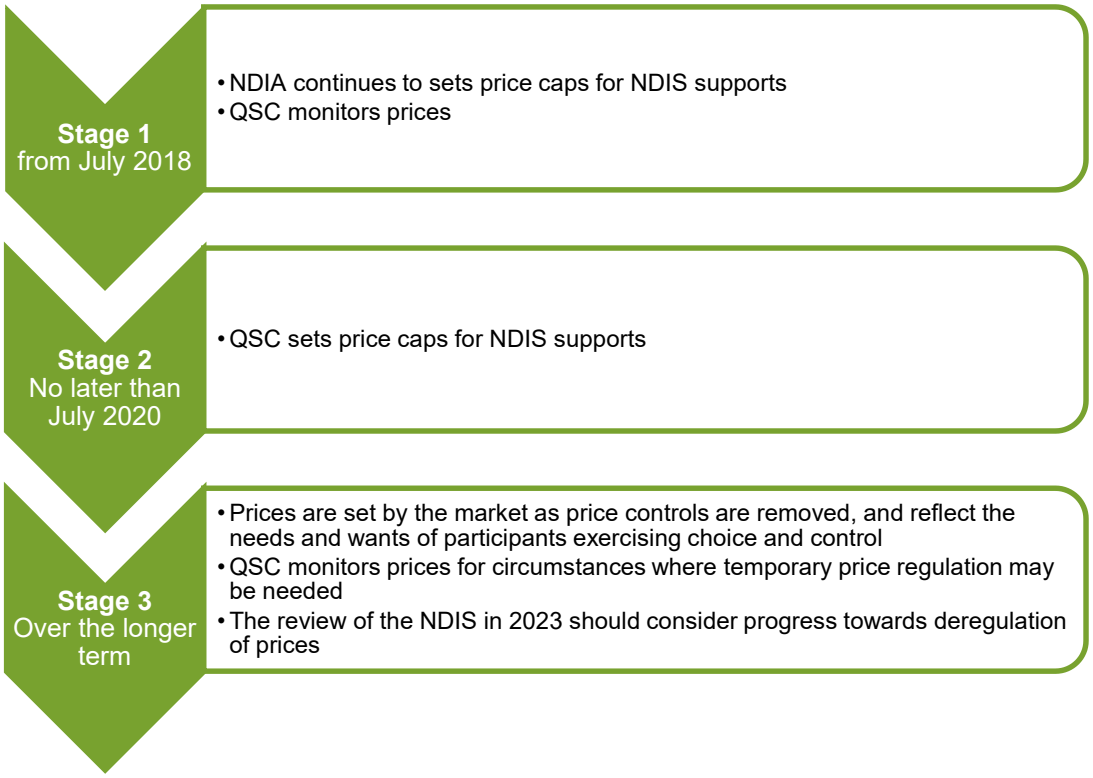
The Commission is concerned that while ever the price-setting mechanism is held within the NDIA, there is an incentive for it to be used to offset budget pressures. Prices should be set with market development as the primary focus. To better reflect the above principles, the Commission proposes moving towards the deregulation of prices in three stages (figure 7).

- The first stage reflects the current situation: the NDIA continues to set price caps for NDIS supports. But to provide additional oversight and improve the transparency of price-setting, the NDIS Quality and Safeguards Commission (QSC) should begin monitoring prices from its commencement in July 2018, particularly to highlight price settings it considers to be inconsistent with longer-term market development.
- The second stage (following the end of transition) addresses the greater need (see above) to ensure strong and competitive markets that provide a sufficient quantity of supports to meet the demand from 475 000 participants. To that end, the QSC should take over the role of price regulator no later than July 2020.
- The third stage is characterised by the longer-term removal of price controls by the QSC as markets for disability supports become more fully developed (which will occur at different times in different jurisdictions). The review of NDIS costs in 2023 should consider the state of market development including progress towards deregulation of prices. Following deregulation, there will still be need for the QSC to monitor prices to ensure that participant outcomes are being achieved through the ongoing provision of safe and quality supports.

It is undeniable that the supply response to the scheme is less than what will be required to deliver supports to participants.

The NDIA's cautious approach in setting prices was commensurate with the uncertainties around cost pressures early in the scheme, but the pace and growth of market development now needs to be accelerated. Vesting price regulation powers in the QSC will ensure that market development (and participant wellbeing) receives the focus that it needs, and reflects its increasing importance over time as the scheme rolls out.

Figure 7 **The PC's recommended path for NDIS price deregulation**



Without better oversight and transparency of price signals in the near term to achieve the required significant increase in supply, the benefits of the NDIS will not be fully realised. These concerns were raised by numerous stakeholders, including many of the governments funding the scheme. The Victorian Government, for example, said:

> It is important to separate the price-setting function from the NDIA and then clarify the role and accountability to be retained by the NDIA. Victoria considers that there is also an immediate need to consider areas where NDIS pricing may be inhibiting market growth or risking provider failure (particularly in areas or services in which there are thin markets). In some areas, the NDIA appears to have applied flawed assumptions to its calculation of prices. Examples include low allowances to train, supervise and recruit direct support staff, unrealistic assumptions around the amount of time staff need to spend undertaking non-client facing functions, and low assumptions around the proportion of overall costs devoted to overheads (particularly during the transition period). Victoria considers that these areas should be corrected as soon as possible.

Independent price monitoring and regulation will benefit participants, providers, and the community. Participants will be assured that quality and safety standards are considered in the pricing of NDIS supports. Providers will have greater certainty that price setting will be transparent and evidence-based. And the community can be confident that the funds they have contributed to the scheme will be spent in a way that best balances the needs of market development and the interests of participants.

Thin markets need more attention

When creating a new market for disability supports, there is a risk that, in some areas, or for some types of supports, the market (the number of providers or participants) will be too small to support the competitive provision of services ('thin market'). Thin markets are not new — they have been, and will continue to be, a persistent feature of the disability support sector.

In the absence of government intervention, there will be greater shortages, less competition, and ultimately poorer outcomes for participants. Participants at most risk are those who:

- live in outer regional, remote or very remote areas
- have complex, specialised or high intensity needs, or very challenging behaviours
- are from culturally and linguistically diverse backgrounds
- are Aboriginal and Torres Strait Islander Australians
- have an acute and immediate need (crisis care and accommodation).

The NDIA has not, to date, developed a Provider of Last Resort policy, or its Market Intervention Framework, and this has led to concerns about continuity of services. These policies should be published as soon as possible.

More flexible funding, service delivery and other measures tailored to specific circumstances are also needed. The NDIA should consider the widest range of approaches, including block-funding.

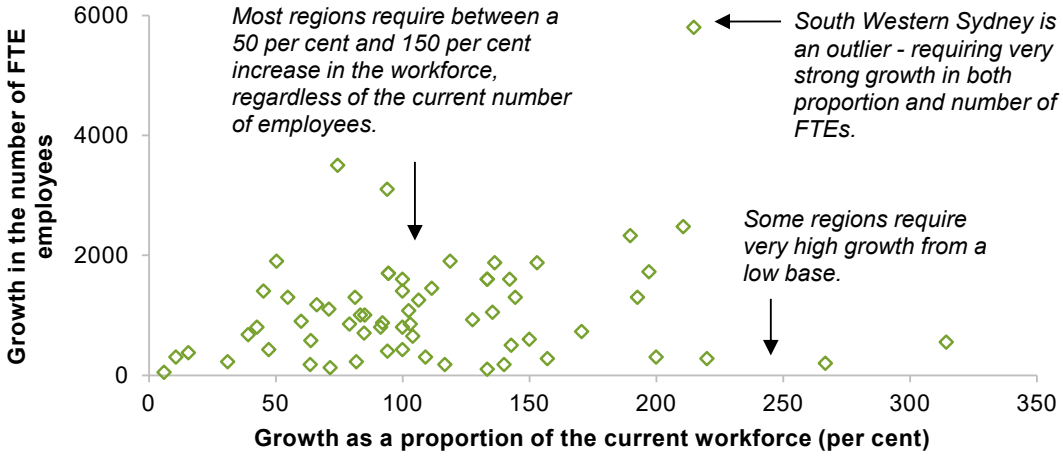
The NDIA should also collect and publicly release granular data, feedback and reports on thin markets, including when Provider of Last Resort arrangements are used. This will help inform the appropriateness and effectiveness of market interventions. Regardless of the approach chosen, there is a need for transparent reporting and evaluation of thin market arrangements, and collaboration between the Australian and State and Territory Governments.

The workforce is not growing fast enough

As the NDIS provides more individualised supports for people with disability, the workforce needed to provide those supports will need to both increase and become more diverse. There is broad consensus that the number of full-time equivalent positions will need to roughly double over the transition period — at a local level, some regions will need to triple their workforce or more to meet demand (figure 8).

Figure 8 **Variation in workforce growth required in different regions[a]**

Each dot represents the growth in the amount of full-time equivalent (FTE) employees needed relative to the current situation, both in terms of the number and proportion, between 2015-16 and 2019-20.



[a] The NDIA's market position statements provide 'low and high' estimates for the number of FTE disability workers at present and what will be needed in the future. To derive these estimates for growth, the midpoints of each range are used. No data are available for Western Australia. Regions are areas consisting of several local government areas.

Several policy changes are recommended to mitigate the potential workforce shortage over the short term, including:

- meeting the desires of many existing workers — who are qualified and experienced, and usually work part-time — to work additional hours
- trialling different approaches to help fund volunteer organisations to provide participant supports
- allowing for skilled migration where residual shortages remain persistent.

Building the workforce is a long-term exercise

While these measures will help to address workforce shortages in the transition period, more attention also needs to be paid to the longer-term development of the workforce.

The responsibility for workforce development is currently shared jointly between the DSS and the NDIA — with the former having 'oversight' of workforce development and the NDIA allocated the task of 'market steward'. The DRC also plays a role in workforce development issues, along with the relevant State and Territory Government departments.

The current fragmented landscape of roles and responsibilities for workforce development is understandable given the breadth and reach of the scheme, and the speed of implementation, but is unacceptable. The risk is that a fragmented workforce policy may

lead to inaction, or result in duplication or unnecessary programs at a time when the scheme can least afford it. While some progress is being made to better coordinate the activities of different jurisdictions, much more needs to be done.

A 'big tent' approach to workforce development remains appropriate, but the roles and responsibilities of different parties should be clarified and made public. This is a big task, and is not yet being given the attention it needs.

- State and Territory governments should have more responsibility for workforce development issues over the transition period, as they have the best experience of where there has been historically unmet need and the approaches best suited to solve such issues in particular jurisdictions.
- The Australian Government should retain oversight of the scheme, and focus on areas that affect the supply and demand of care workers from an economy-wide perspective, including the interaction of the NDIS with other care sectors (such as aged care) and monitoring trends in the supply of skilled workers through tertiary and vocational education.
  - The Australian Government should adjust immigration policy where necessary to address workforce shortages.
- The NDIA is best placed to provide more granular detail to governments on where supply gaps are emerging, or likely to emerge.
- Governments should also regularly consult with providers on emerging workforce policy issues, such as where the incentives of the scheme may be affected by other laws and regulations like minimum standards, conditions of State and Commonwealth awards, and training and development.

Over the long term, the workforce development responsibilities of State and Territory Governments will diminish as the NDIS is fully rolled out and supplants their existing disability support programs. Even then, State and Territory Governments should remain 'in the tent' when it comes to workforce policymaking given the interaction between the NDIS and other mainstream services.

Building the evidence base is also important

Existing data on the size and scope of disability care workers and the organisations they are employed by are poor, and not commensurate with the importance of the NDIS. The DSS (the agency currently tasked with market development oversight) said that 'a significant limitation to assessing the NDIS market readiness is the availability of market and workforce data'. To address this deficiency, the Australian Government should fund the collection of more fit-for-purpose data by the Australian Bureau of Statistics and the university sector.

Participants need help to make the most of the NDIS

The NDIS is about giving participants more choice and control over their supports. While some participants will be ready to manage and work with the NDIS to implement their plans, others will be less so, and may find it difficult to get the most out of the scheme. This in turn will reduce the overall benefits and financial sustainability of the scheme.

How ready participants are to make the most of their plan will depend on a number of factors, including: an individual's capacity; their network of informal carers and peers; the assistance provided under the NDIS; how ready the market is to provide supports; and the complexity of the scheme. As participants spend more time in the NDIS, there will also be some degree of 'learning by doing'.

However, some scheme participants are finding it hard to understand and interact with the NDIS, particularly because the scheme is a new way of allocating and supplying disability supports. There is a lack of useful information about providers and their services. Providing timely, accessible and useful information to participants about providers will help people with disability access their NDIS supports, and better exercise choice and control.

Supports provided in plans give some assistance to participants to implement their plans, including through support coordination (a key means to bolster the readiness of participants with complex needs). However, there is some evidence that support coordination is being provided to participants for only a fixed period of time. The NDIA should allocate support coordination based on need, rather than time.

Intermediaries can also help participants navigate the NDIS, as they can provide tailored supports to participants to manage their plans, including helping to pay providers and hire workers. Intermediaries are especially important for those who may struggle to deal with the administrative burden of managing their own affairs (while allowing participants to retain choice and control). They can also reduce scheme costs by reducing the administrative burden for the NDIA and aggregating participants' purchases of common supports.

However, the take-up rate of intermediaries to date has been slow. Only 11 per cent of participants in the transition period are using intermediaries. To encourage greater use of intermediaries, the NDIA should provide more information to participants and planners about the roles and use of intermediaries. Intermediaries should also be closely monitored to ensure that safeguards are in place to protect participants and providers. And the NDIA should continue to assess the capacity of participants to self-manage on a case-by-case basis.

Disability advocates also play an important role and help participants in a way that NDIS supports cannot. They can help participants get better plans, find supports, navigate the new scheme with its new jargon and complexities, and provide systemic advocacy about difficulties faced by people with disability. However, many State and Territory Governments have reduced or ceased funding for disability advocacy — rolling it into NDIS funding of supports instead. As advocacy remains important over the transition period, the Commission

recommends that funding be restored by jurisdictions that have ceased or reduced funding, and data collection and evaluation of disability advocacy be increased.

More effective government stewardship of the market is needed

As discussed above, there are substantial challenges developing the market supply of disability supports. While some progress is being made, there are still difficulties in growing the number of providers and the disability care workforce, as well as helping participants to become informed and effective consumers (figure 9). This is occurring at a time when the rapid pace of the rollout — and growth in demand for supports — is at its greatest. Based on experience to date, there will be a shortage of disability supports under the scheme.

Many of these challenges could have been anticipated. This highlights the need for more effective market stewardship by governments (including by the NDIA). As the Agency said:

> Market stewardship recognises that when governments implement policies to increase consumer choice and adopt market-based delivery, they must also oversee how the marketplace develops.

Just as providers, workers and participants need to change their approach to disability supports, so too must governments.

The responses from jurisdictions have varied, and their effectiveness is unclear. Although some of the variation reflects jurisdictional differences (including the rollout timetable), it also highlights the uncertainties around the roles and responsibilities of governments under the NDIS. In practice, this has led to gaps, duplication and shifting of responsibilities. This is a risk to the scheme, and to the wellbeing of participants and their families.

While the bilateral agreements provide some level of detail about 'who is responsible for what', more rigorous communication, public reporting and coordination of market stewardship activities are needed. The DRC should immediately clarify and publish the specific and practical delineation of market stewardship roles, responsibilities and accountability arrangements of Australian, State and Territory Governments. Where governments, their agencies and/or the NDIA are responsible for a market stewardship task, there should be clear and transparent reporting about the specific outcomes they are to achieve, the timeframe in which it is meant to occur, and progress towards that goal. Governments should also coordinate their market stewardship actions across all sectors, particularly with other care sectors and mainstream services.

Coordination among market stewards is important, but the release of timely, market-relevant data are also needed urgently. The Australian, State and Territory Governments should, with the NDIA and QSC, collect and publish disaggregated, tailored and forward-looking market data. This includes provider and workforce data, as well as qualitative information and feedback from liaison with market participants. A better evidence base would enable a deeper understanding of the market and in turn, inform risk-based market stewardship responses.

Figure 9 **The main actors, actions and Commission's recommendations affecting market readiness**

Key issue	Provider readiness: Price Signals	Provider readiness: Non-Price Signals	Workforce readiness	Participant readiness
Responsible stakeholders	Price regulator (currently NDIA)	Provision of market information (NDIA)	Coordination of workforce development activities by Governments, DSS and NDIA	Assistance in plans (NDIA)
Main current actions	McKinsey & Company price review initiated by the NDIA	Changes arising from the NDIA provider pathway review	Sector Development Fund Workforce action plan developed by DSS	Changes arising from the NDIA participant pathway review
Commission recommends	Principles-based pricing Independent price monitor and regulator (NDIS Quality and Safeguards Commission)	NDIA to release more frequent and granular data on participant demand NDIA to make public its Provider of Last Resort policy and Market Intervention Framework	Better coordination between governments, providers and the NDIA to develop the workforce Appropriate data collection Trialling use of volunteers	Implement objectives of the eMarketPlace Clarifying the supports that help participants Encouraging use of intermediaries Continue funding disability advocacy

All of the market readiness issues suggest that market stewardship needs improvement

Clarify and make public the roles and responsibilities for each party
Require transparent and regular reporting against outcomes
Collect and make public disaggregated, tailored and forward-looking market data
Coordinate market stewardship actions across all sectors

10 Governance

The governance arrangements for the NDIS are complex and reflect the shared responsibility of the scheme between the Australian and State and Territory Governments. While the NDIS is administered by an Australian Government Authority (the NDIA) under Commonwealth legislation and under the direction of an Australian Government Minister, it is designed and funded by the Australian, State and Territory Governments.

In 2011, the Commission recommended a single national scheme, and a single national agency, to provide disability care and support. The Commission considers that this is still the best model, and that Western Australia, the sole jurisdiction to remain outside the NDIS, should be in the national NDIS. The possibility of Western Australia joining the scheme is currently under consideration by the Western Australian Government.

NDIS rules

Under the current governance arrangements, State and Territory Governments play a significant role in setting NDIS policy. For example, while the Minister for Social Services is responsible for creating NDIS Rules, Category A Rules require unanimous agreement from the Australian Government and each host jurisdiction.

There have been cases where NDIS rules have taken considerable time to implement. The process for implementing or amending Category A NDIS Rules should be streamlined, to ensure that swift changes can be made in response to developments that threaten the financial sustainability of the scheme. The Commission does not recommend that the requirement for agreeing to Category A NDIS Rules be changed from unanimous agreement. Instead, the process should be changed to encourage timely agreement to Rules without diluting the control of State and Territory Governments. This could be done, for example, by requiring governments to state whether they agree or disagree to a proposed rule introduction or change within a certain amount of time. No response could be taken as agreement to the proposal.

The NDIA's operating costs and staff cap

The NDIA needs sufficient autonomy to manage the NDIS as an insurance-based scheme.

The NDIA is subject to a cap on operating costs. At full scheme the cap is set at 7 per cent of package costs. While capping operating costs could encourage efficiency, if the cap is set too low it could hinder the NDIA's ability to effectively manage the scheme. While similar types of schemes operate close to a 7 per cent average when they are close to maturity, they also typically have significant fluctuations in their annual operating expenses as a proportion of their overall expenses. A target of 7 to 10 per cent, with the expectation that the NDIA would sit at the bottom of this range, would give the NDIA the flexibility to smooth year-to-year fluctuations in spending, while still encouraging efficiency.

The NDIA also has a full scheme cap of 3000 directly employed staff. Capping staff levels could lead to poorer outcomes, especially early in the scheme's life when the agency is building capacity and institutional knowledge, and developing first plans for many participants. The number of employed staff (and in-house skills) required will depend on the model adopted to undertake planning, and is likely to change as the scheme matures. The NDIA, as a corporate Commonwealth entity, should be given the independence to determine the most effective and efficient number of staff to deliver the scheme.

Monitoring the performance of the NDIS

Performance reporting is important for ensuring outcomes are realised and that there is accountability when they are not. It is also an important component of the insurance approach. The performance of the NDIS is currently monitored and reported through a number of reports, including the quarterly report to the DRC and the Annual Financial Sustainability Report.

While the NDIA is still developing its performance reporting, there are some gaps in the framework and the reporting against the framework, especially around quality. As reporting on outcomes develops, evidence of good outcomes will be evidence of good quality plans, processes and experiences. However, this could take many years. In the meantime, reporting on measures and indicators of quality is needed, and should begin by June 2018.

There is also a need for improved public reporting of review processes. The NDIA should publicly report on the numbers of reviews, review timeframes, outcomes of reviews, and participant satisfaction with the review process. This would improve clarity, transparency and accountability around the effectiveness of the review process.

11 Funding

To ensure that the integrity of the NDIS' objectives are maintained, the funding arrangements for the NDIS need to provide funding certainty and allow the scheme to operate in line with insurance principles. This requires:

- sufficient funding for the NDIA to take a lifetime approach to participant supports
- predictable funding that gives people with disability (and their families and carers), and those that may acquire a disability later in life, certainty that they will receive reasonable and necessary supports over their lifetime
- incentives for the NDIA to efficiently and effectively operate the scheme
- incentives for governments to take a collaborative approach to mainstream interfaces and other disability services.

The current funding arrangements

In 2011, the Commission's preferred funding option was for the Australian Government to be the single funder of the NDIS. This option was preferred on the basis that it would:

- provide certainty and clear lines of funding responsibility
- avoid the inefficiencies of the Commonwealth-State 'blame game' that can afflict shared funding arrangements
- reflect the Australian Government's capacity to raise efficient and sustainable taxes of the magnitude required.[6]

The Commission also recommended that the Australian Government direct payments from consolidated revenue into a National Disability Insurance Premium Fund using a legislated formula that provided stable revenue to meet the actuarially-assessed reasonable needs of the NDIS and included funding for adequate reserves.

The funding arrangement for the NDIS (expected to cost $22 billion in 2019-20) is a pooled approach (this was the Commission's second, less preferred option), with funding from Australian and State and Territory Governments. In the first year of full scheme, the State and Territory Governments (assuming Western Australia joins the national scheme) will contribute a combined $10.3 billion to the NDIS, and the Australian Government will pay the remainder. The arrangements are governed by a range of bilateral agreements that are to be revisited every five years. The NDIA does not have a reserve to manage fluctuations in expenditure.

DisabilityCare Australia Fund arrangements should be phased out

A 0.5 percentage point increase in the Medicare levy provides some funding for the NDIS via the DisabilityCare Australia Fund (DCAF). The DCAF is managed by the Future Fund and is subject to management fees. A maximum of $9.7 billion over 10 years will be credited to the State and Territory Governments to partially reimburse their NDIS contributions, with the remainder available to the Australian Government (at least 75 per cent of the revenue).

The Australian Government's 2017-18 Budget also included plans to increase the Medicare levy by (a further) 0.5 percentage point and credit it to the yet to be established NDIS Savings Fund (alongside other redirected savings, contributions from NDIS underspends returned to the Australian Government, and recommitted funds from the Building Australia Fund and Education Investment Fund (subject to legislation)). The NDIS Savings Fund is a special account ring-fenced within consolidated revenue and is not subject to management fees.

6 This option was subject to the State and Territory Governments reducing their taxes to avoid increasing the tax burden on Australians beyond what is necessary to provide additional funding to the NDIS.

The DCAF arrangements will become less appropriate over time as State and Territory Government withdrawals become more frequent and the 'churn' of funds increases. The Commission recommends that the DCAF arrangements be discontinued after 2023-24[7] and that the Medicare levy funds for the NDIS be put into the proposed NDIS Savings Fund.

Escalation parameters

As the NDIS is designed to be a no-fault scheme that covers the entire population, the contributions of governments to the NDIS can be thought of as an 'insurance premium' paid by individuals through their taxes. The current Bilateral Agreements provide that the State and Territory Government contributions will increase by 3.5 per cent each year (the 'escalation parameters') until 2023, subject to the outcomes of this study.

The current escalation parameters of 3.5 per cent are based on the long-term annual projections of the consumer price index of 2.5 per cent and a net population growth rate of 1 per cent. The threshold issue for escalation parameters is whether or not State and Territory Government contributions at full scheme and beyond should keep pace with scheme costs or maintain existing real per capita contributions.

The argued benefit of State and Territory Government contributions tracking scheme costs is to give them some 'skin in the game' to control costs. However, there are a number of factors that contribute to increasing scheme costs, and most of these are not within the control of the State and Territory Governments. State and Territory Government tax bases are also less efficient than the Australian Government's, which means it is more costly for them to raise funds than it is for the Australian Government.

The Commission recommends keeping State and Territory Government NDIS contributions constant on a real per capita basis over time, as it is reasonable to expect that their tax revenue will grow with inflation and population.

On the basis of current projections of population and price growth post 2019-20, the currently agreed escalation parameters of 3.5 per cent are at the lower end of the likely range of values based on reasonable assumptions. An escalation parameter of 4 per cent would be more appropriate over the short to medium term, until they are reviewed in 2022-23.

Funding an insurance-based scheme

Insurance schemes typically prepare actuarial forward estimates of costs over a period of time and adjust their insurance premiums in line with long-term actuarial projections of future scheme costs. Premiums are usually set at a level to allow reserves to build up to manage year-to-year fluctuations in costs and to set aside money for claims not yet finalised.

7 Governments have not negotiated payments to the State and Territory Governments after 2023-24.

Having access to reserves also allows insurance companies to make upfront investments aimed at reducing scheme costs over the longer term.

For the NDIS to operate as an insurance-based scheme, the NDIA needs to have the autonomy to manage the lifetime risk of participant costs and to manage discrepancies between actual and estimated costs in any given year. The NDIA, rather than the Australian Government, is best placed to manage the costs of the scheme and risk of cost overruns because it has the best information to do so.

Increasing funding contributions in line with cost increases, with a buffer for risk, would provide the NDIA with sufficient certainty and flexibility to manage the costs of the scheme, rather than having to rely on injections of cash from the Australian Government (which should be rare in a well-run insurance scheme) under the current cost overrun arrangements. It would also provide greater certainty to governments about future contribution obligations.

Allowing the NDIA access to a pool of reserves could also result in improved lifetime outcomes for participants (as the NDIA could focus more on long-term investments) and provide assurance to the community that the scheme is insulated (to some extent) from the vagaries of the budget cycle. Governments should commit now to establishing a pool of reserves for the NDIA. The reserve entitlement should be calculated based on an actuarial and economic analysis of the optimal reserve amount and allowed to gradually accrue over time.

12 Data

The NDIA collects data on participants when they access the scheme, when plans are developed, at plan implementation and at plan review. At full scheme, there will be data on about 475 000 scheme participants. And while the longitudinal dataset to support actuarial analysis of the scheme will take time to build (little data are currently available), as one study participant said, 'the NDIA is building the most comprehensive population-based longitudinal database on disability in the world'.

The NDIA's information and communication technology system needs to be fit for purpose to undertake the longitudinal data analysis, reporting and monitoring required to support the insurance approach of the NDIS. And there are some issues with the current system not being capable of extracting all the information required. Progress on enhancing the information and communication technology needs to be monitored by the NDIA.

It is also imperative that access to the longitudinal dataset is made available to other researchers. The NDIA has a legislative basis for allowing others to use the NDIS data, but it is yet to establish policies for data sharing. A data sharing policy should be established.

But not all data relevant for assessing the effectiveness of the NDIS will be (or should be) collected within the scheme. A number of stakeholders raised concerns about data collections outside the NDIS discontinuing as State and Territory Governments wind down

disability support services. It is important that data are available to examine the interface between the NDIS, other disability supports and mainstream services. The Australian, State and Territory Governments should commit to the ongoing funding of the Survey of Disability, Ageing and Carers and an expanded Disability Services National Minimum Data Set.

Recommendations and findings

How is the scheme tracking?

FINDING 2.1

The scale and pace of the National Disability Insurance Scheme (NDIS) rollout to full scheme is highly ambitious, and will not be delivered as scheduled in terms of participant intake. The rollout schedule risks the National Disability Insurance Agency (NDIA) not being able to implement the NDIS as intended and it poses risks to the financial sustainability of the scheme. The NDIA is cognisant of these risks.

FINDING 2.2

The Productivity Commission supports the National Disability Insurance Agency's (NDIA's) approach to projecting scheme costs and the decision to delay integrating data from the trial and transition period to date. As such, the Commission has not revised its own projections of scheme costs.

However, it is imperative that new data are incorporated into the NDIA's assessment of longer-term costs as soon as possible. The Commission's assessment is that, in the absence of major new data reliability issues, there should be sufficient data for the NDIA to update the estimates of scheme costs on the basis of scheme experience for the 2017-18 Annual Financial Sustainability Report.

FINDING 2.3

The National Disability Insurance Scheme, at the end of trial, came in under budget. But of concern to the Productivity Commission is that this was in large part because not all committed supports were used (in 2015-16 the utilisation rate was 76 per cent). While lower than expected levels of utilisation means lower scheme costs, it also implies poorer outcomes for participants.

Based on trial and transition data, scheme costs are broadly on track compared to the National Disability Insurance Agency's (NDIA's) long-term modelling. At this stage, early cost pressures (such as greater than expected numbers of children in the scheme) are being more than offset by lower than expected levels of utilisation.

The NDIA has put in place initiatives to address emerging cost pressures. It is too early to assess the effectiveness of these initiatives.

Scheme benefits

FINDING 3.1

Early evidence suggests that the National Disability Insurance Scheme is improving the lives of many participants and their families and carers. Many participants report an increase in the amount of support provided, more choice and control over the supports they receive, improvements in their quality of care, greater independence and an increase in overall wellbeing.

FINDING 3.2

Not all participants are benefiting from the National Disability Insurance Scheme. The groups at risk of having a less positive experience include those with psychosocial disability, complex and multiple disabilities, and language and cultural barriers, as well as people with disability transitioning into the community from the criminal justice system, the homeless and the socially isolated.

RECOMMENDATION 3.1

The National Disability Insurance Agency should collect and publish data on whether or not participants eligible for individualised supports through the National Disability Insurance Scheme have employment restrictions. Data should be collected in a format similar to data collected on employment restrictions by the Australian Bureau of Statistics Survey of Disability, Ageing and Carers.

Scheme eligibility

RECOMMENDATION 4.1

When determining that an individual is eligible for individualised supports through the National Disability Insurance Scheme under the disability requirements, the National Disability Insurance Agency should collect data on which of the activity domains outlined in section 24 of the *National Disability Insurance Scheme Act 2013* (Cwlth) are relevant for individuals when they enter the scheme.

RECOMMENDATION 4.2

The National Disability Insurance Agency should remove the Performance Indicator Target placed on Early Childhood Early Intervention partners that seeks to ensure that less than 50 per cent of children who connect with the partner are referred for access to the National Disability Insurance Scheme.

RECOMMENDATION 4.3

The National Disability Insurance Agency should make public a process for changing the conditions listed in List A and List D of the operational guidelines on access to the National Disability Insurance Scheme, including identifying under what circumstances a change in the lists may be considered.

RECOMMENDATION 4.4

The National Disability Insurance Agency should implement a psychosocial gateway. The gateway should be the primary pathway that people with psychosocial disability enter the National Disability Insurance Scheme.

The gateway should:

- use specialised staff
- operate on a face-to-face basis to the greatest extent possible
- consider models of outreach to engage people with psychosocial disability who are unlikely to approach the scheme
- provide linkages to both clinical and non-clinical services and supports outside the scheme
- collect data on both entrants into the scheme and people linked to services and supports outside the scheme.

Scheme supports

RECOMMENDATION 5.1

The National Disability Insurance Agency (NDIA) should implement a process for allowing minor amendments or adjustments to plans without triggering a full plan review.

If required, the Australian Government should amend the *National Disability Insurance Scheme Act 2013* (Cwlth) to enable the NDIA to implement such a process.

RECOMMENDATION 5.2

The National Disability Insurance Agency should:

- review its protocols relating to how phone planning is used
- provide clear, comprehensive and up-to-date information about how the planning process operates, what to expect during the planning process, and participants' rights and options
- ensure that Local Area Coordinators are on the ground six months before the scheme is rolled out in an area and are engaging in pre-planning with participants.

RECOMMENDATION 5.3

The National Disability Insurance Agency should ensure that planners have a general understanding about different types of disability. For types of disability that require specialist knowledge (such as psychosocial disability), there should be specialised planning teams and/or more use of industry knowledge and expertise.

Boundaries and interfaces with the NDIS

FINDING 6.1

It is a false economy to have too few resources for Information, Linkages and Capacity Building, particularly during the transition period when it is critical to have structures in place to ensure people with disability (both inside and outside the National Disability Insurance Scheme) are adequately connected with appropriate services.

RECOMMENDATION 6.1

Funding for Information, Linkages and Capacity Building (ILC) should be increased to the full scheme amount of $131 million for each year during the transition.

The effectiveness of the ILC program in improving outcomes for people with disability, the adequacy of its funding, and its impact on the sustainability of the National Disability Insurance Scheme should be reviewed as part of the next COAG agreed review of scheme costs in 2023. The ILC budget should be maintained at a minimum of $131 million per annum until results from this review are available.

RECOMMENDATION 6.2

The Australian, State and Territory Governments should make public — through the COAG Disability Reform Council (DRC) — their approach to providing continuity of support and the services they intend to provide to all people with disability (including the value of supports and number of people covered), beyond supports provided through the National Disability Insurance Scheme. Arrangements for continuity of support should be made clear before full scheme implementation.

The National Disability Insurance Agency should report annually to the DRC on boundary issues as they are playing out on the ground, including identifying service gaps and actions to address barriers to accessing disability and mainstream services for people with disability. The reporting should be used for ongoing monitoring, evaluation and improvements.

RECOMMENDATION 6.3

Each COAG Council with responsibility for a service area that interfaces with the National Disability Insurance Scheme (NDIS) should have a standing item on its agenda to address how these services interface with NDIS supports. The standing item should cover service gaps, duplication and other boundary issues, including ways to improve outcomes for people with disability. Each Council should put forward issues and proposed solutions to the Disability Reform Council for action.

At review points of National Agreements and National Partnership Agreements under the *Intergovernmental Agreement on Federal Financial Relations*, parties should agree to specific commitments and reporting obligations that are consistent with the *National Disability Strategy*. The Agreements should be strengthened to include more details around how boundary issues are being dealt with, including practical examples.

RECOMMENDATION 6.4

If the medical and general accident streams of the National Injury Insurance Scheme are not implemented, then State and Territory Governments should bear the additional costs borne by the National Disability Insurance Scheme because of the absence of these streams.

Provider readiness

FINDING 7.1

In a market-based model for disability supports, thin markets will persist for some groups, including some participants:

- living in outer regional, remote and very remote areas
- with complex, specialised or high intensity needs, or very challenging behaviours
- from culturally and linguistically diverse backgrounds
- who are Aboriginal and Torres Strait Islander Australians
- who have an acute and immediate need (crisis care and accommodation).

In the absence of effective government intervention, such market failure will result in greater shortages, less competition and ultimately poorer participant outcomes.

RECOMMENDATION 7.1

The National Disability Insurance Agency should address thin markets by:

- considering a range of approaches, including block-funding
- publicly releasing its Provider of Last Resort (POLR) policy and Market Intervention Framework discussed in the *NDIS Market Approach: Statement of Opportunity and Intent* as a matter of urgency
- collecting and making publicly available disaggregated data, feedback and reports on thin markets, including when POLR arrangements are used.

RECOMMENDATION 7.2

Bilateral agreements regarding the full rollout of the National Disability Insurance Scheme should only include in-kind funding arrangements for services that are required to ensure continuity of support for existing clients. For in-kind services that persist past transition, a timetable for when they will be ‘cashed out’ should be included in bilateral agreements.

Pricing of disability supports

FINDING 8.1

The National Disability Insurance Agency's approach to setting price caps to date has hindered market development by discouraging the provision of some disability supports. In some cases, it has led to poor participant outcomes, especially for those with complex needs. The benefits of the National Disability Insurance Scheme will not be fully realised if the Agency continues with its current pricing approach.

RECOMMENDATION 8.1

The body responsible for regulating the price of supports under the National Disability Insurance Scheme should have relevant capabilities and the necessary resources to set price caps in a manner that is:

- transparent, with wide public consultation and publicly available information, including all assumptions used in any pricing models
- evidence-based
- supported by clear and limited legislative authority
- independent
- timely, particularly in giving providers sufficient time to phase in changes and be responsive to market conditions.

RECOMMENDATION 8.2

The Australian Government should amend the *National Disability Insurance Scheme Act 2013* (Cwlth) to require the National Disability Insurance Scheme Quality and Safeguards Commission (QSC), upon its commencement in 2018, to monitor, review and report on the price caps for scheme supports set by the National Disability Insurance Agency (NDIA). This should include appropriate funding for the QSC to undertake price monitoring of scheme supports, and to continue the business characteristics and benchmarking study currently undertaken by National Disability Services and the University of Western Australia.

The Act should require the NDIA to provide any relevant data and information that is required by the QSC in its price monitoring functions. The NDIA should make public a summary of the report of the 2017 McKinsey & Company price review upon completion, and provide the full report to the QSC.

RECOMMENDATION 8.3

The Australian Government should amend the *National Disability Insurance Scheme Act 2013* (Cwlth) to transfer the National Disability Insurance Agency's (NDIA) power to set price caps for scheme supports to the National Disability Insurance Scheme Quality and Safeguards Commission (QSC) by no later than 1 July 2020. The Act should require the NDIA to provide any relevant data and information that is required by the QSC in its price regulation functions.

Prices should only be regulated as narrowly and for as short a time as possible. As part of its price regulation functions, the QSC should:

- collect, de-identify and publicly release data on providers' characteristics, including the price, profits, costs and quality of services
- set price caps for supports at least at a state and territory level, which should be made public no less than 60 days before prices take effect
- comprehensively review and make public its price model on at least an annual basis. This review should be transparent, have wide public consultation, be evidence-based and evaluate the effectiveness of prices in meeting clearly defined objectives
- determine when to deregulate prices for supports, with particular regard to the type of support and region.

Progress towards price deregulation should be considered by the independent review of scheme costs in 2023.

Workforce readiness

FINDING 9.1

The disability care workforce will not be sufficient to deliver the supports expected to be allocated by the National Disability Insurance Agency by 2020.

RECOMMENDATION 9.1

The roles and responsibilities of different parties to develop the National Disability Insurance Scheme (NDIS) workforce should be clarified and made public by the beginning of 2018.

- State and Territory Governments should rely on their previous experience in administering disability care and support services to play a greater role in identifying workforce gaps and remedies tailored to their jurisdiction.
- The Australian Government should retain oversight of workforce development, including how tertiary education and aged care policy interact and affect the development of the workforce.
- The National Disability Insurance Agency should provide State and Territory Governments with data and analyses held by the Agency to enable those jurisdictions to make effective workforce development policy.
- Providers of disability supports should have access to a clear and consistent mechanism to alert the National Disability Insurance Agency, the NDIS Quality and Safeguards Commission, and the Australian, State and Territory Governments about emerging and persistent workforce gaps.

RECOMMENDATION 9.2

The National Disability Insurance Agency should publish more detailed market position statements on an annual basis. These should include information on the number of participants, committed supports (disaggregated at a level of detail consistent with the guides used to set price caps), existing providers and previous actual expenditure by local government area.

The Australian Government should provide funding to the Australian Bureau of Statistics to regularly collect and publish information on the qualifications, age, hours of work and incomes of those working in disability care roles, including allied health professionals.

RECOMMENDATION 9.3

The Australian Government should adjust immigration policies where necessary to address National Disability Insurance Scheme workforce shortages.

RECOMMENDATION 9.4

Some volunteer organisations are finding it difficult to provide supports to eligible scheme participants. There is merit in the National Disability Insurance Agency:

- considering whether volunteer organisations should be funded to cover both the initial costs of connecting participants with volunteers and ongoing costs of volunteer management. The Agency should consider whether this is best done through line items for scheme participants or through a more direct funding arrangement with volunteer organisations
- trialling different funding arrangements to cover ongoing costs of volunteer management and collecting data on the outcomes of participants that use such services to better evaluate the costs and benefits of volunteer organisations providing scheme supports over the longer term.

RECOMMENDATION 9.5

The National Disability Insurance Agency should collect data on the number of participants who make use of paid informal carers to deliver scheme supports, including the costs associated with such payments and their length of use.

RECOMMENDATION 9.6

The National Disability Insurance Agency should:

- ensure planners take into account the amount of respite care that is reasonable and necessary under an individualised support package, based on the amount of informal care that is expected to be provided by informal carers
- label short-term accommodation supports provided in participants' plans in a way that makes it clear that these supports can be used for respite
- better inform participants and their informal carers that core supports provided in individualised support packages can be used to fund additional in-home care or support in shared facilities to provide respite
- include specific measures to ensure a supply of respite services in its provider of last resort policies.

Participant readiness and market stewardship

RECOMMENDATION 10.1

The National Disability Insurance Agency should:

- clarify to scheme participants and the community the role of support coordinators in relation to Local Area Coordinators, plan managers, mainstream services and advocates
- allocate support coordination to participants in their plans on the basis of need (and not for a fixed time period) in determining whether it is a reasonable and necessary support, pursuant to section 34 of the *National Disability Insurance Scheme Act 2013* (Cwlth).

RECOMMENDATION 10.2

The National Disability Insurance Agency should provide accessible information to participants and the public about the providers available in the market and indicators of participant satisfaction with those providers. This information should be updated in as close to real-time as possible, and be consistent with the stated objectives of the eMarketPlace discussed in the *Integrated Market, Sector and Workforce Strategy*. It should be provided no later than 1 July 2018.

RECOMMENDATION 10.3

The National Disability Insurance Scheme Quality and Safeguards Commission, upon commencement, should closely monitor the operation of intermediary services under the National Disability Insurance Scheme, and make changes to safeguarding rules and codes of conduct as necessary to ensure that intermediaries act in the best interests of participants.

The National Disability Insurance Agency should provide clear and timely information about the option for participants to self-manage their plans, and the role that intermediaries can play to assist them to undertake different tasks on their behalf. The Agency should continue to assess the capacity of participants to self-manage on a case-by-case basis, consistent with the provisions of the *National Disability Insurance Scheme Act 2013* (Cwlth).

RECOMMENDATION 10.4

The Australian, State and Territory Governments should continue to fund disability advocacy organisations. State and Territory Governments should fund disability advocacy to 2019-20 by an amount that at least matches the per capita contribution of disability advocacy funding announced by the Australian Government.

The Australian, State and Territory Governments should also collect data from funded disability advocacy organisations about people with disability who use their services, and their outcomes. This data should be in a format that can be linked with data held by the National Disability Insurance Agency, and be made publicly available. The Department of Social Services should undertake an independent evaluation of advocacy funding at the beginning of 2020 to inform future funding arrangements, and thereafter periodically evaluate disability advocacy. These reports should be made public.

FINDING 10.1

The supply of disability supports in the short to medium term will not be able to meet participant demand resulting from the National Disability Insurance Scheme. This is due to a combination of factors, including rapid intake of the scheme, difficulties faced by participants to navigate the new markets for disability supports, difficulties by providers to adjust quickly to a new market-based model of service delivery, and underdeveloped market stewardship.

RECOMMENDATION 10.5

The COAG Disability Reform Council should immediately clarify and make public the roles and responsibilities of the Australian, State and Territory Governments with respect to market stewardship (those actions required to define and support the effective functioning of sustainable and enduring markets for participants and providers). This should include clear and transparent reporting of the specific actions and outcomes they are to achieve (including costs, benefits and risks), timeframes and progress towards goals.

The Australian, State and Territory Governments should:

- with the National Disability Insurance Agency and the National Disability Insurance Scheme Quality and Safeguards Commission, collect and make publicly available disaggregated, tailored and forward-looking market data, including provider and workforce data on supply gaps
- coordinate their market stewardship actions across all sectors, particularly with other care sectors and mainstream services.

Governance

RECOMMENDATION 11.1

The *National Disability Insurance Scheme Act 2013* (Cwlth) should be amended to change the process for agreeing to Category A Rules to reduce the time it takes to implement or amend those rules.

The amendment should not change the requirement that there be unanimous agreement among the Australian Government and the host jurisdictions for implementing or amending Category A Rules.

RECOMMENDATION 11.2

At full scheme, the annual operating budget for the National Disability Insurance Agency should be set within a funding target of 7–10 per cent of package costs with the expectation that, on average, it would sit at the lower end of the band.

The National Disability Insurance Agency should be required, in its annual report, to state the reasons why it has not met this target in any given year.

RECOMMENDATION 11.3

The Australian Government should remove the cap on staff employed directly by the National Disability Insurance Agency.

RECOMMENDATION 11.4

The Western Australian Government and Australian Government should put in place arrangements for Western Australia to transition to the National Disability Insurance Scheme. Any decision to join the national scheme should be made public as soon as possible.

RECOMMENDATION 11.5

The National Disability Insurance Agency should publicly report on the number of unscheduled plan reviews and reviews of decisions, review timeframes, outcomes of reviews and stakeholder satisfaction with the review process.

RECOMMENDATION 11.6

The *NDIS Quality and Safeguarding Framework* and associated regulatory arrangements should be examined as part of the first five-yearly review into National Disability Insurance Scheme costs in 2023.

RECOMMENDATION 11.7

The National Disability Insurance Agency (NDIA) should continue to develop and expand the performance reporting against the *Integrated NDIS Performance Reporting Framework*, including on outcomes, and Local Area Coordination and Information, Linkages and Capacity Building activities.

The NDIA should also fill gaps in its performance reporting, including reporting on plan quality (such as participant satisfaction with their plans and their planning experience, plans completed by phone versus face-to-face, and plan reviews). This work should be made a priority. The NDIA should begin reporting on measures and indicators of quality by June 2018.

The *Integrated NDIS Performance Reporting Framework*, and any additional reporting outside this framework included in the Quarterly report to the COAG Disability Reform Council (DRC), should be regularly reviewed by the DRC and refined as needed.

RECOMMENDATION 11.8

The National Disability Insurance Agency should better balance participant intake, the quality of plans and participant outcomes. This rebalancing should be explicitly tied to quality indicators that are publicly reported on (as per recommendation 11.7).

RECOMMENDATION 11.9

The Australian, State and Territory Governments should immediately start planning for a changed timetable for participant intake for the National Disability Insurance Scheme.

In doing so, the Australian, State and Territory Governments should ensure that adequate continuity of support arrangements are in place and assess whether additional resources are required to ensure the scheme meets its objectives. The issue of resourcing disability services under the changed timetable should be dealt with by the Treasurers and Ministers responsible for the disability portfolio in each jurisdiction, at the next COAG Disability Reform Council meeting.

Funding arrangements

RECOMMENDATION 12.1

The DisabilityCare Australia Fund (DCAF) should be discontinued after 2023-24. All the Medicare levy funds hypothecated for the National Disability Insurance Scheme (NDIS) should be put in the proposed NDIS Savings Fund.

The reimbursement arrangements that currently apply under the DCAF should not be continued after 2023-24. If necessary, the impact of such reimbursements should be reflected directly in reduced contributions from the State and Territory Governments.

RECOMMENDATION 12.2

From full scheme, the escalation parameters that determine the growth of State and Territory Government financial contributions to the costs of the National Disability Insurance Scheme should be set on the basis of population growth and inflation. This will maintain constant real per person contributions from the State and Territory Governments.

The Commission's assessment of projections of population and inflation over the period 2019-20 to 2023-24 suggests the escalation parameters should be set at 4 per cent, rather than the currently agreed 3.5 per cent.

The escalation parameters should be reassessed for the period beyond 2023-24, at 5 yearly intervals, based on the most contemporary projections of population and inflation at that time. The funding shares among the States and Territories should also be rebased according to the most contemporary census population data available at that time.

FINDING 12.1

If funding contributions to the National Disability Insurance Scheme increase in line with projected scheme costs and there is an actuarially-assessed buffer for risk, then cost overruns in a mature scheme will only occur where cost increases are sudden and difficult to predict.

RECOMMENDATION 12.3

From full scheme, the Australian Government should explicitly factor projected increases in scheme costs, based on the provision of reasonable and necessary supports, into the calculation of its contributions to the National Disability Insurance Scheme.

If cost overruns occur from full scheme, they should be funded by the Australian Government.

RECOMMENDATION 12.4

Governments should commit now to providing a pool of reserves for the National Disability Insurance Agency. The pool should build up gradually over time, with the target amount based on an actuarial and economic analysis of the optimal level of reserves.

Data and evidence

RECOMMENDATION 13.1

Australian, State and Territory Governments should commit, by June 2018, to fund (on an ongoing basis) the Australian Bureau of Statistics Survey of Disability, Ageing and Carers, so it can be conducted every three years.

RECOMMENDATION 13.2

The Australian, State and Territory Governments should agree to expand the data collection for the Disability Services National Minimum Data Set to include supports to people with disability that are provided or funded by governments outside the National Disability Insurance Scheme (NDIS).

The data collected should include services provided to NDIS participants, but not provided by the NDIS.

A decision on the data to be collected should be made by June 2018, with the broader data to be included in the 2018-19 Disability Services National Minimum Data Set.

FINDING 13.1

There are benefits from allowing researchers to have access to National Disability Insurance Scheme unit record data. Access could be provided by creating a de-identified longitudinal dataset and by allowing approved researchers access to bespoke and more detailed data sets on a case-by-case basis.

FINDING 13.2

The National Disability Insurance Agency should adopt a risk-based approach to sharing and release of data. A risk-based approach could include:

- open data that are able to be publicly released because they are non-sensitive
- a synthetic dataset that is more disaggregated but also non-sensitive, that is readily provided to researchers
- secure sharing of more sensitive data to researchers in an environment such as SURE
- better sharing of data with other relevant agencies such as the Australian, State and Territory Governments, with secure access and storage procedures put in place.

There are likely to be benefits, particularly in the early years of its operation, from drawing on the capability and expertise of more mature organisations such as the Australian Institute of Health and Welfare and Data61.

RECOMMENDATION 13.3

The National Disability Insurance Agency (NDIA) should engage with stakeholders on how data access will be operationalised. By July 2018, the NDIA should issue a statement outlining the organisation's goals for data sharing and an intended timeline for operationalising data sharing by the NDIA.

1 About this study

The National Disability Insurance Scheme (NDIS) is a new scheme designed to change the way that support and care are provided to people with permanent and significant disability. It is currently being rolled out across Australia and is expected to be fully implemented in all states and territories by mid-2019.

This study is a review of NDIS costs. It looks at the sustainability of scheme costs in light of the benefits and impacts of the scheme on the lives of people with disability, and Australians more generally. The study will help inform the final design of the scheme.

Some background to the study

In 2011, a Productivity Commission inquiry into *Disability Care and Support* found that Australia's system of disability supports was inequitable, underfunded, fragmented, inefficient and gave people with disability little choice and no certainty of access to appropriate supports (PC 2011, p. 5). The Commission recommended that a national disability insurance scheme be established to change the way that support and care are provided to people with significant disability, and to provide insurance cover to all Australians in the event of such a disability. The recommendation was based on the finding that such a scheme would generate substantial community-wide benefits, including improving the lives of people with disability and their families and carers.

The Commission's recommendation was accepted by Australian governments and on 7 December 2012, COAG signed an Intergovernmental Agreement for the launch of the NDIS (COAG 2012b). In the Heads of Agreement between the Australian Government and the State and Territory Governments, it was agreed that the Productivity Commission would review NDIS costs in 2017, to inform the final design of the scheme ahead of its full rollout. The terms of reference for this study were received on 20 January 2017.

1.1 About the NDIS

The NDIS is based on the premise that individuals' support needs are different, and those participating in the scheme should be able to exercise choice and control over the services and support they receive. The objectives of the NDIS (as outlined in the *National Disability Insurance Scheme Act 2013* (Cwlth) (NDIS Act)) include:

- supporting the independence and social and economic participation of people with disability

- providing reasonable and necessary supports, including intervention supports
- enabling people with disability to exercise choice and control in the pursuit of their goals and the planning and delivery of their supports
- facilitating the development of a nationally consistent approach to the access to, and the planning and funding of, supports for people with disability
- promoting the provision of high quality and innovative supports that enable people with disability to maximise independent lifestyles and full inclusion in the community
- raising community awareness of issues that affect people with disability.

The NDIS operates under the NDIS Act, and is administered by the National Disability Insurance Agency (NDIA). Funding for the NDIS is shared by the Australian and State and Territory Governments.

The NDIS provides individualised supports to assist people with permanent and significant disability to participate in economic and social life.[8] This report refers to people who are eligible for individualised supports as 'participants' of the scheme.

For each participant, the NDIS funds 'reasonable and necessary' supports related to their disability. Reasonable and necessary supports are those that help participants live as ordinary a life as possible, including care and support to build skills and capabilities, so that they can engage in education, employment and social and community activities.

Supports are also available to those who meet early intervention criteria. This covers cases where early intervention can significantly improve outcomes and is cost effective. The focus on early intervention reflects the lifetime, insurance-based approach of the scheme.

Individuals eligible for the scheme are assessed, and individual support packages are developed and funded. Access, planning and payments are managed by the NDIA. (In Western Australia, arrangements are different, but intended to be consistent with the NDIS (Porter, Barnett and Faragher 2017).)

The individualised supports provided to participants account for the vast majority of scheme costs and therefore references to 'the scheme' (including in this report) often refer to these supports.

However, the NDIS is broader than just supports for eligible participants. Information, linkages and capacity building (ILC) services are also provided under the NDIS to help all people with disability (not just scheme participants), and their families and carers, with information and referrals to community and mainstream services (including health, education, employment, justice, transport and housing) (NDIA 2016b). ILC will also

[8] Permanent and significant disability is defined in this report as a disability that permanently and substantially reduces a person's functional capacity or psychosocial functioning. This is in line with the eligibility criteria contained in the NDIS Act (s. 24).

facilitate greater social cohesion by promoting awareness and acceptance of disability in the wider community.

More detail on the scheme, including eligibility criteria, planning processes and governance arrangements, is provided throughout this report.

The NDIS is part of a broader system of support

The NDIS is part of a wider disability system. It is one component of the broader *National Disability Strategy 2010–2020*, which was endorsed by COAG in February 2011 and provides a ten-year national policy framework for improving the lives of Australians with disability, their families and carers (COAG 2011; DSS 2016c).

Only a proportion of people with disability will become scheme participants and receive individualised supports. There are approximately 4.3 million people with disability in Australia (figure 1.1). Once fully implemented, the NDIS will provide individual packages to about 475 000[9] people — those people with a permanent and significant disability.

Supports for people with disability (both NDIS participants and non-NDIS participants) are also provided through other Australian and State and Territory Government funded disability services and mainstream services, such as health and education.

1.2 The benefits of the NDIS

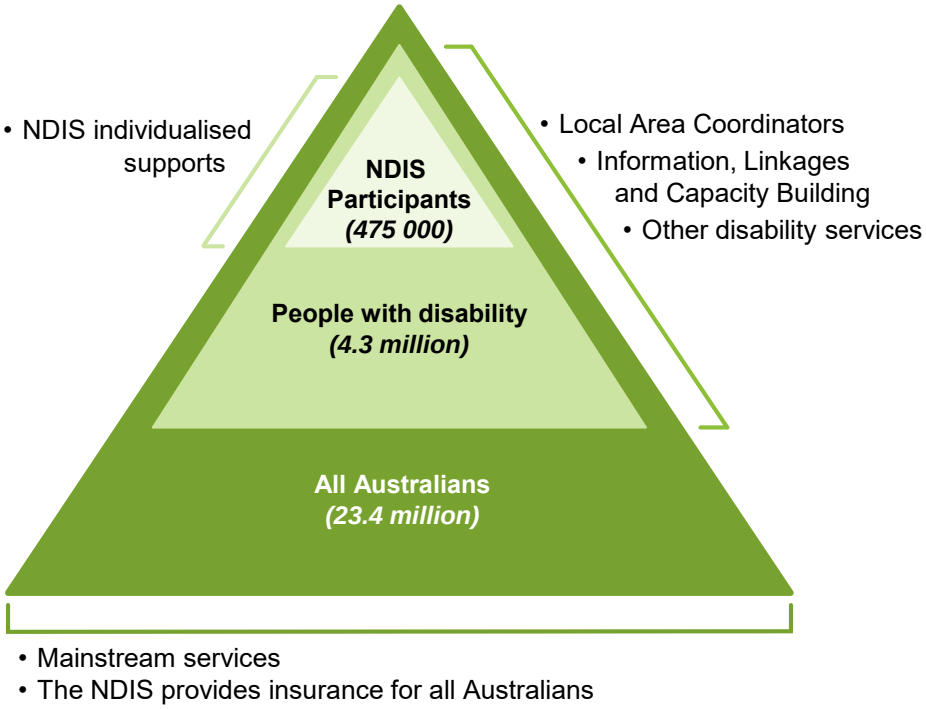
The Commission recommended a national disability insurance scheme in 2011 on the basis of the substantial net benefits it would generate in the long term from:

- improved wellbeing for people with disability and their families and carers through increased care and support, and more choice and control over the supports they receive. This was identified as the area of largest benefit with more, and better targeted, support for participants leading to greater social participation and independence
- efficiency gains in the disability sector — through increased competition and innovation, and better value for money
- savings to other government services — by better supporting people with disability and reducing their reliance on mainstream services
- increased economic participation for people with disability — by overcoming obstacles to employment for those with disability through direct interventions, like school leaver employment programs, and through changes to community attitudes. The Commission estimated that employment of people with disabilities could increase by 100 000 by 2050 (catching up to OECD rates), resulting in $8 billion in additional gross domestic product in that year alone

9 460 000 participants under the age of 65 years and 15 000 aged 65 years and over (chapter 2).

- increased economic participation for informal carers — the Commission estimated that an additional 7500 carers could re-enter the workforce (PC 2011).

Figure 1.1 **The NDIS is part of a broader system of supports[a]**



[a] Number of Australians and those with disability are based on 2015 data. NDIS participants are the projected number of people eligible in 2020.

A new approach to disability care and support

The scheme is designed to change the way that participants and disability support providers interact, and the way that supports are funded. Two of the key changes from previous approaches include a more market-based, person-centred approach to care and support, and a scheme based on insurance principles.

A more market-based approach aims to create incentives that better provide participants with the quantity, quality and variety of services they desire in an efficient way. It is expected to overcome many of the previous system's shortcomings (table 1.1), including by providing participants more choice and control over their supports and services, and encouraging innovation by service providers through increased competition. The market will, nevertheless, continue to have significant government oversight, as in other administered markets such as health and education.

Table 1.1 **Intended effects of the NDIS on the disability services system**

Features of pre-NDIS disability services system	*Features of a more market-based system*
• Largely 'block-funded', with funding provided in advance of service delivery and little freedom to innovate.[a]	• Predominantly fee-for-service paid on invoice. In principle, prices for services are set by the competitive market, and there is innovation by service providers attracting and retaining consumers.
• Services often limited and priorities for families in immediate crisis, rather than for early intervention. Consumers have little control over the services they receive and limited choice of provider.	• Funding to meet the reasonable and necessary support needs for each NDIS participant. Consumers have choice and control regarding the services received and providers used.
• The primary relationship is between the service provider and the funder, with consumers often described as 'passive' recipients of services.	• The primary relationship is between the consumer and service provider. Intermediaries and access to information about provider quality, performance and pricing help consumers exercise choice.
• Providers are subject to various statutory provisions (at all levels of government) regarding quality. The system is complex, difficult to navigate and not well integrated nationally.	• Compliance with a national quality framework. A nationally consistent and navigable system.
• High transaction costs for both consumers and providers.	• Lower transaction costs for consumers and service providers. There is adequate depth and resilience in the market to underpin financial sustainability.

[a] Block funding refers to the process where governments purchase a 'block' of services from a provider, which is to be delivered to clients who meet certain criteria, or are referred to those providers as part of an individualised plan.

Sources: Adapted from ANAO (2016, p. 20), which is based on analysis by PC (2011); DRC (2015a); and NDIA presentations on the market transition.

As an insurance-based scheme, the NDIS takes a lifetime approach to a participant's support needs and life goals (box 1.1). It is intended to provide assurance to both those with permanent and significant disability, and those who may acquire such disability in the future, that they will receive the support they require. In other words, there is essentially no cap on funding — anyone who meets the eligibility criteria is guaranteed to receive funding for supports and services. The scheme also focuses on early intervention investment in people with disability so that their outcomes can be improved later in life, and costs minimised over the long term, even if that involves more spending upfront. The insurance-based approach also allows for ongoing monitoring and refinement of the scheme.

This contrasts with the previous system which operated on an annual capped amount and did not tailor supports to individuals, leading to short-term planning, limited choice, higher long-term support needs, unmet demand and adverse outcomes for some (PC 2011).

Box 1.1 **The NDIS is an insurance-based scheme**

The insurance approach of the NDIS takes a long-term view of the total cost of disability in order to improve participant outcomes and meet the future costs of the scheme. Key elements of the approach include:

- universal coverage by pooling risk across all Australians and taking the risk of disability support costs away from individuals
- creating an innovative and competitive market for disability support, through which participants can exercise choice and control over the planning and delivery of their supports
- a long-term view of the total future social cost of disability for all people who are insured and yet to be insured
- the NDIA — in its role as the social insurance manager — managing the total cost of disability over a participant's lifetime and incentivising short-term investment in participants to reduce long-term costs.

The NDIA identifies four principles for the way that the insurance approach is operationalised.

1. Actuarial estimates of long-term costs — updated to reflect the experience of the scheme, and used to help ensure the scheme is financially sustainable and that the scheme is continuously improved.
2. A long-term view of funding requirements — takes a lifetime view of participant needs and seeks early investment and intervention for people in order to maximise their independence and social and economic participation, and reduce their support requirements in the long term.
3. Investment in research and innovation — to encourage and build the capacity and capability for innovation, outcome analysis and evidence-based decisions on early intervention.
4. Investment in community participation and building social capital — to make the community accessible and inclusive for people with disability, and provide participants and non-participants with necessary supports outside the NDIS, through mainstream services, ILC initiatives and education programs.

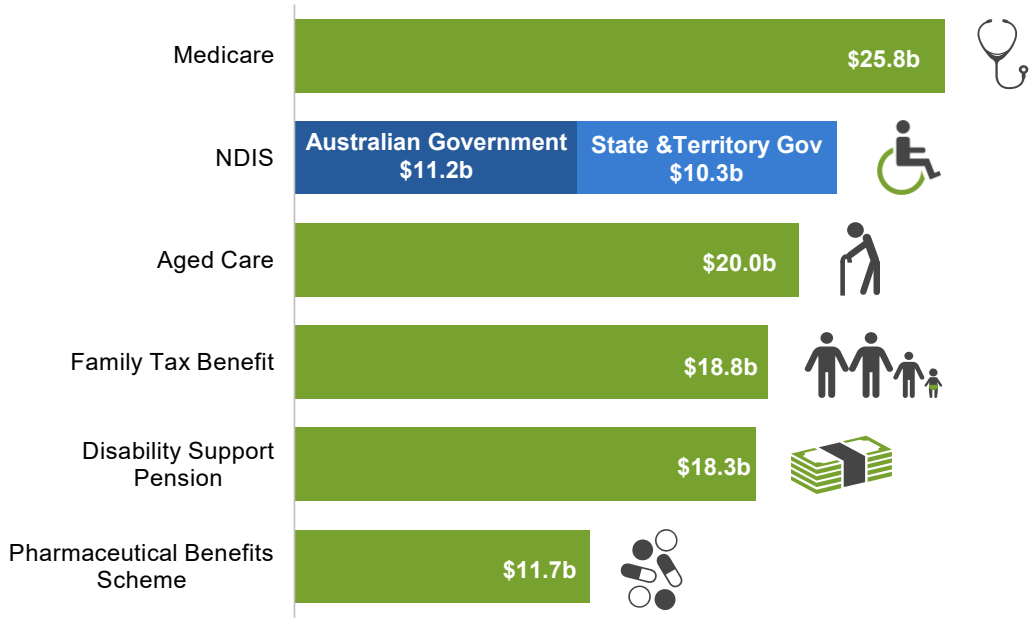
1.3 The NDIS is a major reform

The NDIS is a major reform. As the NDIA (2016i, p. 7) said, the scheme is 'on a scale not previously contemplated in Australia and is designed to address un-met need'. The NDIS will be the largest social reform since the introduction of Medicare. At a currently estimated annual cost of about $22 billion when fully implemented, government expenditure on the NDIS will exceed that on aged care and will be almost double that spent on the Pharmaceutical Benefits Scheme (figure 1.2).

At full rollout, the NDIS is expected to cover 475 000 people with disability. This is almost 200 000 more people than were covered under the previous system (NDIA 2016i, p. 8). To meet this increased demand, the disability workforce will need to more than double (chapter 9).

Figure 1.2 **Projected NDIS expenditure compared with other Australian Government programs, 2019–20[a]**



[a] The NDIS amount is based on Department of Social Services modelling and is sourced from the 2016-17 Australian Government budget (the 2017-18 budget estimate excludes the cost of the Western Australian scheme).

Source: Australian Treasury (2016, 2017c, 2017d).

Introducing a scheme of this scale and nature is a challenging task and it is inevitable that it will take many years before the scheme is fully established and operating smoothly. The enormity and significance of the task was acknowledged by many study participants. For example, the ACT Disability, Aged Carer and Advocacy Service said:

> The NDIS is monumental reform for Australia: a grand scheme (akin to the introduction of Medicare) that has the potential to make vast differences in the life experiences of an array of people with disability, their families and carers both now and in decades to come. (sub. 87, p. 1)

Richard Madden, from the Centre for Disability Research and Policy at University of Sydney, said:

> The NDIS has been introduced quickly, and involves a large increase in public expenditure, and inevitably some uncertainty as long standing support arrangements change. The change effort has been huge for all involved. Inevitably, there have been issues to be addressed, and some delay in ambitious timetables. These issues, while important, must not detract from the achievements made and the opportunities that exist. (sub. 101, p. 3)

And the National Mental Health Commission said:

> … the NDIA has been given an extremely difficult task. Implementing a reform of the scale and nature of the NDIS was always going to be challenging; implementing it with a curtailed timetable, reduced resourcing and under shared accountability arrangements where different governments have different expectations. (sub. PP319, p. 5)

There is overwhelming support for the scheme

While many stakeholders commented on the scale and complexity of the reform, there is an extraordinary level of commitment to the success and sustainability of the NDIS (and to preserving the core principles of the scheme as set out by the Commission). This commitment is shared by governments, people with disability and their families and carers, providers of disability services and disability advocates (box 1.2). For example, Mental Health of Young People with Developmental Disabilities said:

> The NDIS is a ground-breaking social reform that is to be commended and supported. … Designing the NDIS as an insurance scheme with benefits paid to individuals is an empowering move. For too long people with disabilities have not been able to exercise control over their lives as able-bodied and minded Australians do. 'Choice and control' is the right of every person with disabilities and that of their primary carers. (sub. PP269, p. 2)

It is also acknowledged that 'making the scheme work' is not just the responsibility of the NDIA, but also of governments, providers and participants (and their families and carers). As the Australian Disability Discrimination Commissioner said:

> Yes — the NDIS is big, it is complex, and it changes everything, but it is the change that we need. And when we think about what life might be like for people with disability without the NDIS, I think it becomes clear that it is the change we cannot afford to prevent. … ensuring the sustainability and success of the NDIS is not only the responsibility of the NDIA or its board — it is the responsibility of all governments, service providers, participants, their families and carers. If we want real and lasting change for people with disability, we cannot absolve ourselves of our responsibility to make the NDIS work. (McEwin 2017)

Box 1.2 There is overwhelming support for the NDIS

Australian Federation of Disability Organisations:

> We want to begin … by emphasising our unwavering support for the NDIS. AFDO and its members regularly hear from people with disability and their families about the difference the NDIS is making to their lives. People who now have the dignity of appropriate and timely support, the opportunity to be more involved in their communities, the chance to move out of home, the economic freedom of a new job. These are the kinds of differences the NDIS is making. (sub. 180, p. 6)

Anglicare Australia:

> Anglicare Australia strongly believes that the establishment of the NDIS is a major achievement. Our member agencies are already witnessing the transformative power of the scheme for participants, and finding that reconfiguring services to reflect their needs and aspirations is creating opportunities to reimagine and create better outcomes in people's lives. (sub. 157, p. 4)

Women with Disabilities Victoria:

> WDV is a strong supporter of the NDIS. We agree with its fundamental principles, including a human rights approach, choice and control for participants and a clear focus on outcomes for individuals. (sub. PP282, p. 3)

JFA Purple Orange:

> … the NDIS is a major, once-in-many-generations opportunity to invest in the life chances of people living with disability, to achieve a fair go, so that people living with disability take their rightful place as valued active members of Australian community life and the economy. (sub. 186, p. 4)

National Disability Services:

> The principles on which the NDIS is founded remain compelling and inspiring. Doubling the funding for disability support to rectify the chronic under-supply of services, choice and control for people with disability and their families, an insurance approach that focuses on early intervention and building the capacity of individuals and families and increased equity across Australia. (2016, p. 3)

Occupational Therapists Australia:

> OTA is a strong supporter of the NDIS and the scheme's focus on providing individualised support for participants with informed choice and control over their plans. Occupational therapists worked across all NDIS launch sites and contributed to the design and implementation of the scheme during its trial period. They are continuing to support participants as the scheme transitions to full rollout. (sub. PP285, p. 2)

Scope Australia:

> Scope is fully committed to the implementation of the National Disability Insurance Scheme. The Scheme creates a paradigm shift in social policy and recognises the rights of all Australians to live an ordinary life. It has enhanced the lives of more than 60,000 participants and their families and for the first time fully recognises the rights of people with a disability to live their lives as empowered and equal citizens. (sub. 72, p. 29)

Northern Territory Government:

> The NT Government is a strong supporter and advocate of the NDIS which will support Territorians with disability achieve life goals through choice and control. (sub. PP359, p. 9)

New South Wales Government:

> The NSW Government is a strong advocate of the National Disability Insurance Scheme (NDIS). The improvement in the lives of people with disability, as outlined by the Productivity Commission (PC) in its 2011 inquiry report into Disability Care and Support, is a goal embraced by NSW. (sub. 60, p. 2)

Transitional issues can become entrenched problems

It is no surprise, given the size, speed and complexity of the reform, that there are transitional issues with the rollout of the NDIS. All major reforms are followed by a (sometimes protracted) period of disruption and adjustment. Flourish Australia, while strongly supporting the NDIS, said it:

> … as with any reform of such a substantial scale, there can be unintended consequences, implementation issues and uncertainty, especially during the transition phase. We are particularly mindful of the impact of this on the people we support. (sub. 74, p. 1)

Most transitional issues are expected to be ironed out as the scheme rollout is completed and the scheme matures. And the NDIA said that resources are being devoted to addressing implementation issues:

> The NDIS is still in its infancy and delivering the Scheme will evolve and improve over time. The NDIA is intent on learning from experience and improving systems, processes and practices as quickly as possible to ensure the success of the Scheme. (sub. 161, p. 16)
>
> Work to improve the participant and provider pathways … is well underway and, in close consultation with stakeholders, is focusing on reforms that will make processes more responsive and flexible to participant and provider needs, and more focused on outcomes across participant lifetimes. (sub. PP327, p. 10)

However, if transitional issues are not dealt with quickly and effectively, they can become entrenched problems that endure in the longer term and affect the success and sustainability of the scheme. As Blind Citizens Australia said:

> Blind Citizens Australia recognises the NDIS represents the single largest reform Australia has seen since the introduction of Medicare. As such, it is understandable that there are still a number of operational and interfacing difficulties that remain outstanding. The challenge is in ensuring these matters are promptly responded to and resolved. (sub. PP351, p. 14)

1.4 The Commission's approach to the study

This study is a review of NDIS costs. The Commission was asked to look at:

- the sustainability of scheme costs, including current and future cost pressures, and how to manage any potential cost overruns
- whether jurisdictions have the capacity to deliver disability care and support services as the scheme expands
- how the NDIS impacts on, and interacts with, mainstream services
- whether efficiencies have been achieved within the scheme
- whether there are any issues with scheme design, including the application of market and insurance principles, in ensuring the best possible outcomes for people with permanent and significant disability

- funding and governance arrangements, including financial contributions, risk-sharing, and the 'escalation parameters', which define the annual increase in funding required by different jurisdictions.

Costs are one side of the equation — benefits are just as important

A number of stakeholders expressed concern that the Commission would focus on costs and not take into account the intent of the scheme and the potential impact that it could have on the lives of people with disability (box 1.3). As the Australian Federation of Disability Organisations said:

> A focus on costs should not be at the expense of a focus on outcomes for the very people the scheme is intended to support. Any decisions made in the interests of ensuring sustainability should also be consistent with improving outcomes for people with disability. (sub. 180, p. 6)

Box 1.3 Stakeholders said the focus should not be solely on costs

Anglicare Australia:

> … measures of the financial sustainability of the NDIS should not be narrowly held and applied solely within the scheme itself. Although such measures are of course essential, questions regarding the overall worth of the scheme that capture the cost and benefit to Australian society should be included … (sub. 157, p. 21)

Community Mental Health Australia:

> … [CMHA] believes that the Commission in assessing whether or not the NDIS is financially sustainable must investigate how the scheme is being implemented and how this is being managed. (sub. 11, p. 2)

Australian Blindness Forum:

> The financial sustainability of the NDIS should be defined and measured by the standard that all people with disability can access and participate in the community. (sub. 48, p. 17)

New South Wales Government:

> Any review of costs and sustainability isn't necessarily about minimising short term costs. Costs must be considered in relation to the objectives of the NDIS (reasonable and necessary support; choice and control; increased social and economic participation). (sub. 60, p. 9)

Victorian Government:

> The PC rightly highlights the cost risks for the NDIS, as financial sustainability is one of the central tenets of the scheme and crucial for it to operate as intended. However, Victoria considers that the risks of the scheme should be conceived more broadly and over a longer time horizon; successful implementation of the scheme must consider participant outcomes, use an insurance based approach and give greater consideration to market development. (sub. PP298, p. 5)

SDN Children's Services:

> SDN believes that a drive for financial sustainability must not be disconnected from a drive for quality, effective practices. (sub. 73, p. 2)

Autism Aspergers Advocacy Australia:

> Maybe 'sustainability' is the wrong notion. It is more about benefit versus cost, and people having a reasonable standard of living in our community. (sub. 178, p. 36)

While the focus of this study is on scheme costs, costs cannot be considered in isolation of the benefits. The Commission's approach (consistent with the *Productivity Commission Act 1998* (Cwlth)) is to examine costs in light of the benefits and impacts of the scheme on the lives of people with disability, and Australians more generally, using a wellbeing framework (figure 1.5). This is consistent with the insurance approach of the NDIS, which is about 'maximising outcomes for participants and their families/carers at the lowest possible sustainable cost' (NDIA, sub. 161, p. 26). It is also consistent with the objectives of the NDIS (choice and control, independence, social and economic participation, reasonable and necessary support), which are seen by the Commission as integral to the analysis of scheme costs.

What are the factors driving scheme costs?

Assessing the sustainability of scheme costs, including current and future cost pressures, involves examining the factors that drive scheme costs. Key factors include:

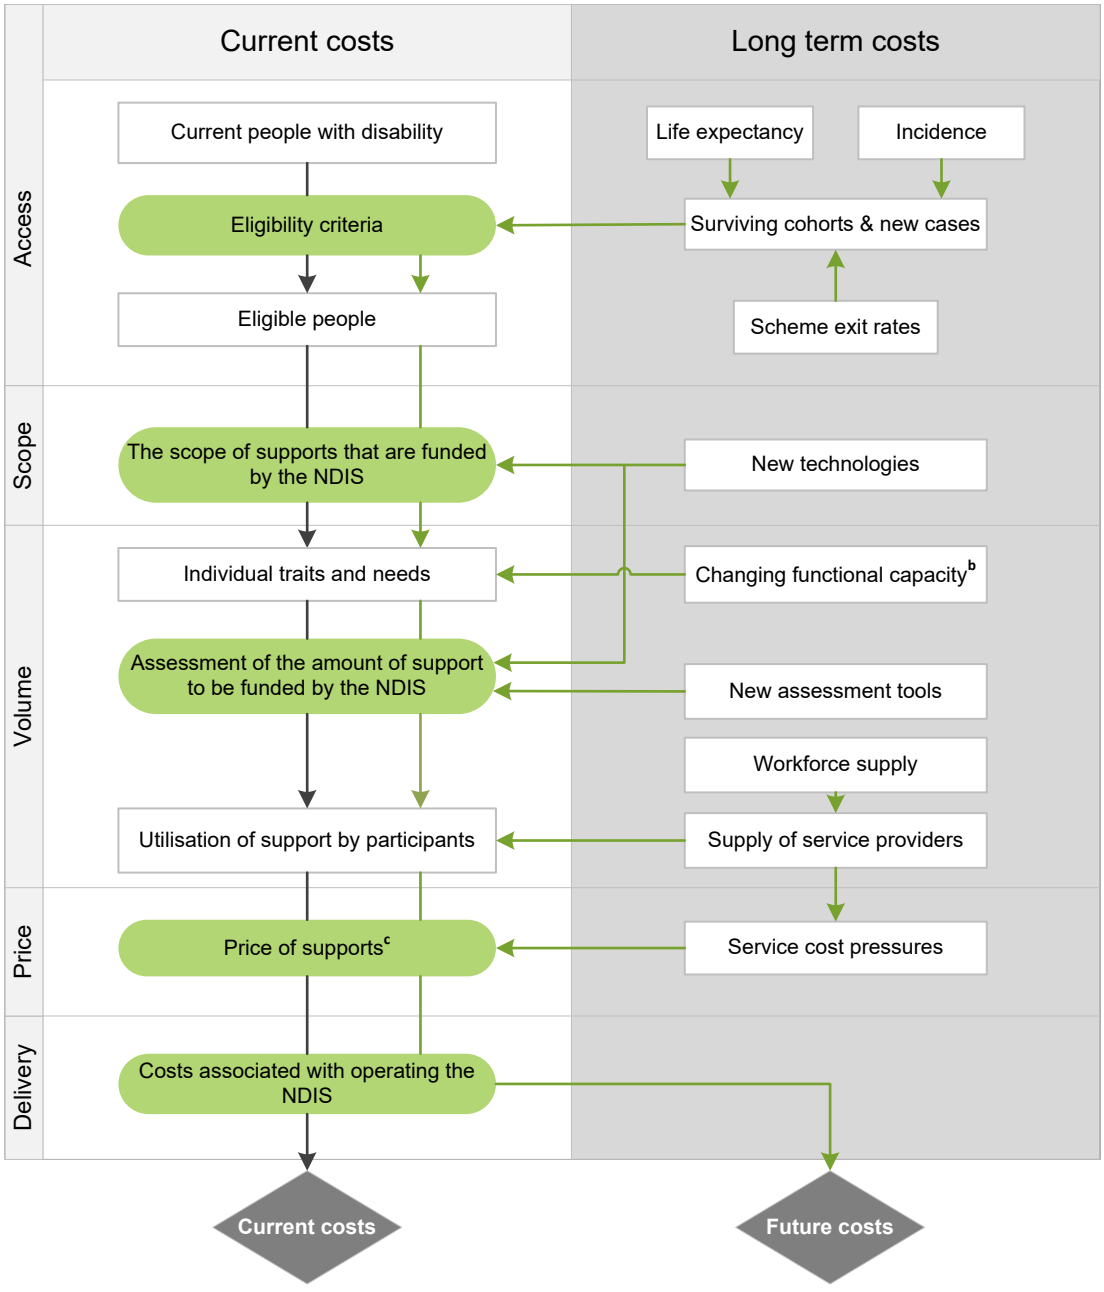
- access — the number and profile (age, sex, disability type, disability severity) of participants in the scheme
- scope — the scope of supports provided to participants in the scheme
- volume — the quantity of supports in a participant's plan and the proportion of supports in a plan that are utilised by a participant
- price — the price paid for supports under the scheme
- delivery — the costs associated with operating the scheme (figure 1.3).

Scheme culture will also be an important driver of costs. Moving away from the welfare culture of current disability systems to one of seeking reasonable and necessary supports and managing down the total cost of disability over a participant's lifetime (in line with an insurance approach) will be critical for the financial sustainability of the scheme. As noted by Bruce Bonyhady, the former Chair of the NDIA Board:

> Importantly, the NDIS cannot be allowed to be turned into a Centrelink-type entitlement model, because under this approach costs would continually escalate. (sub. 100, p. 2)

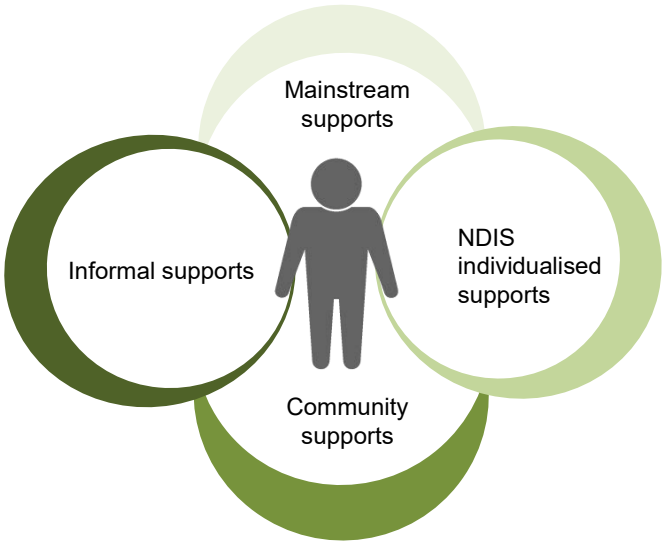
Other support systems can also affect scheme costs. The NDIS, as a person-centred approach to providing disability supports, relies on supports and services outside of the NDIS (including informal, community and mainstream supports) to be in place to help people with disability to live ordinary lives (figure 1.4). If these supports are not available, people with disability could seek NDIS funding to fill the gap, and this could pose risks to scheme costs.

Figure 1.3 **What drives scheme costs?[a]**



[a] Green cells denote cost drivers that the NDIA and/or governments have *direct* control over. Grey cells are cost drivers that can only be *indirectly* influenced by the NDIA and governments. [b] This includes changes in participants' functional capacity attributable to early intervention. [c] Price caps of disability supports are currently set by the NDIA.

Figure 1.4 **A person-centred approach relies on supports beyond the NDIS**



Source: Adapted from NDIA (sub. 161, p. 22).

Sustainability — interpreted as financial sustainability

The Commission interprets scheme sustainability to mean 'financial sustainability'. This is in line with the NDIS Act. Under the Act, the NDIA manages, advises and reports on the financial sustainability of the NDIS. While financial sustainability is not defined or listed as one of the explicit objectives of the Act, the Act (s. 3) does state that 'regard is to be had to … the need to ensure the financial sustainability of the National Disability Insurance Scheme'.

The insurance approach to the scheme and financial sustainability are inextricably linked. For a commercial insurer, financial sustainability is about balance sheet adequacy — there needs to be enough capital to meet some proportion of future expected liabilities by way of cash claims (as set out in prudential standards by the Australian Prudential Regulation Authority) (NDIA 2016h).

However, the financial risks inherent in the NDIS are unique. The NDIS is currently funded on a cash-flow basis — annual contributions meet the cash claims expense — so a balance sheet approach to financial sustainability is not applicable (though there are good reasons for moving closer to funding arrangements that better reflect insurance principles — chapter 12). And because there is no annual capped amount (as there was in previous disability support systems), the financial risk associated with satisfying all valid claims for reasonable and necessary support needs to be managed. As the NDIA explained:

> … unlike traditional disability systems, it is not open to the NDIA to refuse to fund reasonable and necessary supports for a participant who has been found to be eligible on the basis that the

> 'budget has been exhausted'. The NDIS, therefore, faces significant financial risks in the same way that an insurer does and these risks must be managed. Indeed, the NDIS Act explicitly requires the Agency to manage the financial risk that goes with a regime under which any valid claim has to be satisfied. However, the NDIS is still concerned with people rather than claims, and outcomes as well as financial result. (2016h, p. 6)

In light of this, the NDIA defines financial sustainability for the NDIS as:

- the scheme is successful on the balance of objective measures and projections of economic [and] social participation and independence, and on participants' views that they are getting enough money to buy enough high-quality goods and services to allow them reasonable access to life opportunities — that is, reasonable and necessary support; and
- contributors think that the cost is and will continue to be affordable, under control, represents value for money and, therefore, remain willing to contribute. (2016h, p. 18)

Based on the NDIA's definition, achieving financial sustainability requires continuous monitoring of both participants' outcomes and costs. It is not about minimising costs or maximising benefits, but rather balancing the two in a way that ensures there is a net benefit over time. As the NDIA put it:

> … while cost efficiency will be of prime importance to an insurer it will not be the sole focus of the NDIS. Rather, good participant outcomes will be an ongoing objective and, so, finding the right balance between participant outcomes and cost will be critical. (2016h, p. 12)

And as pointed out by the New South Wales Government, financial sustainability must be considered against a long-term (not a short-term) view of costs:

> The lifetime costs for supporting participants must be considered and an investment approach taken. Early intervention principles are appropriate (including beyond just early childhood), and may increase costs in the short term before delivering lower lifetime costs. The alternative is immediate cost reductions that deliver worse social or economic outcomes for participants or the need for acute responses later in life: this is not an improvement to financial sustainability.
>
> … Financial sustainability must be considered with reference to a suite of indicators, with a long-term view, and with consideration of broader impacts elsewhere. (sub. 60, pp. 9–10)

The Department of Social Services supported the NDIA's definition of financial sustainability, and said that:

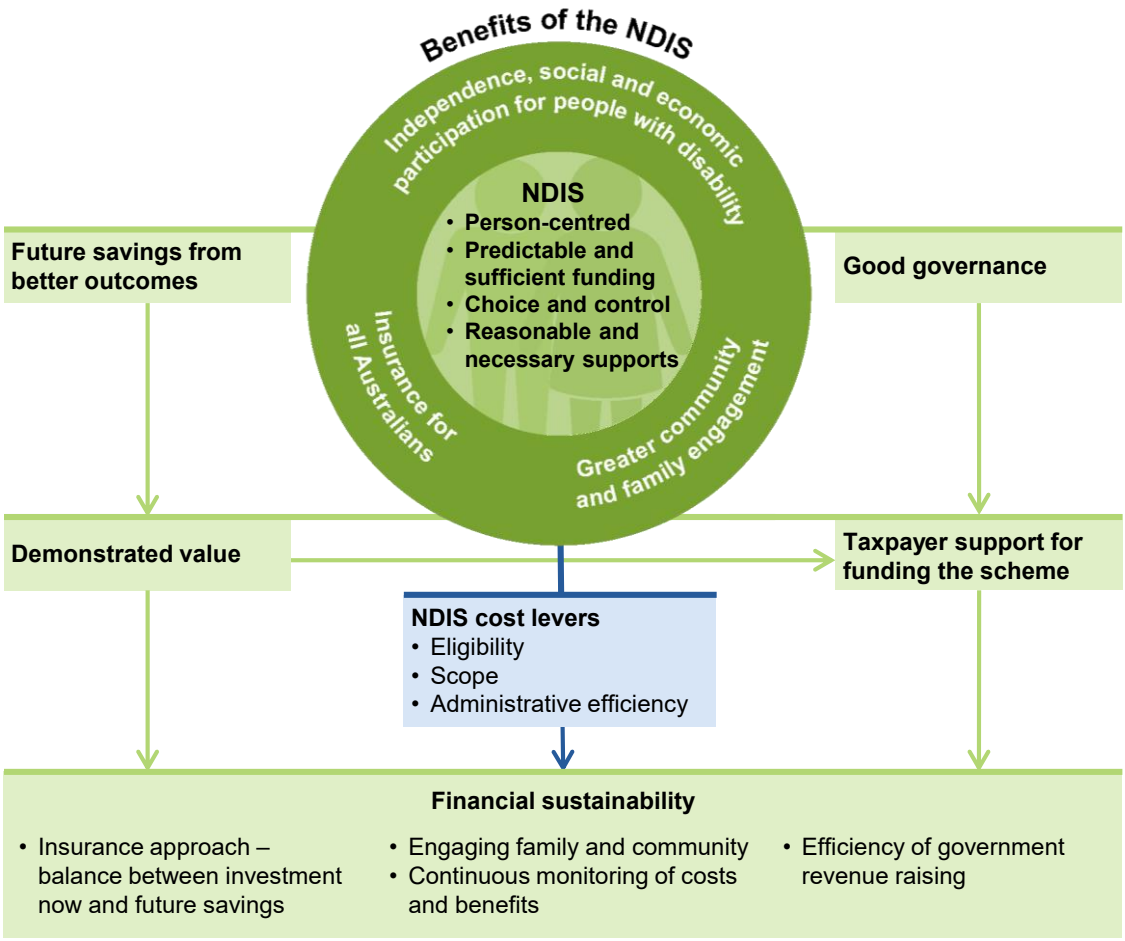
> Considerations of NDIS sustainability need to weigh the success of the Scheme in improving economic and social outcomes and the value-for-money proposition for contributors. (sub. 146, p. 17)

As outlined above, financial sustainability is a difficult concept to define in a unique scheme like the NDIS, but the Commission supports the definition used by the NDIA. The definition provides a clear link between scheme costs, benefits and support from taxpayers.

A wellbeing framework for considering costs and benefits

The Commission examined scheme costs and the financial sustainability of the scheme in light of the benefits to people with disability and Australians more generally using a wellbeing framework (figure 1.5).

Figure 1.5 **Wellbeing framework for considering costs and benefits**



The NDIS aims to improve not only the lives of current scheme participants, but also of future participants. This will only be the case if the scheme is financially sustainable. Financial sustainability is also essential if scheme participants are to consistently receive reasonable and necessary care while they remain in the scheme. Cost overruns could jeopardise the level of care and support participants receive, or result in a return to some of the less desirable features of the previous system (including, for example, an inequitable rationing of support services).

While the NDIS is sometimes described as an 'uncapped scheme', the ultimate cap — and test of financial sustainability — is taxpayers' continuing willingness to pay for it. Unlike

other insurance schemes that rely on premiums to fund costs, the NDIS will only be funded as long as taxpayers consider it is a good use of taxes. Taxpayers' willingness to fund the NDIS will depend on their perception of value for money in terms of:

- people with disability experiencing better lives as a result of the scheme
- the scheme making it easier for families and carers to play a supporting role
- the way the scheme invests in people with disability
- the confidence taxpayers have that the NDIS will be available to cover their care needs (or those of their loved ones) should a disability be acquired in the future
- the supports that are funded (and the evidence base to support what is funded)
- efficiency gains and cost savings in the disability support system and other government services.

Cost overruns could lead to pressure to reduce the scope and certainty of care and supports provided under the NDIS, or require governments to provide more funding at the expense of other programs.

The NDIA's actuarial estimates of long-term costs (which reflect the experience of the scheme and management responses to cost pressures) play an important role in demonstrating to the Australian community that the scheme represents value for money.

Perceptions about the effectiveness of governance arrangements for the NDIS are also important. For example, the community expects planning processes to be in line with the objectives of the scheme and services to meet quality standards. Governments also need to demonstrate that the funds for the NDIS are dollars well spent from a limited tax revenue bucket, and that funding the scheme is not to the detriment of other important expenditures.

Assessing the financial sustainability of the NDIS also involves looking at interrelated systems. This includes, but is not limited to, the efficiency and effectiveness of the NDIA, the readiness of participants, the readiness of providers, and the integration of the NDIS with mainstream services. Only a system that is integrated and holistic in its focus will bring the benefits to people with disability that the scheme is expected to deliver.

It is still early days

While significant benefits are expected to result from the new system of disability care and support, the Commission is aware that, like any major reform, it will be many years before the full extent of the benefits are realised or reflected in objective measures.

Even once the scheme is fully implemented, the transition to a mature market will be gradual, and participants, carers and providers will need time to adjust to the new system. According to an Australian National Audit Office report (ANAO 2016, p. 19), the disability services

market under the NDIS is expected to take up to ten years to develop, and perhaps longer in some market segments. The NDIA, in its Market Approach Statement 2016–2019, said that:

> Developing a strong, contestable marketplace for disability supports is a long term project. All stakeholders in the marketplace will require time to build capability, confidence and systems to support the market mechanisms. Participants, possessing greater consumer power, are learning to make choices and explore different service options. Providers are building an understanding of their customer base and preferences, positioning service offers and transforming their operations. (2016k, p. 12)

And, because the scheme is not yet fully rolled out and there are some transitional issues, the experience to date may not be reflective of the underlying long-term outlook. (Chapter 2 discusses in more detail the limitations of the trial and transition data.)

1.5 A guide to this report

This report outlines the Commission's findings and recommendations on NDIS costs. In conducting this study, the Commission drew on a range of evidence. It consulted widely, including with NDIS participants, advocacy groups, peak bodies, service providers, disability care and support workers and academics. It also met with Australian and State and Territory Government departments and agencies, including extensive liaison with the NDIA and the Department of Social Services. There have also been a number of other reviews of various aspects of the NDIS since the trial began and the Commission drew on these where relevant.

The Commission released an issues paper for this study on 22 February 2017 and a position paper on 14 June 2017. The Commission used the information and evidence provided in the 372 submissions and 185 brief submissions it received in response to these papers (a full list of submissions and consultations is provided in appendix A). The Commission wishes to thank study participants for their input.

Structure of this report

The next two chapters look at how the scheme is performing. Chapter 2 examines how scheme costs are tracking and chapter 3 looks at the evidence, to date, on scheme benefits.

Chapters 4 and 5 discuss two of the key cost drivers for the scheme — eligibility (which determines the number of participants in the scheme), and what supports scheme participants receive (as determined by the rules relating to support coverage and the planning process). Chapter 6 looks at how the NDIS interfaces with non-NDIS disability services and mainstream services and the ways in which this impacts on the financial sustainability of the scheme.

Chapters 7 to 9 look at the supply side of the equation. Chapter 7 assesses whether providers will be able to meet demand for disability services; chapter 8 examines price caps for the NDIS; and chapter 9 considers workforce issues. Chapter 10 looks at whether participants can successfully engage with the scheme.

The last three chapters of the report cover governance arrangements (chapter 11), funding (chapter 12) and data and evidence (chapter 13).

2 How is the scheme tracking?

Key points

- Tracking scheme costs and participant outcomes (and making adjustments in response to scheme experience) is critical to ensuring that the National Disability Insurance Scheme (NDIS) achieves its objectives and is financially sustainable.
- The speed of the launch and the scope of the trial phase meant that some aspects of the NDIS were being developed during trial, including assessment tools and ICT systems.
- To reach the estimated 475 000 participants at full scheme, the National Disability Insurance Agency (NDIA) will need to approve hundreds of plans a day — in 2018-19, about 500 plans will need to be approved and hundreds more reviewed, each day.
  - The intake of participants is already falling behind the expected pace, indicating that the bilateral estimates are unlikely to be met.
- It is inevitable that there will be transitional issues with the rollout of the NDIS given the size, speed and complexity of the reform, but already there are signs that a focus on meeting the bilateral estimates risks the NDIA not being able to implement the NDIS as intended.
  - The focus on getting participants into the scheme has come at the expense of the quality of plans. Some key planning supports for participants are not in place and this has affected participant readiness.
- The NDIA's projection of full scheme costs ($22 billion) is broadly consistent with the Commission's 2011 modelling.
- While the transition experience should inform estimates of full scheme costs, the NDIA considers that, at this early stage, the data have too many limitations to update assumptions on prevalence rates and package costs.
  - In the absence of any new major data reliability issues, there should be sufficient data for the NDIA to update the estimates of scheme costs on the basis of scheme experience for the 2017-18 Annual Financial Sustainability Report.
  - The Commission did not revise its own projections of scheme costs. This is because it broadly agrees with the NDIA's approach to projecting scheme costs and the decision to delay integrating data from the trial and transition.
- Based on trial and transition data, NDIS costs are broadly on track with the NDIA's long-term modelling. While there are more children entering the scheme than expected, this is more than offset by lower levels of utilisation than expected. But while lower than expected levels of utilisation means lower scheme costs, it also implies poorer outcomes for participants.
  - In the first three quarters of 2016-17, the scheme experienced higher than expected package costs, but this improved in the last quarter.
- The NDIA has put in place initiatives to address emerging cost pressures, including the Early Childhood Early Intervention approach and the use of reference package data in the planning process to reduce variability in the level of support provided to participants.

Tracking scheme costs and participant outcomes is critical to ensuring that the National Disability Insurance Scheme (NDIS) achieves its stated objectives and is financially sustainable over the longer term. In 2011, when the Commission estimated full scheme costs for a national disability insurance scheme, it said that insights from the early experience of the scheme should be used to provide a more precise estimate of the long-term scheme costs, given the uncertainties at the time around the costings of the scheme (PC 2011, p. 932).

The National Disability Insurance Agency (NDIA) estimates that at full scheme about 475 000 participants will have individualised supports and the scheme will cost $22 billion in the first year of full operation (NDIA 2016a, p. 18, 2017y, p. 6). The number of participants is higher than what is reported in the NDIA's publications because the NDIA only reports the number of scheme participants under the age of 65 years.[10]

These estimates are consistent with the Commission's 2011 estimates of scheme costs (discussed further below). For this study, the Commission did not update its estimate of long-term scheme costs, however, it did review the NDIA's updates and improvements to the Commission's 2011 estimates. At this stage there are too many limitations with the early scheme data to update the modelling assumptions (though early scheme data can be used to assess where cost pressures may be emerging).

The first section (section 2.1) of this chapter looks at the NDIS rollout schedule. Section 2.2 looks at the assumptions that drive the NDIA's long-term estimates of scheme costs. Section 2.3 provides an overview of scheme participants and costs to date, and looks at how they compare with the NDIA's assumptions.

2.1 The rollout of the scheme so far

The NDIS was trialled from 2013 in different jurisdictions across Australia. Trials commenced in New South Wales, Victoria, South Australia and Tasmania in July 2013 (table 2.1). The trial sites varied in size and scope. For example, the trial sites in:

- South Australia and Tasmania covered the whole jurisdiction but were restricted to certain age groups (children aged 0–14 years for South Australia and 15–24 years in Tasmania)
- Victoria and New South Wales were limited geographically (the Barwon and Hunter regions) but had no age restrictions (apart from the NDIS-wide restriction that participants must be aged under 65 years to enter the scheme).

The transition to full scheme began in all States and Territories in July 2016, with the exception of Western Australia (which began transitioning to a locally administered, but nationally consistent NDIS in July 2017). The Bilateral Agreements between the Australian and State and Territory Governments set out the timeframes for the transition in each

[10] The NDIA projects that in 2019-20, the NDIS will include 460 000 participants under the age of 65 years and 15 000 participants aged 65 years and over. The NDIA reports 460 000 participants in its publications.

jurisdiction, including quarterly estimates of the number of participants who will enter the scheme. Jurisdiction-specific Heads of Agreements signed by the Australian and the State and Territory Governments outline that the full scheme is scheduled to be rolled out nationally by 2019-20, with the timeframes for the transition to differ across jurisdictions (NDIA ndb) (table 2.1).[11]

Table 2.1 **NDIS transition arrangements by jurisdiction**

	Trial period			Transition to full scheme			Full scheme
	2013-14	2014-15	2015-16	2016-17	2017-18	2018-19	2019-20
NSW	Hunter area trial		Early transition in Nepean Blue Mountains area (children aged 0–17 years)	Transition to full scheme (by region)		Full scheme	
Vic	Barwon area trial			Transition to full scheme (by region)			Full scheme
Qld				Transition to full scheme from July 2016 (by region). Early transition from January 2016 in Townsville, Charters Towers and Palm Island			Full scheme
SA	Statewide trial (children aged 0–14 years)			Transition to full scheme (by age and region)		Full scheme	
Tas	Statewide trial (people aged 15–24 years)			Transition to full scheme (by age)			Full scheme
NT		Barkly region trial		Transition to full scheme (by region)			Full scheme
ACT[a]		Territorywide trial		Full scheme			
WA[b]		Perth Hills area trial MyWay trial		Transition to locally administered NDIS			

[a] The Bilateral Agreement for the NDIS launch between the Australian Government and the ACT Government notes that from 2016-17, the ACT will be in 'transition to full scheme'. This transition has been categorised as 'full scheme' because all residents who meet the eligibility criteria will have access to the scheme. [b] In February 2017, the Australian Government and Western Australian Government signed a Bilateral Agreement for a nationally consistent, but locally administered, NDIS.

Sources: Adapted from ANAO (2016, p. 79); NDIA (ndb); Porter, Barnett and Faragher (2017).

The speed of participant intake is creating problems

In 2011, the Commission recommended that the NDIS commence in July 2014 in two geographic regions (PC 2011, p. 938).[12] With the benefit of hindsight, the schedule recommended by the Commission was highly ambitious and was unlikely to have been met.

[11] The Bilateral Agreements covering the trial phase (signed between 2012 and 2014) included the planned intake of participants and the balance of cash and in-kind contributions to the scheme. A second set of Bilateral Agreements cover the arrangements for transitioning the NDIS to full scheme. These were signed in 2015 and 2016. The ACT reached full scheme at the completion of the trial period so a second bilateral agreement was not required.

[12] The Commission also recommended that the scheme would be national by July 2015 and reach full scheme by 2018-19.

But the scheme was launched a year earlier than even that ambitious timetable, and the scope of the trials was broadened significantly. The changed timing and scope of the trials compressed the planning phase for the scheme and exacerbated some of the issues faced by the scheme. Some aspects of the scheme were being built and tested over the trial, for example:

- the NDIS commenced without an assessment tool to help determine reasonable and necessary supports and had to build one over the first three months of operation (NDIA, sub. 161, p. 3). The Commission acknowledged that there was no ideal assessment tool for the NDIA to use, but also said that the scheme should not be delayed in the absence of 'perfect' tools (PC 2011, pp. 338–339)
- the ICT system used during trial was an interim system that would not scale to full scheme (NDIA, sub. 161, p. 3). The new system, put in place in 2016 for full scheme, has also had a number of issues (chapter 13).

A review of the capabilities of the NDIA described the Agency as being 'like a plane that took off before it had been fully built and is being completed while it is in the air' (Whelan, Acton and Harmer 2014, p. 7).

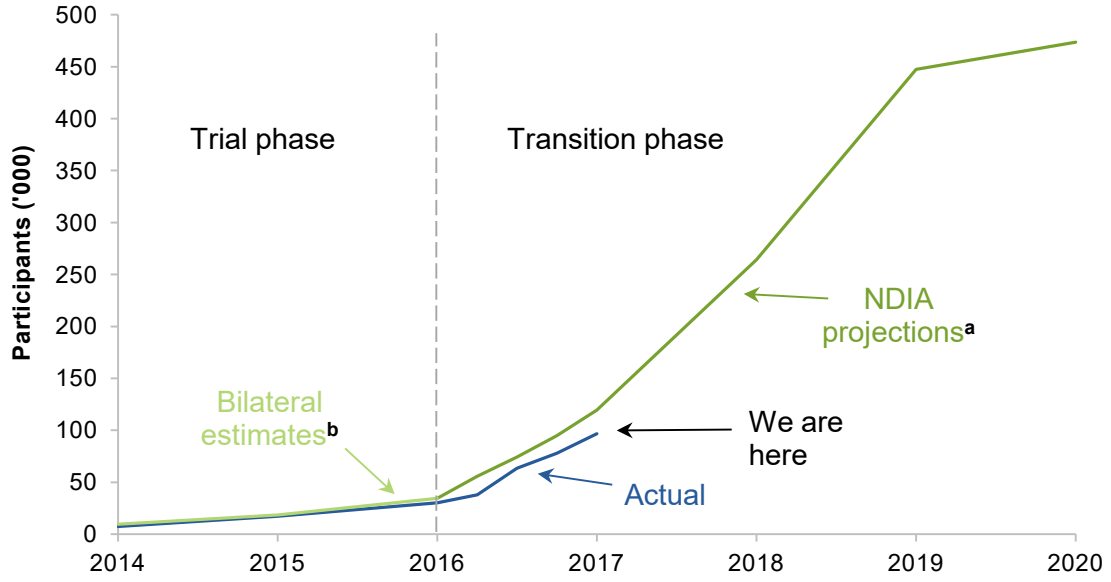
The participant intake schedule is highly ambitious given the magnitude of the reform. To reach the estimated 475 000 participants at full scheme by 2019-20, the NDIA will need to approve hundreds of plans a day (figure 2.1). In the June 2017 quarter, the NDIA approved about 15 000 plans, or roughly 165 plans a day (NDIA 2017y, p. 13). In 2018-19 (the final year of transition), NDIA modelling indicates that about 500 plans will need to be approved, and hundreds more reviewed, each day.

As JFA Purple Orange (sub. 186, p. 7) said the NDIS transition arrangements 'mean a tsunami of new participants will be processed into the scheme over the next two years'. Associate Professor Helen Dickinson of the Public Service Research Group at the University of New South Wales (2017) also recently commented that 'this vast reform is being implemented at break-neck speed'.

The NDIA is already struggling to keep up with the participant numbers included in the Bilateral Agreements — at the end of June 2017, there were 97 000 participants with approved plans, which was just 83 per cent of the bilateral estimates (table 2.2).[13] If the number of people approved to enter the scheme but awaiting a plan (26 000) are added to scheme participant numbers, then the bilateral estimates have only just been reached.

[13] The 97 000 participants with an approved plan reported by the NDIA includes 6 314 children who have entered the Early Childhood Early Intervention pathway but who *do not* have an approved plan. It also includes participants aged 65 years and over (however, the bilateral estimates only include participants aged 0 to 64 years).

Figure 2.1 **Growth in number of participants in the scheme[a]**



[a] Scheme participant projections are based on projections prepared by the Scheme Actuary for the NDIA's 2015-16 Annual Financial Sustainability Report using data at 30 June 2016. The Commission adjusted the projected number of participants for the four quarters of 2016-17 to be consistent with the bilateral estimates reported in the latest NDIA quarterly report. [b] Bilateral estimates based on the NDIA's quarterly reports.

Table 2.2 **NDIS participants and bilateral estimates**

	Participant cohort with approved plans[a]				*Bilateral estimate*[b]	*Per cent of estimate*
	Existing disability service clients	*New*	*ECEI*[c]	*Total*		
End of 2015-16	15 308	14 973		30 281	34 545	88
End of 2016-17 Q1	20 652	17 214		37 866	54 811	69
End of 2016-17 Q2	37 715	23 489	2 267	63 471	73 070	87
End of 2016-17 Q3	47 703	27 857	2 439	77 999	93 385	84
End of 2016-17 Q4	58 400	32 238	6 134	96 772	116 555	83

[a] This includes participants who at one point had an approved plan but who have since exited the scheme. [b] The bilateral estimates presented in this table are for participants aged 0–64 years. [c] ECEI denotes the number of children who have entered the Early Childhood Early Intervention pathway but who *do not* have an approved plan.

Source: NDIA (2017y, p. 17).

The NDIA, commenting on the bilateral estimates before the Commission's position paper, said:

> The transition to full scheme commenced on 1 July 2016 and immediately there were problems. The new systems and process, coupled with the scale of intake and issues with the ICT portals saw the NDIA fall behind both in terms of the bilateral estimates and the quality of the participant and provider experience.
>
> The NDIA was able to recover against the bilateral estimates, but problems emerged during this time with the quality of plans and concerns were expressed about aspects of the planning process and the impact on the participant experience. These are matters that the NDIA is now actively addressing. (sub. 161, p. 4)

There also appears to be fewer clients in existing programs transitioning to the NDIS than the national minimum data set suggested, and compared with the estimated number of transitioning participants in the Bilateral Agreements (noting that the numbers in the Bilateral Agreements are estimates, not hard targets). The NDIA said:

> The original estimates of the expected presentation rate were based on demographic data available at the time (e.g. geography, age and the scope and nature of the previous State and Territory client bases). The early Transition experience indicates that other 'real-time' factors are also determinants of the actual participant presentation rate (e.g., participant readiness to join or phase into the Scheme, and difficulties contacting participants due to multiple sources of contact data of varying quality). (sub. PP327, p. 10)

Despite the lower than expected participant intake to date, at this stage the NDIA has not revised the overall expected number of participants in full scheme (sub. 161, p. 76). It has, however, indicated that the lag associated with participants presenting to the scheme is likely to persist (sub. PP327, p. 10).

If the current trend continues, it will take an additional year (2020-21) before all 475 000 participants will be in the scheme (though this delay could be longer if the scheme falls further behind the bilateral estimates when the participant intake ramps up in 2017-18, or if participants do not apply to enter the scheme as soon as they are eligible — something that is already being observed in some jurisdictions).

It is the Commission's view that the current timetable for participant intake will not be met.

Transition to full scheme is a unique stage in the life of the scheme

Given the size, speed and complexity of the reform, it is inevitable that there will be transitional issues with the rollout of the NDIS. It needs to be recognised that the scheme is still in its infancy and it will take time to get it right. A number of study participants noted that the transition period is a unique period in the life of the scheme. The Australian Federation of Disability Organisations, for example, said:

> We acknowledge that there have been many issues during trial and the transition to full scheme implementation. But we also recognise that this is a unique period in the life of the NDIS. Never

> again will the scheme have to grapple with the multiple challenges posed by bringing in a large number of participants in such a short period of time. Once this period of transition is over, growth will be limited to a small number of new participants. AFDO understands that there are significant operational challenges in ensuring hundreds of thousands of people enter the scheme in a short period of time. (sub. 180, p. 8)

Mental Health Australia also said:

> The Transition period is a unique period in the life of the NDIS. Never again will large numbers of people be required to move into the Scheme in such a short period of time. Difficulties were to be expected given the numbers of people involved and the complexity of the task at hand. (sub. PP321, p. 19)

But already there are signs that the rollout schedule is compromising the NDIA's ability to implement the NDIS as intended, and risking the financial sustainability of the scheme — and the number of participants entering the scheme is only just starting to ramp up. Many of the concerns raised with the Commission in this study relate to the rollout schedule and the risks of focusing on participant numbers (box 2.1). The NDIA is also aware of the risks, noting that:

> … bilateral estimates can and do impact upon the way in which the Scheme is delivered. This can put sustainability at risk and impact on the way in which early intervention and investment initiatives are implemented in the short term. It may also have adversely impacted the quality of plans. (sub. 161, p. 109)[14]

While the NDIA has been set a challenging task of generating plans for tens of thousands of participants each quarter, it is important that it also undertakes the planning process in a way that achieves the objectives of the scheme (chapter 5).

A further problem resulting from the participant intake schedule is that parts of the supporting infrastructure that are essential to the objectives of the scheme are not operating as intended. For example, Local Area Coordinators (LACs), which play a key role in delivering information and linking individuals to disability services, were supposed to be 'on the ground' in rollout areas six months before participants joined the scheme (chapter 5). But this did not occur and some areas were still without a LAC months after they joined the scheme. The need to meet bilateral estimates also resulted in LACs being asked to divert resources away from Information, Linkages and Capacity Building (ILC) tasks to undertake planning-related activities. ILC is important for containing scheme costs and reducing reliance on individualised supports (chapter 6).

[14] The NDIA rightly notes that actual participant numbers lagging behind bilateral estimates does not in itself present 'a risk to the financial sustainability of the Scheme' as fewer participants equates to lower costs (NDIA, sub. PP327, p. 10). However, a focus on the meeting the bilateral estimates at the expense of plan quality does have the potential to increase scheme costs in the long term.

Box 2.1 Risks from the rollout schedule are highlighted

House with No Steps:

> … the Scheme has aggressive ramp-up targets. These are putting pressure on the NDIA's capacity to develop quality plans for participants. Unfortunately, the need to achieve high growth in participant numbers appears to be outweighing considerations of plan quality and consistency. (sub. 104, p. 5)

Community Mental Health Australia:

> If the focus purely becomes about signing as many people up as quickly as possible and preventing cost-overruns, then the intent of what the NDIS was actually meant to deliver starts to become lost. (sub. 11, p. 2)

Maurice Blackburn Lawyers:

> We believe the roll-out timeline of the NDIS is highly ambitious and increases the serious risk of inadequate delivery of services to participants. It also poses significant financial risks to the scheme as a whole. (sub. 58, p. 6)

Blind Citizens Australia:

> While we understand the agency is under intense pressure to meet the targets that have been agreed upon under the bilateral agreements between state and territory governments, meeting these targets should not come at the expense of the basic rights and freedoms of people with disability. (sub. 130, pp. 2–3)

Australian Federation of Disability Organisations:

> The need to bring in a large number of participants into the scheme to meet bilateral targets has during transition led to practices which have not always been consistent [with] the original vision of the scheme. (sub. 180, p. 5)

Young People in Nursing Homes Alliance:

> Trying to meet the very demanding targets in the bi-lateral agreements has been torturous for both the scheme and for its partners. The NDIS has had to divert resources away from core commitments to manage these urgent imperatives … (sub. 187, pp. 26–27)

Plan Management Partners:

> … the volume of plans to be completed in order for the scheme to achieve its milestone rollout targets is ultimately generating more work for LACs and plan reviewers due to the variability in quality of resultant plans. (sub. 126, p. 11)

Catholic Social Services Australia:

> The speed of the NDIS rollout will put considerable pressure on processing participants' eligibility, assessment and planning. This pressure will be exacerbated by annual plan reviews that are required for those already in the scheme. (sub. 166, p. 7)

The Department of Social Services:

> … there are risks arising from the scale and pace of roll-out that has potential to place strain on the NDIA, and on agreed transition timeframes. (sub. 146, p. 24)

Mental Health Australia:

> At this time, the NDIA is being judged on volume, on time and on budget. … In the headlong rush to meet both time and volume commitments outlined in bilateral agreements, as the CEO of the [NDIA] recently conceded, insufficient attention appears to have been paid to quality … Processes that are ill-suited to people with psychosocial disability are compromising outcomes for individuals. Consequently, the vision of the Scheme and public confidence in its effectiveness are undermined. (sub. PP321, p. 19)

The NDIA (sub. 161, p. 16) acknowledged that its 'systems and processes are not at peak efficiency and are not ideal in terms of dealing with the speed and scale of the intake challenge'. Also that:

> While the NDIA remains committed to meeting the bilateral estimates, it recognises that the systems and processes that underpin delivery must continue to improve to meet the scale of the challenge while delivering appropriate high quality individual outcomes. The achievement of the bilateral estimates must be done in a manner that maintains the commitment in all jurisdictions to quality, safety, improved outcomes and sustainability. (sub. 161, p. 16)

The rollout schedule has also meant that the market for disability care and support (including providers, workers and participants and their families) has had very little time to adjust to the new scheme (chapters 7–10). As One Door Mental Health said:

> The speed with which the roll-out has occurred has placed significant financial strain on providers, particularly small providers, as a result of needing to move from the relative stability of block-funding arrangements to the uncertainty of unknown revenue through fee-for-service. (sub. 179, p. 11)

Without time to allow for the demand side to become better informed and active, and for the supply side to adjust and grow, there is a risk that participants will be unable to use their supports, either because the services are simply not there, or because participants are not sufficiently well equipped to navigate the scheme.

A number of participants agreed with the Commission's assessment of the risks to the scheme from the ambitious participant intake schedule. For example, Legal Aid NSW said:

> In our experience, the timing and pace of the NDIS rollout has led to poor outcomes for many participants. The focus on participant numbers has compromised the quality of the planning process, and often, participants are left frustrated and dissatisfied with their plans. (sub. PP245, p. 3)

Queensland Government:

> The Queensland Government agrees that the timeframes are ambitious and shares concerns regarding the NDIA's ability to implement the scheme as intended including its ability to manage the increased workload as it approaches full scheme rollout. (sub. PP345, p. 3)

And Catholic Social Services Australia said:

> CSSA agrees with the Commission's finding that the speed of scheme rollout has put considerable pressure on the capacity of the NDIA … leading to compromises in the planning process, lack of support for participants and inadequate communication with providers. (sub. PP278, p. 2)

The NDIA, in response to the Commission's position paper, re-emphasised that the Agency is actively working to mitigate the risk associated with the participant intake schedule. The

NDIA noted the planning process as the most pressing challenge to scheme rollout and stated that significant work is being undertaken to improve the scheme's operation.

> The quality of participant outcomes is the NDIA's primary consideration relative to the speed of the rollout. (sub. PP327, p. 10)

Chapter 5 makes recommendations designed to improve the quality of the planning process. Chapter 11 explores whether additional changes are required to mitigate the risks that the rollout schedule presents to the sustainability of the scheme.

FINDING 2.1

The scale and pace of the National Disability Insurance Scheme (NDIS) rollout to full scheme is highly ambitious, and will not be delivered as scheduled in terms of participant intake. The rollout schedule risks the National Disability Insurance Agency (NDIA) not being able to implement the NDIS as intended and it poses risks to the financial sustainability of the scheme. The NDIA is cognisant of these risks.

2.2 Projections of scheme costs

One of the NDIA's insurance principles is to develop actuarial estimates of long-term costs (chapter 1). Actuarial estimates are compared with the actual scheme experience, so that the NDIA can identify cost pressures, and track and monitor responses put in place to address those pressures.

However, estimating future scheme costs presents a number of challenges. For example, while there is information on the number of potential participants who are currently receiving support from existing State and Territory Government programs, there are only survey data (which are subject to sampling error) on the number of potential participants not receiving support from government programs.

There is also uncertainty about the support needs of potential participants. While there are comprehensive data on the catastrophic injuries that are covered by compensation schemes (mostly spinal cord, brain and burn injuries), for most disabilities, comprehensive data on the level of funding required to achieve good long-term outcomes are not available. The NDIA has constructed reference packages for different disabilities with the help of expert reference groups (chapter 5). These packages will be refined over time as data are collected from the NDIS on the effectiveness of different supports and their cost.

In 2011, the Commission estimated a national disability insurance scheme would cover 411 000 participants at a gross cost of $13.6 billion at full scheme (PC 2011) (box 2.2).

Box 2.2 The Commission's modelling approach in 2011

In its 2011 report on *Disability Care and Support*, the Commission estimated that a national disability insurance scheme would cover 411 000 participants and would have a gross cost of $13.6 billion (and a net cost of $6.5 billion) at full scheme. The costings were based on three calculations:

- the number of people who would be eligible for the scheme
- the level of support that these people would require
- the average per person cost associated with each level of support — four types of support were costed: care and support; aids and appliances; home modifications; and transport.

No single data source contained all the information required.

- The primary data source for numbers of people and level of support was the 2009 ABS Survey of Disability, Ageing and Carers. The number of participants entering with psychosocial disability was calculated by consulting with experts who had previously examined the prevalence of enduring psychiatric disability.
- A variety of sources were used to estimate the average per person costs for different types of support, including data from the Victorian Transport Accident Commission, the New South Wales Lifetime Care and Support Scheme, and the Multiple Sclerosis Longitudinal Study.

The Commission also estimated that when the scheme matured (around 2050), the *net* cost would be $4.4 billion. The long-term savings were attributable to assumptions regarding early interventions and community capacity building (for example, more people with disability are able to live in the community with intensive supports rather than in supported accommodation).

A further offset of about $720 million was assumed when the national injury insurance scheme matured.

The Commission recognised that there were significant uncertainties about the cost estimates because of the nature and quality of the data, and undertook a number of sensitivity analyses to explore these uncertainties.

Source: PC (2011, pp. 748–780).

The NDIA (2017y, p. 6) projected that by 2019-20 the NDIS will cover 475 000 participants and cost about $22 billion each year.[15] These estimates are broadly consistent with the Commission's 2011 modelling after taking into account inflation (including the effects of pay rises awarded to social and community services workers by the Fair Work Commission in 2012), population changes, and costs associated with participants aged 65 years and over (who enter the scheme prior to 65 years) (box 2.3).

[15] Both the Commission's and the NDIA's projections of scheme costs include Western Australia. While the gross cost of the NDIS is estimated to be $22 billion in 2019-20, the scheme is expected to reduce the funding required for a range of government programs. A review by the Australian Government Actuary in 2011 estimated these offsets to be about $11 billion (NDIA, sub. 161, p. 29).

Box 2.3 Comparing the NDIA's estimates and the Commission's 2011 estimates

While the NDIA uses a different methodology to that used by the Commission in 2011 to estimate costs, the differences in projected costs are mainly attributable to incorporating population projections, industry-specific wage increases and costs associated with participants aged 65 years and older (table below).

Population

Between 30 June 2012 and 30 June 2020, Australia's residential population aged under 65 years is projected to increase by 12 per cent. Applying this increase to the Commission's estimate of 411 250 scheme participants (aged under 65 years) results in 461 000 participants aged under 65 years — this is in line with the 458 368 participants estimated by the NDIA. Incorporating population projections adds about $1.5 billion to the Commission's estimates of scheme costs.

Wage increases in the disability sector

In February 2012, the Fair Work Commission found that employees in the community and disability sectors were underpaid compared to public service workers doing similar jobs. The subsequent Equal Remuneration Order applies adjustments ranging from 23 per cent (for employees at the lowest level) to 45 per cent (for employees at the highest level) in nine instalments between December 2012 and December 2020. These adjustments are applied on top of increases from the annual wage review undertaken by the Fair Work Commission.

The NDIA's modelling of scheme costs assumes that average cost of care in the disability sector will increase 29 per cent between 30 June 2014 and 30 June 2020. If Australian Government Actuary assumptions regarding cost increases from the Department of Social Services' funding model are applied between 2011-12 and 2013-14, the total increase in average costs to 2020 is 44 per cent. The NDIA assumptions imply an increase in average costs from $31 183 to $45 018 per participant. These cost increases would add about $6.4 billion to the Commission's estimates of scheme costs.

Participants aged 65 and older

The NDIA modelling projects that there will be 15 000 participants aged 65 years and over in 2019-20 and that they will add an extra $1.09 billion to scheme costs (with an average cost of $71 000 per participant). The Commission's 2011 estimates of costs did not include participants 65 years and over on the basis that they did not represent a net increase in costs to the Australian Government (as their support was funded under the aged care system).

	Participant numbers	*Scheme costs ($b)*
Productivity Commission estimates 2011[a]	**411 250**	**12.82**
Population projections to 2019-20	49 544	1.54

Sources: Commission estimates; NDIA unpublished estimates; PC (2011); Fair Work Australia (2012).

The NDIA's methodology is more refined than that used by the Commission in 2011 (the NDIA gave the Commission its long-term cost projection model used to produce the 2015-16 Annual Financial Sustainability Report). The key differences between the NDIA's model and the Commission's 2011 model are:[16]

- participant numbers are modelled for 14 separate disability groups (apart from psychosocial disability, there was no distinction between disabilities in the Commission's 2011 modelling)
- average package costs assumptions are based on reference package data developed by expert reference groups (the Commission in 2011 used data from injury and accident schemes that operate in Australia)
- epidemiological data on incidence and mortality rates for different disabilities were used to model participant numbers over time (the Commission did not explicitly model entry and exit rates in 2011).

Some key assumptions behind the NDIA's cost projections

There are a number of key assumptions that drive the NDIA's long-term projections.

- *Prevalence and incidence rates* — the estimate of participant numbers at full scheme (prevalence) is derived using the ABS Survey of Disability, Ageing and Carers and epidemiological data. Estimates of entry (incidence) and exit rates used to make long-term projections also use these data.
- *Long-term prices* — inflation of 4.3 per cent per year is assumed in the short term based on current wage rates (including the Social, Community, Home Care and Disability Services Award), with a long-term assumption of 4 per cent per year.
- *Utilisation* — there is no explicit assumption regarding underutilisation in the NDIA's projections. The projections assume that participants are allocated, and completely spend, a reference package of supports (the expected level of support required by participants given their age, disability and level of function).
- *Early intervention and early investment* — the NDIA's projections assume that early investment will reduce costs by 0.35 per cent per year. This assumption was originally developed for the Commission's modelling in 2011.
- *Technology* — advances in technology can both increase and decrease costs. The NDIA does not make any assumptions about the effect of technological advances on scheme costs.

[16] The Commission understands that further improvements to the modelling approach will be made for the 2016-17 Annual Financial Sustainability Report.

Participants aged 65 years and over

The proportion of NDIS costs that is attributable to participants aged 65 years and over will increase over time. The NDIA's modelling projects that in 2029-30, almost 20 per cent of scheme costs will be linked to participants aged 65 years and over compared to about 5 per cent in 2019-20 (table 2.3). This suggests that the share of total NDIS funding provided by the Australian Government will increase substantially over time as it is responsible for the funding of all participants aged 65 years and over (and all Indigenous participants aged over 50 years). This does not necessarily mean that there will be a sizable net cost to the Australian Government, as it also has primary funding responsibility for the aged care system (chapter 6).

Table 2.3 **NDIS costs attributable to participants aged 65 years and over**

Year	*Scheme costs (all participants)*	*Scheme costs (65 years and over)*[a]	*Proportion of total costs (65 years and over)*
	$b	$b	Per cent
2019-20	22.3	1.2	5.2
2024-25	30.6	4.1	13.4
2029-30	40.9	8.2	19.9
2039-40	70.2	19.3	27.5
2049-50	113.6	34.1	30.0

[a] This includes operating costs associated with participants aged 65 years and over.

Source: Unpublished NDIA modelling estimates.

The magnitude of the projected increase in the costs associated with participants aged 65 years and over is influenced by a number of assumptions relating to ageing in the scheme, including:

- the exit rates of participants aged 65 years and over, which can be disaggregated into:
  - mortality exit rates — these are based on epidemiological data and are disability specific
  - exit rates for participants entering the aged care system. Participants are assumed to enter the aged care system (and exit the NDIS) when they enter residential aged care (chapter 6).[17] These exit rates are based on (limited) data on the rates of transition to residential aged care and are disability specific
- the average package costs for participants aged 65 years and over:

[17] NDIS participants aged 65 years and over can choose to transition to the aged care system or remain in the NDIS. However, the financial incentives are such that there is little incentive for participants to make this transition (chapter 6). When a scheme participant enters residential aged care, they cease to be an NDIS participant.

- average package costs for those aged 65 years and over are assumed to be higher than for participants aged 55–64 years for about half of the primary disability groups — in 2019-20, the difference is assumed to be 20 per cent
- for the disability groups just identified, average package costs for older participants are also assumed to increase at a faster rate (an additional 1 per cent above economic inflation for every year between 2019-20 and 2044-45) than for participants aged under 65 years (i.e. in 2044-45, average package costs are an *extra* 25 per cent higher than for participants aged under 65 years, or 50 per cent higher in aggregate).[18]

More on utilisation rates…

Utilisation rates during the transition period are likely to remain significantly lower than the utilisation rate expected at full scheme. While data integrity issues make it difficult to develop precise projections on support utilisation at full scheme (2019-20), trial and transition data suggest a utilisation rate of about 75–85 per cent is plausible by the end of the transition phase (section 2.3).

Beyond 2019-20, utilisation rates are expected to rise as the market for supports matures. However, they are unlikely to reach 100 per cent — the NDIA noted that experience in other schemes suggests a utilisation rate of between 80 and 95 per cent could be expected (NDIA, sub. 161, p. 70).

Future updates to the projections of scheme costs

The NDIA has made some adjustments to their long-term cost projections using some trial data, but it has not made more extensive changes to cost projections based on all trial and transition data. Early scheme data deviate from some of the assumptions included in the NDIA's projections (section 2.3), but these data have too many limitations to update assumptions about prevalence and package costs. The data also reflect a period of the scheme prior to management responses implemented by the NDIA to address early cost pressures (discussed below).

As a number of study participants noted, it could be some time before conclusions can be made about the financial sustainability of the scheme. For example, the Victorian Government said:

> The Review is being undertaken at a very early state in the transition to full scheme and the market is at an early stage of its development — too soon to arrive at any conclusions about the scheme's ongoing costs or sustainability.
>
> It may be several years before total costs and lifetime costs are known. Little data is currently available and further experience is required to understand how the application of insurance principles can vary costs over a participant's lifetime. (sub. PP298, p. 1)

[18] The aggregate difference is 50 per cent not 45 per cent (20 per cent plus 25 per cent) due to compounding.

The New South Wales Government also said:

> Transition experience should inform estimates of full scheme costs, but must not be automatically extrapolated. Costs during transition must be considered with reference to the expected costs during this period (not with reference to full scheme costs). (sub. 60, p. 10)

The NDIA indicated that as the scheme rolls out, the transition data collected will be used to better inform estimates of full scheme costs, and to assess the effectiveness of the NDIA's responses to address cost pressures — in its latest quarterly report, the NDIA said that it is undertaking ongoing work to 'verify the longer-term cost of the NDIS based on scheme experience to date' (NDIA 2017y, p. 6).

It is imperative that new data are incorporated into the assessment of longer-term costs as soon as possible. Given the low levels of utilisation that the scheme has experienced in the transition to date (section 2.3), and the fact that underutilisation is likely to continue in the short to medium term (with funding implications), it is particularly important that utilisation assumptions are incorporated into the modelling. In the absence of any major data reliability issues, there should be sufficient scheme data to update estimates of scheme costs based on scheme experience for the 2017-18 Annual Financial Sustainability Report.

From time to time, the NDIA's costings of the scheme may need to be updated to reflect policy changes that alter the scope of the NDIS. For example, changes to the scope of the National Injury Insurance Scheme would impact on the cost of the NDIS and need to be reflected in the estimates of scheme costs (chapter 6).[19] It is important that any policy changes are incorporated quickly into the NDIA's costing of the scheme and that the changes attributable to the policy change are clearly articulated to preserve the public's confidence in the scheme's financial sustainability.

The Commission did not revise its own projections of scheme costs. This is because the Commission broadly agrees with the NDIA's approach to projecting scheme costs and the decision to delay integrating data from the trial and transition (but stress that these data should be incorporated as soon as practicable). It is the Commission's view that the NDIA's projections of scheme costs should inform the Australian Government's budget estimates for the NDIS (chapter 12).

In any case, point estimates of total scheme costs do not tell the whole story. Financial sustainability is about both costs and benefits, and risks to financial sustainability cannot always be easily modelled, or identified from scheme data. A long-term focus, both within and outside the NDIS, is therefore important. While the NDIA is responsible for monitoring scheme costs and responding to the cost pressures that it can control, all governments have a responsibility to ensure the success of the scheme and its financial sustainability.

[19] Another example is the cost risk around specialist school transport services. If Governments decide that the NDIS should cover the costs of specialist school transport services, this would add between $300–$600 million each year to the cost of the scheme. This is a cost risk being considered by the NDIA, but it is not included in the Agency's cost modelling or financial sustainability reporting for the full scheme. (NDIA, sub. PP370, p. 10)

FINDING 2.2

The Productivity Commission supports the National Disability Insurance Agency's (NDIA's) approach to projecting scheme costs and the decision to delay integrating data from the trial and transition period to date. As such, the Commission has not revised its own projections of scheme costs.

However, it is imperative that new data are incorporated into the NDIA's assessment of longer-term costs as soon as possible. The Commission's assessment is that, in the absence of any major data reliability issues, there should be sufficient data for the NDIA to update the estimates of scheme costs on the basis of scheme experience for the 2017-18 Annual Financial Sustainability Report.

2.3 Key insights from trial and transition data

While it is early days, there are some insights from the early experience of the NDIS (from trial and transition data — July 2013 to June 2017). This section looks at participant characteristics, package costs, and utilisation of supports. These three factors determine the year to year costs incurred by the NDIA on individualised supports.

Trial and transition data need to be interpreted with caution

The first point to note is that data from the trial and transition phase need to be interpreted with caution. This is because:

- differences in trial sites and phasing schedules mean that the data cannot necessarily be used as a guide to anticipate full scheme experience (for example, the average level of committed support by a jurisdiction will reflect the trial cohorts for each jurisdiction)
- early scheme data are often subject to small sample sizes — minimal weight should be placed on disaggregated results where sample sizes are small
- the number of scheme participants in a region is likely to be an underestimate of the full scheme number because it takes time for potential participants to approach and gain access to the scheme. (On the other hand, the number of exits due to successful early intervention are likely to be lower in the first years of the scheme as it can take some years for the benefits of early intervention to accrue.)
- it can be difficult to determine whether observed cost pressures are transitional or whether they are likely to persist
- during transition, about 20 per cent of committed support is expected to be provided in-kind (Australian, State or Territory Government programs delivered under existing block-funding arrangements) (DSS, sub. 146, p. 22) and these supports tend to be more expensive than standard supports (NDIA, sub. 161, p. 101)

- data integrity may impact on the analysis, arising in part as a result of the NDIA transitioning to a new ICT system in July 2016. Some concern remains, despite the NDIA making manual adjustments where known data integrity concerns exist.

What do the early data tell us about participants?

At the end of the trial phase in June 2016, the number of participants with an approved plan (30 281) was 83 per cent of bilateral estimates (36 307) (NDIA 2016b, p. 42). (There were another 5400 participants who had been determined as eligible, but who did not yet have an approved plan.)

At the end of June 2017 (the most recent quarterly report), an additional 86 000 people had been found eligible for the scheme. This took the total number of scheme participants who had ever been active to 122 065 (NDIA 2017y, p. 15). About 97 000 active participants have an approved plan (NDIA 2017y, p. 15).

Participants by disability

Almost two-thirds of current scheme participants either have an intellectual disability (37 per cent) or autism (29 per cent) as their primary disability (figure 2.2). Psychosocial disability is the next most common disability, accounting for about 6 per cent of scheme participants.[20]

Participants with disabilities such as stroke and multiple sclerosis tend to be older, while participants with autism and other sensory/speech disabilities are relatively young (figure 2.2).

Most participants with autism enter the scheme under early intervention requirements (and early intervention is most effective at younger ages). In recent years there has been an increase in the number of autism diagnoses — likely in part due to a growing awareness of autism and more sensitive screening tools leading to higher prevalence rates for younger ages (Gothe-Snape 2017).

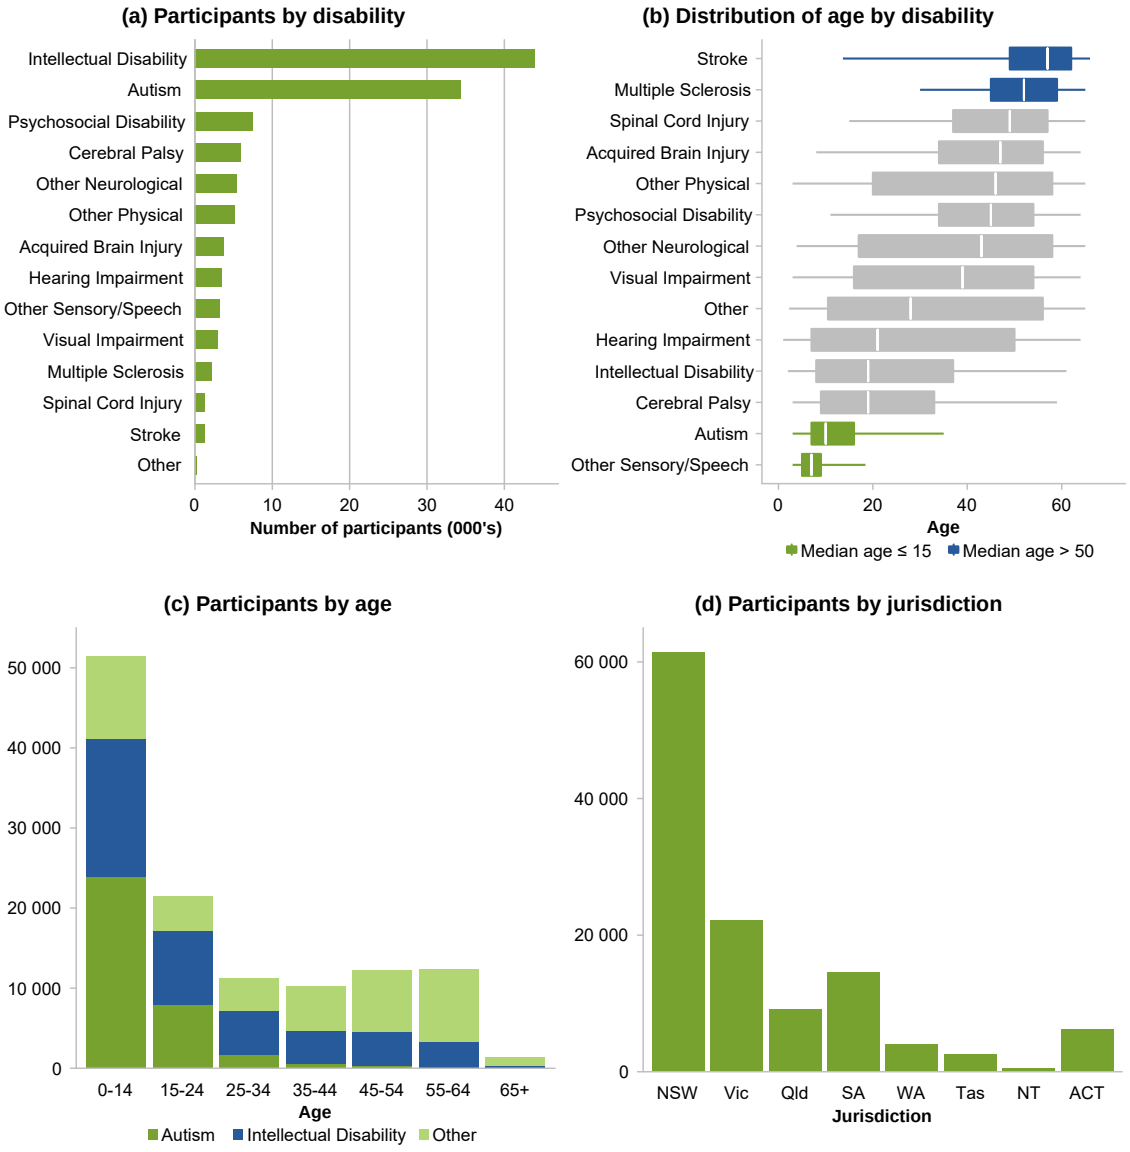
Disability-specific prevalence rates at the Barwon and Hunter trial sites broadly match those assumed in the NDIA's long-term modelling for all but the largest disability groupings (box 2.4) (figure 2.3). Prevalence rates were higher than the NDIA's long-term modelling assumptions for:

- autism, where prevalence rates were significantly higher in both trial sites (the NDIA implemented initiatives in response, discussed below)

[20] In addition, about 4 per cent of participants have a psychosocial disability that is not considered their primary disability (NDIA, sub. 161, p. 82).

- intellectual disability, where prevalence rates were much higher in the Barwon region, but not the Hunter region. The higher prevalence rate for intellectual disability in the Barwon region was most pronounced in participants aged under 18 years.

Figure 2.2 **Some insights: NDIS participants[a,b,c]**



[a] All figures include data on active eligible participants at 30 June 2017. [b] Figure (b) shows box plots of the distribution of the age of participants for different disability groups. The vertical line represents the median age of participants with that disability and the box shows the interquartile range (quartiles 1 and 3). The box plot tails show the 2.5 and 97.5 percentiles. [c] In figure (d), the number of participants in Western Australia includes the Perth Hills NDIS trial site, but not the Western Australia NDIS MyWay trial.

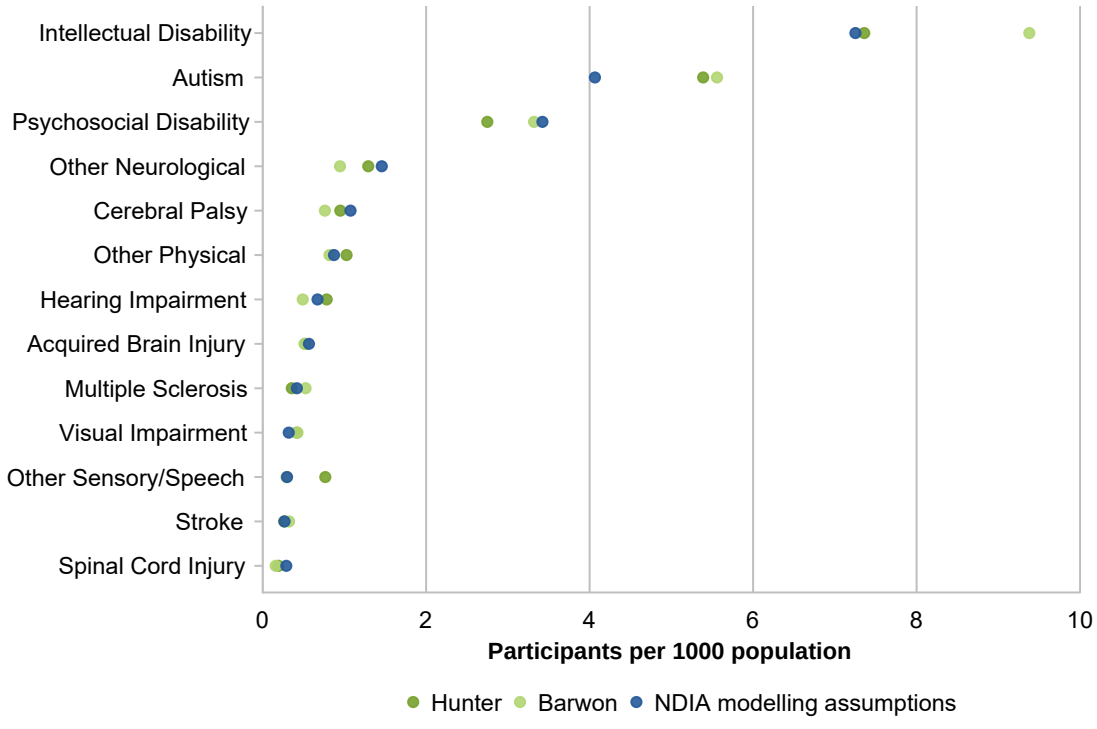
Source: Commission estimates based on unpublished NDIA data.

Box 2.4 Calculating prevalence rates

It is difficult to assess how participant numbers are tracking compared to the NDIA's long-term modelling assumptions, as it takes time for potential participants to approach and gain access to the scheme. To address this issue, the Commission used data from the Barwon and Hunter trial sites. Both these sites have been in operation since July 2013 and are open to everyone under the age of 65 years.

One significant limitation of this approach is that these trial sites may not be representative of the broader Australian population. Another limitation is that the NDIA has found that participants are continuing to approach the scheme at mature trial sites at a rate that is above that expected if only participants with newly acquired disabilities were approaching the scheme (though this latter factor would suggest prevalence may be even higher relative to the modelling assumptions than the numbers so far collected would indicate). Similarly, the number of exits from the scheme due to successful early intervention is likely to be lower than would be expected at full scheme, as it can take some years for the benefits of early intervention to accrue.

Figure 2.3 Prevalence rates by disability — trial compared to the NDIA's long-term estimates[a]



[a] Prevalence rates for a region are calculated as the number of active eligible participants with the selected disability per 1000 of the population aged 0–64 years at 30 June 2016. Data on the population for the Barwon and Hunter trial regions were sourced from the 2016 ABS Census of Population and Housing.

Source: Commission estimates based on unpublished NDIA data.

There is a lot of uncertainty around the number of participants with psychosocial disability at full scheme.

- Modelling work undertaken by the Department of Health (sub. 175, p. 4) in 2016, using the National Mental Health Service Planning Framework, estimated that about 92 000 people (18–64 years) have severe and complex psychosocial disorders that would closely align with the NDIS eligibility criteria for individualised supports.
- David McGrath Consulting estimated that 'approximately 289 000 people with a severe mental illness will need individualised, intensive 'NDIS-like' community supports in any 12-month period' in work conducted for Mental Health Australia in 2015 (Mental Health Australia, sub. 155, p. 10).
- The NDIA (2016b, p. 26) expects there will be about 64 000 participants with a primary disability of psychosocial disability in the scheme in 2019-20. According to the NDIA, at this stage of the rollout, the number of participants with psychosocial disability is tracking broadly in line with the modelling assumptions in mature trial sites (Scheme Actuary 2016).

Estimating the number of people with psychosocial disability eligible for the scheme is difficult because a robust and comprehensive database from which to draw is lacking. However, given there are a range of estimates prepared by stakeholders and agencies, it is essential that the methodology used is fully transparent, so that the estimates can be assessed and considered in relation to projections of numbers of participants with psychosocial disability at full scheme.

Participants by age

The largest share of participants in the scheme are children aged 14 years and under (about 51 000 or 43 per cent of total participants at the end of June 2017) (figure 2.2). About 47 per cent of children in the scheme have autism, and 33 per cent have an intellectual disability (including developmental delay).

The number of children in the scheme is higher than originally expected — this is even after accounting for the fact that the number of children in the scheme is skewed by the South Australian trial site, which was only for children.

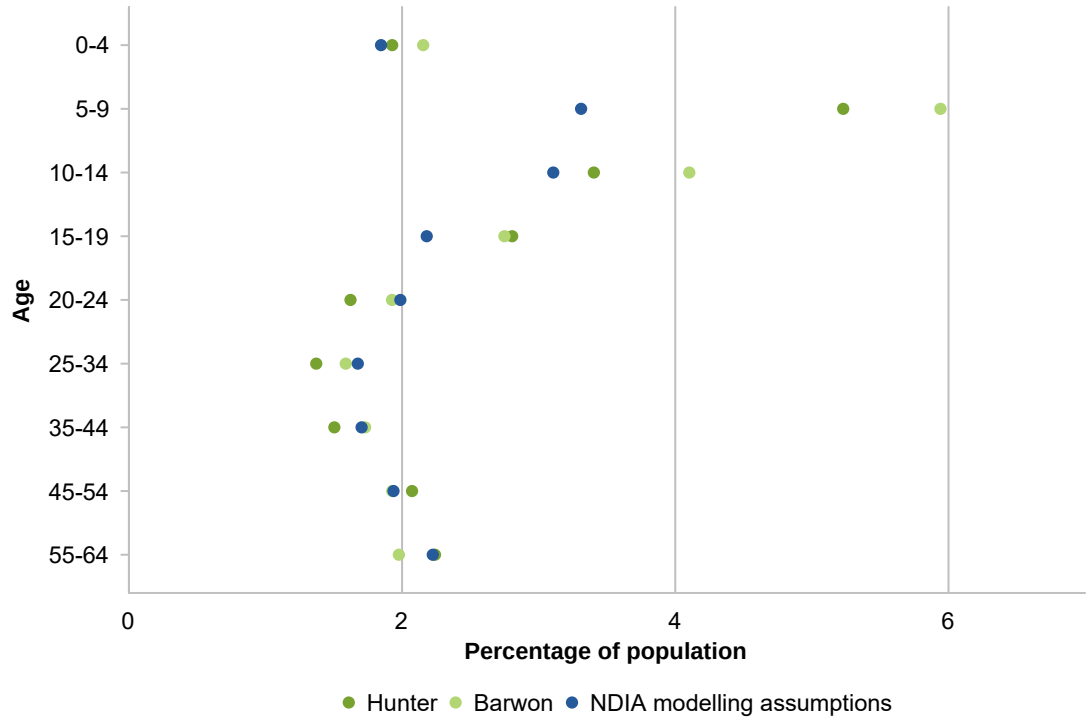
An analysis of the experience of trial sites by the NDIA (sub. 161, p. 78) found that the prevalence rates for children aged 0 to 6 years:

- exceeded the Commission's 2011 estimates in South Australia, Barwon and the ACT trial sites
- were in line with the Commission's 2011 estimates in Western Australia and the Hunter trial sites.

Looking at the data from the Barwon and Hunter trial sites, the Commission reached a similar conclusion. The largest gaps between actual and expected prevalence rates (based on the

NDIA's long-term modelling) are for children aged 5–9 years followed by children aged 10–14 years and young people aged 15–19 years. There are larger gaps for the Barwon region than the Hunter region (figure 2.4).

Figure 2.4 **Prevalence rates by age group — trial compared to the NDIA's long-term estimates[a]**



[a] Prevalence rates for a region are calculated as the number of active eligible participants in a given age group per 1000 of the population in the age group at 30 June 2016. Data on the population for the Barwon and Hunter trial regions was sourced from the 2016 ABS Census.

Source: Commission estimates based on unpublished NDIA data.

Participants by level of function

Participants are assessed for their level of functional capacity when they enter the scheme (box 2.5). Level of function data have been collected since July 2016 and data are available for almost 85 000 participants. At the end of June 2017, of those participants who have been assessed:

- 38 per cent had a high level of function
- 38 per cent had a medium level of function
- almost a quarter had a low level of function.

Box 2.5 Assessing level of function

As part of the planning process, the NDIA assesses each participant's level of function. This is one of many pieces of information that it uses to develop plans to help participants progress towards their personal goals and aspirations.

The National Disability Insurance Agency currently uses different assessment tools for 11 key disability types and the World Health Organisation Disability Assessment Schedule version II (WHODAS II) (for adults) and the Paediatric Evaluation of Disability Inventory-Computer Adaptive Test (PEDI-CAT) (for children) where no specific tool is identified. The scores of each assessment tool are mapped to a scale of 1 (high functional capacity) to 15 (low functional capacity), which provides a common measure across different types of disability.

To simplify its analysis, the Commission aggregated levels of function into three groups: high (levels 1–5), medium (levels 6–10) and low (levels 11–15).

Source: NDIA (sub. 161, p. 10).

Compared to the NDIA's long-term modelling assumptions, the distribution of participants by level of function to date is more heavily weighted towards the medium and low levels of function. This difference reflects, in part, the scheme's phasing schedules — participants with the greatest support needs are typically the first to enter the scheme in a region (figure 2.5). This is supported by the fact that the distribution of level of function for mature trial sites (Barwon and Hunter) is closer to the modelling assumptions.[21] (The distribution of level of function for the Hunter trial site is not expected to match modelling assumptions as it included a number of large residential facilities.)

That said, scheme costs will be higher than estimated if the early distribution of participants with lower levels of function persists at full scheme.

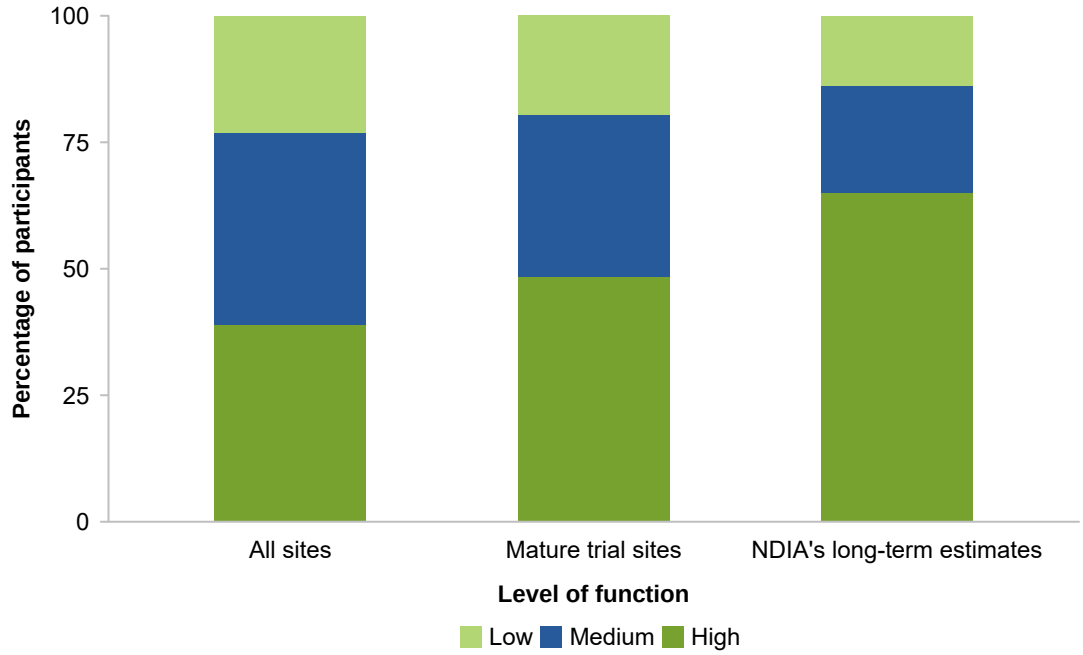
Participants by jurisdiction

About half of current NDIS participants are located in New South Wales (figure 2.2) — in comparison, the state accounts for 32 per cent of Australia's total population. This overrepresentation is because New South Wales had two trial sites while other jurisdictions had one. New South Wales is also further along the transition to full scheme (New South Wales is scheduled to reach full scheme by July 2018 — a year earlier than all the jurisdictions except South Australia and the ACT) (table 2.1).

[21] Data on level of function have not yet been collected for all trial participants.

Figure 2.5 **Distribution of participants by level of function compared to the NDIA's long-term estimates[a]**

At 30 June 2017



[a] 'All sites' denote all eligible scheme participants at 30 June 2017 for whom level of function data are available. 'Mature trial sites' denotes all eligible scheme participants at 30 June 2017 who were trial participants at the Barwon and Hunter trial sites and for whom level of function data are available. 'NDIA's long-term estimates' denote the distribution of level of function implicitly assumed in the NDIA's projections of scheme costs.

Source: Commission estimates based on unpublished NDIA data.

Participants by Indigenous and CALD status

The number of NDIS participants who identify as Aboriginal and Torres Strait Islander is broadly in line with estimates of disability prevalence for Aboriginal and Torres Strait Islander Australians. Aboriginal and Torres Strait Islander people represent 3 per cent of the population (ABS 2017a), and estimates of disability prevalence range from between 1.5 to 2 times the prevalence of the non-Indigenous population (ABS 2016a, 2016b; AIHW 2016). The NDIS data indicate that about 5 per cent of NDIS participants identify as Aboriginal and Torres Strait Islander.

However, some caution is warranted as it is not clear how the rollout schedule has influenced the number of Aboriginal and Torres Strait Islander participants in the scheme and there are some factors that may make it difficult for the NDIS to engage with Aboriginal and Torres Strait Islander people (many Aboriginal and Torres Strait Islander people with disability are reluctant to identify as people with disability and have only had a limited interaction with the disability service system (FPDN 2016)).

The NDIA does not report the number of culturally and linguistically diverse (CALD) participants as the data are not currently collected. That said, in the June 2016 quarterly report, the NDIA found that 4 per cent of participants in the trial were classified as CALD and that this was lower than expected (though again it is difficult to account for possible phasing schedule impacts) (NDIA 2016p, p. 34).[22]

The NDIA (2016t, p. 3) has developed a CALD strategy to support people from CALD backgrounds in accessing the services of the NDIS. CALD participants also have difficulties interacting with the planning process (chapter 5).

What do the early data tell us about package costs?

The scheme, at the end of the trial, came in under budget — there was a surplus of about 1.5 per cent of the funding envelope over the three years. However, this was in large part because not all committed supports were used (discussed further below).

The level of committed support (or a participant's package cost) is the dollar amount of support in a participant's plan. However, it is not necessarily the amount of support that a participant receives — there are a range of reasons why supports may be underutilised (discussed below). Over the course of the trial, the average annualised package cost was $36 049.[23] This is slightly below long-term modelling assumptions of average package costs ($38 360 in 2015-16 dollars).

However, making this comparison is of limited value because it does not account for the composition of participants included in the trial. Notably, the trial included a higher proportion of children (who typically receive less funded support than other participants because they receive more informal care). While participants with lower levels of function typically entered the scheme first during the trial — which would increase package costs — this was more than offset by the number of children entering the scheme.

To address this limitation, the Commission compared annualised package costs to the reference package amounts for each participant where level of function data were available. Reference packages represent the average expected package amount for a participant given their age, disability and level of function, and are a building block for the NDIA's modelling of scheme costs (box 2.6). Importantly, the package cost of a single participant is *not* expected to be equal to the reference package amount (factors such as scope for informal support and requirements for aids are important inputs into a participant's plan and can

[22] The NDIA (2017y, p. 7) identifies a participant as CALD if their country of birth is not Australia, New Zealand, the United Kingdom, the United States of America, Canada or South Africa, or their primary language spoken at home is not English.

[23] This figure excludes the cost of three large residential centres — Stockton and Kanangra (in the Hunter trial site) and Colanda (in the Barwon trial site) — which include a high concentration of high-cost participants in one geographical area. The average annualised package cost increases to $39 065 when they are included (NDIA 2016b, p. 46).

generate large differences between individual packages and reference package amounts), but package costs can be compared to reference packages at an aggregate level.

Box 2.6 Reference packages — fundamental to assessing financial sustainability, not individual packages

To acquit the study's terms of reference, it is necessary to examine the assumptions of the NDIA's financial sustainability modelling, and to consider the reference packages used to project costs for different cohorts of people with different disabilities over the long term.

Reference packages form a key part of understanding long-term costs, and whether the scheme is 'on track' in aggregate. That said, reference packages (and the data presented in this chapter) should not be conflated with what an individual might expect to receive in an individualised funded package at any given time. This is because a package received by an individual is determined by much more than a reference package (chapter 5), and the reference package amount does not account for an individual's particular goals, nor what supports may be reasonable or necessary in a particular individual's circumstances.

Comparing annualised package costs to the reference package amounts is further complicated by participants in Shared Supported Accommodation (SSA). SSA is accommodation for people who require specialist housing solutions and intensive support needs. SSA is designed for participants with extreme functional impairment. As such, package costs for participants in these facilities are substantially higher than other scheme participants (typically about $200 000).

At the end of June 2017, 8 per cent of participants with plans approved from July 2016 were in SSA. While the Commission's estimates include participants in SSA, there are reasons why the package costs of these participants may be lower as the scheme matures.

- There are a number of participants with relatively high levels of function in SSA who will potentially require significantly less support if they receive appropriate capacity building supports early in their lives.
- SSA services are currently delivered under in-kind arrangements and as such are likely to be priced on the high side. State and Territory Governments determine the price of in-kind services (chapter 7).

There are also some data integrity issues around data on committed supports for the transition period linked to the use of the NDIA's ICT system. The NDIA has made adjustments to the data provided to the Commission (and to the data that the NDIA publishes to meet its reporting requirements) to address a number of the identified issues.

For its position paper, when it compared annualised package costs with reference package amounts, the Commission found that the average annualised cost of packages was higher

than expected given the characteristics of participants ($60 000 compared to $56 000) for the period 1 July 2016 to 31 March 2017.[24]

However, after including data for the June 2017 quarter, the average annualised cost of packages has decreased and is now in line with expectations given the characteristics of participants ($54 000 compared to $55 000). A large part of this change can be attributed to the noticeable decrease in the proportion of participants who are in SSA that has occurred over this time period (11 per cent compared to 8 per cent).[25]

Packages by disability

Scheme participants with spinal cord injuries have the highest annualised average level of committed support ($114 000), followed by those with cerebral palsy and acquired brain injury (both $91 000) (figure 2.6). If participants in SSA are excluded, the averages fall to $109 000, $72 000 and $71 000 respectively.

There is significant variation in the amount of committed support received by participants with high-cost disabilities. The distribution of committed support for these disabilities is skewed towards some very high-cost participants, many of which are in SSA (figure 2.6). Disabilities with lower average levels of committed support (like autism and visual and hearing impairment) exhibit less variation in costs. Some participants with high-cost packages may have comorbidities that increase the level of support required, but are classified into a single disability group for reporting purposes.

Average annualised package costs are significantly lower than the NDIA's long-term modelling assumptions for seven of the high-level disability groupings (figure 2.7). However, package costs for participants with intellectual disability (the most common disability grouping) and visual impairments are higher than long-term modelling assumptions (though the number of participants with visual impairment is much lower than the number with intellectual disability so the aggregated impact is much lower). Average annualised package costs are broadly in line with long-term modelling assumptions for the remaining disabilities.

Packages by level of function

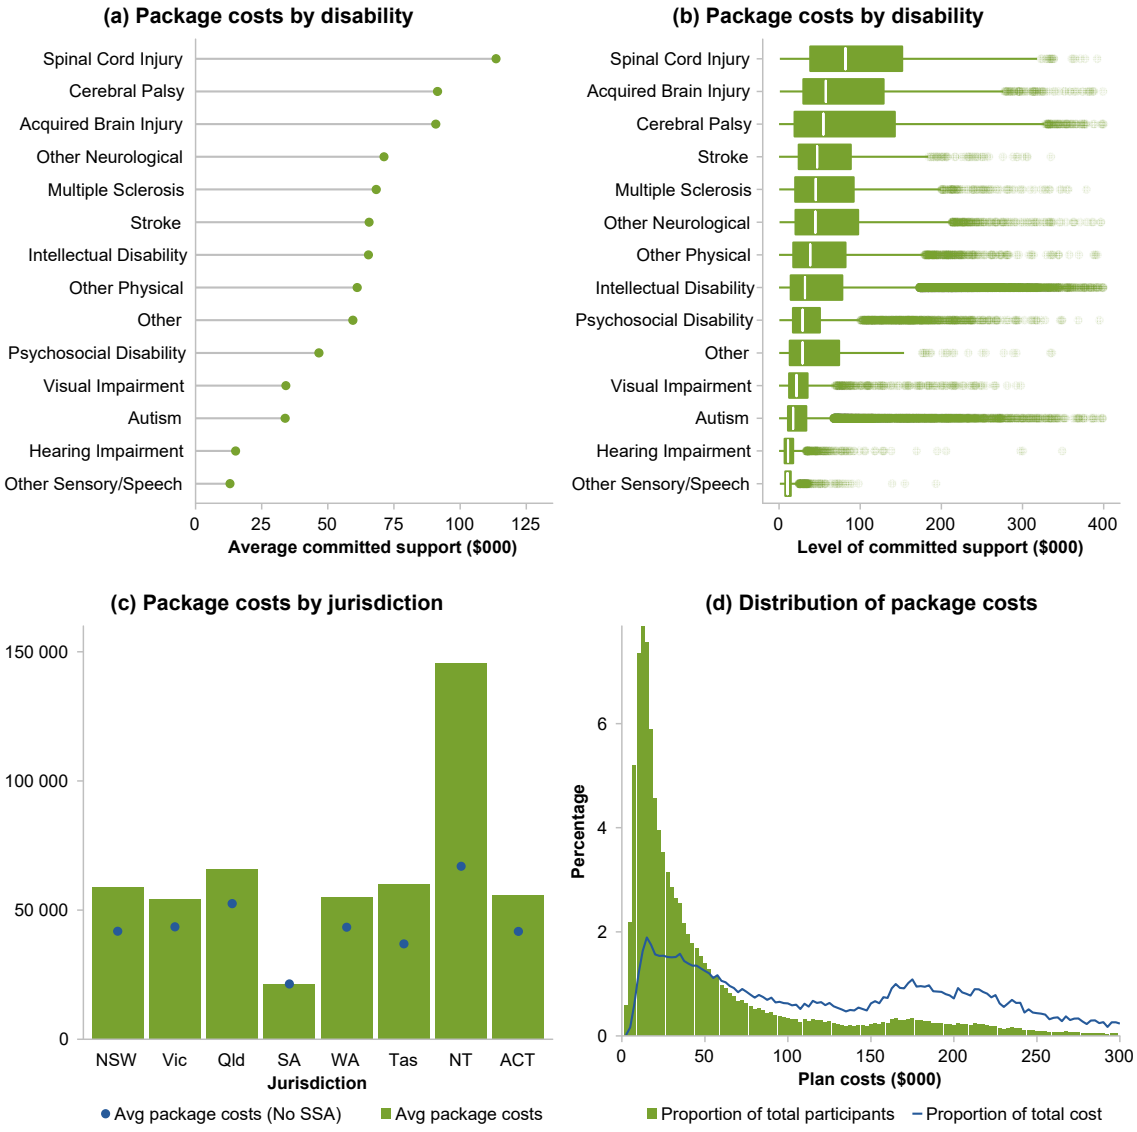
As expected, the average annualised package cost is highest for participants with the lowest level of function (figure 2.8). The average level of committed support for plans associated with low levels of function is almost $110 000, just over four times the amount for participants with high levels of function (about $26 000).

[24] Unless otherwise stated, the Commission has used plans effective after 1 July 2016 when analysing package costs.

[25] This trend brings the proportion of scheme participants who are in SSA towards the NDIA's long-term estimates of SSA prevalence (about 7 per cent).

Figure 2.6 **Some insights on annualised package costs[a,b,c]**

Plans effective from 1 July 2016



[a] For participants with multiple plans over the time period, the latest plan is used. [b] Figure (b) shows box plots of the distribution of the level of committed support for different disability groups. The white dash represents the median and the box shows the interquartile range (quartiles 1 and 3). The box plot tails show the minimum and maximum observations (though points that deviate by more than 1.5 times the interquartile range from the box are considered outliers and are denoted by a dot point). [c] In figure (c), Western Australia includes the Perth Hills NDIS trial site but not the WA NDIS MyWay trial.

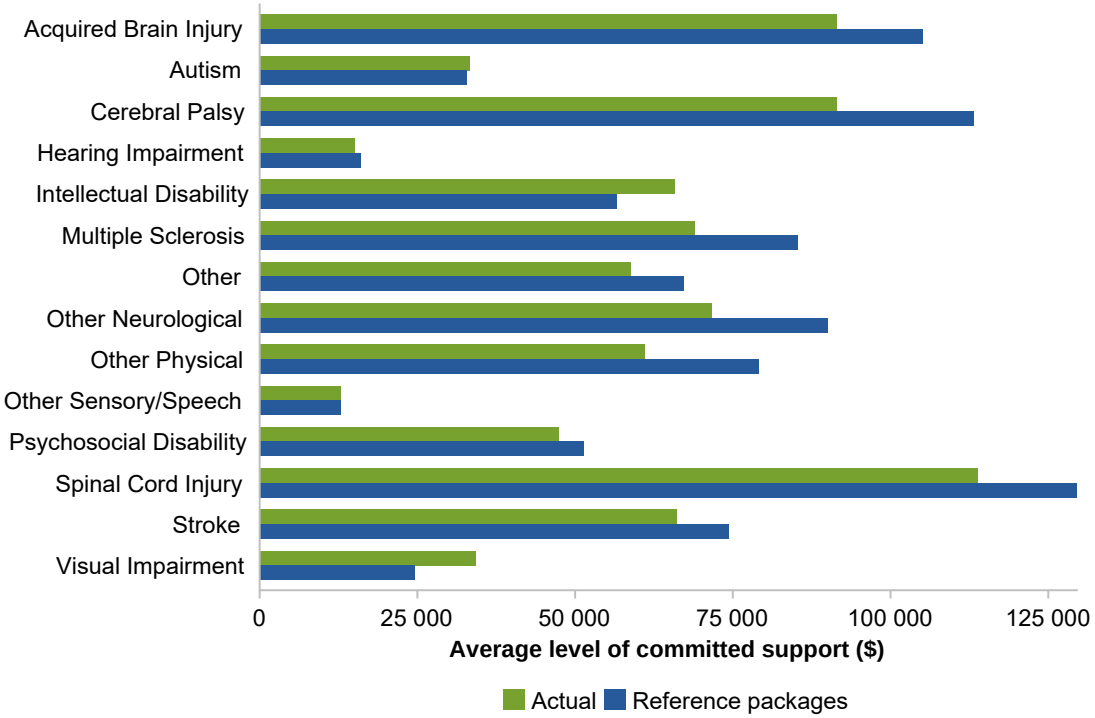
Figure 2.7 **Average annualised level of committed support compared to reference packages, by disability[a,b,c]**

Plans effective from 1 July 2016



[a] Reference packages are the average package cost assumed in the NDIA's long-term modelling based on age, disability and level of function. They *are not* what an individual should expect to receive in an individualised funded package at any given time. [b] For participants with multiple plans over the time period, the latest plan is used. [c] Reference packages are linked to assessment tools. Therefore, participants who are assessed using the generalised assessment tools (including all participants with psychosocial disability) are linked to a 'generalised' reference package.

Source: Commission estimates based on unpublished NDIA data.

There are significant differences between average annualised packages costs and the NDIA's long-term modelling assumptions by level of function (figure 2.8).

- The average level of committed support for participants with low levels of function (who require more support) is less than expected (about $109 000 compared to $148 000). One explanation for this result may be that reference packages are underestimating the amount of informal support provided by families and carers.
- The average level of committed support for participants with medium levels of function is higher than modelling assumptions ($50 000 compared to $41 000).
- Participants with high levels of function (who require less support) are obtaining higher value packages on average than the modelling assumes ($25 000 compared to

$11 000).[26] The NDIA suggested that fewer participants than expected entering the scheme with small package amounts (less than $10 000) is in part due to problems with planning processes (NDIA 2016a, p. 40).

Figure 2.8 **Average annualised level of committed support compared to reference packages, by level of function[a,b]**

Plans effective from 1 July 2016

They *are not* what an individual should expect to receive in an individualised funded package at any given time. [b] For participants with multiple plans over the time period, the latest plan is used.

Source: Commission estimates based on unpublished NDIA data.

Participants in SSA are a significant driver of average costs for the high and medium levels of function cohorts (figure 2.8). Given that SSA is designed for people with low levels of function, this suggests issues with how SSA was managed in the past. Historical experience suggests that investing in capacity building supports early to keep participants with high and medium levels of function out of SSA is critical for minimising scheme costs in the future.

Packages by jurisdiction

Participants in the Northern Territory have the highest average package costs ($150 000) followed by those in Queensland ($66 000). Participants in South Australia have the lowest average package costs ($21 000) (figure 2.6(c)).

[26] The average annualised package cost for participants with high levels of function ($29 000) only includes participants for whom reference package data are available. The average annualised package cost is $31 000 when all participants with high levels of function are included.

The average package cost differences are driven by the phasing schedules.

- About 39 per cent of Northern Territory participants with an approved plan are in SSA with an average package cost of $320 000.[27]
- The NDIS only began operating in Queensland at the beginning of 2016 and therefore has a disproportionate number of participants with low levels of function.
- Because of the scope of the South Australian trial, almost all the scheme participants in that state are children who generally have lower levels of committed support than older participants.

The distribution of total committed supports

The distribution of committed supports is heavily weighted to low cost packages with the most common package costing between $10 000–$15 000 (figure 2.6(d)).

The distribution of committed supports weighted by total cost of packages is flatter, peaking at $10 000–$15 000 and $175 000. The second of these peaks is attributable to participants in SSA. High cost participants account for a significant proportion of scheme costs — the top 20 per cent of packages (those over $80 000) account for 62 per cent of total committed supports.

Types of support provided

Most (over half) of the committed supports are earmarked to help scheme participants with their daily life — support for daily activities (box 2.7) (figure 2.9).[28] Social and community programs make up about 19 per cent of committed support and supports to improve daily living skills about 13 per cent. Employment supports make up about 2 per cent of committed support (discussed further in chapter 3).

[27] Scheme participants in SSA in the Northern Territory tend to be in the most complex types of SSA.

[28] Participants have some control over how they allocate their support budget depending on the support category (that is, they do have some scope to deviate from the support described in their plan).

Box 2.7 Types of support

Supports provided under the NDIS fall into one of fifteen *support categories,* which in turn can be grouped into three *support purpose categories*:

- Core supports — support that enables participants to complete activities of daily living, and enables them to work towards their goals and meet their objectives.
- Capital supports — an investment, such as assistive technologies, equipment, home or vehicle modifications, and funding for capital costs associated with specialised housing.
- Capacity building supports — support that enables participants to build their independence and skills.

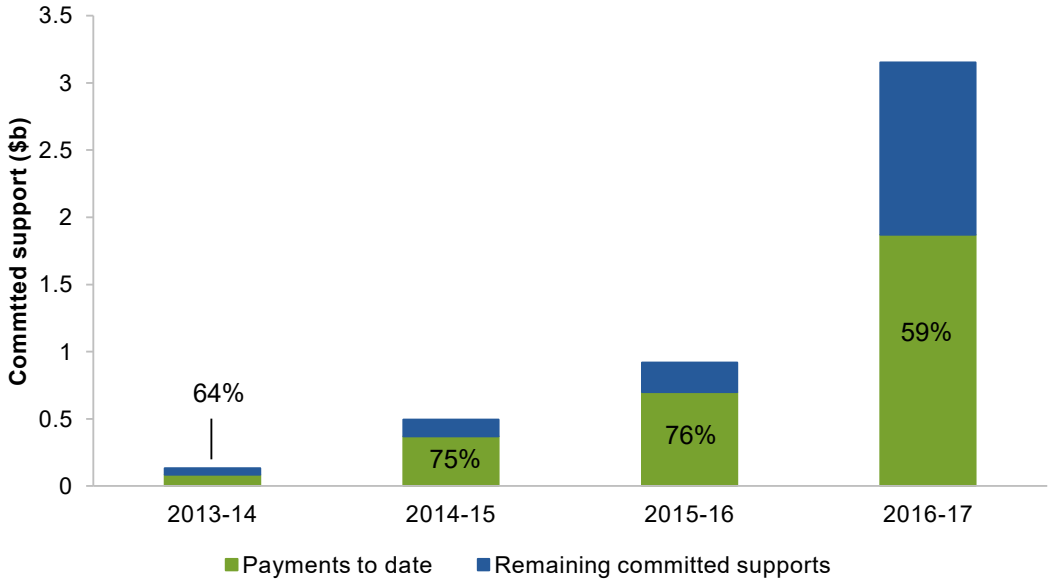
Utilisation

Participants are not using all their packages — for the final year of the trial (2015-16) just 76 per cent of committed supports were used (figure 2.10).[29] As discussed above, low utilisation is the reason why there was a surplus of about 1.5 per cent of the funding envelope at the end of the trial, despite higher than expected levels of committed support (NDIA 2016b, p. 144).

Figure 2.10 **Utilisation of committed supports**[a]



[a] Invoices for some payments for 2016-17 have not yet been received. The NDIA have indicated that the utilisation rate is likely to increase to 70 per cent once all invoices are received (NDIA 2017y, p. 37).

Source: NDIA (2017y, p. 37).

The utilisation rate for 2016-17 was substantially lower — 59 per cent of committed supports have been used to date. The lower rate is in part because not all services have been invoiced. Actuarial modelling undertaken by the NDIA indicates that the utilisation rate is likely to increase to 70 per cent once all invoices are received (NDIA 2017y, p. 37). The remaining difference can be attributed to the significant intake of participants in the first year of transition — new participants tend to have lower utilisation rates when they first enter the scheme (discussed below).

[29] This figure is based on payments that have been made to date. There can be a lag between the date a service was provided and the date that it was invoiced.

According to the NDIA (and supported by comments from other study participants), on-the-ground experience indicates that the reasons for the utilisation rates being below full utilisation vary by the individual and their circumstances. Some reasons include:

- insufficient supply of supports to meet demand, especially for specific supports (such as short-term accommodation) and in particular markets (such as remote and very remote areas) (Commonwealth Ombudsman, sub. 137; Inclusion Australia, sub. PP357; Macarthur Disability Services, sub. 57; APA, sub. 93; PDCN, sub. 29; Public Service Research Group, sub. 56; VICSERV, sub. PP284)
- participants experiencing difficulties navigating the system, which can mean they are unable to implement a plan once it has been approved (ABF, sub. 48; CSSA, sub. 166; Macarthur Disability Services, sub. 57; PDA, sub. 38; Vision Australia, sub. PP210)
- scheme participants not needing all the supports they are entitled to (planners overestimating the amount of funded support that will be needed, or including supports that do not meet the needs of participants) (Macarthur Disability Services, sub. 57; Vision Australia, sub. PP210)
- the market for plan supports (such as support coordination and plan management) being relatively immature and therefore limiting the help that participants can obtain (Anglicare Australia, sub. 157)
- some participants cannot easily access information about how much of their supports are available (Public Service Research Group, sub. 56).

Some underutilisation of supports is expected in the early stages of the scheme — as participants and providers adapt to a new system for providing disability care — but utilisation rates are expected to rise over time. In fact, utilisation rates did increase over the period 2013-14 to 2015-16, before dropping when a substantial number of new participants entered the scheme in 2016-17 (figure 2.10).

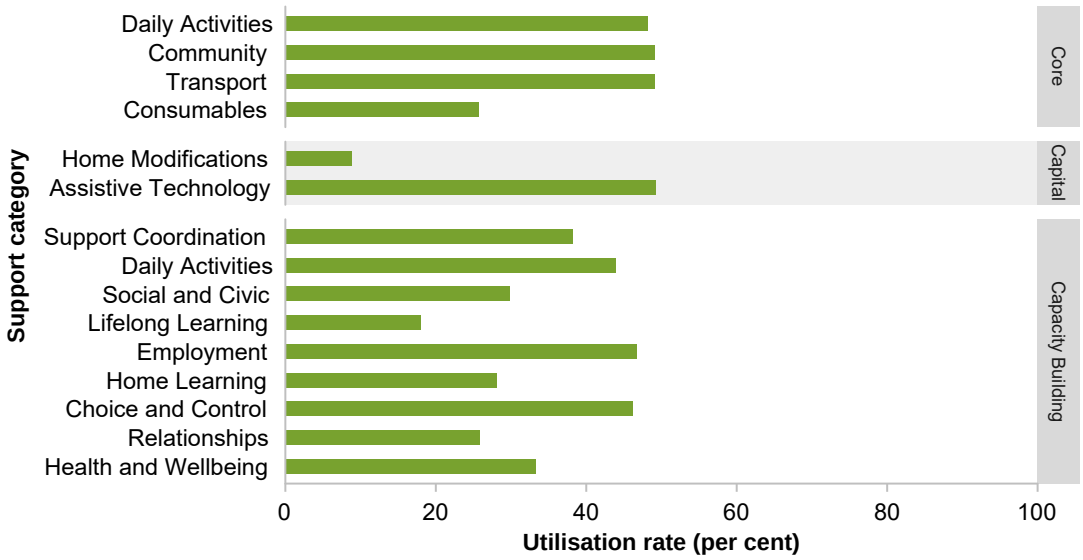
The NDIA (sub. PP327, p. 12) said that 'participant utilisation rates have increased as participants spend more time in the Scheme'. While the NDIA's estimates of scheme costs implicitly assume that all committed supports are spent when the scheme is fully implemented, the NDIA (sub. 161, p. 70) said that 'in a person-centred system the utilisation rate will never be 100%'. The NDIA also noted experience in other schemes suggests a utilisation rate of between 80 and 95 per cent could be expected.

Utilisation by support type

While there are data on utilisation rates disaggregated by support type, it needs to be interpreted with caution as it is not possible to incorporate claims data relating to in-kind supports (these data need to be sourced directly from jurisdictional reconciliations of in-kind supports). This means that disaggregated utilisation rates will be lower than the overall figure.

Keeping that caveat in mind, there are clear differences between the utilisation rates of committed supports for some support categories (figure 2.11). In 2016-17, the transport, assistive technology and social and civic support categories had the highest utilisation rates (each at 49 per cent) and the home modifications support category had the lowest (9 per cent utilisation rate).

Figure 2.11 **Utilisation rates by support type[a]**



[a] There are two reasons why the utilisation rates presented in this figure will be an underestimate: claims data relating to in-kind supports are not included, and invoices for some payments for 2016-17 have not yet been received. However, this is unlikely to have a significant impact on the relativities between support categories.

Source: Commission estimates based on unpublished NDIA data.

Utilisation in subsequent plans

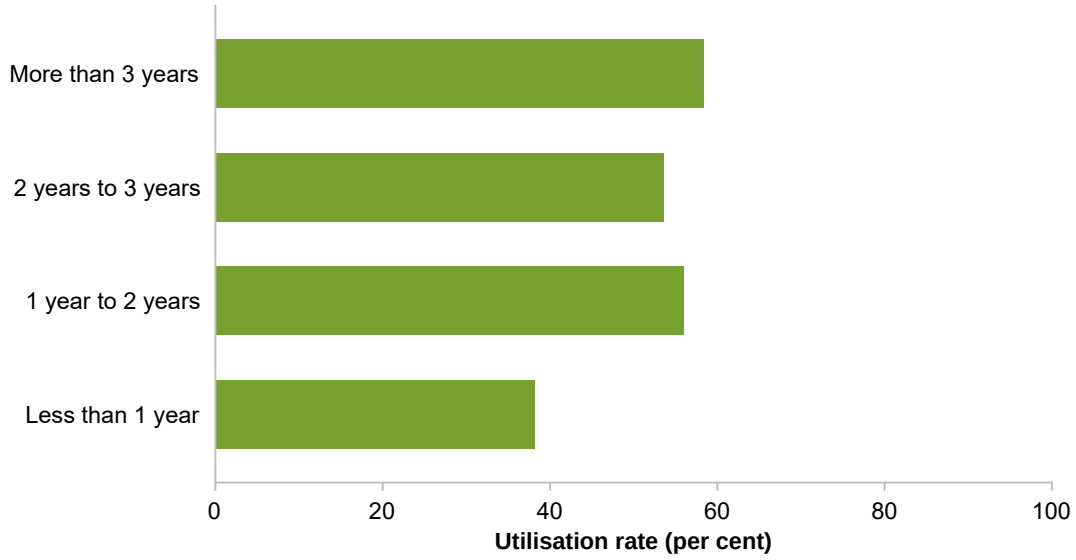
Utilisation rates are higher for participants who have been in the scheme for more than a year compared with those in their first year in the scheme (figure 2.12). But there are no significant differences in the utilisation rates for participants who have been in the scheme for more than a year (about 56 per cent). After adjusting for missing in-kind payments (about 13 per cent)[30] and the payments that have not yet been received (about 11 per cent),[31] and recognising the data integrity issues that impact the calculation of utilisation rates, the

[30] The utilisation rate for 2016-17 data provided to the Commission is 46 per cent, 13 percentage points lower than the reported utilisation rate in the latest NDIA quarterly report (NDIA 2017y, p. 37).

[31] The latest NDIA quarterly report notes that the utilisation rate is likely to eventually rise to 70 per cent once all invoices are received (NDIA 2017y, p. 37)

utilisation rate for participants who have been in the scheme for more than a year would be 80 per cent in 2016-17.

Figure 2.12 **Utilisation rates in 2016-17 by time in scheme[a]**



[a] There are two reasons why the utilisation rates presented in this figure will be an underestimate: claims data relating to in-kind supports are not included, and invoices for some payments for 2016-17 have not yet been received. However, this is unlikely to have a significant impact on the relativities between different lengths of time in scheme.

Source: Commission estimates based on unpublished NDIA data.

Some emerging cost pressures

Bringing the analysis of these three components of scheme costs together, the early scheme data suggest that NDIS costs are broadly in line with the NDIA's long-term modelling estimates.

While more children are entering the scheme than expected, this has been *more* than offset by lower levels of utilisation than expected. If the rollout of the scheme also remains behind the bilateral estimates, it is highly likely that scheme costs in 2019-20 will be lower than the NDIA's projections (this will be because fewer people than expected are accessing support).

However, it is critical that emerging cost pressures are managed as utilisation rates are expected to increase. The Department of Social Services (sub. 146, p. 20) echoed this sentiment, noting that 'better management of cost pressures should reduce the impact of increasing utilisation rates'. That said, if the cost pressures emerging from the trials and transition are not addressed, the financial sustainability of the scheme over the longer term will be at risk.

The NDIA is tasked with ensuring that the NDIS is financially sustainable, and this involves identifying and managing emerging cost pressures. The Scheme Actuary compares the experience of the NDIS to projections on an ongoing basis and reports to the Board quarterly. If cost pressures are detected early, management responses can be put in place before problems become entrenched.

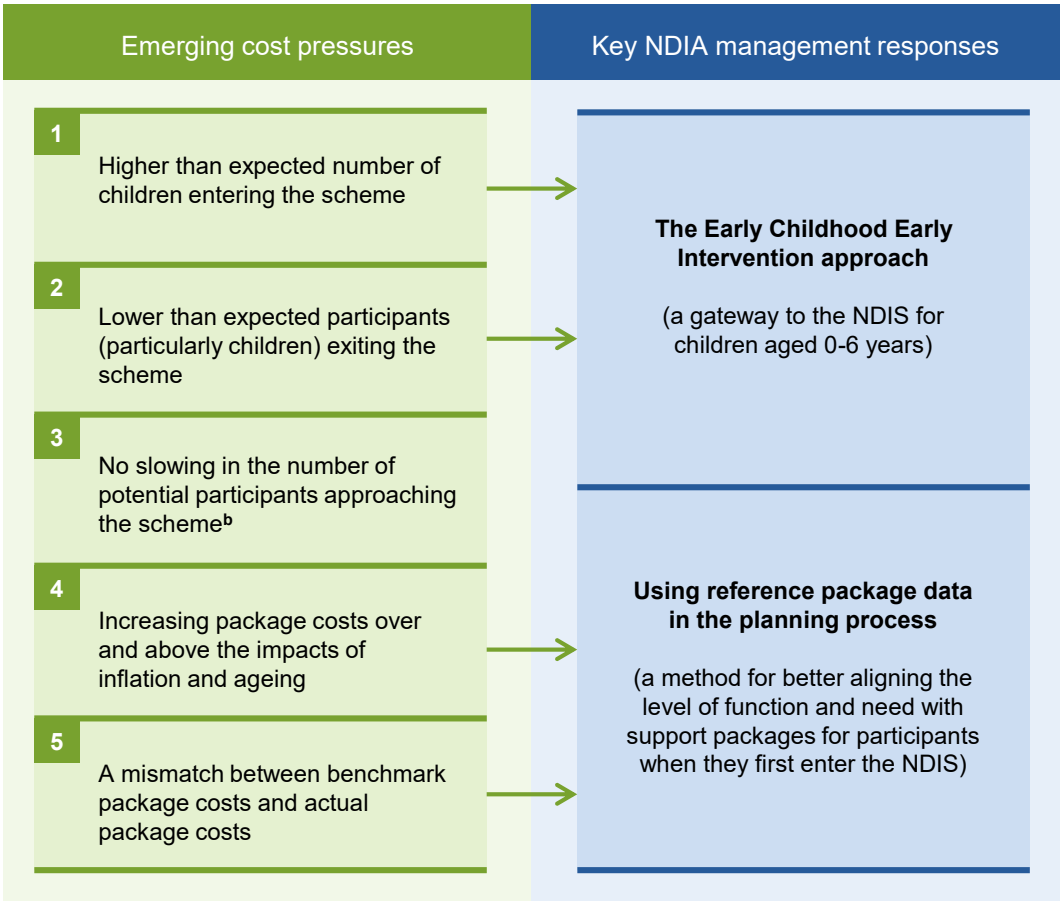
In the NDIA's most recent annual report (released in October 2016), the Scheme Actuary identified five cost pressures from the trial sites that need to be managed for full scheme, including:

- a higher than expected number of children (especially in the trial sites of South Australia, Victoria and the ACT)
- increasing package costs over and above the impacts of inflation and ageing (as plans are reviewed)
- potential participants continuing to approach the scheme (the number of people approaching the scheme in some trial sites that have been operating since 2013 is more than would be expected if only people with newly acquired disabilities were approaching the scheme)
- a lower than expected number of participants exiting the scheme (particularly children who entered the scheme under the early intervention requirements)
- a mismatch between benchmark package costs and actual package costs. There is a greater than expected level of variability in package costs for participants with similar conditions and levels of function (NDIA 2016b, pp. 16, 144).

In line with the insurance approach to identifying risks early and putting in place management responses, the NDIA has put in place initiatives to address these cost pressures (figure 2.13). The responses include the Early Childhood Early Intervention approach (chapter 4), and the use of reference package data in the planning process (chapter 5) (NDIA 2016b, pp. 16–17, 56–57).

While it is too early to conclusively assess the effectiveness of these initiatives, data for 2016-17 may indicate that the new planning process is helping to mitigate the cost pressures related to package costs (table 2.4). (Uncertainty about the effect of phasing schedules make strong conclusions difficult.)

Figure 2.13 **The NDIA's responses to emerging cost pressures**[a]



[a] This figure includes the NDIA's two main responses to emerging cost pressures. The NDIA has initiated several smaller projects to address emerging cost pressures, such as an analysis of reasonable and necessary costs across the lifespan of participants. These are detailed in the NDIA's 2015-16 Annual Report (NDIA 2016b, pp. 145–146). [b] Potential participants continuing to approach the scheme is not a cost pressure that can easily be addressed by the NDIA.

Source: NDIA (2016b, pp. 144–146).

Table 2.4 **The latest information on NDIS cost pressures**

Cost pressure	*2016-17 update*
Higher than expected numbers of children	The prevalence of 0–6 year olds did not significantly change in 2016-17, but the prevalence of 7–14 year olds and 15–18 year olds increased.
Lower than expected participants exiting the scheme	Few participants exited the scheme in 2016-17.
No slowing in the number of potential participants approaching the scheme	This trend continued in 2016-17 (though there was some reduction in New South Wales and the ACT).
Increasing package costs over and above the impacts of inflation and ageing	The rate of increase in package costs between plans increased in the first three quarters of 2016-17. In the last quarter, the rate decreased but it remains above expected levels.
A mismatch between benchmark package costs and actual committed support	This cost pressure improved in 2016-17, especially in the last quarter.

Source: NDIA (2017y, p. 39).

FINDING 2.3

The National Disability Insurance Scheme, at the end of trial, came in under budget. But of concern to the Productivity Commission is that this was in large part because not all committed supports were used (in 2015-16 the utilisation rate was 76 per cent). While lower than expected levels of utilisation means lower scheme costs, it also implies poorer outcomes for participants.

Based on trial and transition data, scheme costs are broadly on track compared to the National Disability Insurance Agency's (NDIA's) long-term modelling. At this stage, early cost pressures (such as greater than expected numbers of children in the scheme) are being more than offset by lower than expected levels of utilisation.

The NDIA has put in place initiatives to address emerging cost pressures. It is too early to assess the effectiveness of these initiatives.

3 Scheme benefits

Key points

- The costs of the National Disability Insurance Scheme (NDIS) need to be considered in the context of the benefits the scheme is expected to generate.
- The NDIS is expected to generate substantial economic benefits that will significantly exceed the additional costs of the scheme. Expected benefits include:
  - improved wellbeing for NDIS participants, their families and informal carers
  - increased economic participation for NDIS participants and their informal carers
  - broader efficiency gains and cost savings in the disability support system
  - savings to other government services.
- It is too early to assess whether the expected benefits of the NDIS are being realised — current outcomes data are based on trial site data and many benefits from the scheme are expected to be realised over the long term.
- That said, there is early evidence that the NDIS is changing lives — reported benefits include improved wellbeing, more supports, and greater choice and control for many scheme participants, their families and informal carers.
- But some people with disability report poorer outcomes under the NDIS when compared with previous disability services.
- The particular groups at risk of having a less positive experience with the NDIS include people with psychosocial disability, complex and multiple disabilities, and language and cultural barriers, as well as people with disability transitioning into the community from the criminal justice system, the homeless and the socially isolated.
- The NDIS has helped some participants and their carers enter or remain in the workforce, but there are concerns that employment supports are not being considered in many plans.
  - About one in five NDIS participants over the age of 15 years currently have employment support included in their plans (and for some age groups it is higher).
- There is a need for better data and reporting (to enable better analysis) on why many participants are not accessing employment supports.

The focus of this report is on National Disability Insurance Scheme (NDIS) costs, but costs need to be considered in the context of the benefits the scheme is expected to generate. The NDIS holds the promise of transforming the lives of people with disability, their families and carers with flow-on benefits for all Australians. It also provides insurance cover for all Australians. Realising the benefits of the NDIS is critical, not only for the wellbeing of people with disability and their families and carers, but also so the community continues to be willing to pay for the NDIS.

This chapter looks at the evidence to date (noting that it is still very early days) on the benefits of the NDIS. Section 3.1 provides a brief summary of the expected benefits and discusses some of the challenges with measuring the benefits. Section 3.2 looks at early outcomes for participants, families and carers. Section 3.3 examines employment outcomes. Section 3.4 looks at early indicators of the broader economic and social benefits of the NDIS.

3.1 Expected benefits and measurement of outcomes

The NDIS is expected to generate substantial benefits that are expected to significantly exceed the additional costs of the scheme (PC 2011, p. 56). The benefits are expected from:

- improved outcomes for NDIS participants, their families and informal carers
- increased economic participation (employment outcomes) for both NDIS participants and their informal carers
- broader efficiency gains and cost savings in the disability support system and savings to other government services.

Support for the NDIS (chapter 1) is based on the potential benefits from the scheme. Every Australian Counts, for example, spoke about the NDIS giving back to the economy.

> At its heart, the NDIS is about people. The Scheme is a once-in-a-lifetime change to the way disability support is delivered in Australia. It is going to affect millions of Australians. … Long-term, the NDIS will give back to the economy. Indeed, it would cost far more not to implement it. The NDIS will create jobs in the sector; improve long-term outcomes for people with disability, families and carers; and decrease reliance on health care and welfare. (sub. 92, p. 2)

And the Mental Health Community Coalition of the ACT said that it:

> … views the NDIS with great hope. It holds promises for a better more integrated life for people living with disability. It offers flow on benefits that will affect all Australians. But we must take care to ensure that we get it right. This requires time, investment, flexibility and persistence. (sub. 135, p. 2)

Tracking the benefits

Comparing the benefits of the scheme relative to expectations is difficult (and arguably more difficult than making the same comparison for costs). Some of the benefits are difficult to calculate because they are intangible (for example, the benefits to people with disability from greater choice and control). This was acknowledged by the Australian Federation of Disability Organisations.

> Some economic outcomes are easily captured and quantified — investment in capacity building or home modifications or equipment can reduce support costs in the long term. And if an NDIS participant is supported to move into employment, or a family carer re-enters the workforce, the economic impact of that change can be measured.
>
> But other, just as important outcomes, are not only more difficult to capture, they are more difficult to assign value. What value can we assign, for example, to increased inclusion? To increased independence? To increased dignity? (sub. PP325, p. 6)

But while it can be challenging to measure intangible outcomes, they can make a significant difference to the lives of people and need to be considered.

Many NDIS outcomes — such as the benefits of early intervention (chapter 4), efficiency gains in the disability sector, savings to government services and increased workforce participation (and the resulting fiscal savings) — will only be realised over the long term. This in part reflects the scheme's adoption of insurance principles that allow for upfront investments where these have the potential to yield future benefits. As the Victorian Government said:

> The NDIS' financial sustainability will critically depend on effective application of insurance principles to drive early investment that will save future costs by improving outcomes for people with disabilities, including their capacity to live independently and participate in social and economic life. This will also reduce the longer term reliance of people with disabilities and their carers on mainstream services and income support. (sub. 174, p. 14)

Data that can be used to assess the benefits of the NDIS are limited at this early stage of the scheme rollout. There are two main sources of data that provide some early insights.

- The NDIS Short Form Outcomes Framework (box 3.1).
- The intermediate report of the NDIS evaluation undertaken by the National Institute of Labour Studies (box 3.2).

Because of limited data, this chapter also relies on anecdotal information from stakeholders (in comments, submissions and consultations) to gain insights on benefits and areas where benefits could be at risk of not being realised. The limitation of anecdotal evidence is that it provides no information about the frequency that particular anecdotes (including issues) arise. Going forward, it is important that the right data are collected to ensure that benefits can be more comprehensively tracked as the scheme is fully rolled out and over the long term. Data issues are discussed in more detail in chapter 13.

Box 3.1 The NDIS Short Form Outcomes Framework

The National Disability Insurance Scheme (NDIS) Short Form Outcomes Framework is an approach to measure the outcomes of NDIS support. It includes eight indicators of participant experience (known as participant domains) as well as outcomes related specifically to families and informal carers (table below). It was piloted in the first three months of 2015 and is now being rolled out scheme wide.

The Framework will allow tracking of participant and scheme progress over time, and demonstrates how participants are faring relative to other Australians and to other OECD countries. It will also contribute to an understanding of what types of supports lead to good outcomes for people with disability, their families and carers.

Between November 2015 and July 2016, the NDIA collected data from existing participants to provide an early indicator of participant progress under the NDIS. More recent data mostly reflect participants' lives when joining the NDIS to form a baseline that can be used to assess the benefits of the scheme.

Participant domains
Choice and control — improved choice and control and planning and delivery of supports
Daily activities — increased ability to undertake daily activities with adequate levels of support
Relationships — increased levels of social inclusion and reduced experiences of loneliness
Home — improved satisfaction with home environment now and five years into the future
Health and wellbeing — improved health and wellbeing and increased ease of access to health services
Lifelong learning — increased opportunities to learn new things
Work — increased uptake of paid employment (and the associated social inclusion)
Social, community and civic participation — increased participation in community activities chosen by the participant, and reduced negative experiences associated with being excluded
Family and carer domains
Families have the support they need to care
Families know their rights and advocate effectively for their family member with disability
Families are able to gain access to desired services, programs, and activities in their community
Families have succession plans
Parents enjoy health and wellbeing

Sources: NDIA (2015d; sub. 161, pp. 27–36).

Box 3.2 **NDIS Evaluation**

In 2013, the Australian Government Department of Social Services commissioned a consortium led by the National Institute of Labour Studies to conduct an evaluation of the trial of the National Disability Insurance Scheme. The study monitors and evaluates the experience of participants, and their families and carers, service providers and their workforce in the trial sites of the ACT, Victoria, New South Wales, Northern Territory, South Australia and Tasmania.

An initial report, that described how the evaluation was being conducted, was delivered to the Department of Social Services in December 2015.

An intermediate report, based solely on trial site data, presented a synthesis of the quantitative and qualitative evidence collected to date and was released in December 2016.

- The qualitative evidence was sourced from in-depth interviews of people with disability, their families and carers (123 interviews), disability service providers (49), disability workforce stakeholder organisations (29) and National Disability Insurance Agency staff (87).
- The quantitative evidence is based on a survey of about 4400 people with disability and about 3400 families. Survey participants were split into two groups — those included in the NDIS trial and those outside the NDIS trial — and their experiences compared.

A final report is scheduled to be completed later in 2017. It will incorporate an additional wave of survey data.

3.2 Outcomes for participants, families and carers

Generally, people with disability and their families face social and financial challenges and, as a group, are among the most disadvantaged in Australia (PC 2011, p. 112). People with disability are more likely to experience relatively poor health, lower levels of participation in education, training and employment, social exclusion, lack of access to goods, services and facilities and ongoing discrimination (COAG 2011, p. 12).

The NDIS is designed to deliver much needed support to improve outcomes for participants, their families and carers. Personalised supports are one of the main ways the benefits of the NDIS are realised (discussed in chapter 5, box 5.1).

The NDIS is improving lives

The NDIS is improving lives. Reported NDIS benefits include improved wellbeing, access to more supports, and improved choice and control for many scheme participants, their families and carers.

Participants and carers report improvements in wellbeing

One of the prime motives behind the NDIS is to improve the wellbeing of people with disability. Wellbeing is expected to improve under the NDIS via better quality of care, increased independence, and increased engagement in the economic and social life of the community.

When outcomes for NDIS participants are improved there are flow-on benefits to their families and informal carers. For example, reasonable and necessary care for participants may result in increased opportunity for informal carers to increase their social and economic participation.

Many submissions and comments received as part of this study spoke about the NDIS improving the lives of participants, their families and carers (box 3.3).

The NDIS evaluation found that many NDIS participants, their families and informal carers have experienced improvements in quality of care, independence and overall wellbeing.

- 49 per cent of participants said the quality of care had improved with the NDIS.
- Many participants can now take part in activities independently and are able to follow interests and social activities that had previously been inaccessible.
- Carers reported an 'increased sense of positivity and wellbeing' because their NDIS participants were more involved in activities they enjoyed and were able to participate in wider interests outside of the home.
- The evaluation also reported that qualitative evidence 'makes clear that on the whole the NDIS has improved the wellbeing of scheme participants and their family members and carers' (Mavromaras, Moskos and Mahuteau 2016, pp. xv, xvi, 38).

The NDIS Short Form Outcomes Framework (based on data collected from existing participants over the period November 2015 to July 2016) also reported:

- about two-thirds of scheme participants aged 15 years and over said the NDIS had helped with daily living (64 per cent for participants aged 15–24 years and 71 per cent for participants aged 25 years and above)
- almost two-thirds of participants aged 15 years and over said the NDIS helped with health and wellbeing (62 per cent of participants aged 15–24 years and 65 per cent of participants aged 25 years and over)
- 89 per cent of carers with children aged under five years said the NDIS had improved their child's development (NDIA, sub. 161, pp. 36, 38).

Box 3.3 **The NDIS — changing lives of participants, their families and carers**

APC Prosthetics:

> … the participant outcomes from the scheme have been overwhelmingly positive. Many participants are enjoying improved mobility and improved quality of life outcomes that were simply not available through the existing State-based treatment pathways. (sub. PP244, p. 1)

Anne Hansen:

> … I have seen the life changes in people with disability who now have NDIS funding. They are now accessing community, having a good life and have hope for their futures. The burdens are off the family, some aged carers, and there is job creation. Broken wheelchairs are now being replaced and people who never had wheelchairs, now have and can access the community. I now see happy people. (brief sub. 2)

Kerrie Newton:

> My NDIS plan has given me funding for someone to come into the home to help. This has taken an enormous amount of pressure off my family so they can live a more normal life. I also received some transport funding and for the first time in four years I have been able to leave the house independently. I am feeling more positive about my future. (brief sub. 154)

Lorraine Rodrigues:

> The NDIS to me is knowing that my son will have a future of his own to look forward to if I am unable to care for him for whatever reason. (brief sub. 3)

The stories of Oni and Harry provided by the National Disability Insurance Agency:

> 'I've been working with a speech therapist to get my speech up and it's really helping. I can say a few more words and actually pronounce them properly and all that,' Oni remarked … 'He's only been in one year and the changes have been remarkable. I've seen his confidence improve out of sight. I've heard him be able to speak and say words that we didn't even know he knew,' Chelinay remarked.
>
> 'The NDIS has definitely improved our lives – Harry's and ours as a family,' she said. 'We've been able to get funding to purchase Harry a manual wheelchair … now he can access places he could never in his electric wheelchair, so he now has more flexibility. He was recently able to go the beach with his classmates – something he had never been able to do before!' (sub. 161, pp. 41–43)

The NDIS is providing more supports to many participants

Early indications are that most NDIS participants are accessing more supports under the NDIS than under the previous disability system, including more hours of support, a wider range of support and greater access to equipment.

- The NDIS evaluation found that 'the majority of respondents receive increased supports as a result of becoming NDIS participants' (Mavromaras, Moskos and Mahuteau 2016, p. xi).
  - The average number of different supports accessed by participants increased from about 2 to 3 under the NDIS (Mavromaras, Moskos and Mahuteau 2016, p. 32).
- The Every Australian Counts online survey reported that 78 per cent of participants and 74 per cent of carers said they had the same or more support than before the NDIS (Every Australian Counts 2017).

- The NDIS Short Form Outcomes Framework reported that 88 per cent of carers with children aged under five years said the NDIS had improved their child's access to specialist services (NDIA, sub. 161, p 36).

Many participants to this study also said that they are accessing increased supports under the NDIS. For example, Merle Searle said:

> The NDIS has made such a huge difference to us and our young man on a day to day basis as we are in the older age bracket i.e. over 70 and now because of the extra funding he has support workers that can take him into the community. (brief sub. 17)

Karen Wakely said:

> We began implementing our plan in Jan 2016. In a little over 12 months, the change it has facilitated has been extraordinary. For the first time we have been able to access meaningful therapeutic supports. (brief sub. 43)

The NDIS is giving many participants more choice and control over supports

In addition to improved wellbeing and more supports, a key marker of the success of the NDIS is whether the scheme is providing more choice and flexibility in the timing of supports and who provides them.

The NDIS evaluation found that 44 per cent of participants surveyed had a greater say over the supports they received, and 46 per cent had more choice over who provided their supports (Mavromaras, Moskos and Mahuteau 2016, p. 60). However, the NDIS Short Form Outcomes Framework data suggest that the percentage of people benefiting from more choice and control under the NDIS is significantly larger — 73 per cent of scheme participants aged 15–24 years stated that they had more choice and control over their life (NDIA, sub. 161, p 36).

A number of submissions to this study also commented on the NDIS providing greater choice and control. For example, Robert Altamore said:

> The NDIS has changed my life because it has given me the ability to set my own goals, exercise my choices and given me control of my money to spend on the adaptive technology and the training I need to change my life and participate in the general community. (brief sub. 36)

And Helen Harrop said:

> My son has been a NDIS participant since August 2016. He is 26 years old, … the benefits to my son within this short time span have been terrific. For the first time in his life he has control. Within his plan he has more opportunity to get out and experience many different options so he can enjoy life. (Every Australian Counts, sub. 92, p. 14)

FINDING 3.1

Early evidence suggests that the National Disability Insurance Scheme is improving the lives of many participants and their families and carers. Many participants report an increase in the amount of support provided, more choice and control over the supports they receive, improvements in their quality of care, greater independence and an increase in overall wellbeing.

But not all are having a positive experience

Some people with disability report poorer outcomes under the NDIS when compared with previous disability services. The NDIS evaluation found that:

- about 16 per cent of participants reported feeling that they had less choice and control of their supports under the NDIS
- about one-quarter of participants are accessing fewer distinct supports (Mavromaras, Moskos and Mahuteau 2016, pp. 60–61).

A Melbourne Social Equity Institute survey (42 NDIS participants and carers who were part of the Barwon trial) reported that:

  - participants' expectations and experiences of the NDIS were strongly influenced by their circumstances
  - resources to help people exercise choice and control over their support were not always available
  - in some cases, service users had limited choice over what was available for them to purchase with their funding package, especially in regional areas
  - participants feel like their views are often overlooked in planning processes
  - participants who do not fully understand the system tend to feel disadvantaged. (Warr et al. 2017, pp. 7–8)

The NDIA (2017y, p. 28) also found a fall in participant satisfaction with the scheme since it entered the transition phase — the percentage of participants describing satisfaction with the Agency as good or very good dropped from an average of 95 per cent in 2015-16 (quarter 4) to 84 per cent in 2016-17 (quarter 4). This may be linked to the speed of the rollout and changes to planning processes over that period (chapter 5).

In some cases, participants are not realising the benefits of the NDIS because they are finding it difficult to access disability supports (chapter 2 discusses underutilisation of supports). The NDIS evaluation attributes this to lengthy waiting lists for some providers or types of support, a lack of local providers, and lack of quality provision. Unmet demand for supports is more common for those living in rural and remote areas (15 per cent more likely than

those in urban areas), and for older participants (Mavromaras, Moskos and Mahuteau 2016, p. 31). This is discussed further in chapter 7.

Some of the most vulnerable are at risk of not realising NDIS benefits

Early evidence suggests that people experiencing poorer early outcomes under the NDIS tend to be some of the most vulnerable people with disability.

According to the NDIS evaluation, participants who are receiving less NDIS support are often those who are unable to effectively advocate for services on their own behalf, and participants who struggle to understand the sometimes complex NDIS processes (Mavromaras, Moskos and Mahuteau 2016, p. xi).

> … vulnerable families, those unable to navigate the NDIA website to find what services and providers were available, and those less able to articulate support needs, are less likely to experience greater choice over their supports. (Mavromaras, Moskos and Mahuteau 2016, p. xiii).

In particular, both the qualitative and quantitative data from the NDIS evaluation indicate that people with mental health and psychosocial disability are more likely to report less choice and control over supports since becoming NDIS participants (Mavromaras, Moskos and Mahuteau 2016, p. xiii).

Study participants also identified a number of groups who appear to be at risk of having a less positive experience with the NDIS. These include people with psychosocial disability, complex and multiple disabilities, and language and cultural barriers, as well as people with disability transitioning into the community from the criminal justice system, the homeless and the socially isolated (box 3.4).

It is important to monitor the utilisation of NDIS supports to identify gaps where vulnerable groups may be 'falling through the cracks'. This study identifies a number of areas where support for vulnerable people with disability could be improved.

- Chapter 4 recommends a specialised psychosocial gateway to improve how the scheme engages with people with psychosocial disability.
- Chapter 5 looks at planning and the use of specialised planning teams.
- Chapter 6 discusses the role of Local Area Coordinators and interface issues between the NDIS and mainstream services.
- Chapter 7 discusses provider of last resort arrangements.
- Chapter 10 considers support coordination.

Box 3.4 Concerns that for some the NDIS experience is less positive

Health Services Union:

> Increasingly, social policy theorists and researchers are positing that the NDIS has 'been constructed predominantly with people with physical and sensory disabilities in mind. For this constituency, who have less difficulty in negotiating the world, the [scheme's] emphasis on individual autonomy and agency makes the most sense. For those with complex and multiple disabilities, and for people with cognitive and intellectual impairment, in contrast, the benefits are less clear, and an individual approach can be counterproductive.' HSU members have echoed these sentiments. (sub. 132, p. 20)

Cohealth:

> It is [also] anticipated that the capacity for outreach will be significantly diminished due to the NDIS pricing structure. The most marginalised and vulnerable groups (eg homeless, CALD [culturally and linguistically diverse] communities, young people, Aboriginal and Torres Strait Islanders), and those who are particularly unwell, often need assertive and active outreach to engage. …
>
> With a framework based on individual choice and control, consumers who don't have knowledge of the NDIS, the ability to advocate for themselves or connections with support services (eg people who are homeless or socially isolated) may miss out on the benefits of the NDIS. It is critical that existing services and supports continue to be funded to ensure supports are provided to the most vulnerable groups. (sub. 50, p. 13)

Early Childhood Intervention Australia Victoria/Tasmania:

> ECIA members report lower numbers of children and families from some backgrounds accessing the NDIS system. In particular, there are fewer families from culturally and linguistically diverse (CALD) backgrounds, fewer Aboriginal and Torres Strait Islander families and fewer vulnerable children and families. Providers largely attribute this to the many hours of extra support required in pre-planning to facilitate access for these families to the scheme. (sub. 129, p. 8)

Psychiatric Disability Services of Victoria:

> … as implementation of the NDIS is rolled out across our State, we are becoming increasingly concerned that the design and functionality of the NDIS does not appropriately align with the needs and requirements of people living with a mental illness. (sub. 169, p. 2)

Butterfly Foundation:

> Concern has been expressed, by a number of key organisations in the mental health sector, consumers and carers that the NDIS may not deliver on promised benefits for Australians living with complex mental illnesses, such as eating disorders. There is a fundamental tension between the NDIS' aim to support those with permanent and incapacitating conditions, and the belief that recovery from mental illness is possible. (sub. 78, p. 3)

Prader-Willi Syndrome Association of Australia:

> Even though some people with PWS can read, and speak quite well, their other cognitive limitations means they cannot take up the level of choice and control anticipated by the NDIA. People with PWS struggle with abstract concepts like a service level agreement, and cannot plan to monitor, or comprehend under-performance by providers, never mind dismiss them. They cannot understand invoicing or budgeting on an NDIS scale, nor the criticality of completing multiple layers of administration to ensure service delivery. (sub. PP228, pp. 2–3)

Public Health Association of Australia:

> Successful navigation of, and interaction with, a complex service environment at a time of rapid change and stress, such as release from prison, is likely beyond the capacity of most individuals with cognitive disability without support. Any gaps in the support and care from the lack of integration between the criminal justice system and disability systems will likely magnify the disadvantage for this vulnerable population. (sub. 134, p. 8)

FINDING 3.2

Not all participants are benefiting from the National Disability Insurance Scheme. The groups at risk of having a less positive experience include those with psychosocial disability, complex and multiple disabilities, and language and cultural barriers, as well as people with disability transitioning into the community from the criminal justice system, the homeless and the socially isolated.

3.3 Employment outcomes

For all individuals, the benefits of working in paid employment include increased economic security and improved wellbeing. For people with disability, the benefits of employment can also include feeling valued, useful and included in everyday life (NDIA 2017u, p. 4). As Michael Boyle commented:

> Work is important to the health and wellbeing of everyone but especially to those who are ill or have a disability and suffer consequent lack of self-esteem or possess limited opportunities for socialisation. Work helps in dealing with isolation and depression which add to the problems and difficulties of those with a disability and may be reflected in demands for further NDIS assistance. (sub. 27, p. 7)

For the community, greater workforce participation of people with disability can mean savings to government budgets (reduced welfare payments and increased taxable income). Epic Employment Services said:

> Throughout EPIC's 27 year life, we have seen time and time again the importance of helping someone find a job. The economic and social benefits that accompany employment for both the individual and the community cannot be overstated. Through employment, people have a reduced reliance on income support, make greater tax contributions and become consumers of more goods and services. (sub. 70, pp. 1–2)

But there can be barriers for people with disability participating in employment. The NDIS evaluation found that workforce barriers include:

- a person's health and disability
- a lack of opportunities
- employers' opinions of people with disability
- difficulties with transport and parking
- difficulties using facilities or equipment
- lack of schooling, training or experience (Mavromaras, Moskos and Mahuteau 2016, p. 78).

People with disability have lower labour force participation rates and higher unemployment rates than those without disability. In 2015, about 53 per cent of working-age Australians

with a reported disability were in the labour force and 10 per cent were unemployed. For those with a profound or severe core activity limitation, the labour force participation rate was significantly lower at 25 per cent and the unemployment rate higher (almost 14 per cent). This compares with an unemployment rate of about 5 per cent and a labour force participation rate of about 83 per cent for people of working-age without disability (ABS 2016a).

However, with the right supports, employment barriers can be surmountable for many people with disability. The story of Ben Hunter (box 3.5) is one example of how well targeted, individualised supports can lead to rewarding work opportunities and increased social inclusion.

Box 3.5 Reaching employment goals, the story of Ben Hunter

Ben is 21 years old, has Down Syndrome and is non-verbal. He is also the front man for the baking business, Ben & Co, Bakers with Purpose.

> … with Ben's NDIS funding, and with his career front of mind, Carolyn [Ben's mum] left her job as a primary school teacher, employed support workers and started Ben & Co, Bakers with Purpose. Selling produce at regular market stalls, the family business's focus is to now provide opportunities for young people with intellectual disability — to fill the gap they identified with Ben. …
>
> Carolyn said. 'Often when young people with intellectual disability leave high school they fall through the cracks. Many struggle to find purpose and direction in their lives. Most are relegated to non-customer-service type work where they don't get as many opportunities to regularly interact with the general public. We want to help change this'.
>
> She said their aim was to provide employment and mentoring experiences through Ben & Co. to help support young people with intellectual disability to acquire and further develop their social skills, alongside their hospitality and retail skills. (The Queensland Times 2017)

While Ben & Co started as a way to increase opportunities for Ben, it has grown into an enterprise helping young people of all abilities find their social independence and participate in the local economy (NDIA 2017e, p. 18).

Caring for a person with disability also impacts on employment. In 2015, the labour force participation rate for primary carers (56 per cent) and other carers (77 per cent) was lower than that for non-carers (80 per cent). Carers were also less likely to be employed (66 per cent) compared with non-carers (76 per cent)[32] (ABS 2016a).

The NDIS is expected to increase employment by:

- providing more appropriate support that allows participants to manage their disability in the workforce

[32] Participation and employment rates for carers aged 15 to 64 years. Primary carers are the main providers of informal care to people of any age with disability. Other carers provide informal assistance (but not the main care) to people of any age with disability and to older people (aged 65 years and older) without disability.

- making it easier to obtain care through providers, thereby freeing up informal carers to enter the workforce or increase their hours worked (NDIA, sub. 161, p. 30).

Estimates of potential employment benefits under the NDIS are presented in box 3.6.

Box 3.6 Potential employment outcomes from the NDIS

Increased participation of people with disability

- The Productivity Commission (2011, pp. 960–963) estimated that if Australia were to reach the average OECD relative employment rate for people with mild to profound disabilities, employment would rise by 100 000 people by 2050. And this, in turn, would increase Australia's GDP by an estimated 0.2 percentage points, or $8 billion in 2050. (The Commission also estimated that broader Disability Support Pension reforms could increase employment by an additional 220 000 people).
- PwC (2011, p. 26) estimated that if Australia realised disability employment ratios comparable to the top eight OECD economies, the employment increase could be 50 000 higher than the Productivity Commission's estimate.
- National Disability Services worked with State and Territory Governments to model the potential employment impact of the NDIS. In New South Wales a potential employment uplift of between 7800 and 12 400 people with disability has been identified (NDIA, sub. 161, p. 30).
- The NDIA (sub. 161, p. 31) estimated that the fiscal impact would be between $2.1 billion and $4.4 billion per year if between 103 000 and 218 000 people with disabilities are able to increase their hours of work or join the workforce (noting that the upper bound is based on the impacts of broader Disability Support Pension reforms).

Increased participation of informal carers

- The Productivity Commission (2011, p. 966) estimated that there were 120 000 unemployed, co-resident primary carers of people with disabilities who would be eligible for funded supports by the NDIS. If a conservative half of these unemployed carers returned to work, Australia's GDP was estimated to increase by $750 million annually.
- PwC (2011, p. 25) estimated that about 80 000 disability carers could enter the workforce or increase their hours worked as a result of the NDIS.
- National Disability Services work (with State and Territory governments) identified that 10 700 carers (on a full-time equivalent basis) in New South Wales and 4000 carers in Western Australia could return to the workforce as a result of the NDIS (NDIA, sub. 161, p. 31).
- The NDIA (sub. 161, pp. 31–32) estimated that the fiscal impact would be between $0.9 billion and $1.7 billion per year if between 56 000 and 104 000 carers could increase their hours worked as a result of the NDIS.

The NDIS has improved employment outcomes for some

The NDIS has helped some participants and their informal carers enter or remain in the workforce (box 3.7).

Box 3.7 Some participants report improved employment outcomes

Karene Gravener:

> I have improved physically, emotionally and mentally because of the support of the NDIS. We, as a family, have been able to live life, and pursue our dreams. My husband has been able to be in full-time employment without the stress of being a carer, and we are building our own home. (brief sub. 96)

Lauren McGowan-Slee:

> My condition got worse about seven years ago, and at my worst, I couldn't get out of the house and sometimes even bed. Last week I started full time work, a feat that was once seen as impossible. It's not easy. I get fatigued and crash out most evenings and end up in bed quite early, but I don't mind because I am living a meaningful life!
>
> Because of the NDIS, I have supports that mean I can do a job that works with my disability and have the physical home tasks I can't do taken care of. I can sit and use my brain with no worries, so that is what I do for work, but I struggle to do physical tasks so I get help for that. (brief sub. 52)

Richelle Carta:

> I was struggling to sustain my lifestyle with very minimal funding but due to the NDIS I can continue to be a wife, mum, work full time and have a life with my family by having ongoing funding to provide me with morning and night personal care support seven days a week. (brief sub. 111)

Lynne Foreman:

> … I can now choose who cares for me, as I now have a choice. I have the hours I need to live my life and also because of flexibility in my plan, I am now an employee … Most of us now feel we can take part in the community, and I know some because of the NDIS have part-time jobs. We are healthy in our mind and that's a good thing in its self. (brief sub. 71)

Susanna Goodrich:

> My son Toby is sixteen. He has Down Syndrome. He's had a rough few years with an autoimmune condition … The NDIS has provided funding that has changed Toby's life. His week has opened up from a routine of school, family life and the occasional social event, to a week that looks much like his other teenage brothers: he plays sport, goes out with peers, works in a part time job and will soon be learning how to catch the bus to the local shopping and entertainment hub. (brief sub. 39)

But some concern that participation benefits will not be fully realised

Some stakeholders argued that a more concerted effort is needed to realise the expected benefits of increased economic participation under the NDIS. National Disability Services, for example, said:

> Increasing the employment participation of people with disability and carers is fundamental to the financial sustainability of the NDIS. … The Productivity Commission anticipated that the then proposed NDIS would generate profound economic benefits and that a key source of these benefits would be 'increased economic participation for people with disabilities … and their informal carers'. … To date, the proportion of NDIS plans with employment supports is disturbingly low … (sub. 51, p. 3)

In 2016-17, the NDIA reported that:

- 16 per cent and 26 per cent of NDIS participants aged 15 to 24 years and 25 years and over respectively were in paid employment

- 30 per cent of family members/carers of participants aged 25 years and over were working in a paid job (about 45 per cent for carers of participants aged 0–24 years)
  - of those that had a paid job, 76 per cent of family members/carers of participants aged 25 years and over were permanently employed (74 per cent and 73 per cent for carers of participants aged 0–14 and 15–24 years, respectively)
- 57 per cent of family members/carers of participants aged 25 years and over said they were able to work as much as they wanted (42 per cent and 47 per cent for carers of participants aged 0–14 and 15–24 years, respectively)
  - of those unable to work as much as they want, over 80 per cent cite their family member with disability as a barrier to working more and about 30 per cent cited insufficient flexibility of jobs as a barrier to working more (NDIA 2017y, pp. 26–27).

Confusion around what employment supports are provided by NDIS

Employers, employment services and the NDIS all have a role in supporting the employment of NDIS participants (box 3.8).

Submissions to this study raised concerns about a lack of awareness of what employment supports are available in the community. Legacy Australia, for example, said:

> For many people with disability, getting a job is near impossible. Another simple but very important issue is that both those responsible for providing facilities and services and those in need of assistance are often unaware of the resources that are already available in the community. For example, many employers (including Government agencies) are not aware of programs such as 'Job Access'. There is a need to put more effort into ensuring that the extensive resources that are available in the community are communicated to those who need to know. (sub. 168, p. 3)

Others said there is confusion between what employment supports are available under the NDIS as opposed to mainstream services. Deafness Forum of Australia said:

> There is likely to be disagreement or confusion between existing programs and the NDIS in relation to which program is responsible for the cost of providing support to people who qualify for assistance through several programs. For example, an NDIS participant requiring particular technology or an Auslan interpreter to support them in the workplace might reasonably expect to have those needs met in their NDIS plan. However there is also the option to access technology and Auslan interpreters through the Job Access Employment Assistance Fund. This appears to be duplication in service provision that could lead to double dipping, or more likely, lead to the person not being able to access the support they need in a timely way if the NDIS and Job Access dispute which program is responsible for funding the supports. (sub. 127, p. 15)

Box 3.8 Employers, employment services and the NDIS

Employers

Employers are responsible for:

- making reasonable adjustments to enable people with disability to access their workplace
- employment-specific aids and equipment such as computers and modified desks
- reasonable adjustments to buildings, such as installing ramps
- transportation for work activities, such as attending a meeting (NDIA 2017o).

Employment services

Employment services and programs (including both disability-targeted and open employment services) are responsible for providing advice and support to:

- people with disability to prepare for, find and maintain jobs
- employers to encourage and assist them to hire and be inclusive of people with disability in the workplace (including support, training and resources, funding assistance to help employers make reasonable adjustments, and incentives for hiring people with disability, such as wage subsidies).

Disability Employment Service (DES), and Job Services Australia (JSA) providers are the primary source of assistance to prepare for, find and maintain employment (NDIA 2017o).

The NDIS

The NDIS funds supports to assist participants with employment where these are beyond the requirements of employment services and employers. The scheme also funds supports that participants would require regardless of the activity being undertaken. The scheme does not fund the cost of education, such as course fees. These remain the responsibility of the education system and individuals. NDIS employment supports include:

- assisting participants (who are not eligible for DES or JSA assistance) to build their skills and capacity to participate in employment, as well as assistance to find and maintain employment
- personal care or assistance with transport where the participant requires these supports regardless of the activity they are undertaking
- assistive technology devices such as wheelchairs and personal communication devices
- supported employment, such as services offered by Australian Disability Enterprises (NDIA 2017o).

The NDIS also provides School Leaver Employment Support (SLES), a reasonable and necessary support for Year 12 school leavers, to assist them to transition from school and reach their employment goals. SLES was introduced because the NDIA identified a need for employment support to ‘start young to set up expectations for employment’ as a strategy to address a culture of low employment expectations (from participants, families, planners and the community) for people with disability. SLES is tailored to meet participants individual goals and includes work experience, job skills training, travel training and links to ongoing support such as DES (De Natris and Battersby 2016).

An effective interface between NDIS employment supports, and other mainstream employment services is essential for achieving good outcomes for NDIS participants. Spinal Cord Injuries Australia stressed the importance of a well-integrated system of employment supports.

> … emphasis should be put on assisting people into the workforce through targeted support and designed in a way that works flexibly with mainstream employment assistance — the two areas should not work in isolation but [be] integrated across service provision. (sub. 61, p. 4)

And there must be clear boundaries between the responsibilities of the NDIS and mainstream employment services for the NDIS to be financially sustainable.

Employment supports are one of a number of disability support areas where interface issues are emerging between the NDIS and mainstream services. Interface problems and the role of Information, Linkages and Capacity Building in providing linkages to other services (including employment services) are discussed in chapter 6.

Concern that participants are not accessing NDIS employment support

There is concern that many NDIS participants (that could benefit from the opportunity to work) do not have employment supports included in their plans. For example, Westhaven Association said:

> The evidence from the plans being produced to date shows NDIA has failed to ensure that NDIS participants are supported to gain productive employment. Without the employment outcomes expected from the scheme, NDIS may not achieve the return originally projected by the Productivity Commission. (sub. 81, p. 2)

Some stakeholders said that planners do not have a good understanding of what employment supports are appropriate for scheme participants (House with No Steps, sub. 104, pp. 5–6; Roundsquared, sub. 170, pp. 5–6) and as a result, scheme participants are not offered employment supports, or encouraged to think about how they might increase their economic participation.

A number of stakeholders suggested that planners and LACs should be more focused on employment outcomes. National Disability Services, for example, said:

> A broad spectrum of employment options should be open to people with disability, including Supported Employment Enterprises … More must be done to boost demand for, and access to, NDIS employment supports. NDIS planners and LACs should adopt a 'work first' approach which motivates and assists an increased proportion of NDIS participants to connect with work. (2017a, pp. 8–9)

Similarly, Milner & Clyde said:

> We understand that one of the fundamental premises upon which the sustainability of the NDIS has been built is that increased levels of labour force participation by people with disability, and also by carers, will result in lower support and income replacement costs and liabilities. Currently, there is little evidence that there is a focus on workability. … We therefore believe

> that the introduction of a focus in participant plans on work participation is urgently required and should be actively monitored. (sub. 94, p. 2)

Qualitative evidence from the NDIS evaluation found that while there was an increase in participation in employment related activities over time, only a few NDIS participants were undertaking volunteer work, work experience, supported employment and paid work. Further, the evaluation reported that:

> Increased economic participation amongst people with disability was considered a long term process, with time needed to develop job-readiness skills, create programs to support both participants and employers, and to change cultural beliefs about employability and opportunities for employment for people with disability. It was argued that more needed to be done to develop effective guidance, supports and linkages to employers in order to open up labour market opportunities for people with disability. (Mavromaras, Moskos and Mahuteau 2016, p. xvi)

Recent unpublished NDIA data[33] indicate that $108 million — 2.4 per cent of NDIS funding for committed supports — is committed to employment supports (chapter 2, figure 2.9). While some stakeholders consider this to be a relatively small amount for a support that is expected to generate significant benefits, what is more important (than comparing funding of employment supports with other supports under the NDIS) is to look at whether the funding for employment supports is meeting its objectives.

About 9000 NDIS participants (or 19 per cent of participants over the age of 15 years) currently have employment supports in their plans. And for some age groups it is higher:

- 32 per cent for NDIS participants aged between 19 and 24 years
- 22 per cent for those aged 25 to 34 years.

On average, participants received $12 000 committed funding for employment support (table 3.1), however, some plans have over $35 000 of committed employment support funding.

Employment support varies by type of disability and level of function. The disability groups most likely to have employment supports in their plans are those with intellectual disability (28 per cent) and autism (24 per cent). By level of function, 23 per cent of NDIS participants with a relatively high or medium level of function have employment support in their plans, compared with 9 per cent of participants with a relatively low level of function (table 3.1).

[33] Commission estimates based on unpublished NDIA data on participants with plans from July 2016.

[a] This excludes 5 participants whose function is listed as not applicable.

Source: Commission estimates based on unpublished NDIA data, participants with plans from July 2016.

There are a number of reasons why increased economic participation flowing on from the NDIS may take some time.

- NDIS-funded initiatives to engage community and businesses to improve employment outcomes for people with disability are still being rollout out (Information, Linkages and Capacity Building funding was not part of the NDIS trial, chapter 6).

- The NDIS is most likely to be effective for people entering the system for the first time and will thus have a greater effect as time goes on.[34]

There is some early evidence that employment support is increasingly being included in plans, but the number of plans (with employment support being considered) that have been reviewed is relatively small.[35]

There is a need for better data and reporting (to enable better analysis) on why many participants (currently about 80 per cent of participants over the age of 15 years) are not accessing employment supports. In particular, work prospects vary by level of disability and some NDIS participants, such as those with a profound or severe core activity limitation, may never have the capacity to work. The NDIA should collect data on whether or not participants eligible for individualised supports through the NDIS have a disability that limits their capacity to work.

The ABS *Survey of Disability, Ageing and Carers* collects data on employment restrictions including whether a person with disability:

- is permanently unable to work
- restricted in the type of work they can or could do
- needs, or would need, at least one day a week off work on average
- is restricted in the number of hours they can, or could, work
- requires special equipment, a modified work environment or special arrangements
- needs ongoing assistance or supervision
- would find it difficult to change jobs or get a preferred job
- needs assistance from a disability job placement program or agency (ABS 2016a).

NDIA employment data should be collected in a format similar to this to enable the comparison of NDIS employment outcomes with ABS data on the outcomes of people with disability outside of the NDIS.

[34] In 2011, the Commission noted that those who have been in the system for a while often 'have missed opportunities for early intervention, had poor educational experiences, been dogged by low expectations by others, faced a community culture not strongly conducive to their employment and had long breaks from employment that erode skills and confidence' (PC 2011, p. 960).

[35] Commission estimates based on unpublished NDIA data (of participants with at least two plans and where the previous plan was at least 6 months old) indicate that of the participants with employment support in at least one plan, 25 per cent of participants gained employment support when the plan was reviewed, 57 per cent maintained employment support and 17 per cent no longer had employment support included in their plan.

The NDIA should also consider collecting and publishing information on other reasons why NDIS participants may not be accessing employment support. For example, a participant may:

- be permanently retired from the workforce
- already be employed and not in need of employment support
- be receiving all necessary support from mainstream employment services
- have low expectations of finding employment
- be unaware that employment supports are available under the NDIS.

RECOMMENDATION 3.1

The National Disability Insurance Agency should collect and publish data on whether or not participants eligible for individualised supports through the National Disability Insurance Scheme have employment restrictions. Data should be collected in a format similar to data collected on employment restrictions by the Australian Bureau of Statistics Survey of Disability, Ageing and Carers.

3.4 The broader benefits of the NDIS

As discussed throughout this chapter, the NDIS is expected to generate a number of broader economic and social benefits beyond the improved outcomes of people with disability and their families and carers.

In particular, the scheme is expected to replace funding from a range of other government programs. Examples include:

- the National Disability Agreement
- Home and Community Care
- residential and community aged care
- aids and appliance schemes
- transport taxi subsidy schemes
- psychiatric disability community supports (PC 2011, p. 779).

A review by the Australian Government Actuary in 2011 estimated these offsets to be worth about $11 billion in 2018-19 (AGA 2012, p. 26).

Beyond government program offsets, the NDIS is expected to have a range of additional indirect fiscal impacts. These include a reduced burden (and therefore cost savings) on the health and justice systems and reductions in the lifetime cost of disability as a result of early

investment and intervention. The NDIA's preliminary estimates (sub. 161, p. 29) suggest that the NDIS will reduce:

- costs for the health system by between $140-$300 million each year (by reducing hospitalisations for people with disability and limiting the need for people with disability to remain in hospital due to a lack of more appropriate arrangements)
- justice system costs by between $350-$850 million each year (by reducing incarceration rates of those with mental disabilities)
- supported accommodation costs by between $1.2-$1.6 billion each year (as a result of the increased ability for people with disabilities to live independently).

At this early stage of the rollout, it is difficult to measure whether these broader benefits are being realised. Chapter 13 discusses in more detail how benefits should be tracked over the longer term.

4 Scheme eligibility

Key points

- The eligibility requirements of the National Disability Insurance Scheme (NDIS), as set out in the *National Disability Insurance Scheme Act 2013* (Cwlth), are consistent with the principles of the scheme.
- However, eligibility is broader than the Commission recommended in 2011 in two key areas: the inclusion of people with substantially reduced functional capacity to undertake learning or social interaction; and children with developmental delay. These broader criteria have cost implications for the scheme. These groups were not included in the Commission's 2011 costings of the scheme.
- Data are not available to assess the cost implications of adding learning and social interaction to the eligibility criteria for disability requirements. The National Disability Insurance Agency (NDIA) should improve its data collection in this area.
- Trial site data show that a significant number of children are entering the NDIS with developmental delay.
  - Early intervention for children with developmental delay can yield benefits. This suggests that including these children is consistent with the insurance principles of the scheme. The NDIA should monitor research in this area and build its evidence base on what early intervention supports work for children.
  - The definition of developmental delay, as prescribed in the NDIS Act, sets a high standard for children to be eligible for individualised supports. However, during the scheme's trial, a high proportion of children in the scheme were found to not have a significant functional deficit relative to their peers. This partly reflected the transition arrangements for clients transitioning from state and territory schemes.
  - The recently introduced Early Childhood Early Intervention (ECEI) pathway is a tighter gateway in principle, and should result in better enforcement of the eligibility criteria for children aged 0-6 years (in all areas, including developmental delay). However, it is too early to assess the effectiveness of the ECEI approach in practice.
- While there is value in maintaining diagnostic lists that streamline access to the NDIS, the NDIA should make public the process for changing the conditions in these lists, including under what circumstances a change may be considered.
- There is broad support for people with psychosocial disability being included in the NDIS. That said, many concerns were raised about how some aspects of psychosocial disability align with the design and operation of the scheme.
  - The boundaries of the scheme are important, and should not be changed. However, a specialised psychosocial gateway should be introduced to improve how the scheme engages with people with psychosocial disability on an operational level.

For the National Disability Insurance Scheme (NDIS) to deliver cost effective outcomes and remain financially sustainable, it is important that the eligibility criteria are aligned with the objectives of the scheme. The legislated eligibility criteria, as they currently stand, target those people with disability who the Commission intended the scheme to cover. However, the criteria are somewhat broader than that proposed by the Commission in 2011 (PC 2011, pp. 174–175), and this has cost implications for the scheme.

There are a number of factors that affect scheme participant numbers, including the:

- size and age profile of the Australian population
- prevalence, incidence, nature and severity of disability within the population
- eligibility criteria
- effectiveness of entry pathways in upholding the eligibility criteria
- effectiveness of exit pathways when people no longer meet the eligibility criteria for individualised supports.

This chapter looks at the factors from this list that are relevant to the design of the NDIS — the eligibility criteria (section 4.1) and entry and exit pathways (section 4.2). One of the key eligibility issues raised in this study was the inclusion of psychosocial disability in the NDIS. This issue is discussed in section 4.3.

4.1 The eligibility criteria

The NDIS is for all Australians. It provides insurance against the costs of support in the event that a person acquires or is born with a significant disability. And anyone with, or affected by, disability can approach the NDIS for information, linkages and capacity building. Individualised supports under the NDIS, however, are targeted at people with permanent and significant disability or those who meet early intervention requirements. In this context, 'eligibility criteria' refers to access to these individualised supports.

The eligibility criteria are critical in an uncapped scheme

The NDIS is a new way of providing disability supports. When services were block-funded, governments had tight control of how much money was provided for disability services. However, individualised supports provided under the NDIS are uncapped — so long as an individual meets the eligibility criteria, and the supports provided are 'reasonable and necessary supports' (chapter 5), an individual will receive the support that they need and for as long as they need (often for their whole lifetime). This means that from a budgetary perspective, the NDIS is less certain than previous models of disability support.

The eligibility criteria are the main instrument available for determining how many people will receive individualised support through the NDIS. It is important that these criteria are clear, aligned with the objectives of the scheme, and rigorously upheld.

Eligibility differences when compared to PC 2011 recommendations

When the Commission designed the NDIS in 2011, it recommended that the eligibility criteria for individualised supports uphold the following principles:

- individuals should have a disability that is, or is likely to be, permanent reflecting the irreversible nature of disabilities; and
- individuals would meet one of the following conditions:
  - have significantly reduced functioning in self-care, communication, mobility or self-management, and require significant ongoing support (the recommendation to restrict access to people with significant, ongoing support needs — rather than anyone with disability — reflects the objective that the NDIS embody a risk-pooled insurance scheme, which focuses on minimising the impact of high cost, low frequency events)
  - qualify for an early intervention group (covering people for whom there is good evidence that early intervention would be safe, cost-effective and significantly improve outcomes — box 4.1) (PC 2011, pp. 13–14).

The Commission also recommended that participants meet residence and age requirements.[36]

Box 4.1 Why early intervention is important

An important recommendation in the Commission's 2011 *Disability Care and Support* inquiry was that individualised supports be available to 'an early intervention group, comprising of individuals for whom there is good evidence that the intervention is safe, significantly improves outcomes and is cost effective' (PC 2011, p. 63).

A key tenet of the NDIS is that it takes a lifetime approach to providing care and support. Early intervention is one way to embody this. Early intervention seeks to incur expenditure during the early stages of a person's disability in order to improve (or maintain) their functioning later on, or reduce the volume of supports that they need later in life.

Providing early intervention support through the NDIS can mean:

- a better quality of life for scheme participants by addressing many of their needs early, and building or maintaining their functional capacity
- a delay in the need for care (or a lower cost of providing care) in later stages of a participant's life, which contributes to a more financially sustainable scheme.

[36] In 2011, the Productivity Commission proposed that the NDIS would not cover people acquiring a disability over the age pension age (PC 2011, p. 14). At that time, the age pension age was 65 years.

The eligibility criteria for the NDIS (as set out in ss. 21–25 of the *National Disability Insurance Scheme Act 2013* (Cwlth)) are broadly in line with what the Commission recommended in 2011 (table 4.1). However, there are two key differences:

- a person can receive individualised supports under the disability requirements if they have substantially reduced functional capacity to undertake the activities of *learning or social interaction* — the activities proposed by the Commission were restricted to mobility, self-care, self-management and communication (PC 2011, p. 198)
- a child can receive individualised supports under the early intervention requirements if they have developmental delay.

Table 4.1 **A summary of the NDIS eligibility requirements**[a]

Age requirements	Residence requirements
Aged under 65	• Australian citizen • Permanent resident • Hold a protected special category visa
And meet either:	
Disability requirements	**Early intervention requirements**
Disability attributable to one or more: • intellectual • cognitive • neurological • sensory • physical impairments; or • an impairment attributable to a psychiatric condition; and	• Has one or more identified intellectual, cognitive, neurological, sensory or physical impairments that are, or likely to be, **permanent**; or • Has one or more identified psychiatric conditions that are, or likely to be, **permanent**; or • Is a child who has developmental delay; and
The impairments are, or are likely to be, **permanent**; and	The early intervention support is likely to benefit the person by **reducing the person's future needs** for supports in relation to disability; and
Impairments substantially reduce **functional capacity** or **psychosocial functioning** to undertake one or more of the following activities: • communication • social interaction • learning • mobility • self-care • self-management.	The early intervention support is likely to benefit the person by: • **mitigating or alleviating** the impact of the person's impairment on their functional capacity • **preventing the deterioration** of such functional capacity • **improving** functional capacity • strengthening the **sustainability of informal supports** available to the person, including through building the capacity of the person's carer.

[a] This figure represents an overview of what the Commission considers to be the main aspects of the eligibility criteria. The NDIS Act prescribes that more requirements are met than those outlined here.

Source: NDIS Act, ss. 21–25.

Both these differences allow more people to qualify for individualised supports under the NDIS than the Commission included when costing the scheme. The extent to which the less restrictive eligibility criteria are contributing to scheme participation, and consequently, scheme costs, is a key question for this study.

Based on the eligibility criteria proposed in its 2011 report, the Commission estimated that approximately 410 000 people would be eligible for individualised supports under the NDIS (PC 2011, p. 160). Using the Commission's estimates as a basis, the NDIA has increased the estimated number of scheme participants to 460 000 (or 475 000 including those aged over 65 years, as discussed in chapter 2). This change in expected numbers was mostly attributable to population increases and participants aged over 65 years.

Adding learning and social interaction to the disability requirements — what is the effect?

Data are not available to make an assessment about the impact on scheme costs of adding learning and social interaction to the eligibility criteria for the disability requirements. However, Speech Pathology Australia said advice from their members who are NDIS providers is that:

> … they have not been providing services to children whose only disability relates to learning and literacy — thus, it is our conclusion that the increased numbers of people entering the Scheme is not due to the eligibility of people whose *only* functional disability relates to learning and/or social interaction. (sub. 136, p. 15)

It seems reasonable to assume that relationships across domains exist. However, the NDIA does not collect data specifically on which, or how many, of the six activity domains specified in the Act that scheme participants enter through. This means that assessing the extent to which one particular domain is driving entry into the scheme, or how common it is for scheme participants to have reduced functional capacity across multiple domains, is not possible.

Collecting data at entry on which domains apply to each participant would not only inform what parts of the eligibility criteria are having a large impact on participant numbers (and therefore scheme costs), but also allow for more granular analysis of who is in the scheme and what their needs are likely to be. Such information may also be useful to the NDIA in its monitoring and forecasting roles.

RECOMMENDATION 4.1

When determining that an individual is eligible for individualised supports through the National Disability Insurance Scheme under the disability requirements, the National Disability Insurance Agency should collect data on which of the activity domains outlined in section 24 of the *National Disability Insurance Scheme Act 2013* (Cwlth) are relevant for individuals when they enter the scheme.

There was broad support for the collection of these data, including from Legal Aid NSW (sub. PP245, p. 4), Flourish Australia (sub. PP246, p. 2), Multiple Sclerosis Australia (sub. PP283, p. 5), Bruce Bonyhady (sub. PP333, p. 9) and the Queensland Government (sub. PP345, p. 5).

The NDIA — in response to the Commission's position paper — agreed that collecting data at entry about which domains apply to each participant would provide useful information on the drivers of scheme costs (sub. PP327, p. 16). The NDIA also said that collecting specific data on the activity domains will require data definitions and response formats to be developed, and suggested that the information begin to be published from the commencement of the full scheme (1 July 2019) (sub. PP327, p .17). This timeframe is reasonable.

Including developmental delay in the early intervention requirements — what is the effect?

A child has developmental delay if it takes longer for them to reach age-specific milestones than other children. The term developmental delay is used in the absence of a diagnosed condition — that is, there is usually a more specific condition causing the developmental delay, including disability, but this condition is not yet able to be formally identified. This can be because it is difficult to reach an accurate diagnosis given the age and capabilities of the child.

The 'developmental trajectory' of children with developmental delay varies. In some cases, children may 'catch up' to their peers either with or without support. Others may need more substantial support for a longer period, which is often the case if the underlying condition causing the developmental delay is a significant disability.

The effect of including developmental delay as a condition eligible for individualised support was explored in detail by Dyson, Cutter and Moore (2015). The review, which was commissioned by the Department of Social Services (DSS), found that:

- about 11 600 children with developmental delay or global developmental delay would be eligible for support under the scheme (p. 15) (box 4.2), with an estimated annual cost of $155 million
- the vast majority of children in the scheme with developmental delay or global developmental delay could be expected to progress to full scheme participation — in part because of the high access requirements for developmental delay, and in part because developmental delay and global developmental delay is 'often predictive of the future diagnosis of intellectual disability' (p. 87)
- ' … the costs associated with including children correctly identified as having [developmental delay or global developmental delay] is of immaterial consequence to the sustainability of the NDIS' (p. 9)

- given the likelihood that a child with developmental delay would progress to the full scheme, early intervention could reduce costs to the scheme in the longer term by reducing future need (p. 17).

Box 4.2 Developmental delay and global developmental delay – what is the difference?

Definitions for developmental delay and global developmental delay vary. The Commission looked at many definitions to draw out the key features that define the conditions.

A child has *developmental delay* when they take longer than other children to meet age specific milestones in a specific area (or domain). Because children develop at different rates, and some will inevitably reach a milestone before others, most definitions require that a child be substantially or significantly behind their peers before they are identified as having developmental delay.

In contrast, a child is considered to have *global developmental delay* if they take longer to meet specific milestones across multiple domains. Some definitions require only more than one domain to be affected, while others require all domains to be affected. The definition of global developmental delay published by COAG in 2012, required a delay across a majority (out of five) domains.

Different definitions also outline different domains to be considered. However, they often include:

- motor skills (both gross and fine)
- speech and language skills
- social and/or emotional skills
- cognitive ability.

The definition of developmental delay for the purposes of the NDIS is set out in section 9 of the Act, and is spelled out in full in box 4.4.

Sources: COAG (2012a, p. 4); Disability Services Commission (2011, p. 12); QDCCSDS (2014, pp. 4–5).

Including developmental delay is consistent with the objectives of the scheme

The evidence base on the effectiveness of early intervention in improving the trajectories for children with developmental delay, or reducing the future costs of their care, is still being developed. Nevertheless, there is general acceptance that for children with developmental delay, access to early intervention leads to improved outcomes (box 4.3).

Such evidence suggests that there is a firm rationale for children with developmental delay to be eligible for individualised supports under the early intervention requirements of the NDIS. In 2011, the Commission recommended that the NDIA build an evidence base on early intervention, in part to inform what forms of intervention are beneficial and therefore warrant potential funding through the scheme (PC 2011, p. 632). As discussed later in the chapter, the NDIA is working on developing the evidence base on early interventions for children.

The evidence on early intervention for children with developmental delay should be a particular focus, given the developing evidence base, and given the higher than expected number of children entering (and the lower than expected number of children leaving) the scheme.

Box 4.3 Evidence supports early intervention for developmental delay

Evidence points to children with developmental delay benefiting from early intervention supports. For example, when summarising the evidence, KPMG said:

> For children already exhibiting developmental delay, effective early intervention strategies can both alter the course of their developmental trajectories and prevent the onset of secondary complications … The earlier a child is identified as having a developmental delay or disability, the more likely they are to benefit from strategies targeted towards their needs. The success of early intervention strategies not only assists families through the provision of extra support for their child, but also decreases costs to schools and communities in the later years as children transition to school. (2014, p. 3)

Dr Michael Guralnick — now the Director of the Center on Human Development and Disability in the University of Washington — presented a similar conclusion:

> Early intervention for children at risk and for those with established intellectual disabilities is now firmly embedded in the context of general early childhood development. An overarching developmental framework has been advanced and has achieved a high level of consensus; one that is relevant to typically developing young children and to those vulnerable to a range of developmental problems, particularly intellectual disability. (2005, p. 318)

Guralnick also noted the:

> … long-established intervention science indicating that comprehensive early intervention programmes can, at a minimum, help prevent the substantial decline in intellectual development that generally occurs across the early childhood period for children with developmental delays. (2017, p. 211)

Early intervention for children with developmental disability was also described to be 'of clear benefit' by the Royal Australasian College of Physicians (2013, p. 2), while the World Health Organisation notes that early intervention for children with disability can enhance developmental competencies, minimise secondary complications and build the effectiveness of support networks (WHO 2012, p. 27).

The Victorian Government submitted that:

> Access to high quality early childhood intervention services has been demonstrated to improve outcomes for children with disabilities and their families. For families, the earlier the interventions begin, the easier it will be for them to adapt to the challenges they face when their children are identified with a disability or developmental delay. (sub. 174, p. 9)

Numbers in the scheme to date

Trial site data (to June 2016) show that just under 4000 individuals (or roughly one-third of the 11 600 estimate by Dyson, Cutter and Moore (2015)) entered the scheme with a primary health condition recorded as being either developmental delay or global developmental delay (NDIA 2016p, p. 58, table 2.1.11(c)). If the prevalence rate experienced in trial sites was observed nationally, there would be more children with developmental delay in the scheme than Dyson, Cutter and Moore's estimate.

However, trial site prevalence rates may not be reflective of prevalence rates expected on a national level. Further, the NDIA has recently redesigned the entry pathway for children aged 0–6 years with the introduction of the Early Childhood Early Intervention (ECEI) approach (discussed below). This changes how the eligibility of children is assessed, and is designed to better ensure that the eligibility requirements for individualised supports are upheld.

Two possible explanations for higher numbers of children

There are two possible reasons why there may be more children with developmental delay in the scheme to date than expected:

- more children meet the eligibility criteria than expected or
- assessment processes allow children who do not meet the eligibility criteria to enter the scheme.

This section looks at the eligibility criteria for developmental delay. The extent to which assessment processes could be contributing to higher than expected numbers is discussed in the next section.

The definition of developmental delay for the purposes of the NDIS is outlined in box 4.4. A child with developmental delay must meet this definition to be eligible for individualised supports under the early intervention requirements (as well as meeting residency requirements).

Box 4.4 How does the NDIS define developmental delay?

The definition of developmental delay is set out in section 9 of the NDIS Act. It states that developmental delay means a delay in the development of a child under 6 years of age that:

(a) is attributable to a mental or physical impairment or a combination of mental or physical impairments; and

(b) results in substantial reduction in functional capacity in one or more of the following areas of major life activity:

  (i) self-care

  (ii) receptive and expressive language

  (iii) cognitive development

  (iv) motor development; and

(c) results in the need for a combination and sequence of special interdisciplinary or generic care, treatment or other services that are of extended duration and are individually planned and coordinated.

Source: NDIS Act.

Some study participants raised concerns about the adequacy of the developmental delay definition in the NDIS Act. However, most of the evidence presented to the Commission on developmental delay suggests that the current definition requires a significant threshold to be met. For example, Dyson, Cutter and Moore (2015, p. 11) found that the definition of developmental delay prescribed in the Act sets 'a high access hurdle', particularly the requirements for there to be a substantial reduction in functional capacity, and the exclusion of children who only require uni-disciplinary intervention.

The ACT Government also said that a delay across one domain was in itself generally insufficient to qualify for individualised supports through the NDIS:

> … the NDIA has recently changed the operational guidelines relating to eligibility to the scheme for developmental delay. Specifically, the 'need for a combination and sequence of special interdisciplinary or generic care, treatment or other services that are of extended duration and are individually planned and coordinated' is being interpreted to mean children with only one area of delayed development are not eligible. As a result, the NDIA access team deems children with one area of delay not eligible for the scheme because they do not require interdisciplinary care and these children are no longer receiving (or renewing) packages or early intervention supports. (sub. 156, p. 9)

In making this point, the ACT Government expressed concern that this pushes the cost of providing support to people with a delay in only one area back onto State and Territory Governments. The fact that the NDIS sets a high access hurdle — which the Commission considers to be important — means that some children will require support outside the scheme. Consequently, all governments need to work together to ensure that there are supports outside the NDIS for children who do not meet the eligibility requirements.

Because the criteria that children must meet to qualify for individualised supports under the scheme is high, this suggests that it is the process by which children are entering the scheme (not the eligibility criteria) that is resulting in higher than expected numbers. This is consistent with evidence provided by the NDIA that a significant proportion of children who entered the scheme during the trial stage appeared to have little or no reduction in their functional capacity compared to their peers (discussed in the next section).

The number and cost of children with developmental delay in the scheme should continue to be monitored by the NDIA. Should changes to assessment processes be made, but children who do not meet the definition of developmental delay (as outlined in the Act) continue to enter the scheme, there is a strong case for changing the definition of developmental delay in the Act so that it is clearer under what circumstances a child would qualify for individualised supports.

4.2 Are entry and exit pathways effective?

Effective entry pathways are imperative to the successful functioning of the NDIS. They uphold the eligibility criteria of the scheme and only allow people who meet these criteria to qualify for NDIS supports. Excessively porous pathways may allow people who do not meet eligibility requirements to access the NDIS, placing cost pressures on the scheme.

There are two main pathways for people to enter the NDIS:

- the Early Childhood Early Intervention (ECEI) pathway for all children aged 0–6, including those with developmental delay (NDIA 2016g)
- a general pathway for people aged 7–65 years (NDIA 2016m).

Entry into the NDIS can be self-initiated, or facilitated by the NDIA (this includes the NDIA contacting people receiving disability services that are being phased into the NDIS when the scheme becomes available in their area).

The NDIA also has a list of defined programs (run by governments prior to the introduction of the NDIS). People receiving supports through these programs do not need to show that they meet the disability requirements, as the requirements for the programs and the NDIS are considered 'equivalent' (NDIA 2016m).

The NDIA said that these defined programs could be a contributing factor to the higher than expected number of children entering the scheme:

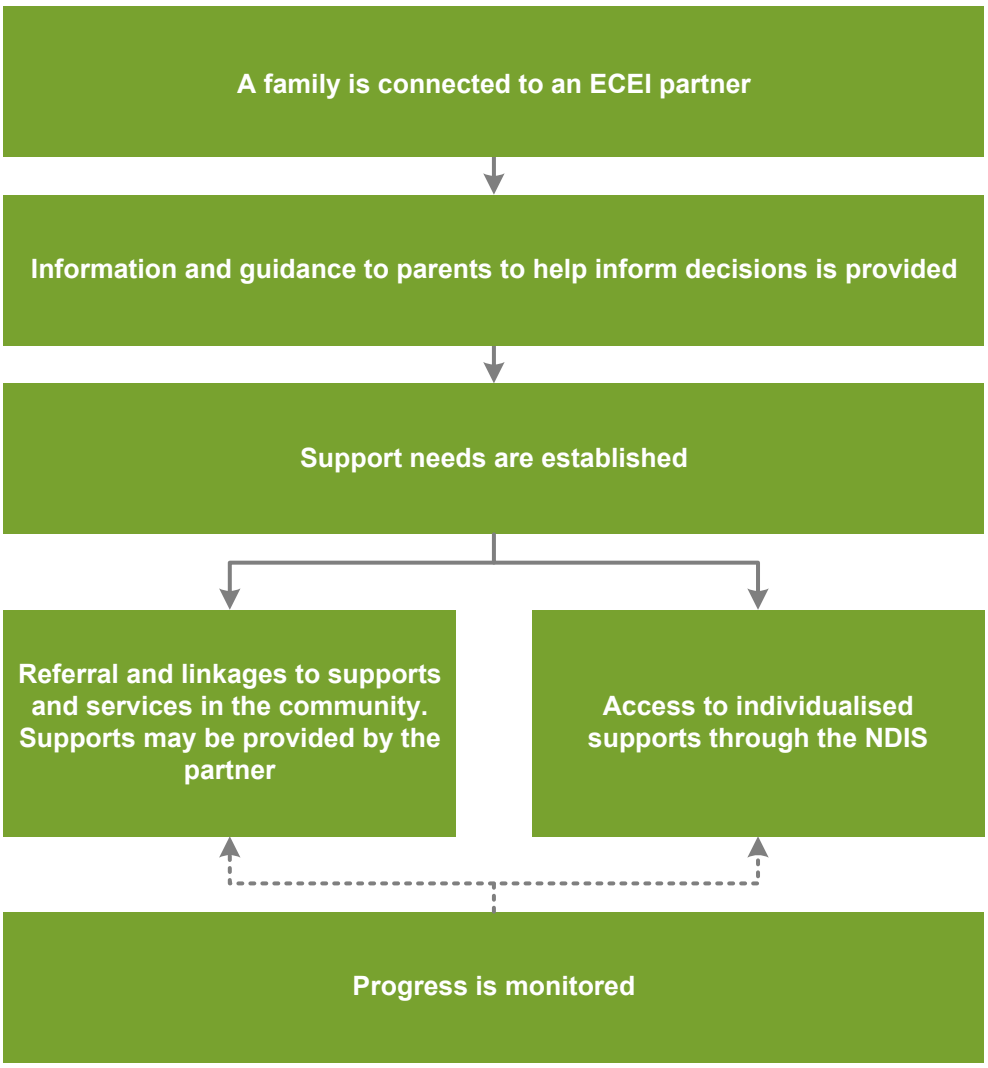
> The NDIA has observed that the change to the access criteria around developmental delay in conjunction with the diagnostic entry criteria for Commonwealth, State and Territory programs to support children with autism has led to increased numbers. (sub. 161, p. 75)

However, as an entry pathway, these lists are relevant during the transition phase of the NDIS, but will become largely redundant at full scheme.

The Early Childhood Early Intervention pathway

In response to the higher than expected number of children entering the scheme in the trials, the NDIA introduced the ECEI pathway for children to enter into the scheme (NDIA 2016b, p. 16). Prior to the ECEI pathway — which commenced in 2016 and is being rolled out in line with the full scheme — children entered the scheme via the general pathway — through the lodgment of an access request and subsequently an assessment of eligibility and need. Figure 4.1 summarises how the ECEI pathway works.

Figure 4.1 **The ECEI process**



Source: Adapted from NDIA (2017f).

Under the ECEI approach, a family with a child with disability or developmental delay seeking support is connected to an ECEI 'partner' in their local community. To be a partner, an organisation must be approved by the NDIA and have experience in early childhood intervention.

Partners assess the support needs of a child with disability and their family and, based on the assessment, determine the supports and services the child needs. Early childhood partners can provide:

- information and linkages to mainstream supports and services
- 'timely short to medium early childhood early intervention supports' — examples of these supports include: information, family based education, parenting support services and therapy (DSS 2016b, p. 11)
- access to a NDIS plan. If it is considered that a child is best supported by a NDIS plan, it remains a NDIA delegate who determines whether a child is eligible and approves a plan, although the ECEI partner is responsible for providing information that will inform a decision on access and assisting with plan development (DSS 2016b, pp. 11–18).

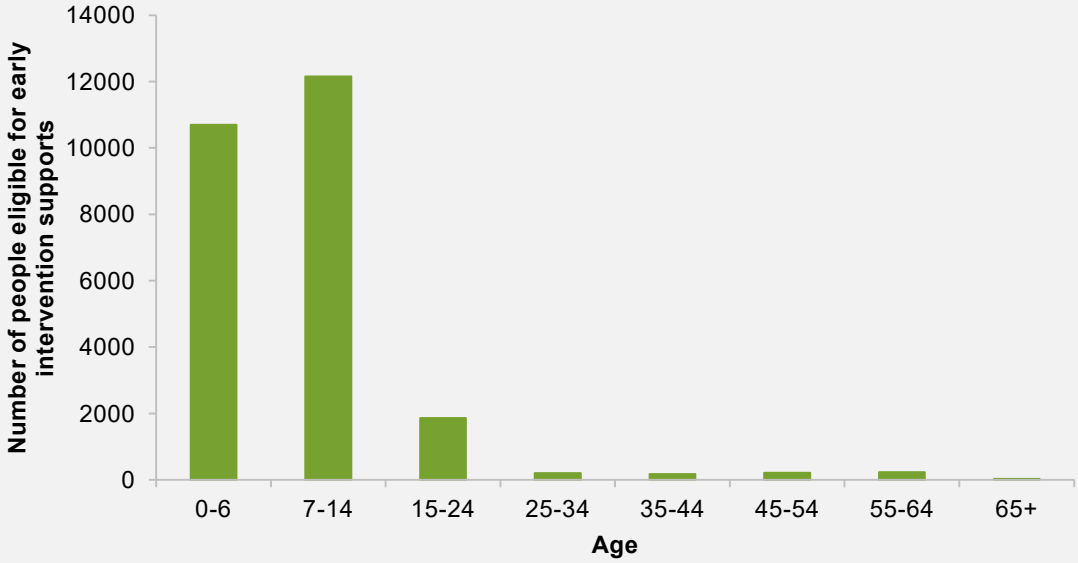
On paper, the ECEI approach does not appear to be very different to how people enter the NDIS under the 'general' pathway. However, the specialised nature of ECEI partners, and the fact that they can provide short- and medium-term support, and refer children to mainstream services, means that the ECEI approach places significant emphasis on upholding eligibility while supporting less severe cases outside of the scheme. The ECEI approach seeks to reduce the number of children with milder levels of disability from entering the scheme, thereby reducing cost pressures.

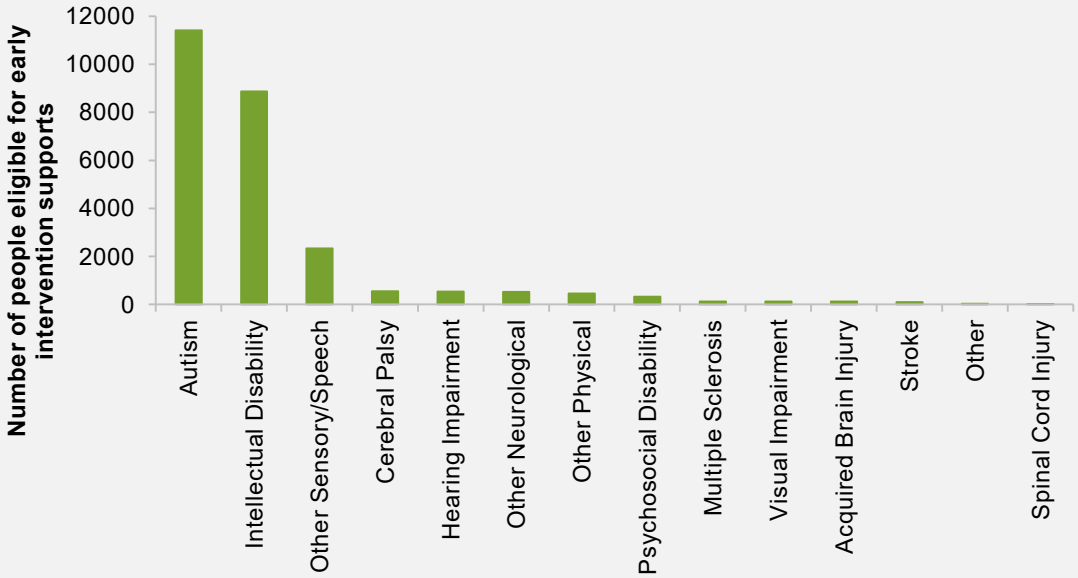
NDIA data on 'who' qualifies for early intervention through the legislated early intervention criteria show that almost 90 per cent are children, and are participants with autism or intellectual disability (box 4.5).

Box 4.5 Who is eligible for NDIS early intervention?

NDIA data provide insights on the main groups who qualify for early intervention in the scheme. Most (about 90 per cent) of those who entered the scheme under the early intervention criteria outlined in the NDIS legislation are children (aged under 15 years of age) and most have either autism or intellectual disability (based on access decisions between 1 July 2013 and 30 June 2017).

People who entered the NDIS by the early intervention criteria, by age and disability





For plans effective from July 2016, the average annual committed support for people who entered under the early intervention requirements was just over $18 100. For people receiving early intervention supports for autism and intellectual disability, the average annualised committed packages were about $17 700 and $17 100 respectively.

What study participants had to say about the ECEI approach

In general, study participants were positive about the likely effectiveness of the ECEI approach (box 4.6). The New South Wales Government, for example, said 'the ECEI process represents best practice for children under 7 years' (sub. 60, p. 17).

Box 4.6 General support for the ECEI approach, but some concerns

Lifestart Co-operative Limited:

> Over time, if implemented correctly with experienced and well credentialed Early Childhood Partners, outcomes for children, their families and the scheme will be positive. [The ECEI approach] should ensure that children get the right support, in a timely manner and in the right amount. It should see the number of children requiring individualised plans decrease. This trend has emerged with the introduction of ECEI Partners in the Nepean Blue Mountains where Lifestart has provided children with supports and assistance where these children and families were able to be well supported without a plan. (sub. 97, p. 4)

National Disability Services:

> NDS … supports the concept of the ECEI approach. The broad gateway of ECEI enables some children with lesser needs to receive short-term assistance … It also allows time to see how a child responds to short-term early intervention before making a decision on eligibility, while still giving immediate access to an NDIS package to those with obvious significant and long-term disability. (sub. 51, p. 4)

The Department of Social Services:

> The early indications are that the inclusion of developmental delay in the NDIS and the Early Childhood Early Intervention (ECEI) gateway approach is effective in supporting children. It is expected a number of these children will meet their development goals and will not require long-term NDIS supports. (sub. 146, p. 3)

Allied Health Professions Australia:

> AHPA and its members support the role of early intervention but note that the early childhood early intervention (ECEI) approach may risk excluding children with a need for support, increasing the burden on other systems and schemes. If the scheme doesn't meet the child's needs there is the risk that this may result in higher levels of support in the future negating the purpose of early intervention programs. (sub. 37, p. 10)

However, some study participants expressed concerns about how the ECEI approach is working for particular disability types, including children with hearing impairments (Deafness Forum of Australia, sub. 127, p. 13, The Shepherd Centre, sub. 107, p. 4). For example, the Royal Institute for Deaf and Blind Children said:

> Models such as the ECEI have resulted in a cost shift from the Agency to providers, with little specificity around specific abilities. The ECEI process has imposed significant and redundant elements for children with hearing impairment, and if strictly implemented would actually delay access to services. (sub. 95, p. 7)

While children with hearing and other sensory disabilities are likely to make up a small proportion of the children who access the ECEI approach, this underscores the need for the ECEI approach to be versatile enough to accommodate all disability types, particularly as it is intended to represent the primary entry pathway into the scheme for children aged 0–6.

Before the ECEI approach was introduced, the number of children receiving individualised supports through the NDIS without having a substantial functional deficit relative to their peers was significant. The NDIA pointed to their analysis of PEDI-CAT scores for a sample of children who entered the scheme during trial which found that:

> … the aggregated scores indicated that, overall, around 40% of participants had scores of 30 or more ('average') across each of the four domains. That is, these participants did not seem to have any identified deficits, compared to the normal range for their age. (sub. 161, p. 78)

To provide additional context around this statement, in its submission in response to the position paper, the NDIA noted that children who entered the scheme through the trial were assessed on the basis of a medical diagnosis. The 40 per cent figure was found by back testing a sample of children who entered during trial with the PEDI-CAT assessment tool (sub. PP327, pp. 19-20).

A small number of study participants questioned the appropriateness of the PEDI-CAT tool and how it was applied to certain types of disability (chapter 5). The Commission is not in a position to comment on the validity or accuracy of the PEDI-CAT tool. However, it is a common tool used by the NDIA to assess the severity of disability in children (a factor in determining eligibility for the scheme), and to have such a significant proportion of children in the scheme with mild or no identifiable deficits relative to their peers points to the importance of having a tight and rigorous entry gateway.

Children with mild or no deficits in the NDIS clearly runs counter to the objectives of the scheme, and depending on the volume of supports that these children receive, could have significant cost and equity implications. As such, a tighter gateway that better assesses eligibility is necessary.

The ECEI approach can be this tighter gateway. Using specialised organisations with experience in identifying and treating developmental delay and childhood disability should result in more accurate assessments of whether children meet the criteria for individualised supports under the NDIS. The emphasis on providing timely short- and medium-term supports as well as support through mainstream services to children with needs, but not severe enough to warrant entry into the NDIS, is also positive.

A version of the ECEI approach (for children and young people under 18 years) was part of the early NDIS transition in the Nepean Blue Mountains. According to the New South Wales Government, 'anecdotal evidence from this process suggests the effectiveness of the model in diverting children from specialist disability supports funded by the NDIS to mainstream and community based support options' (sub. 60, p. 18).

However, it is too early to tell if the ECEI approach has been successful in upholding the eligibility criteria of the NDIS, and contributing to beneficial outcomes for children who are ineligible for individualised support. And as the DSS observed, the 'gateway's actual success will be dependent on services outside the NDIS being available, and the management of family expectation about how children's needs are better met' (sub. 146, p. 13).

The NDIA has developed an evaluation and monitoring framework for the ECEI approach. In time, this framework should assist with monitoring children's pathways (including entry and exit from the NDIS via the gateway) and evaluating the effectiveness of the ECEI approach.

The Brotherhood of St Laurence commented on the importance of ECEI being evidenced-based:

> As the initial roll-out of the NDIS nears completion, children with developmental delays will be the largest group of people with disability entering the NDIS. Understanding what works for children who gain access to the NDIS is vital to manage costs. To ensure the NDIS provides value for money and can reduce the life-long impact of developmental delays on children, ECEI needs to be underpinned by a strong evidence-based practice, policy and research agenda. Most importantly, ECEI staff need access to the latest research and evidence to inform service design and practice. This is especially important given the emerging findings that some interventions and/or programs can be harmful and/or have limited evidence regarding their efficacy. (sub. 189, p. 12)

Mental Health of Young People with Development Disabilities also pointed to the potential harm that can result from interventions that are not evidence-based:

> Non-evidence based intervention, even if delivered by well-meaning therapists and service providers, have significant potential to do more harm than good, advance behavioural and emotional problems and limit a child's ability to develop. … It is imperative the NDIA has a mechanism to ensure that all stakeholders of the NDIS — participants and their families and carers, professional staff developing plans with participants, and practitioners and organisations delivering services — receive clear and empowering information regarding the high value of evidence-based interventions, supports and programs. (sub. PP269, p. 3)

The NDIA is also developing an early intervention approach for the 7–14 years cohort (sub. 161, p. 26).

Concerns about the ECEI approach KPIs

One of the 'Performance Indicator Targets' that applies to ECEI partners is that '<50% of children who connect with the Partner are referred for access to the NDIS' (DSS 2016a, p. C-6). Amaze (sub. PP281, p. 10) submitted that this target is inappropriate in an entitlement-based scheme and could be affecting the practices of ECEI partners.

The Commission is also concerned. One of the key features of the NDIS, compared with previous models of disability support, is that it is not rationed — anybody who meets the eligibility criteria can and should receive support. Whether a child meets the eligibility criteria should be the driver of access.

As such, the Commission considers that a target that seeks to ensure that less than 50 per cent of children who approach ECEI partners are referred for NDIS access is not appropriate. It is an unacceptable outcome if ECEI partners were to not recommend NDIS access for an

eligible child because they were required to meet a target. And there could be instances when more than half of the children who approach an ECEI partner will meet the eligibility criteria to qualify for access to the NDIS.

The target should be removed.

RECOMMENDATION 4.2

The National Disability Insurance Agency should remove the Performance Indicator Target placed on Early Childhood Early Intervention partners that seeks to ensure that less than 50 per cent of children who connect with the partner are referred for access to the National Disability Insurance Scheme.

The 'general' pathway

For people aged 7–65 years, entry to the NDIS begins with the lodgment of an access request. This can be lodged through a form, but is increasingly being completed by telephone. In lodging an access request, a potential scheme participant provides information on their age and residency status (the first two components of the eligibility criteria), as well as information about their disability.

To demonstrate their disability, an applicant is typically required to provide evidence of the condition from their treating doctor or specialist. The NDIA may also require evidence from an applicant's health professional on the impact of the disability on the applicant's ability to undertake tasks related to mobility, communication, social interaction, learning, self-care and self-management. For some conditions (contained in a list maintained by the NDIA), the impact of the disability on a person's functional capacity is assumed and further evidence is not required (NDIA nda).

The NDIA has 21 days to either decide whether the prospective participant meets the eligibility criteria, or to request additional information (NDIS Act s. 20). The additional information may require the potential participant being assessed or examined, and the NDIA has the authority to nominate where this occurs (s. 26(1)).

The Commission was presented with little evidence to suggest that the entry pathway for people under disability requirements is having an undue influence on scheme costs.

The role of diagnostic lists

The NDIA maintains lists — List A and List D — that allow streamlined access to the NDIS for people with certain conditions. Broadly speaking, these lists mean that, if someone has a condition on the list, they automatically meet certain parts of the eligibility criteria (box 4.7).

Box 4.7 **List A and List D**

List A

If an individual has a condition outlined in List A, the National Disability Insurance Agency (NDIA) 'will be satisfied that the person meets the disability requirements without further assessment', meaning in effect, the permanence of an individual's condition, and its impact on their functional capacity, is assumed (residence and age requirements still must be met). List A contains about 30 conditions. For some listed conditions, a specified level of severity must be met in order for the streamlined entry arrangements to apply.

List D

Under the NDIS Act, when assessing whether a potential participant is eligible for individualised supports under the early intervention requirements, the NDIA must be satisfied that the supports will benefit the person by reducing future need (s. 25(1)(b)) and benefit the person in one of the ways prescribed in s. 25(1)(c) (table 4.1).

However, if a child (aged under seven years) has a condition that is on List D, the NDIA 'is satisfied that the child meets the early intervention requirements without further assessment'. List D contains about 130 conditions, including global developmental delay.

Developmental delay (as defined in the Act) is not contained in the list, however it is given streamlined entry arrangements under the *National Disability Insurance Scheme (Becoming a Participant) Rules 2016* (Cwlth) (r. 6.10) that states that the CEO is taken to be satisfied that a child satisfies s. 25(1)(b) and s. 25(1)(c) if 'one or more of the child's impairments is a mental or physical impairment which, by itself or in combination with other mental or physical impairments, results in developmental delay' (p. 14).

Sources: NDIA (2016m, nda).

These lists represent a tradeoff. The appeal of the lists is that they:

- place less of an onus on a potential participant to demonstrate eligibility
- provide a degree of certainty for people with these conditions and their families that they will be supported through the NDIS
- reduce the administrative burden on the NDIA.

However, the lists can affect incentives. They can also be an overly generous entry pathway if set too expansively.

In the case of List D, which applies only to early intervention entry for children under 7 years, the presence of a diagnostic list can run counter to the insurance principles if it leads to the entry of children who are unlikely to benefit from individualised support. The list could also conceivably inhibit exits from the scheme — if diagnosis, rather than expected benefits form the basis of early intervention, a child may remain eligible so long as their condition is present, even if the participant has received early intervention and the expected benefits have been realised (or are unlikely to be realised).

While many post position paper submissions commenting on the lists acknowledged the tradeoff of maintaining these lists, the vast majority considered the benefits to outweigh potential risks.[37] The NDIA also supported maintaining the lists, noting that with List D:

> The NDIA is of the opinion that List D does not result in supports being provided to children who are unlikely to benefit from them. (sub. PP327, p. 18)

In arguing for maintaining List A, the NDIA said there was 'little evidence to suggest that entry pathways for people under the disability requirements is putting pressure on scheme costs' (sub. PP327, p. 19). However, the Agency did identify that:

> Autism Spectrum Disorders may represent a difficulty for List A, and there is evidence to suggest that use of the diagnosis process for autism may differ from the process's intent (resulting in access to the Scheme where eligibility requirements would not otherwise be met). (sub. PP327, p. 19)

Given the broad support for the lists, and little evidence that the lists are leading to people entering the scheme who would not meet the wider eligibility criteria, there seems to be value in maintaining the lists. However, because the lists are a key entry pathway, they should be monitored to ensure they work as intended.

There also needs to be an expedient process to change the lists if new information becomes available (for example, there may be new evidence that people with a particular condition respond differently to early intervention than previously thought) or if there is evidence that the lists are providing an entry pathway for people who would not meet the wider eligibility requirements (as the NDIA suggests might be emerging with respect to Autism Spectrum Disorders).

Given that the lists sit in the NDIA's operational guidelines, rather than the more formal NDIS Rules, there should be fewer barriers to the NDIA modifying lists as required. There is, however, limited transparency about the process by which the lists may be changed — something that was noted by some study participants (Children and Young People with Disability Australia, sub. PP358, p. 4 and National Disability Services, sub. PP295, p. 2). National Disability Services, for example, said in relation to List D:

> It is not clear why some conditions with widely varying degrees of severity are listed and others (such as autism) are omitted. The reasons for inclusion on the list or exclusion should be transparent. (sub. PP295, p. 2)

[37] Study participants who supported maintaining List A and/or List D included: Legal Aid NSW (sub. PP245, pp.4-5); Youngcare (sub. PP253, p. 3); ACT Disability, Aged and Carer Advocacy Service (sub. PP260, p. 3); Victorian Council of Social Service (sub. PP264, p. 3); EACH (sub. PP276, p. 5); Speech Pathology Australia (sub. PP303, p. 5); Amaze (sub. PP281, p. 8); National Disability Services (sub. PP295, p. 2); Early Childhood Intervention Australia Vic/Tas (sub. PP301, p. 2); and the Benevolent Society (sub. PP334, p. 6).

The Commission considers that there are benefits from increased transparency about the process by which the content of List A and List D may be changed. Greater transparency would:

- help the public to understand the purpose of the lists and why some conditions are included on the lists and others not
- impose a level of discipline on the NDIA to ensure that the lists do not remain static, but rather are adjusted to reflect new evidence, or to address concerns that people with listed conditions who are entering the scheme may not meet the wider eligibility criteria.

RECOMMENDATION 4.3

The National Disability Insurance Agency should make public a process for changing the conditions listed in List A and List D of the operational guidelines on access to the National Disability Insurance Scheme, including identifying under what circumstances a change in the lists may be considered.

There is limited information on exits

As discussed in chapter 2, a cost pressure identified by the NDIA is the lower than expected rate at which people are exiting the scheme. At the end of June 2017, just over 1000 participants had exited the scheme, with most of these exits being people who had permanent disability plans, rather than early intervention plans (NDIA 2017y, p. 16).

In its most recent Annual Financial Sustainability Report (2015-16), the NDIA stated that its baseline actuarial model assumes an exit rate of 2.1 per cent of participants each year. However, observed exit rates (as of 30 June 2016) were lower (1.2 per cent per annum). Exit rates of children are particularly low — 0.7 per cent per annum for children aged 0–6 years and 0.3 per cent for children aged 7–14 years (NDIA 2016a, pp. 36–37).

The exit rates included in the NDIS model are long term assumptions. It may take some years before participants — particularly children — receiving capacity building supports through the early intervention requirements are in a position to leave the scheme. The NDIA is monitoring exit rates and should continue to consider actions that will arrest trends in exit rates that do not appear to be consistent with the aims of the scheme.

4.3 Psychosocial disability and the NDIS

Support for including psychosocial disability in the NDIS …

In 2011, the Commission recommended that people with permanent psychosocial disability with significant long-term support needs be supported through the NDIS (PC 2011). The recommendation was made on the basis that:

- the day-to-day support needs for people with significant and enduring psychiatric disability are effectively the same as people who have an intellectual disability or an acquired brain injury
- some important parts of the care that is needed to be provided to people with psychosocial disability — namely community-based supports such as outreach or day programs — are best met through the NDIS
- providing supports to people with psychosocial disability through the NDIS provides them with the wider benefits of the scheme, including personalisation of supports to meet the needs of the individual and more choice over what supports are provided, when and by whom (PC 2011, pp. 186–189).

These points remain salient, and lend support to people with psychosocial disability being supported through the NDIS. And, while the Commission heard a range of views about whether the NDIS represents the 'right' vehicle to provide support to people with psychosocial disability, most submissions to this study were optimistic and/or supportive about the role the NDIS is playing in meeting needs of people with psychosocial disability (box 4.8).

That said, as discussed in chapter 3, there is evidence that some people with psychosocial disability are experiencing less positive outcomes than others in the scheme. For example, people with psychosocial disability are more likely to report less choice and control over supports since becoming a NDIS participant compared with other groups of participants in the scheme (Mavromaras, Moskos and Mahuteau 2016, pp. xi–xiii) and are more at risk of experiencing poor outcomes.

Box 4.8 Strong support for the NDIS from the mental health sector

Flourish Australia:

> Flourish Australia strongly supports the NDIS and the opportunity it provides for greater certainty, choice and control, and economic and social participation for people with disability who require life-long support. We are also strongly supportive of the inclusion of psychosocial disability within the Scheme's remit, and have seen firsthand the benefits of the Scheme for the people we support and their families. (sub. 74, p. 1)

Mental Health Community Coalition of the ACT:

> MHCC ACT views the NDIS with great hope. It holds promises for a better more integrated life for people living with disability. (sub. 135, p. 2)

The National Mental Health Commission:

> The NMHC considers the NDIS to be an important initiative with its promise of individualised care and choice for eligible people with psychosocial disability. It is a potentially very important element in addressing the long standing unmet needs of people with mental illness for effective community and disability supports. (sub. 153, p. 1)

Mental Health Australia:

> The National Disability Insurance Scheme (NDIS) is an historic opportunity to improve the lives of people who have for far too long missed out on the support they need to live contributing lives in the community. Mental Health Australia strongly supports the policy intent underpinning the Scheme, and hopes to work with government over the long term to maximise choice and control for people living with mental illness and psychosocial disability. (sub. 155, p. 3)

The Department of Health:

> There is broad stakeholder support for the inclusion of psychosocial disability in the NDIS, with feedback suggesting that participants are receiving better and more effective support and assistance under the NDIS than what was available to them before accessing the scheme. (sub. 175, p. 2)

… but there are some concerns about how well it fits in the scheme

While there is broad support for psychosocial disability to be included in the NDIS, several study participants identified parts of the scheme's design that are challenging for people with psychosocial disability. For example, the requirement that an impairment be 'permanent', was identified as being incompatible with recovery models used to support people with psychosocial disability. It was also suggested that the requirement could preclude people with significant needs from seeking or receiving support from the scheme. The Royal Australian and New Zealand College of Psychiatrists said that it was concerned about:

> … the centrality of disability 'permanence' in the eligibility criteria for the NDIS as the language of 'permanence' does not fit with the recovery-oriented approach of the mental health sector … Eligibility criteria that relies on permanence may therefore contribute to many individuals not seeking, or opting out of, treatment if that treatment is predicated upon their acceptance of the lifelong nature of their illness. (sub. 158, p. 2)

Mental Illness Fellowship of Australia Inc also said that it:

> … maintains that the criteria for permanency in the context of psychosocial disability is inappropriate, as it is not based in prognostic evidence, is incongruent with recovery-orientated practice, and is unnecessary for ensuring the NDIS supports those most in need. (sub. PP338, p. 2)

And the New South Wales Government:

> The recovery focus in contemporary mental health practice does not align neatly with the NDIS requirement that psychosocial disability is considered a permanent disability. (sub. 60, p. 14)

Similar arguments were presented by the Butterfly Foundation (sub. 78, p. 3), Top End Association for Mental Health Inc (sub. 102, p. 9), Anglicare Tasmania (sub. 145, p. 24), Mental Health Australia (sub. 155, p. 8) and VICSERV (sub. 169, p. 7), amongst others. Some stakeholders suggested that, for psychosocial disability, the permanent requirement should be amended. However, others, such as the National Mental Health Commission, argued that that the concepts of permanence and recovery are not necessarily mutually exclusive:

> The NDIS requirement for Tier 3 participants to establish a 'permanent impairment' can appear to be somewhat at odds with the more strengths-based concept of 'recovery' used in mental health. 'Recovery' is not synonymous with the absence of illness. Rather, it means people who are living with, or have experienced, mental illness can nevertheless lead contributing and meaningful lives, in which they feel safe and secure, have connections with community and family, are engaged in social and economic participation (whether paid or not), and are physically and mentally thriving (not just surviving).
>
> From this perspective, recovery is not inconsistent with the philosophical underpinnings of the NDIS that aim to support people with lifelong disability to live an ordinary life so they can engage in education, employment and community activities. (sub. 153, pp. 1–2)

The DSS made a similar point:

> The investment approach of the NDIS and the recovery model of mental health are both about building capacity, and are well aligned. In the NDIS context, recovery is about achieving an optimal state of personal, social and emotional wellbeing, as defined by each individual, whilst living with or recovering from mental health issues. Recovery approaches acknowledge that the effects of illness and subsequent psychosocial disability may or may not diminish over time. This means that while some people may recover to the point they do not require any mental health or disability supports, others will always require supports to assist and maintain their recovery, ongoing community participation and social inclusion. Similarly, the idea of permanence is about the irreversible nature of a disability, regardless of whether it is chronic or episodic. Therefore the eligibility criteria should not be changed in relation to people with psychosocial disability. (sub. PP318, p. 12)

Concerns about how permanency relates to psychosocial disability are not new. The issue was examined in detail by EY as part of its *Independent Review of the NDIS Act*. The review found ' … there is currently not a case to amend the NDIS Act to address concerns about the

concept of permanency in the context of mental illness' (p. 36), citing a number of reasons (box. 4.9).

Box 4.9 The independent review of the NDIS Act and the concept of permanency in the context of psychosocial disability

In July 2015, the Australian Government commissioned EY to conduct an independent review of the NDIS Act. The review recommended that the need for an impairment to be permanent in the context of mental illness should not be changed. The review provided four reasons to substantiate this.

- The concept of permanency is 'neither minor nor tangential, but central to the design of the NDIS' (p. 36). The review noted that amendments to permanency provisions could (even unintentionally) widen the scope of the scheme, with potential cost implications.
- The legislative framework already accommodates some of the concerns that stakeholders expressed to that review, such as allowing impairments to fluctuate or vary in intensity, or by allowing for the prospect that a person's functional capacity, including their psychosocial functioning, may improve.
- The available evidence at the time did not suggest that permanency provisions were dampening participation in the scheme for people with mental illness.
- The NDIS had 'invested considerable effort in attempting to enhance the responsiveness of the NDIS to people with mental illness' (p. 38).

Source: EY (2015, pp. 34–38).

The Commission supports including people with psychosocial disability in the NDIS. The evidence suggests that a significant number of people with psychosocial disability are eligible and are successfully engaging with the scheme.

- At the end of June 2017, there were about 6000 active participants with psychosocial disability with approved plans, accounting for seven per cent of scheme participants (NDIA 2017y, p. 19).
- Data (to December 2016) also indicate that 81 per cent of people with psychosocial disability who lodged an access request to the NDIS are eligible for the scheme, although this is a lower acceptance rate compared with most other conditions[38] (NDIA 2016r, p. 56).

Scheme boundaries are important, and as the scheme matures and people become more familiar with the scheme, these should become clearer. The Commission cautions against changing the eligibility criteria to relax or loosen the definition of permanency and how it relates to psychosocial disability. Requiring that a condition be permanent is a key tenet of

[38] Across all disability types, about 93 per cent of access determinations found the applicant eligible. The conditions with the highest proportion of successful access requests were autism and cerebral palsy (99 per cent) and the conditions with the lowest were 'other' (67 per cent) and 'other physical' (73 per cent) (NDIA 2016r, p. 56).

the NDIS. Removing or relaxing this requirement would represent a significant risk to the financial sustainability of the scheme.

And while demonstrating permanence may be more difficult for people with psychosocial disability (than for people with other types of disability), permanence is about the irreversible nature of disability which may be of a chronic, episodic nature. The NDIS Rules and operational guidelines accept that a permanent condition may be episodic requiring different amounts of support at different times.

That said, the Commission accepts that some aspects of psychosocial disability do not sit that well in the NDIS, given the design of the scheme and how it operates. In the position paper, the Commission explored the idea of a specialised entry gateway for people with psychosocial disability. Study participants were generally supportive of the idea (box 4.10).

Box 4.10 Participant support for a specialised gateway

Mental Health Australia:

> The development of a psychosocial gateway should commence in tandem with the NDIA's reforms to the wider planning process. Early work on the key design features of a psychosocial gateway should be done with consumers and carers, providers and peak advocacy organisations. (sub. PP321, p. 20)

Victorian Government:

> Current access processes for these people are not operating satisfactorily, evidenced by the high (and growing) number of plan cancellations in Victoria particularly affecting persons with psychosocial needs. Victoria supports the PC's suggestion for a dedicated psychosocial gateway and would welcome the opportunity to be involved in determining its optimal design. (sub. PP298, p. 2)

VICSERV:

> We also note that the Commission raised the concept of a specialised 'gateway' as a unique entry pathway for people with psychosocial disability. Such a pathway would help forge a connection with organisations that already have considerable expertise in psychosocial disability, and would provide linkages to supports and services for individuals with severe and persistent mental illness, but who are ineligible for an NDIS package. (sub. PP284, p. 5)

The Victorian Council of Social Service (VCOSS):

> VCOSS believe the option of a specialist psychosocial gateway has potential to improve people's access to the scheme. (sub. PP264, p. 3)

Why a specialised gateway is needed

There are particular challenges with effectively engaging people with psychosocial disability who may — for example — be hard to reach, or may be distrustful of attempts to provide them with support. As Flourish Australia said:

> … people with a lived in experience of a mental health issue that results in psychosocial disability can also be distrustful of, or find it difficult to navigate government bureaucracies and programs. Some may require time, additional support and/or the chance to hear first-hand from peers about their experience, before they are prepared to give something a go. (sub. 74, p. 6)

A similar point was made by the Mental Health Community Coalition of the ACT:

> Many potential NDIS participants with PSD [psychosocial disability] have a long history of interaction with government services. Over the course of this journey they have been let down many times; made to feel like 'the other'; and spent many hours of time pursuing things that produce little benefit. They have felt judged and demeaned in the process. They are, understandably, suspicious of government as a result. They are not necessarily keen then, to engage with yet another long and involved government initiative that invades their privacy; and another degrading experience of having someone they have no relationship with making such important judgements about them. These are the hurdles faced by service providers in getting many people with PSD to engage in the NDIS. (sub. 135, p. 15)

These characteristics of psychosocial disability present significant challenges for the scheme, particularly in engaging, assessing and planning for people with psychosocial disability. A number of stakeholders suggested that these processes are not functioning well (chapter 5). For example, the Mental Illness Fellowship of Australia pointed out that current assessment and planning practices may be anxiety inducing or traumatic for people with psychosocial disability:

> Having to re-contact a range of people to gather evidence on the history of illness, as well as the experience of being 'interviewed' and assessed, can be experienced as extremely invasive and in some cases, triggering. Symptoms related to psychosocial disability itself can present barriers to access, such that those with anxiety and trauma may require significant support to prepare and attend assessment appointments in which they are exposed to strangers and may feel threatened, judged or vulnerable. Practices by the NDIA or its agents such as calling transitioning participants without fore-warning, conducting telephone interviews, and/or failing to communicate regularly with applicants has exacerbated participants' anxiety and caused considerable distress. (sub. 122, p. 9)

The Joint Standing Committee on the National Disability Insurance Scheme also noted problems with the planning process for people with psychosocial disability:

> Overall, the committee believes the planning process has not been operating well for people with psychosocial disability and has resulted in many cases with less than satisfactory experiences and outcomes for participants … Given the episodic nature of mental health conditions, an agile planning and review process is crucial to ensuring that participants have continuity of appropriate support. (JSCNDIS 2017c, p. 34)

And Neami National pointed to reasons why the planning process may need to be different for people with psychosocial disability:

> Within the NDIS, planning is comprehended as a relatively simple process of information gathering and interpretation, with needs converted into actions through a plan that will last 12 months. This works for some but not all people with a psychosocial disability. For some people planning is a process, dependent on an interactive relationship developed over time, with needs revealed through this relationship, and required actions negotiated between the consumer and planner over time. … The current NDIS process does not accommodate this more interactive approach to planning that has been a strength of community provided mental health services, in particular in meeting the needs of people who are disengaged or marginalised. (sub. 63, p. 6)

One Door Mental Health also said:

> Of critical importance when engaging consumers and carers is that engagement must occur on the participant's terms in a manner appropriate to their individual circumstances. There should be no underlying assumption of readiness for any phase of access to the NDIS. Cold-calling potential participants asking if they need support, with no insight into the support the person needs, is both distressing and ineffective. (sub. PP266, p. 8)

Specialisation is one way to overcome the unique challenges around successfully engaging people with psychosocial disability in the NDIS. One of the key concerns raised by study participants was the knowledge, skills and experience of planners in relation to psychosocial disability. Neami National, for example, said:

> A significant proportion of people with mental illness and related psychosocial disability experience conditions that can present as complex due to factors including: the fluctuating and episodic nature of their condition; difficulties engaging in assessment or service provisions; cognitive deficits that are not necessarily apparent. To ensure effective planning occurs, planners require specific knowledge, skills and experience in engaging and working with people with mental illness and related psychosocial disability. (sub. PP347, p. 5)

One Door Mental Health argued that this is one area where leveraging industry expertise and establishing relationships with potential participants has been underutilised. One suggestion put forward was for the NDIA to discuss the situation of potential scheme participants with current program managers to better understand the individual (sub. PP266, p. 8).

Using more specialised staff — through experience and/or training — should improve the way the scheme connects to and communicates with people with psychosocial disability. Given the current lack of a specific assessment tool and reference package for psychosocial disability, having staff who have a degree of specialisation to assess psychosocial disability is particularly critical.

The value of specialised staff was recognised by the Joint Standing Committee on the National Disability Insurance Scheme:

> Given that participants with psychosocial disability as their primary disability are expected to account for about 13.9 per cent of all NDIS participants by 2019-20, the NDIA should consider having a specialised team of NDIS planners for people with psychosocial disability. This would ensure better plan outcomes for participants, less need for reviews and ultimately contribute to the sustainability of the Scheme. (JSCNDIS 2017c, p. 34)

The NDIA has previously considered the case for a 'new' gateway for people with psychosocial disability, but identified a 'preferred' option of improving the current pathway (National Mental Health Sector Reference Group 2017, p. 2). However, given that people with psychosocial disability are one of the groups at risk of experiencing poorer outcomes in the scheme (chapter 3), the Commission's view is that a psychosocial gateway is a reform worth pursuing.

What features should a psychosocial gateway have?

While the NDIA is best placed to design a psychosocial gateway (in consultation with key stakeholders such as participants, peak bodies, providers and experts in mental health), there are number of key features that the Commission considers the gateway should have.

The first is specialised staff.

Ensuring assessment and planning is undertaken by specialised staff should facilitate better outcomes for scheme participants (because they understand the nature of psychosocial disability and are familiar with appropriate supports). It also ensures that staff are well placed to make appropriate referrals for alternative supports for people who are not eligible for support through the NDIS.

One option for the specialist gateway is to use partner organisations, similar to the ECEI approach. However, other approaches may also be effective — for example, the NDIA could foster specialisation by nominating and training planners to be used exclusively for the gateway.

The second important feature — given widespread concerns about the effectiveness of phone planning for people with psychosocial disability (chapter 5) — is face to face engagement where possible.

Neami National suggested a more iterative planning process for people for whom single-event planning is challenging. This could involve short term plans for high level support coordination, with the goal of developing a longer term plan that is aligned with the person's complex needs (sub. 63, p. 7). Planning and assessment processes should utilise existing information where possible.

Third, the gateway should consider models of outreach to improve engagement for people with psychosocial disability who are unlikely to approach the scheme. Several submissions — including Mental Health Australia (sub. PP321, p. 25), the Victorian Government (sub. PP298, p. 11) and Orygen (sub. PP254, p. 3) — emphasised the value of outreach in improving engagement for people with psychosocial disability.

The cost effectiveness of different outreach approaches need to be considered, with models selected that are expected to yield high benefits relative to the cost of establishing and maintaining them.

Fourth, the gateway should provide a 'soft entry' point for people with psychosocial disability. While the gateway would undertake an assessment of, and assist with plan development for, scheme participants, it also should have a linkage and referral function to other services and supports (like the ECEI approach) for those found to be ineligible for the scheme.

The ability of the gateway to act as an effective linkage and referral service will depend on the adequacy of services and supports provided outside of the scheme. The NDIS is not meant to support everyone with psychosocial disability, and even for those who do qualify for individualised supports, other systems will be critical to their support and care needs (for example, the health system meeting clinical needs). Many people will not meet the eligibility criteria for individualised supports and therefore will need to be supported outside of the scheme.

At present, what supports will be available for people with psychosocial disability who are not eligible for the scheme is unclear, and needs to be addressed (this issue is discussed further in chapter 6).

Finally, the gateway should have a data collection function. At a minimum, data should be collected on:

- the number of people approaching the gateway, and the number of people assessed for scheme eligibility
- basic demographic information about people who approach the gateway (such as gender, age and postcode of residence)
- information on a person's psychosocial disability, including diagnosed mental health conditions and any assessments of severity or impact on functionality that have been undertaken
- the actions taken by the gateway (for example, applying for scheme entry, or linkage to non-scheme services).

The data should be collected, used and disseminated in accordance with the principles outlined in chapter 13 of this report.

RECOMMENDATION 4.4

The National Disability Insurance Agency should implement a psychosocial gateway. The gateway should be the primary pathway that people with psychosocial disability enter the National Disability Insurance Scheme.

The gateway should:

- use specialised staff
- operate on a face to face basis to the greatest extent possible
- consider models of outreach to engage people with psychosocial disability who are unlikely to approach the scheme
- provide linkages to both clinical and non-clinical services and supports outside the scheme
- collect data on both entrants into the scheme and people linked to services and supports outside the scheme.

5 Scheme supports

Key points

- The National Disability Insurance Scheme (NDIS) is designed to cover individualised disability supports that are reasonable and necessary. This includes supports that help people with disability to pursue their goals, live independently and participate in the community and in employment. The NDIS is meant to complement other mainstream or specialist services available to the wider population, not replace them.
- The extent of support coverage matters — under-coverage could mean that the benefits of the NDIS are not fully realised, but over-coverage of supports could create cost pressures and pose a risk to the financial sustainability of the scheme.
- The overall costs and benefits of the NDIS are affected by the volume of supports funded under the scheme, as well as how supports are allocated — that is, the planning process.
  - The touchstone of what is reasonable and necessary directly impacts the quantity and types of supports funded. The concept of 'reasonable and necessary' is malleable, and allows scheme participants the flexibility to exercise choice and control.
  - The quality of planning processes is a key determinant of the success and long-term sustainability of the NDIS — it influences what costs are incurred; the predictability of costs; outcomes for participants; and the integrity of, and community support for, the scheme as a whole.
- The planning process is about matching scheme participants with supports. It involves conversations between the participant and the National Disability Insurance Agency to determine, for each participant: their goals and aspirations, their level of function and appropriate supports.
- The challenge for the planning process is finding the right balance between individualisation and good outcomes for scheme participants on the one hand, and ensuring equity among participants and the financial sustainability of the scheme on the other.
- Planning processes are currently not operating well. The speed of transition and performance indicators that focus on participant numbers have placed pressure on the National Disability Insurance Agency to finalise plans quickly, and the quality of plans has been compromised.
  - Planning conversations with scheme participants are said to be rushed and superficial. Most plans are prepared by phone, which limits engagement with participants and can mean that planners do not get the 'full picture'.
  - The planning process is not clear, transparent and accessible. Nor are processes inclusive or sufficiently flexible to accommodate differing needs, particularly for participants with complex needs or from culturally and linguistically diverse backgrounds.
  - There is variability in planner skills, experience and training. Planners often lack knowledge about different types of disability, which can hinder their ability to formulate a good plan. Planner performance could be improved by using specialised planning teams for some disabilities and better leveraging industry expertise.

The quantity and types of supports funded by the National Disability Insurance Scheme (NDIS) are key drivers of scheme costs. Supports are also important for realising many of the benefits of the NDIS (box 5.1) because they help scheme participants:

- pursue their goals, objectives and aspirations and increase their independence
- increase their social and economic participation (and increase the social and economic participation of carers)
- reduce their need for other supports and services
- develop their capacity to actively take part in the community.

For this reason, striking the right balance is crucial: over-coverage of supports could create cost pressures and pose a risk to the sustainability of the scheme, but under-coverage could mean that the benefits of the NDIS are not fully realised.

The overall costs and benefits of the NDIS are also affected by *how* supports are allocated to scheme participants. Good planning processes are important for matching scheme participants with the supports that will result in improved outcomes and help maintain the integrity of, and community support for, the scheme as a whole. Poor planning processes can increase the likelihood of cost blowouts and undermine the accuracy of cost projections, compromising the ability of governments to plan for the future of the scheme.

The *National Disability Insurance Scheme Act 2013* (Cwlth) (NDIS Act) provides for two types of supports for people with disability.

- Specialist disability supports funded by the NDIS are called *reasonable and necessary supports*. The types of supports that may be funded include: assistance with daily personal activities and household tasks; therapeutic supports (such as occupational therapy, speech therapy and behavioural support); mobility equipment; home and vehicle modifications; and services that enable employment and participation in community, social economic and daily life activities (NDIA ndf).
- The National Disability Insurance Agency (NDIA) may also provide *general supports* to people with disability, even if they are not eligible for the NDIS. General supports include: coordination, strategic and referral services and activities, to help people with disability access mainstream services, such as health, education and transport services (Commonwealth of Australia 2013b, p. 8).

This chapter is about the specialist supports that are funded under the NDIS — that is, reasonable and necessary supports. The rules governing the scope of supports covered by the NDIS are covered in section 5.1. Section 5.2 gives an overview of the process for allocating supports to individual scheme participants — the planning process. Section 5.3 discusses the key concerns raised by study participants about the planning process and considers what implications these have for scheme sustainability. The interface between the NDIS and other services is discussed in chapter 6.

Box 5.1 Many of the benefits of the NDIS are realised through supports

Brenda Gillett:

> My adult son James (39 years old) who has an intellectual disability, lived at home until almost two years ago, when we then decided it was time for him to try to live as independently as possible without our total support … James just loves his own 'unit' and his new (and much loved) support person who is enabling James to become more independent each day; and is helping him to become more inclusive in his community … James also has used funding specifically set aside for a speech pathology assessment and is looking forward to catching up with the 21st century and the rest of his generation by buying an iPad with which to look at his photos and use a communication app to help him express his needs and wants. (brief sub. 15)

Sally Shackcloth:

> My adult daughter's life has improved in many ways since she was a member of the trial group in Tasmania. An occupational therapist found that her bed was unsafe both for her and for the support workers dressing her. The physio review recommended a hip x-ray because of increasing mobility problems. The result is she is now having preventative treatment so her condition doesn't deteriorate … Very importantly, she is now participating in an ongoing speech pathology program with an expert speech pathologist as she needs a communication system tailored to her needs. Up to now she has no reliable way to communicate. (brief sub. 19)

Karen Wakely:

> For the first time we have been able to access meaningful therapeutic supports. Previously therapy was only once a month, and was inadequate for gaining any momentum. Now we access either psyc or occ therapy every week, and it has been far more effective in developing the social and practical skills needed for independent living. For the first time, my child is beginning to successfully participate in mainstream community activities. (brief sub. 43)

Lauren McGowan-Slee:

> Because of the NDIS I have supports that mean I can do a job that works with my disability and have the physical home tasks I can't do taken care of … I am excited to be a taxpayer again, it fills me with so much pride to be giving back again. With the NDIS I can afford to get to work, the transport contributions mean I don't have to reduce my work days to afford taxis. I have adaptive technology which means I can do things by myself and be safe. I am also blind and I can finally read again and I used funding to get me to a functional level so I could work. … I can afford to buy healthier food and get help preparing it instead of having to buy pre prepared meals so I have had less digestive problems, and I don't see the doctor as often. I have a person who can be with me when I do exercise so I can exercise effectively without being afraid of falling over or getting injured when I lose muscle control. (brief sub. 52)

Graham Lawrence:

> Under her NDIS approved plan, Michelle has the ability to purchase a 5 day/week community access program with a group of her peers, with arranged leisure, craft and life education activities … [this] makes it possible for the Government to save an estimated $300,000 – $400,000 p/a. This is the typical net cost of providing care (equivalent to their own home), for people with the severe levels of disability which Michelle has. (brief sub. 78)

Sonya & Stephanie Nicolaides:

> My Daughter Stephi has been on the NDIS for three months now and it has made a dramatic change to her life. She now has the same life opportunities other Australians take for granted. She is able to have regular physio and hydro therapy now, which helps with all her tight muscles. Stephi seems to be a lot happier within herself and able to move a lot easier without much pain. We were able to get ramps to the front and rear of the house, making it very easy to get Stephi in and out of the house in her wheelchair now. (brief sub. 132)

5.1 What supports are funded under the NDIS?

The NDIS is designed to cover individualised disability supports that are 'reasonable and necessary' (Gillard 2012; PC 2011, pp. 257–261).

This includes supports that help people with disability to:

- pursue their goals and maximise their independence
- live independently and be included in the community as fully participating citizens
- participate in the community and in employment (NDIS Act s. 4(11)).

However, the NDIS is not meant to replace mainstream or other specialist services available to the broader population, and does not fund supports that are covered by other areas of government (including hospital and doctor visits, and school teacher aides).

In addition, the NDIS Act s. 34(1) specifies criteria for determining whether supports (general or individualised) may be provided to scheme participants. This includes whether the support:

- will assist the participant in achieving their stated goals and aspirations
- will facilitate the participant's social and economic participation
- represents good value for money
- will (or is likely to) be effective and beneficial for the participant
- should (within reasonable expectations) be provided by families, carers, informal networks or the community
- is most appropriately funded or provided through the NDIS.

The National Disability Insurance Scheme (Supports for Participants) Rules 2013 (Cwlth) and operational guidelines maintained by the NDIA provide additional rules and guidance for deciding what supports may be approved.

What is reasonable and necessary?

Individualised support funding under the NDIS is bounded by the touchstone of what is reasonable and necessary. However, the concept of 'reasonable and necessary' is not specifically defined in the legislative framework. Notably, the NDIS Act 'does not prescribe the types of supports that would be considered 'reasonable and necessary' across all participants' (EY 2015, p. 9), nor does it provide direct guidance on how to determine whether a support is reasonable and necessary.

As the court in *McGarrigle v National Disability Insurance Agency* observed:

> Although the phrase 'reasonable and necessary supports' is used throughout the legislative scheme, including in the objects and principles provisions, it is not defined. Its meaning can be

> derived from the context in which it is used, especially in my opinion s 4(11), which sets out what reasonable and necessary supports should enable and empower people with a disability to do, read with s 14 which sets out the purposes for which funding for reasonable and necessary supports is provided. ([2017] FCA 308 at [41])

As such, the bounds of what is reasonable and necessary will ultimately be shaped by court and tribunal decisions over time, having regard to the text of the legislation, rules and operational guidelines. These decisions will affect what will be funded under the NDIS, and therefore overall scheme costs. On this basis, the NDIA identified 'decisions by the Administrative Appeals Tribunal (AAT) or court system in interpreting the boundaries of … reasonable and necessary supports' (sub. 161, p. 45) as a policy lever affecting the financial sustainability of the NDIS that is outside of its control (box 5.2).

Box 5.2 McGarrigle v National Disability Insurance Agency

Mr Liam McGarrigle is a scheme participant with autism spectrum disorder and intellectual disability. Each week, he attends a group program for three days and is employed for two days. Transport to and from these activities is by taxi or provided by a support worker. As part of his third plan, Mr McGarrigle was allocated $11 850 for 'transport to access daily activities'. This represented about 75 per cent of his total transport costs ($15 850).

In the Administrative Appeals Tribunal

Mr McGarrigle sought a review of this decision in the Administrative Appeals Tribunal, seeking to have his transport costs fully funded. The Tribunal found that, while transport is a reasonable and necessary support for Mr McGarrigle, it was open to the National Disability Insurance Agency (NDIA) to decide to fund less than the full cost of the support. The Tribunal said, 'I am satisfied that the decision to fund 75 per cent of his weekday transport costs strikes an appropriate balance between what is reasonable and necessary for him and the overall financial sustainability of the NDIS' [64].

In the Federal Court

On appeal, the Federal Court of Australia overturned the Tribunal's decision. It reasoned that the imperative language of the NDIS Act (specifically, the words 'will be funded' in s. 33(2)(b)) pointed to the fact the scheme intends that supports will be fully funded. The Court also noted that the Act does not refer to contributions from the participant towards the cost of supports.

The NDIA lodged an appeal of this decision to the Full Federal Court. It argued that the CEO of the NDIA could refuse to fund a support on the grounds of 'financial sustainability'. The Full Court did not consider this argument because it was a new argument and therefore not a permissible grounds of appeal. The Full Court dismissed the appeal on 21 August 2017.

Is additional clarity required?

In the position paper, the Commission asked whether there is sufficient clarity around how and whether the 'reasonable and necessary' criterion should be applied and whether better legislative direction about what is reasonable and necessary is required. The feedback was mixed.

Clarity for scheme participants and planners

The majority of responses addressed the question of whether 'reasonable and necessary' is sufficiently clear from the perspective of planners and scheme participants. Study participants identified issues with operationalising the concept of 'reasonable and necessary'. A particular concern is that there are different perceptions about what supports are reasonable and necessary (Flourish Australia, sub. 74, p. 5; PDA, sub. 38, p. 9; MIFA, sub. PP338, p. 9; NDS, sub. PP295, p. 3). Alzheimer's Australia, for example, said:

> In our experience, there are large variances in what is considered 'reasonable and necessary' in relation to assessment planning. For example, one person with younger onset dementia was assessed and given horse riding lessons, while another person was not allowed bathroom aids. There also needs to be an oversight and improvement process that monitors how an assessor or planner determines what is considered 'reasonable and necessary'. (sub. 10, p. 13)

Some study participants also said that planners' lack of knowledge about different types of disability impacts their ability to identify what supports are reasonable and necessary for different scheme participants (AASS sub. PP330. pp. 4–5; ABF, sub. PP263, p. 4; MND Australia, sub. PP255, p. 4; MS Australia, sub. PP283, p. 5; RIDBC, sub. PP259, p. 6). The issue of planner knowledge is discussed further in section 5.3.

The NDIA (sub. 161, p. 92) also acknowledged that 'there is still confusion within the sector and the community, and to some extent within the NDIA, around the scope of reasonable and necessary supports'.

Views were split on whether this problem should be addressed through further legislative direction. Some study participants thought that legislative reform could help clear up confusion around how to operationalise the concept of reasonable and necessary supports (CMHA, sub. PP270, p. 3; Disability Services Australia, sub. PP256, p. 2; One Door Mental Health, sub. PP266, p. 6; VICSERV, sub. PP284, p. 3).

But others disagreed (AASS sub. PP330. pp. 4–5; Anglicare Australia, sub. PP339, p. 3; Mental Health Coalition of South Australia, sub. PP308, p. 3; Women with Disabilities Victoria, sub. PP282, p. 5). A key concern was that greater legislative clarity would impose greater restrictions, reducing flexibility and choice for scheme participants (NSW Government, sub. PP230, p. 3; OPA, sub. PP241, p. 1; VALID, sub. PP332, p. 3; YDAS, sub. PP262, p. 3).

The Commission agrees that amending the legislation is not appropriate for clarifying, for scheme participants and planners, what specific supports will or should be funded by the NDIS. Rather, additional guidance, where required, should be contained in rules, operational guidelines or other policy documents. As the Queensland Government said:

> [It is] appropriate for high level principles on 'reasonable and necessary' to be contained in the Act, with more detailed guidance and examples in subordinate legislation and/or … operational guidelines to facilitate consistency of decision making and expectation management. (sub. PP345, p. 7)

The NDIA has operational guidelines, practice guides, work practices and task cards to help planners exercise their judgment about what is a reasonable and necessary support. This allows for greater flexibility and individualisation, and gives scheme participants choice and control over their supports. As the NDIA explained:

> Decisions around reasonable and necessary supports require balancing the need to empower participants to explore different ways of achieving increased participation with the need to spend taxpayers' money consistent with legislation and in a way that minimizes risk of misuse or fraud. (sub. 161, p. 92)

However, as argued by a number of study participants, greater transparency and better communication is required to help scheme participants understand what supports are covered by the NDIS (Amaze, sub. PP281, p. 12; DAA, sub. PP292, p. 3; EarlyEd, sub. PP290, p. 2; Vision Australia, sub. PP252, p. 5; Women with Disabilities Victoria, sub. PP282, p. 5; YPINH, sub. PP326, pp. 2–3). Publishing examples or benchmarks of what is a reasonable and necessary support could help (AASS sub. PP330. pp. 4–5; MIFA, sub. PP338, p. 9; RIDBC, sub. PP259, p. 6; PDA, sub. 38, p. 8).

Clarity for courts and tribunals

What legislation says about reasonable and necessary supports is important because it provides courts and tribunals with a framework for evaluating whether decisions about those supports have been properly made.

In 2011, the Commission made recommendations about various criteria for determining whether a support is reasonable and necessary (PC 2011, pp. 258–259). These criteria were adapted from the Lifetime Care and Support Scheme in New South Wales and are echoed in the NDIS Act s. 34(1) (discussed above). However, the NDIS's legislative regime is different to that of the Lifetime Care and Support Scheme — and the scheme contemplated in PC (2011) — in two subtle ways.

No explicit requirement to assess whether supports are reasonable and necessary

First, while the NDIS Act repeatedly refers to 'reasonable and necessary supports', it does not explicitly state that individualised supports funded under the NDIS must be, or are assessed to be, 'reasonable and necessary'. By contrast, the New South Wales Lifetime Care

and Support Scheme explicitly requires a direct assessment of what treatment and care needs are reasonable and necessary in the circumstances (*Motor Accidents (Lifetime Care and Support) Act 2006* (NSW) ss. 11A, 23).

That said, a requirement for such an assessment may be implied by the text of the legislation. The Second Reading Speech for the NDIS Act also exhibits an intention to require an assessment of what is reasonable and necessary:

> The scheme will give people the care and support that is objectively assessed as being reasonable and necessary over the course of their lifetime. (Gillard 2012)

It also appears that the NDIA (sub. PP327, p. 23) considers itself obligated to assess whether a support is reasonable and necessary.

However, these considerations are not determinative of how a court would interpret the NDIA's obligations, and there is a risk that the legislation could be interpreted in a manner contrary to lawmakers' intentions. One way of minimising this risk would be to redraft the NDIS Act s. 34 to explicitly state that individualised supports funded under the NDIS must be, or are assessed to be, reasonable and necessary in the circumstances (Legal Aid NSW, sub. PP245, p. 7).

No explicit criteria for assessing whether supports are reasonable and necessary

Second, the NDIS Act does not explicitly provide a schema for determining whether a support is reasonable and necessary. The considerations outlined in the NDIS Act s. 34(1) are not framed as criteria exclusively for deciding whether a support is reasonable or necessary. Instead, they are considerations for deciding whether any type of support (that is, general or individualised) may be provided to scheme participants. As the court in *McGarrigle v National Disability Insurance Agency* observed:

> Although s 34 is headed 'reasonable and necessary supports', it in fact expressly deals with both general supports … and reasonable and necessary supports … ([2017] FCA 308 at [39])

Despite this, the court went on to suggest that what is a reasonable and necessary support is related to or coincides with the criteria in s. 34(1), as well as other (as yet unidentified) factors.

> Whether a support is 'reasonable' requires a different assessment to whether a support is 'necessary' … the concept of necessity would appear to tie one aspect of the CEO's assessment to an evaluation of the kinds of factors set out in [some parts of s. 34(1)]. The word 'reasonable' would appear to be directed at factors such as those set out in [other parts of s. 34(1)]). That is not to say the meaning of each word is exhausted by the factors set out in s 34(1): rather, it is to illustrate the different work that each concept does as an adjective in the phrase 'reasonable and necessary supports'. ([2017] FCA 308 at [91])

Victoria Legal Aid (sub. PP314, p. 4) considered the legislation, together with the judicial commentary in *McGarrigle v National Disability Insurance Agency*, to provide sufficient direction about what is reasonable and necessary. Other study participants also expressed a

preference that additional clarity, where required, to come from court and tribunal decisions, rather than legislative change (AFDO, sub. PP325, p. 13; Maurice Blackburn, sub. PP309, p. 6).

On the other hand, some study participants saw merit in clarifying the nature of the connection between the concept of 'reasonable and necessary' and the criteria in s. 34(1). This could be achieved by:

- framing the criteria in s. 34(1) as considerations for determining whether a support is reasonable and necessary (Legal Aid NSW, sub. PP245, p. 7)
- defining 'reasonable and necessary supports' as supports that satisfy the criteria in s. 34(1) (Dr Kylie Burns, sub. PP315, p. 3).

Ongoing evaluation and review

In 2015, an independent review of the NDIS Act found that stakeholders were generally 'supportive of how the legislative framework defines the concept of reasonable and necessary supports' (EY 2015, p. 49). The NDIA (sub. PP327, p. 23) also advised that it is not currently seeking change to s. 34(1). That said, in the 2015 review, some stakeholders raised concerns about specific elements of s. 34(1) (EY 2015, pp. 49–54). Some participants to this study also raised similar types of concerns (Dr Kylie Burns, sub. PP315, pp. 3–4; Legal Aid NSW, sub. PP245, p. 7; YPINH, sub. PP326, p. 3).

It is still early in the operation of the NDIS Act. At this stage, it is unclear what 'gaps' will emerge in the legislative framework over time and how case law will develop to fill those gaps. However, based on feedback to this study, it appears that calls for better legislative direction are stronger now than at the time of the independent review of the Act in 2015.

On this basis, there is a case for ongoing monitoring and evaluation of whether the body of law (including legislation and case law) around reasonable and necessary supports is operating in a manner that is consistent with community expectations and what is intended for the scheme. This will be particularly important in the early years of full scheme.

In 2016, COAG agreed to conduct a further review of the NDIS Act (COAG 2016, p. 7), and on 16 June 2017, the COAG Disability Reform Council agreed that the review should occur in 2021 (DSS, sub. PP318, p. 8). The Commission agrees that a further review of the legislation under full scheme should proceed. That review should consider, amongst other things, the issues relating to the drafting of the NDIS Act raised in this study, as well as the impact of court decisions on the content of the law.

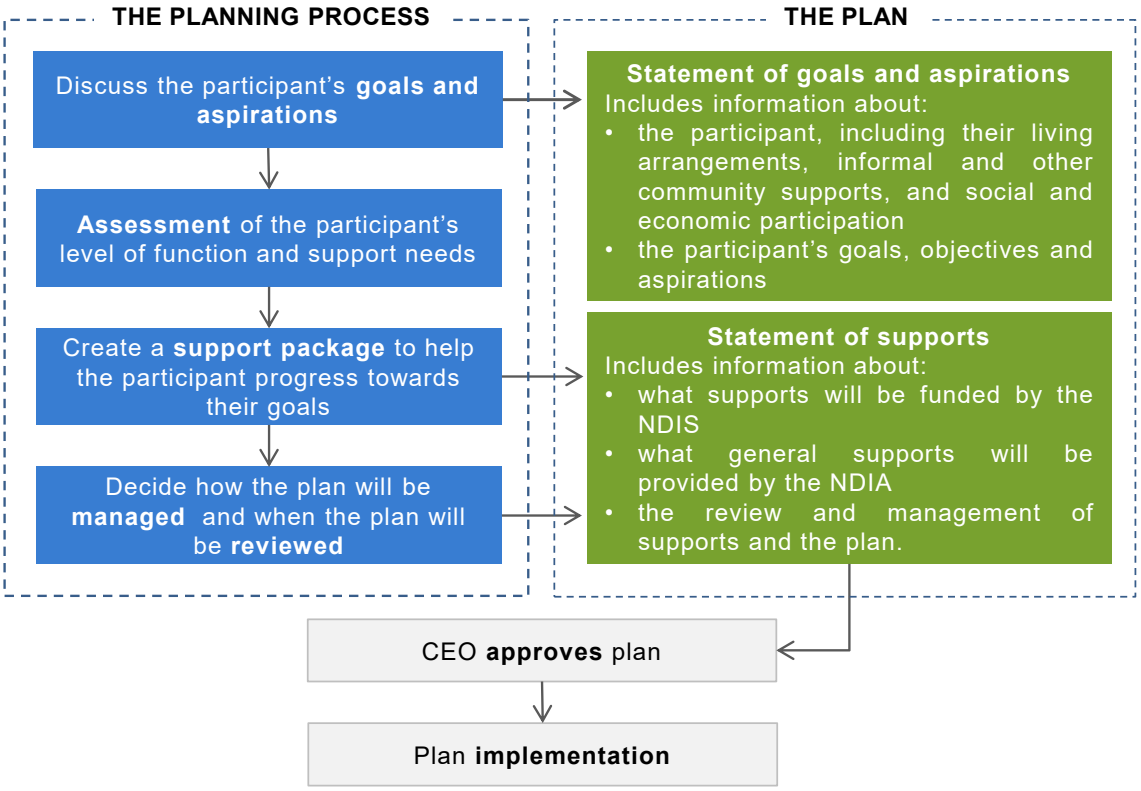
5.2 About plans and the planning process

Supports are allocated to scheme participants through a plan, which is prepared through conversations between a planner and the participant. As the NDIS Act (s. 31) states, where

practicable, the development of a plan should be individualised, be directed by the participant and maximise participant choice and control.

The planning process involves several steps (figure 5.1), designed to elicit information about the scheme participant, which is used to inform the content of the plan.

Figure 5.1 **Making a plan**



1. The participant and planner discuss the participant's goals and aspirations. This conversation is used to help put together a statement of goals and aspirations, which includes information about the participant, including: their living arrangements, informal and other community supports, and social and economic participation, as well as their goals, objectives and aspirations.
2. The NDIA conducts or considers assessments of how the participant is performing in different areas of their life ('level of function' or 'functional capacity'), including their 'activity limitations, participation restrictions and support needs arising from [the] participant's disability' (*National Disability Insurance (Supports for Participants) Rules 2013* (Cwlth) r. 4.1), and identifies areas where the participant requires support.
3. A support package is put together to help the participant progress towards their goals. The support package may include general supports, as well as reasonable and necessary supports, and is set out in a statement of supports.

4. The planner and the participant decide when or under what circumstances the plan will be reviewed. They also decide how the plan will be managed (such as self-management, management by the NDIA, or using a plan management provider), including whether support coordination is required. (Plan management and support coordination are discussed in chapter 10.) This information is also included in the statement of supports.
5. Before the plan is finalised, it must be approved by the CEO of the NDIA (or a delegate).

For most people, their first plan is completed over the phone (NDIA 2016e, p. 1), although some planning conversations do take place face to face. In its submission following the position paper, the NDIA (sub. PP327, p. 25) said it intends moving towards using face-to-face planning as a default approach.

Assessment and tools

The assessment process is about evaluating the scheme participant's level of function and identifying the supports that will allow them to progress towards their personal goals and aspirations. Choosing the right tools for the job is challenging, as there is no universally agreed assessment tool for evaluating the care and support needs of people with disability. There are, however, several features that an assessment tool should have (box 5.3).

Box 5.3 Desirable features of assessment tools

To ensure the sustainability of scheme costs, it is important that assessment tools are:

- *valid* — the tools should test what they purport to and provide a basis for accurately identifying the nature, frequency and intensity of a person's support needs. Assessment tools that are not appropriate could threaten scheme sustainability.
- *reliable* — the tools should yield consistent measures across time, individuals and situations; results should not be influenced by when or where the assessment is undertaken, who is undertaking the assessment, or the identity of the individual per se.
- *accurate* — the tools should reduce the risk that assessors and individuals overstate or understate their support needs.
- *efficient* — an efficient tool is one that collects sufficient information to assess support needs in the least costly manner.

Assessment tools also need to be continually monitored and refined to ensure that they remain in line with scheme objectives, and keep pace with evolving best practice and community expectations.

Source: PC (2011, pp. 315–320).

Since the NDIS commenced, the NDIA has used several different assessment tools as part of the planning process (box 5.4).

Box 5.4 The evolution of NDIS assessment tools

The National Disability Insurance Agency (NDIA) has undertaken significant work to identify appropriate assessment tools for identifying the support needs of scheme participants.

- *Mid-2013*: the NDIA commenced delivering the National Disability Insurance Scheme without an assessment tool, as none was available.
- *Late 2013*: adoption of the Support Needs Assessment Tool (SNAT). The SNAT attempted to identify functional support needs through a planning discussion, and provided the participant with a detailed, personalised support plan. After the first year of trial, it became apparent that the SNAT was not fit for purpose.
- *Late 2014*: further work on identifying appropriate assessment tools. This entailed a survey of functional assessment tools used around the world, and evaluating these tools for relevance, usability and reliability. The cost of acquiring and using these tools was also a crucial consideration. The process included extensive consultation and engagement with key stakeholders and experts across the key disability types, including clinical experts and researchers, and disability associations.
- *Mid-2015*: identification and testing of a new suite of assessment tools. This included different tools for 11 key disability types, and the World Health Organization Disability Assessment Schedule version II (WHODAS II) where no specific tool was identified.
- *Mid-2016*: adoption of the new suite of assessment tools. The NDIA has the capability to administer some of these assessments tools in house, but they can also rely on assessments performed by specialists.

Considerable work around assessment tools remains to be done. For example, the NDIA still has no tool for evaluating the support needs of people with psychosocial disability. Engagement with representatives in the mental health sector on this point is ongoing.

Source: NDIA (sub. 161, pp. 9–11).

Feedback about the NDIA's use of assessment tools was mixed.

- Some study participants were critical of the NDIA's assessment tools, but it was sometimes unclear which specific tools they were referring to (ABF, sub. 48, p. 10; Alzheimer's Australia, sub. 10, p. 10; Belinda Jane, sub. 80, pp. 5–6; Macarthur Disability Services, sub. 57, p. 6; QAI, sub. 115, p. 11).
- Other study participants were critical of how certain tools were used, particularly in relation to early childhood and early intervention (chapter 4). For example, the AEIOU Foundation (sub. 32, p. 8) said that PEDI-CAT is not appropriate for children with intellectual disability. The Shepherd Centre (sub. 107, p. 12) made a similar observation about young children with hearing loss. Others questioned whether NDIA staff were adequately trained to apply the PEDI-CAT tool (ECIA Victoria/Tasmania, sub. 129, p. 10; Noah's Ark, sub. 108, pp. 10–11).

Many study participants said that they were unable to obtain information about what assessment tools the NDIA uses (including tools for assessing level of function). Physical

Disability Australia said this made it difficult to comment on the appropriateness of assessment tools.

> Information about assessment tools is scarce on the NDIS website … Furthermore, there is no mention of them on the pages dealing with planning processes and planning conversations. It is therefore difficult for [Physical Disability Australia] (or anyone) to comment on them as it is not clear which assessment tools are being used and by whom. (sub. 38, p. 7)

The Centre for Disability Studies also said:

> A major barrier to the on-going improvement and implementation of the NDIS is the lack of access to, or public domain information on the assessment tool(s) in use by the National Disability Insurance Agency … we do not see why the assessment tool itself is not public domain, unless for commercial copyright reasons. Many support needs assessments in use across jurisdictions are in the public domain, or are available upon purchase or enquiry. (sub. 49, p. 2)

The NDIA is required to specify what assessment tools it uses in its operational guidelines (National Disability Insurance (Supports for Participants) Rules 2013 (Cwlth) r. 4.4), which must be published on a website and kept accurate, up-to-date and complete (*Freedom of Information Act 1982* (Cwlth), ss. 8-8B, 8D). But, in practice, study participants' knowledge about what assessment tools the NDIA uses appears to be sourced indirectly, through word of mouth or via experiences with the planning process. The Commission was also unable to determine what assessment tools are used by the NDIA, based on information in the public domain. Information about the role of assessment tools in the planning process could help participants understand how or to what extent assessment tool results influence the supports that they receive.

Using reference packages in planning

As discussed in chapter 2, the NDIA has identified increasing package costs (over and above the impacts of inflation and ageing) as a source of cost pressures. The NDIA developed reference packages to assist with monitoring scheme experience and assessing cost pressures (box 5.5). Reference packages are based on age, disability type and level of function. Reference packages can also help improve equity in the scheme by giving clearer guidance on 'typical' arrangements.

Based on the learnings from trial, the NDIA adopted a new approach to determining support packages on 1 July 2016 — this was called the 'first plan process'. This approach uses reference package data to assign scheme participants a 'typical support package' based on their age, disability type and level of function. This is adjusted to account for the individual support needs of participants to create the participant's plan (box 5.6).

Box 5.5 Reference packages

Reference packages are an 'indicative' support package, developed as a way to identify typical support needs and funding for different cohorts of scheme participants.

The National Disability Insurance Agency currently uses a suite of assessment tools for evaluating scheme participants' level of function, covering 11 key disability types. The reference package cohorts are based on these 11 disability types, age and level of function.

Reference package data were tested and validated using:

- back-captured data — that is, data about previous support packages
- expert groups in each of the 11 disability categories — these groups included academics, consumers and providers.

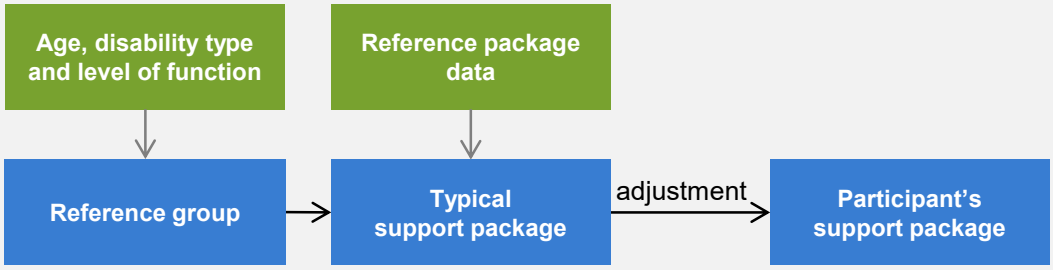
Back-captured data and the work of expert groups were also used to identify how different variables impact the value of support packages. This information allowed the Scheme Actuary to validate the assessment tools, and develop a basis for determining 'reasonable and necessary' funding at an aggregated level.

Work to refine reference packages is ongoing. For example, no reference package is currently available for people with psychosocial disability. Reference packages also have limited utility where a person has more than one disability and the secondary disability is an important contributor to support needs. As more data are collected, reference packages will become more sophisticated and better informed by actual experience.

Source: NDIA (sub. 161, pp. 10–11).

Box 5.6 Using reference package data in planning

Scheme participants are allocated a 'typical support package', based on their reference group (which is determined by their age, disability type and level of function). The typical support package may include funding across eight core domains: daily activities; social participation; consumables; transport; home modifications; assistive technology; capacity building; and support coordination.



For each participant, the level of funding is adjusted according to their circumstances. This is done using a questionnaire, which asks about each of the domains, including what supports the participant already has in place and whether these are sufficient and sustainable. For example, where it is reasonable that sustainable informal, community or mainstream supports continue to assist the participant, or where other informal, community or mainstream supports may provide a better outcome, funding is adjusted in the participant's support package.

Source: NDIA (sub. 161, pp. 10–11).

Balancing different considerations

A number of study participants argued that the use of reference package data is at odds with person-centred planning and that it limits choice and control during the planning process (AASW, sub. 124, p. 4; Flourish Australia, sub. 74, p. 13; Lifestart Co-operative, sub. 97, p. 9). ACT Disability, Aged and Carer Advocacy Service (sub. 87, p. 14), for example, said that the approach 'carries inherent risks that planners (and assessment tools) will overly rely on reference plans as opposed to taking a person-centred approach'.

A person-centred or individualised approach to planning is central to the NDIS. The scheme is about matching participants with the supports that are right for them; however, this needs to be done in the context of the sustainability of the scheme and achieving a consistent approach to funding packages.

During the first year of trial, a highly detailed and person-centred approach was taken to planning, but according to the NDIA it was found not to be fit for purpose.

> [The] Support Needs Assessment Tool (SNAT) was a construct that attempted to identify functional support need and through a planning discussion using the tool to provide the participant with a detailed personalised support plan. The SNAT was used throughout the first year of trial. However, at the end of this period, it had become apparent that the SNAT was not fit for purpose. While the SNAT delivered an individualised outcome, there was no correlation of the SNAT to the reference packages upon which the funding of the Scheme was based. (sub. 161, pp. 9–10)

While some expressed greater satisfaction with processes during trial (for example, Down Syndrome Australia, sub. 121, p. 13), according to the NDIA (sub. 161, p. 10), it led to 'highly prescriptive plans that provided detail at the daily and sometimes the hourly level minimising the flexibility for participants to exercise choice and control'.

The first plan process, introduced in 2016, sought to improve the approach taken at trial by enabling people greater flexibility in how they used their funds against goals and outcomes that they identified. It also sought to address the issues of consistency between support packages by providing guidance to planners about what support packages for different groups should look like.

The challenge for the future of the planning process is to find the right balance between individualisation and good outcomes for scheme participants on the one hand, and ensuring equity among participants and the financial sustainability of the scheme on the other. It is likely to be some time before the right balance is struck.

A dynamic process

As with all insurance-based schemes, the tools and processes for handling and assessing claims are a matter of ongoing refinement. This is necessary to ensure that the insurance scheme remains 'on track' and is viable in the long term. Dynamic processes are also

important to allow the scheme to adapt to changing circumstances or incorporate information that becomes newly available over time.

Part of this process is ongoing monitoring and evaluation (chapter 11). The NDIA undertakes internal monitoring of its processes.

> The first plan process is a dynamic process which will include ongoing refinement as more data and information becomes available. The process allows continuous monitoring of committed support and utilised support, with benchmark costs. As the NDIS moves through transition, the NDIA is continually monitoring and seeking opportunities to enhance the planning process from a participant, provider and staff perspective. The NDIA is currently reviewing the plan review process to streamline the process and ensure it continues to meet the needs of both the participants and Scheme sustainability. (sub. 161, p. 89)

In December 2016, the COAG Disability Reform Council agreed to review the first plan process at the end of June 2017 (DRC 2016). This review should consider whether the first plan process strikes the right balance between individualisation and ensuring equity across participants, and whether the process helps ensure that the scheme is sustainable in the long term.

Information about how the planning process works is important

Many study participants were unsure or unaware of how the first plan process operated. Scope Australia (sub. 72, p. 15) suggested that this was because 'communication from the Agency and its contractors has been inconsistent and at times poor'.

A number of study participants were unsure or mistaken about:

- what the first plan process was
- the rationale for adopting the first plan process
- whether or to what extent support packages were adjusted for individual circumstances
- whether or how supports received under legacy programs were taken into account.

With evolving processes, it is important that scheme participants and their families and carers can access accurate and up-to-date information about the planning process. Dr. Kylie Burns explained the importance of transparency for scheme participants:

> The use of reference packages which are not transparent and available to applicants may also create confusion and resentment in participants who legitimately understand the planning process to be highly individualised based on the provisions of legislation and the NDIS rules (which do not make reference to reference packages). (sub. PP315, p. 5)

ACT Disability, Aged and Carer Advocacy Service (sub. 87, p. 14) said, 'we would encourage a transparent and rigorous approach to consideration of benchmarking and reference plan topics'. Clear messaging about how and why things are changing is also important for maintaining the credibility of evolving planning practices.

Plan reviews

Usually, plan reviews occur as part of the planning cycle — that is, at the expiry of a scheme participant's previous plan (usually after 12 months). However, unexpected plan reviews can be triggered if the scheme participant changes their statement of goals and aspirations or requests a plan review (NDIS Act, ss. 47–48). Often plan reviews are initiated by the scheme participant because their supports do not, or cease to, meet their needs or expectations. Changes to a plan may also be required if information in the plan is incorrect or missing.

Currently, any changes to a plan require a full plan review. Several study participants advocated to allow plans to be amended or varied without triggering a full review (BCA, sub. 130, p. 5; MND Australia, sub. 45, p. 2; Woden Community Service, sub. 159, p. 10).

Full plan reviews can be time-consuming and costly, and scheme participants may also be unable to access the supports they need while they wait for their plan to be reviewed (AOPA, sub. PP294, pp. 3–4). A process for amending or adjusting plans would improve the cost effectiveness of review processes, especially when the proposed changes to the plan are minor (Jacqueline Pierce and Associations, sub. 147, p. 5).

Some also suggested that amendment processes could be used to manage supports for participants when needs change quickly — such as in the case of episodic or degenerative disorders (ABF, sub. 48, p. 3; MND Australia, sub. 45, p. 2). However, where a participant's circumstances change significantly, it will be more appropriate to undertake a full plan review (provided it is undertaken with sufficient expediency).

A process for allowing minor amendments or adjustments to plans without triggering a full plan review was supported by many participants (box 5.7). The NDIA (sub. PP327, p. 25) indicated that it is currently undertaking work to streamline the process for making small plan changes.

However, the NDIS Act s. 37 does not permit variations to a plan once it has come into effect, meaning that the implementation of an amendment process could require legislative change. As Legal Aid NSW explained:

> In our view, this change would require legislative amendment, not just a new NDIA process. Section 37(2) of the NDIA Act states that a participant's plan 'cannot be varied after it comes into effect, but can be replaced under Division 4'. Under Division 4, a participant may request a review of his or her plan at any time and may revise the participant's statement of goals and aspirations at any time, which results in the replacement of the plan. (sub. PP245, p. 8)

If this is the case, the Australian Government should amend the NDIS Act to allow the NDIA to implement a process for making minor amendments or adjustments to plans without triggering a full plan review.

Box 5.7 Many support minor amendments to plans without a full review

Early Childhood Intervention Australia:

> ECIA agrees that the NDIA should implement a process for allowing minor amendments or adjustments to plans without triggering a full plan review. Currently, where there have been minor errors such as plan management choice, a full review is required. … . Due to growth spurts, children can outgrow a piece of equipment such as a wheelchair or orthotics that should be replaced as needed without the full review process. (sub. PP249, p. 4)

Parkinson's Australia:

> Due to progressive nature of Parkinson's there is often the need to frequently adjust plans as the illness progresses, this is particularly important for some of the atypical Parkinson's conditions, such as Multiple System Atrophy, Progressive Supra Nuclear Palsy and Cortico Basal Degeneration, which can progress rapidly. Parkinson's Australia considers that facilitating minor amendments or adjustments to plans to reflect changes in a participant circumstances or changes in the service provision environment would remove unnecessary bureaucracy and assist in the smooth operation of the scheme. (sub. PP232, p. 8)

Australian Orthotic Prosthetic Association:

> Given the issues inherent with the current planning process, plans for orthotic/prosthetic consumers are commonly inadequate and require amendment. … if a plan does not include the necessary supports that would enable a participant with limb-loss to receive a prosthetic limb, an entire review is implemented. This often requires a significant time delay, during which a participant is unable to access the necessary supports and services. For consumers of orthotic and prosthetic services, this may mean a significant period of time without the ability to access the community, mobilise and remain independent. … the current plan review process may take up to three months. (sub. PP294, pp. 3–4)

Prader-Willi Syndrome Association of Australia:

> Plan reviews must be more responsive, to avoid a costly crisis. (sub. PP228, p. 4)

MJD Foundation:

> Because of the inconsistent quality between planners, it would be sensible to have a process whereby plans can be revised without the need for a formal request for a review. (sub. PP233, p. 7)

Young People in Nursing Homes:

> The planning system must be changed to enable adjustments without the need for a full review and replacement plan to be developed. This 'dynamic plan' model should be the default position and criteria need to be developed to guide decisions about when a new plan is needed. (sub. PP326, p. 4)

Early Childhood Intervention Australia Victoria/Tasmania:

> Simplifying the review process for minor amendments will reduce costs and minimise delays for participants accessing services and supports. (sub. PP301, p. 3)

RECOMMENDATION 5.1

The National Disability Insurance Agency (NDIA) should implement a process for allowing minor amendments or adjustments to plans without triggering a full plan review.

If required, the Australian Government should amend the *National Disability Insurance Scheme Act 2013 (Cwlth)* to enable the NDIA to implement such a process.

The role of Local Area Coordinators in the planning process

In some areas, planning discussions are conducted and plans are prepared by Local Area Coordinators (LACs). However, under current legislative arrangements, LACs do not have the power to approve plans — that is, plans prepared by LACs must still be approved by the NDIA.

In its initial submission, the NDIA (sub. 161, p. 13) said that there may be some benefits to allowing approval functions to be delegated to LACs, including increased efficiencies due to reduced double-handling of plans by LACs and the NDIA. The NDIA also said that delegating approval functions could lead to greater certainty for scheme participants.

> More importantly, it would improve the experience of participants by allowing the LAC, while in discussion about support needs and within defined parameters and agreed reporting and monitoring arrangements, to be able to confirm the level of reasonable and necessary funding and move straight to a discussion on plan implementation. (sub. 161, p. 13)

A small number of study participants supported changes to the NDIS Act to allow the NDIA to delegate plan approval functions to LACs (Disability Services Australia, sub. PP256, p. 2; South Australian Government, sub. PP354, p. 4; VICSERV, sub. PP284, p. 3). Some also said that delegation would be appropriate if it could be shown that LACs had sufficient capacity and training (CMHA, sub. PP270, p. 6; MS Australia, sub. PP283, p. 6, Speech Pathology Australia, sub. PP303, p. 9; Parkinson's Australia, sub. PP232, p. 8). The Queensland Government (sub. PP345, p. 8) also said there might be a case for 'rapid or limited approvals for participants supported by LACs engaged by the NDIA who cover very remote areas, for example, the Torres Strait Islands'.

However, the majority of study participants were opposed to allowing delegation, [39] driven mainly by concerns about:

- the risk to plan quality as a result of the NDIA having reduced control and oversight over plans and the planning process
- the capacity of LACs to perform additional functions, due to time and resource constraints
- conflicts of interest (real or perceived) between different roles — for example, giving LACs plan approval functions could compromise their ability to provide impartial pre-planning support
- reduced accountability, clarity and transparency around roles and responsibilities.

[39] Study participants who opposed the delegation of approval functions to LACs included: ADACAS (sub. PP260); AEIOU Foundation (sub. P277); AFDO (sub. PP325); Anglicare Australia (sub. PP339); ABF (sub. PP263); APS (sub. PP229); Bruce Bonyhady (sub. PP333); CPSU (sub. PP310); Flourish Australia (sub. PP246); HSU (sub. PP316); Legal Aid NSW (sub. PP245); MIFA (sub. PP338); NSW Government (sub. PP230); One Door Mental Health (sub. PP266); PWSAA (sub. PP228); RIDBC (sub. PP259); and Vision Australia (sub. PP252).

On balance, it does not appear that legislative change to enable the delegation of plan approval functions to LACs is warranted at this stage. In response to the position paper, the NDIA (sub. PP327, p. 24) also advised that it 'is not currently seeking legislative change to allow the delegation of plan approval to LAC partners'.

5.3 How is the planning process tracking?

Good planning processes are essential for the success of the scheme and long-term sustainability, as the quality of the planning process has a bearing on what costs are incurred in the scheme, the predictability of scheme costs and the integrity of the scheme (box 5.8). The Northern Territory Government said it considers the planning process to be one of the most important elements of the scheme.

> The quantity of supports received by participants is a key driver of costs, and therefore a consideration for the ongoing financial sustainability of the Scheme. However, without a high quality planning process which supports participants to identify and work towards their goals and aspirations, choice and control for participants will not be achieved. (sub. 205, p. 3)

The planning process is not operating well. The Commonwealth Ombudsman reported that the planning process is one of the main sources of complaints to the office (sub. 137, p. 7).

Participants to this study also expressed dissatisfaction with planning processes. In particular, participants expressed concern about:

- the lack of consultation and engagement with scheme participants
- the accessibility and transparency of processes and planners
- the quality of planners (including LACs undertaking planning functions).

A real concern is that poor planning processes are compromising the quality of plans. The Commission heard that plans often do not meet scheme participants' needs or expectations, and sometimes they include supports that are not wanted or needed (Macarthur Disability Services, sub. 57, p. 4). Several study participants also reported considerable variability in plans for scheme participants with similar needs (Neami National, sub. 63, p. 8; PDA, sub. 38, p. 8; PDCN, sub. 29, p. 3). For example, Brain Injury SA said:

> Brain Injury SA is aware of one household with multiple children with similar needs. Each child had a different planner and each plan provided funding for different services. In another instance, involving twins with developmental delays and similar levels of need, the plan for one child included support coordination while the plan for the other child did not. (sub. 116, p. 5)

Box 5.8 Why are good planning processes important?

Outcomes, benefits and equity

As discussed in chapter 1, financial sustainability is not just about costs. It is also about whether outcomes are being realised, and whether those who are paying for the scheme remain willing to do so (NDIA 2016h).

Poor planning processes can mean that scheme participants are allocated supports that are not right for them. This in turn can mean that many of the benefits of the scheme (such as increased quality of life, greater social and economic participation, and reduced need for other or future supports) are not fully realised. Poor planning processes can also result in greater variability in plans and outcomes for scheme participants with similar needs, compromising equity within the scheme. Together, these factors can undermine the credibility of, and community support for, the scheme as a whole — and hence its long-term sustainability.

Costs associated with reviews

Poor planning processes can result in plans that do not reflect the needs or expectations of scheme participants. Increased requests for plan reviews can add to the workload of planners. Review processes can also place greater stress on scheme participants and providers. As Occupational Therapy Australia said:

> … reviews can take months to complete, resulting in added frustration for families and potentially affecting the relationship between participant and provider. (sub. 15, p. 5)

Greater use of review processes can increase the administrative costs of the National Disability Insurance Agency, as well as costs in other areas. For example, appeals to the Administrative Appeals Tribunal or the Federal Court of Australia place a greater burden on the justice system (chapter 11).

Certainty about costs

Poor planning can introduce additional uncertainty about scheme costs (New South Wales Government, sub. 60, p. 15; PDA, sub. 38, p. 9).

- Poor planning processes can be unreliable — that is, they do not yield consistent results across time, individuals and situations. This increases the variance in the value of support packages, increasing the unpredictability of scheme costs overall.
- Poor planning increases the likelihood that participants' plans do not match their needs and expectations. This can contribute to underutilisation of plans, driving a wedge between committed and actual support funding.

Greater uncertainty around scheme costs can undermine the accuracy of cost projections, which can make it difficult for governments to plan for the future of the scheme. High variability of scheme costs also increase the risk of cost blowouts.

Market development

The supply of disability supports needs to grow significantly to meet the needs of NDIS participants. Plans specify what supports will be funded by the NDIS, which directly impacts the demand for different types of supports. This, in turn, encourages certain types of supports to be supplied in the market. Good planning processes are necessary to ensure that the signals sent to the market are those that lead to the supply of the supports that best meet the needs of people with disability.

The NDIS is a major reform and the NDIA has been given a monumental task under highly ambitious timeframes (chapter 2). Many of the NDIA's decisions about how to operationalise the planning process are influenced by bilateral estimates and community expectations around reaching new participants quickly. In addition, planning processes have had little time to mature.

However, there is real concern that some of the practices adopted to address the pressures of rollout will become entrenched in practice and in the culture of the NDIS, with implications for the long-term costs and benefits of the scheme.

The following sections discuss the key concerns raised by study participants, and policy options for ensuring that poor practices do not become structural issues that continue to affect the operation of the NDIS in the medium and long term.

Engagement with scheme participants

Engaging with scheme participants during the planning process is important not only for ensuring that they receive the supports that are right for them, but also for the long-term success of the NDIS. Physical Disability Australia suggested that engaging with scheme participants is particularly important in the early stages of planning.

> Given that many planners are new to this type of work and may have limited lived experience of disability, the validity, reliability and accessibility of the processes they use to determine what constitutes an appropriate support package depends on deep engagement with participants, their families and supporters. (sub. 38, p. 7)

The planning process needs to be sufficiently 'deep' so that planners can obtain sufficient information about a participant for them to make a decision about reasonable and necessary supports that minimise lifetime costs, while also making the process person-centred and convenient for scheme participants and their carers. Involving families, carers, support workers and advocates in the planning process can also improve understanding of the functional impact of the participant's disability, their needs and the supports that they require (VCOSS, sub. 176, p. 16).

Concerns about rushed planning

The speed of transition, as set out in Bilateral Agreements, has placed a lot of pressure on the NDIA to finalise plans quickly. This has detrimentally affected the quality of the planning process. SCIA Australia said:

> The rush to get new participants into the scheme against bilateral agreements is proving to be a major headache for the Agency and is severely affecting the quality of first plans. (sub. 61, p. 3)

Similarly, United Voice said:

> Workloads and inadequate time to do the job is one of the most often cited concerns of our members. United Voice members are concerned that [planners] do not have time to do their job properly, that they rush from client to client preventing them from providing quality support. (sub. 118, p. 8)

Study participants also reported feeling that planning meetings are rushed (Flourish Australia, sub. 74, p. 3; Hannah Potapczyk, sub. 26, p. 1; Jennifer Smith-Merry, sub. 55, p. 2; Leadership Plus, sub. 128, p. 2; Maurice Blackburn Lawyers, sub. 58, p. 13; New South Wales Government, sub. 60, p. 15). Engagement with scheme participants during the planning process appears to be fairly superficial, and the NDIA (sub. 161, p. 11) accepted that the focus on throughput during the first two quarters of transition has contributed to poorer plans.

Phone planning

Most planning conversations are now taking place over the phone, although face-to-face meetings are accommodated if required. The NDIA (sub. 161, p. 12) explained that this was a deliberate decision to allow people to enter the scheme as quickly as possible, with provision for scheme participants to consider how they will use their supports and amend their goals over the first year.

This decision was based on trial experience that recognised that people want to join the scheme as soon as they can, but also want time to think about their goals, supports and how they will use them. While it is recognised that this approach is not perfect, it was designed as a short-term measure to meet both of these objectives (NDIA, sub. 161, p. 12).

Study participants overwhelmingly expressed dissatisfaction with this approach to planning,[40] and many provided examples of poor experiences (box 5.9).

Carers Australia Victoria also identified issues with:

> … limited access to supporting documentation whilst on the phone; limited time to properly consider goals and aspirations; confusion about who they are being contacted by and for what; whether the plan will be as comprehensive as it could have been if the participant had the opportunity for a face-to-face meeting; the ability for the planner to recognise opportunities for capacity building. (sub. 131, p. 8)

[40] Study participants who were critical of phone planning included: Activ (sub. PP302); ADACAS (sub. 87); AFDO (sub. PP325); AHPA (sub. 37); ALA (sub. PP257); Alzheimer's Australia (sub. 10; sub. PP313); Australian Red Cross (sub. PP258); The Benevolent Society (sub. PP334); Brain Injury SA (sub. 116); Carers Australia Victoria (sub. 131); CMHA (sub. 9); ECCV (sub. 31); ECIA (sub. PP301); Flourish Australia (sub. 74); Inclusion Melbourne (sub. PP207); Legal Aid NSW (sub. PP245); Macarthur Disability Services (sub. 57); Maurice Blackburn (sub. PP309); Mental Health Community Coalition of the ACT (sub. 135); OPA (sub. PP241); OTA (sub. 15; sub. PP285); PDCN (sub. 29); PDA (sub. 38); SAL Consulting (sub. PP304); The Shepherd Centre (sub. 107); Social Support & Precarious Workforce Research Discussion Group (sub. 71); SUFY (sub. PP242); VALID (sub. PP332); VCOSS (sub. 176); Vision Australia (sub. 252); VMIAC (sub. 167); YDAS (sub. PP262); and YPINH (sub. PP326).

Box 5.9 Experiences with phone planning

Alzheimer's Australia:

> Annie called the Parkinson's 1800 support line as she worried about an over the phone NDIS planning session that had taken place earlier that day. Annie's volume and quality of speech has been impaired due to Parkinson's and she also requires longer to respond to questions. She felt rushed and because her response is delayed she felt that the assessor didn't get a clear indication of her needs. Annie and a Parkinson's Nurse Specialist were able to take the time [to] put information together in order to apply for a review for Annie's plan. (sub. 10, p. 8)

Ethnic Communities' Council of Victoria:

> … anecdotal evidence from advocates and providers in the North Eastern Melbourne Region indicates that some participants are not being adequately informed about the purpose of phone contact by the NDIA or their LAC. These participants are having plans being completed without realising that they are engaging in the process or providing informed consent. (sub. 31, p. 1)

Carers Australia Victoria:

> I received a telephone call from an NDIA representative and requested a face-to- face meeting … The planner requested information regarding my son and said there were notes from his case manager which would be used to help create his plan. I inquired about the case manager, as I was not aware my son had one. The name given was of a man I had spoken to about 20 years ago. The planner said they have all his needs documented. I reiterated the need for a face-to-face meeting to discuss our changing circumstances and the support that my son needs to live independently and future support needs. I was offered a meeting three days later, 90km from my home, which was not possible for me to attend. When I received a follow up call, I thought it was to schedule another time for a meeting, instead it was to tell me that a plan had been created for my son and that I should login to the Portal to see it. A week later I received a copy of the plan in the mail. The plan contained information about my son from over 20 years ago. (sub. 131, p. 9)

Some felt that phone planning limits engagement with the scheme participant and does not allow the planner to see the full picture. For example:

> [Phone planning] is a transactional and blunt approach at a critical stage of a participant's navigation and interaction with the scheme … We feel utilization of phone-planning also creates assumptions of living situation by planners, who are unable to adequately capture the requirements and considerations of participants and respect the role of family, carers and other persons who are significant in the life of the participant. (Social Support & Precarious Workforce Research Discussion Group, sub. 71, pp. 2–3)

And:

> … an assessment completed by phone does not take the person's disability into account and fails to provide the added awareness and accommodation that are possible in a face-to-face meeting. Planners ask questions over the phone, which sometimes assume ability that does not exist. However, this is not evident to the planner because they are not with the person being assessed. They also lack the ability to make observations about the situation of the participant at the time of the phone call, which may involve distractions. (Brain Injury SA, sub. 116, p. 9)

Blind Citizens Australia (sub. 130, p. 3) also said that conducting meetings over the phone 'severely compromises the ability of people who are blind or vision impaired to demonstrate

the difficulties they may face with completing tasks like reading, navigating the environment or household chores'.

Others expressed concern that phone planning takes scheme participants by surprise or does not allow participants to be supported by family, carers or advocates (Flourish Australia, sub. 74, p. 12). Physical Disability Council of New South Wales said:

> Phone plans … do not allow for participants to be supported simultaneously by carers or other important parties; physical sharing of important resources such as weekly planners or aspirational plans; equal access for peoples with specific communication needs; or allow planners to observe physical cues and surroundings for possible supports or equipment needs. (sub. 29, p. 3)

Phone planning is especially problematic for scheme participants with particular accessibility requirements (discussed below), such as mental illness (CMHA, sub. 11, p. 6; Flourish Australia, sub. 74, p. 3), cognitive impairment and neurodegenerative diseases (Alzheimer's Australia, sub. 10, p. 5) or people of culturally and linguistically diverse backgrounds (ECCV, sub. 31, p. 1; VCOSS, sub. 176, p. 9).

The Commonwealth Ombudsman reported that the bulk of complaints he had received about the planning process were from people who participated in phone planning. The Ombudsman suggested that it would be useful to compare the outcomes, satisfaction and review rates of face-to-face and phone planning discussions, noting that:

> While phone meetings likely provide the most cost effective method for planning when only simple administrative overheads are considered, there may be merit in considering whether — if participants who have phone meetings are more likely to subsequently complain or seek review — the time spent on those subsequent interactions detracts from the cost effectiveness of planning by phone. (sub. 137, p. 8)

The Northern Territory Government also said that better outcomes were achieved when face-to-face planning was used.

> In the NT, the planning processes negotiated through the Bilateral Agreement between the Commonwealth and NT to transition the NDIS allow for a more … intimate planning process, with NDIA planning meetings occurring face-to-face and with a representative from the participant's service provider. This also ensures a comprehensive handover and in remote parts of the NT, particularly in remote Aboriginal communities, this approach has been working well. (sub. PP359, p. 6)

Some study participants argued that phone planning should only be used at the request of the scheme participant (Amaze, sub. PP281, p. 6; CMHA, sub. PP270, p. 5; Cohealth, sub. PP261, p. 2; Parkinson's Australia, sub. PP232, p. 3; YDAS, sub. PP262, p. 3). In its submission, the NDIA (sub. PP327, p. 25) stated that it is moving towards using face-to-face planning as a default approach, in response to feedback from scheme participants.

Consulting with participants about plan content

Consulting with scheme participants and their family, carers and advocates is essential to the success of the planning process. However, the Commission heard that, in many instances, scheme participants were not consulted about the content of their plan.

In particular, scheme participants were not permitted to view plans before they were finalised. Community Mental Health Australia said:

> Clients are generally not permitted to see a plan before it is finalised, which anecdotally providers state is hindering clients understanding of their plan … There are incidents where people don't know what they are going to get until the plan is submitted — and there is currently no opportunity to take time to consider the plan before it is finalised. (sub. 11, pp. 3, 11)

Several study participants said that scheme participants should be able to view and comment on their draft plans before they were finalised (CSSA, sub. PP278, p. 3; Family Advocacy, sub. PP346, p. 7; Inclusion Melbourne, sub. PP207, p. 12, Vision Australia, sub. 252, p. 3). National Disability Services explained:

> During the trial phase of the NDIS, participants were invited to comment on their draft plan before it was finalised. That practice has largely ceased. The consequence is that participants can end up with a plan that doesn't reflect their needs and goals. Some participants receive plans they don't recognise. Consistent with the NDIS's focus on choice and control, participants should always have the opportunity to comment on their plan before it is finalised. (2017a, p. 7)

It may be the case that calls for scheme participants to see draft plans are symptomatic of broader concerns about a lack of consultation during the planning process. Poor consultation and communication appear to have resulted in scheme participants being surprised by, or confused about, the content of their final plan. Sufficiently deep consultation practices need to be built into the NDIA's planning process, so that plans adequately meet participants' support needs.

A formal process for allowing scheme participants to view and comment on draft plans could mitigate some of the issues arising from inadequate consultation, but would not address the problem directly. A more direct approach could be to improve consultation and communication with participants during the planning process. This should be accompanied by a process for making minor amendments or adjustments to draft plans (recommendation 5.1), so that errors can be easily corrected.

There also appears to be limited consultation about the length of plans. At present, plans typically run for 12 months, with only a small number of plans made for more than a year. For many scheme participants, shorter plans represent an opportunity to frequently assess whether their allocated supports are in line with their needs. But longer plans may be appropriate for participants whose needs are relatively stable and predictable. Some study participants expressed a preference for longer plans (Autism Association of Western Australia, sub. PP219, p. 11; Name withheld, sub. PP215, p. 4). Greater consultation and flexibility around the length of plans would promote individualisation and choice and control

in the planning process. Decisions about when a plan should be reviewed should take into account the participant's preferences and circumstances, including the stability and predictability of their needs.

The lack of participant involvement is not confined to first plans. Several study participants said that consultation around subsequent plans was also inadequate. Some reported that first plans were simply being 'rolled over' (CPSU, sub. 76, p. 9; HSU, sub. 132, p. 12). For example, the Summer Foundation recounted a mother's experience with her child's third plan.

> No actual review took place and her daughter received a 'form' letter advising that her plan would continue 'as was' for the next 12 months and if she required any changes to apply for an internal plan review within 3 months of receiving this letter! This letter was not even signed! (sub. 113, p. 21)

Others, however, said that requests to have a plan 'rolled over' were ignored.

> In February I was contacted by an NDIA employee to have my plan review early. I tried to ask for it to be rolled over as I had not been able to fully activate the plan. I explained about the portal being down for months which was experience[d] by a large number of service providers. This person would not consider this and proceeded to state I was to be reviewed by phone. (Tricia Curley, sub. 140, p. 4)

Under the current timetable, the NDIA is required to complete a large number of plans in a relatively short period of time, and this has influenced how planning processes are undertaken. However, it is essential that the NDIA undertakes its planning function adequately and in a way that does not undermine the objectives of the scheme. An increased focus on the quality of the planning process will no doubt make it more difficult for the NDIA to keep to the timetable set out in the Bilateral Agreements. But if the quality of plans is compromised because of a focus on participant numbers, this will undermine the effectiveness of the scheme and have implications for long-term costs.

For this reason, it is important that the NDIA's performance is measured based on whether and how effectively it is realising outcomes under the NDIS, rather than just participant numbers (chapter 11). A greater emphasis on reporting on the quality of planning processes will help shift the focus towards better quality plans and give the NDIA the incentive and latitude to focus on participant experience and outcomes.

Accessibility of the planning process

A lack of clear and transparent information

Study participants expressed frustration about the lack of clarity and transparency around the planning process.[41] Noah's Ark, for example, said:

> … there is no information about the planning process and how it is supported in the public domain. There has been a significant change in how plans have been written. These changes have not been documented or an explanation provided. (sub. 108, p. 9)

Mamre Association also said there is a lack of consistency with clear, concise and factual information.

> It is often left up to the general disability sector to try to navigate their way through 'forensic' investigation as to what the information means. There simply is very little capacity within the sector itself to invest in something so time consuming. (sub. 47, p. 1)

And Family Advocacy (sub. PP346, p. 10) said scheme participants experienced difficulties understanding their plans because they were filled with jargon and not available in plain English. Vision Australia argued for better online information:

> The NDIS planning process, even with the new resources rolled out in the past few months, is opaque. Providers who already engage with the system and have a good understanding still struggle to explain it to participants. The NDIA website is confusing: something as simple as a '*the Six Steps to NDIS Success'* would be hugely beneficial, as the lack of a clear process or flowchart hampers participant understanding. (sub. PP252, p. 1)

Scheme participants and their carers need access to relevant, current and accurate information about the planning process that they can easily understand. But there appears to be limited information available to help scheme participants and their families, carers and advocates navigate the system. This is particularly problematic for scheme participants who do not have the time or capacity to navigate a complex and confusing system.

Scheme participants are also often not aware or informed about their rights and options. For example:

- some participants did not know that they could request a face to face planning meeting instead of phone planning (ADACAS, sub. 87, p. 15; Social Support & Precarious Workforce Research Discussion Group, sub. 71, p. 3)
- others were unaware of their entitlement to have an advocate present at their planning meeting — not having an advocate present can negatively affect outcomes for

[41] Participants who expressed concern about the lack of clarity and transparency around the planning process included: Autism Aspergers Advocacy Australia (sub. 178); DPO Australia (sub. 165); Flourish Australia (sub. 74); Inclusion Melbourne (sub. PP207); Mamre Association (sub. 47); Mental Health Community Coalition of the ACT (sub. 135); Name withheld (sub. PP215); Noah's Ark (sub. 108); SWAN Australia (sub. 86); and Tandem (sub. PP212).

participants with limited ability to self-advocate (ABF, sub. 48, p. 9; New South Wales Government, sub. 60, p. 15; Vision Australia, sub. PP252, p. 3).

A lack of information about review processes was also identified as an issue (Legal Aid NSW, sub. PP245, p. 9). For example, Brain Injury SA said:

> … information provided to participants about review is unclear and inadequate. There is minimal information about the process and no information about how or where participants can get help with a review … Further, Brain Injury SA has received anecdotal evidence from parents and guardians that NDIA has not been informing participants of their right to an internal review or external merits review through the [Administrative Appeals Tribunal]. (sub. 116, pp. 9–10)

The NDIA (sub. PP327, p. 26) acknowledged that 'participants have expressed the desire for greater transparency in the planning process and what is required of them'.

Planners are not easily reached

The Commission heard that planners were not identifiable and accessible to scheme participants (AHPA, sub. 37, p. 14; Family Advocacy, sub. PP346, p. 9; OTA, sub. 15, pp. 4–5). The Disability Services Commissioner said:

> Planners are not clearly identifiable and accountable. A participant told us that the planner got his plan wrong and he couldn't call the planner directly to talk about the issue. He raised further concerns that no one at the NDIA records his calls, so he feels he cannot escalate his complaint, as there is no record of his previous contact. (sub. 35, p. 5)

Brain Injury SA also said:

> The 1800 phone number is the only number provided to participants and service providers. Anyone wanting to speak to a planner, even in response to a message that has been left by the planner, must use this number … there is usually a 45 minute wait for calls to be answered. When the call is answered, there is no certainty that the call will be transferred to the relevant office or planner. (sub. 116, p. 10)

Planning processes are not inclusive for all

It is important that planning processes are accessible, inclusive, and sufficiently flexible to accommodate the needs of different scheme participants. This is especially true for participants with complex needs or from culturally and linguistically diverse backgrounds.

As the New South Wales Government said:

> Many NDIS participants that are participants of other state services (justice, mental health) do not have the capacity or capability to interact with the NDIS without intensive support. They may have no natural supports, like family or friends in their lives; they may have family that do not support their best interests; or they may have limited experience as consumers generally and may not be able to exert their rights as participants in the NDIS. Some people with complex needs

> may not be able to define their needs or understand what reasonable and necessary supports they would need to support them. (sub. 60, p. 17)

Planning processes need to be sensitive to the intersection between disability and other social issues, such as homelessness, family violence, and alcohol and other drug use. Study participants also highlighted the importance of providing gender-responsive services (ACT Government, sub. 156, pp. 28–9; DPO Australia, sub. 165, p. 14; Leadership Plus, sub. 128, p. 2; Richard Kennedy, sub. 2, p 2; VCOSS, sub. 176, p. 10; Women with Disabilities Victoria, sub. 111, p. 2).

Needs arising from disability

Many study participants said that planning processes are not inclusive and overlook the needs of people with disability. Sharing Places said:

> People with intellectual disabilities and very high and complex support needs are not understood by NDIA. People with high and complex needs would greatly benefit from a more in depth assessment and planning process. (sub. 53, p. 2)

Communication accessible processes are also important for people with vision or hearing impairment (ABF, sub. 48, p. 9; Deafness Forum of Australia, sub. 127, pp. 16–7; Speech Pathology Australia, sub. 136, pp. 28–9). But Australian Blindness Forum said:

> … participants in the NDIS cannot access any NDIS information in alternative formats. This means that people who are blind or vision impaired cannot independently register themselves with the NDIS or read their own plans. (sub. 48, p. 9)

Vision Australia (sub. PP210, p. 7) called for plans, information and forms to be made available in a wider range of formats, including braille, to ensure that information is accessible for scheme participants.

Planning can also be challenging for people whose needs can change quickly — such as episodic or progressive disorders. Study participants identified psychosocial disability (box 5.10) and degenerative disorders (box 5.11) as particular problem areas.

Language and cultural barriers

Study participants observed that planning processes do not adequately cater for people of different cultural and linguistic backgrounds (Companion House, sub. 84, p. 2; Jesuit Social Services, sub. 117, p. 3; Neami National, sub. 63, p. 6; Northern Territory Government, sub. 205, p. 7; Social Support & Precarious Workforce Research Discussion Group, sub. 71, p. 6; VCOSS, sub. 176, p. 9; VMIAC, sub. 167, pp. 6–7).

Box 5.10 Mental illness and psychosocial disability

The National Disability Insurance Scheme is designed to cover disabilities that are permanent, including those of a chronic episodic nature, such as mental illness and psychosocial disability.

> 'Permanent' refers to the irreversible nature of the disability, even though it may be of a chronic episodic nature. For example, this would include people with significant and enduring psychiatric disabilities, who periodically rely exclusively on support from the clinical services of the mental health system, but at other times are able to live in the community provided they have appropriate supports. (PC 2011, p. 14)

However, the episodic nature of mental illness can mean that some scheme participants' needs are unpredictable. To some extent, this runs contrary to the planning process, which, in broad terms, requires a forecast of the participant's support needs over the life of the plan.

This problem is exacerbated by 'inflexibility in changing arrangements in response to fluctuations in support need because of escalating illness' (Mind Australia, sub. 144, p. 8). This can create incentives for participants to overstate their support needs, so that they can be sure that they have access to adequate support during times of high need.

Due to the nature of their disability, people with psychosocial disability may at times find it difficult to articulate or disclose their support needs during the planning conversation (Anglicare Tasmania, sub. 145, p. 32; VMIAC, sub. 167, p. 7; VICSERV, sub. 169, p. 4). For this reason, such participants 'may need more than one meeting to develop plans due to [the] fluctuating nature of conditions' (Social Support & Precarious Workforce Research Discussion Group, sub. 71, p. 6).

Box 5.11 Progressive and degenerative disorders

Study participants said that certain progressive or degenerative disorders sat poorly with the 'investment approach' of the scheme. For example, Neurological Alliance Australia said:

> … the progressing and complex needs of people with neurodegenerative diseases have been overlooked due to lack of understanding of these diseases or for the sake of expediency … People with a progressive neurological disease run counter to the 'traditional' trajectory of someone on the NDIS: that is, an ability to enhance independence and re-ablement through a more effective engagement of services. For someone with a neurodegenerative disease, however, care needs inevitably increase over time. (sub. 30, pp. 1–2)

In addition, current planning processes do not account for the changing needs of people with progressive or degenerative disorders. Calvary Health Care Bethlehem said:

> For people with progressive disorders, the person's needs can change more rapidly than expected, so there needs to be sufficient flexibility in the plan being reviewed and amended to accommodate unforeseen needs arising. This needs to happen in a timely manner. (sub. 64, p. 2)

Similarly, MND Australia said:

> Plans are based on the 'now' and do not take account of the rapid and increasing needs caused by the progressive degenerative nature of [motor neurone disease], requiring review planning earlier than is necessary. (sub. 45, p. 9)

MND Australia (sub. 45, p. 7) also reported that between June 2016 and January 2017, all plans for people with Motor Neurone Disease in New South Wales and the ACT required review, primarily due to a poor understanding by planners of degenerative diseases.

For many, language barriers can prevent meaningful engagement with planning processes. Neami National (sub. 63, p. 6) said that 'consumers without English as their first language describe difficulties in participating in planning and in getting plans that they can fully implement on account of their language needs'. This is an issue which disproportionately affects Aboriginal and Torres Strait Islander communities:

> English is a second language for many Indigenous people in remote communities. The majority of participants in Barkly identify as being Aboriginal or Torres Strait Islander and for 67% English is not their first language. Many have limited capacity to understand or read it. This has a significant impact on their ability to have genuine input into the formulation of their plans and also impacts on decision making and choice. (Brain Injury SA, sub. 116, p. 3)

And those of refugee background:

> People with disability from a refugee background are often not well equipped to navigate the NDIS in planning meetings and to negotiate a package of supports from providers. Many have little or no understanding of the context of the broader social support system in Australia. (Companion House, sub. 84, p. 2)

Cultural barriers can also make accessing and interacting with the planning process difficult. In particular, there may be confusion about the purpose of planning conversations and there is a risk that scheme participants do not communicate their needs due to different cultural or social norms. (Social Support & Precarious Workforce Research Discussion Group, sub. 71, p. 6). There may also be greater mistrust of government services or an aversion to sharing personal information (VCOSS, sub. 176, p. 9).

Access can be especially difficult for some Aboriginal and Torres Strait Islander communities. Brain Injury SA said:

> Many Aboriginal people can be transient in nature and to uphold their cultural requirements. Therefore, participants are not in regular receipt of mail or telephone communication. In the Barkly region there is no mail delivery to homes and most people do not regularly check their PO Box. If they do not receive a hard copy of their plan they are advised to go onto the portal and get it online. However, many do not have access to computers, nor the awareness of how to use them. Consequently, many participants do not know they have a plan or, if they do, what is in it. (sub. 116, p. 3)

The Australian Medical Association emphasised the need to have culturally appropriate processes and cited evidence of poor planning practices.

> … we were told that in one Aboriginal community, NDIA assessors did not leave their vehicle, instead they yelled questions of Aboriginal people regarding their disabilities … there was no verification of the person's identity other than to ask their name and conduct a conversation from a driveway. Another reported case was that Aboriginal people with disability were asked to leave their homes and find their way to a waiting vehicle for an assessment; this included an Aboriginal person in a wheelchair. (sub. 120, p. 5)

The role of pre-planning support

Pre-planning support can help participants navigate a confusing and complex system. Pre-planning support is directed at helping the participant prepare for the planning conversation, including:

- thinking about their goals and aspirations
- preparing documentation to support the assessment process
- thinking about what supports are available and can help them.

Demand for pre-planning support services is influenced by how accessible and complex planning processes are, as well as the scheme participant's capacity (including their ability, willingness, skills and resources) to navigate those processes (chapter 10). Pre-planning support is provided by a range of different organisations, including advocacy groups and service providers.

Several study participants noted that pre-planning assistance is costly to provide (House with No Steps, sub. 104, p. 5; Mamre Association, sub. 47, p. 2; VICSERV, sub. 169, p. 4). Some argued that the NDIA should do more in the area of pre-planning support (ADACAS, sub. 87, p. 16; CMHA, sub. 11, p. 10; Cohealth, sub. 50, p. 10). Others called for governments to provide additional funds to facilitate pre-planning support (Amaze, sub. 160, p. 5, sub. PP281, p. 7; Cohealth, sub. 50, p. 10; NSW Disability Network Forum, sub. 18, p. 3; Social Support & Precarious Workforce Research Discussion Group, sub. 71, p. 9).

Pre-planning services are one of the core functions of LACs. During transition, LACs were meant to be 'on the ground' in each area six months before the NDIS was rolled out in that area, in part to provide pre-planning support. However, the speed of the rollout has meant that this was not possible and LACs have not undertaken the pre-planning functions as envisaged (NDIA, sub. 161, p. 56). The NDIA needs to have LACs in place so they can provide pre-planning support.

There is also scope for the NDIA to improve transparency and clarity around planning processes. This includes providing clear and up-to-date information about what to expect during the planning conversation, when it will occur, and how the information gathered during that conversation will be used. The planning process could also be made more accessible, especially for people with complex needs and those with different cultural and linguistic backgrounds.

These changes could reduce the need for extensive pre-planning support, and relieve some of the pressure on advocacy groups and service providers to provide such services.

The NDIA is currently undertaking a review of the participant pathway to identify what changes or improvements should be made to planning processes (while achieving the number of completed plans as specified in Bilateral Agreements) to achieve plans that:

- maximise choice and control for scheme participants and contribute to improved participant outcomes
- are of a high quality in terms of a positive participant experience, compliance with all statutory requirements and consistency
- are financially sustainable so that the aggregate value of all plans remains within the funding envelope (sub. 161, p. 4; sub. PP327, p. 22).

However, the NDIA is operating under demanding time and resource constraints, and there are trade-offs between the quality of planning processes and how quickly the scheme can reach new participants. As noted earlier, better planning processes could involve compromises in terms of participant throughput.

RECOMMENDATION 5.2

The National Disability Insurance Agency should:

- review its protocols relating to how phone planning is used
- provide clear, comprehensive and up-to-date information about how the planning process operates, what to expect during the planning process, and participants' rights and options
- ensure that Local Area Coordinators are on the ground six months before the scheme is rolled out in an area and are engaging in pre-planning with participants.

Planners

Planners are an essential part of the planning process and exert considerable influence on scheme participants' experiences within the NDIS. Sufficiently skilled and impartial planners can improve the quality of the planning process and outcomes for scheme participants. As ACT Disability, Aged and Carer Advocacy Service said:

> It is crucial that the NDIA continue to recruit planners with the right combination of skills, experience and passion, that they offer good training and that workload pressures for NDIA staff are managed. Planners need the skills to be able to tailor the planning approach, and their communication style to participants with different needs … (sub. 87, p. 13)

Conversely, planners with less experience, skill or training can have a detrimental effect on the quality of plans and participant outcomes. This is because they may have less knowledge about what supports are appropriate, meaning that plans may include inappropriate supports or fail to include appropriate ones (Brain Injury SA, sub. 116, p. 5).

Impartial planners are also important for scheme participants' experience of the planning process and the quality of plans. As one study participant said:

> The planners can have a great impact both positive and negative on the resulting plans. The planners biases also have an impact on both the discussion and resulting plan of a participant. For two years, the planner I had, put me in a box and thought she knew what and how I wanted supports. She would not listen until I had a panic attack in the meeting. It was only then she started listening. (Hanna Potapczyk, sub. 26, p. 1)

Skills, training and knowledge of specific conditions

A number of study participants were critical of the skills, experience and training of planners as a whole (Carers Australia Victoria, sub. 131, p. 12; DAA, sub. 119, p. 3; Legal Aid NSW, sub. PP245, p. 9; Matt Burrows, sub. 7, p. 3; Mental Health and NDIS Facebook Support Group, sub. 8, p. 3). The Public Service Research Group reported feedback that:

> There's not adequate induction support and supervision training provided to the people who are doing the planning … If we can't get the planning right we're not going to get the scheme right. (sub. 56, p. 6)

Speech Pathology Australia (sub. 136, p. 28) also noted that information about the level of qualifications and training required of planners is not publicly available. And many participants expressed concern about planners' limited disability knowledge.[42] For example, the Australia Physiotherapy Association said:

> Our members report that service planning is being undertaken by staff who have little competence in the specific field of disability relevant to the participant's needs and thus that service plans are at odds with the needs which the NDIS is designed to meet. (sub. 93, p. 13)

In particular, the Commission heard concerns that planners had limited knowledge about specific conditions (box 5.12), such as motor neurone disease, multiple sclerosis and dementia, Prader-Willi Syndrome, autism and Parkinson's Disease.

The Commonwealth Ombudsman reported that:

> Some stakeholders have told us about planners who asked parents when their child was likely to 'recover' from a life-long disability, and others who told people with psychosocial disabilities they should 'try to be more positive'. (sub. 137, p. 8)

[42] Study participants who commented on planners' limited disability knowledge included: AASS (sub. PP330); ABF (sub. 48); ACIA (sub. 141); AHPA (sub. 37); Alzheimer's Australia (sub. 10, sub. PP313); Amaze (sub. PP281); Anglicare Tasmania (sub. 145); APA (sub. 93); APodC (sub. 52); Belinda Jane (sub. 80); Cheryl McDonnell (sub. 79); CMHA (sub. 11); Cohealth (sub. 50); Commonwealth Ombudsman (sub. 137); DPO Australia (sub. 165); Macarthur Disability Services (sub. 57); Macular Disease Foundation Australia (sub. 75); Mental Health Australia (sub. 155); Mental Health Community Coalition of the ACT (sub. 135); Mind Australia (sub. 144); MJD Foundation (sub. PP233); MND Australia (sub. 45); Neami National (sub. 63); OPA (sub. 46); OTA (sub. 15); Parkinson's Australia (sub. PP232); PWSAA (sub. 112); VICSERV (sub. PP284); Vision Australia (sub. PP210); and VMIAC (sub. 167).

Box 5.12 Concerns about planners' limited knowledge of specific disabilities

MND Australia:

> LAC's do not have the expertise to support people with MND [motor neurone disease] … They have no understanding of MND and the disability it creates. They attempt to plan via a telephone conversation, when speech and communication can be one of the early losses created by MND … Several people in Victoria had plans developed by the LAC planner that did not include assistive devices — even though the participant was sitting in a wheelchair at the time! … Face to Face meeting with NDIS planner with experience in complex neurological conditions is imperative. (sub. 45, pp. 8–9)

Alzheimer's Australia:

> NDIS planners, while eager to assist, have very limited knowledge of younger onset of dementia and Alzheimer's disease, and minimal information on what services a client with progressive functional decline may need. They also lack the capacity to estimate the number of hours of support and appropriate resourcing that would be required. (sub. 10, p. 16)

Amaze:

> Concern has been expressed to Amaze about planners and LACs lack of understanding of how a participant's autism may impact on their engagement in the planning process, for example by limiting their capacity to comprehend long verbal advice in planning meetings, to understand the specific intent/meaning of questions asked and provide appropriate and complete answers. (sub. PP281, p. 11)

Prader-Willi Syndrome Association of Australia:

> Anyone acting as a Planner for a person with PWS should be properly informed about the complexity of the condition, *plus the types of risks likely to arise within the planning process*. (PWSAA, sub. 112, p. 4)

Autism Advisory and Support Service:

> Most planners come from an administrative background and have no educational experience or lived experience of what disabilities are (we are often asked what is Autism by planners) nor understand relevant questions to ask in order to extract meaningful data from participants or their families. (sub. PP330, p. 4)

Mental illness and psychosocial disability were also areas of concern among study participants (CMHA, sub. 11, pp. 9–10; Cohealth, sub. 50, p. 10; Macarthur Disability Services, sub. 57, p. 4; Mental Health Carers Australia, sub. 181, p. 10; Neami National, sub. 63, p. 6) and the Joint Standing Committee on the NDIS found that planners had insufficient knowledge about psychosocial disability (JSCNDIS 2017c, p. 26).

Planners, according to a number of study participants, also have limited knowledge of appropriate supports for certain conditions, such as the role of occupational therapists (OTA, sub. 15, p. 4), prosthetics (AOPA, sub. PP294, p. 2), specialist disability accommodation (Quality Living Options Bendigo, sub. PP220, p. 1) and podiatry (APodC, sub. 52, p. 2). VCOSS gave the example of:

> … a deaf participant with cochlear implants [being] allocated two hearing aids in their package, despite hearing aids being ineffective for people with cochlear implants. (sub. 176, p. 12)

The Commission also heard that planners are ill-equipped to connect scheme participants with employment supports (House with No Steps, sub. 104, pp. 5–6; Round Squared, sub. 170, p. 3).

Study participants overwhelmingly agreed that planners performed better when they understood what needs arise from a person's disability. As Community Mental Health Australia said:

> If a planner understands the depths of a person's disability and what is needed to support the individual, the package developed will suit them over a longer term. This reduces the need for a plan to be amended in the future, thereby reducing administrative burden on the NDIA and building confidence in the process for the consumer. (sub. 11, p. 4)

Australian Lawyers Alliance (sub. PP257, p. 8) suggested that planners being familiar with disabilities can speed up the planning process while also better meeting participants' needs.

Improving planners' performance

Planners should, at a minimum, have a general understanding about different types of disability. Several study participants called for planners to receive more education on specific conditions and supports (Alzheimer's Australia, sub. 10, p. 13; Cheryl McDonnell, sub. 79, p. 2; CMHA, sub. 11, p. 4; Cohealth, sub. 50, p. 5; CPSU, sub. PP310, p. 5; Neami National, sub. 63, p. 6; NSW Government, sub. PP230, p. 4; PDA, sub. PP306, p. 3; PWSAA, sub. 112, p. 4; Vision Australia, sub. PP210, pp. 3, 8).

Specialised planners

Study participants also saw a role for specialised planners,[43] such as for people with psychosocial disability. For example, Mental Health Australia said:

> Mental Health Australia supports … a specialised planning team for psychosocial disability. This should be well supported by improved training for planners and oversight of the planning process to ensure consistency and improved outcomes. (sub. PP321, p. 22)

Similarly, Parkinson's Australia argued that scheme participants with progressive neurological conditions would also benefit from specialised planning teams.

> To offer true choice and control [to scheme participants with Parkinson's], NDIS planners must have knowledge of the condition, understand its disabling impact on participants so the unique needs of people living with Parkinson's can be addressed in individual plans. It is strongly recommended that participants with progressive neurological condition[s], such as Parkinson's and atypical Parkinson's conditions, be managed by specialised planning teams that have a good

[43] Study participants who supported planner specialisation included: AASS (sub. PP330); ABF (sub. PP263); Allianz Australia Insurance (sub. PP265); Amaze (sub. PP281); Anglicare Australia (sub. PP339); ALA (sub. PP257); CSSA (sub. PP278); Cohealth (sub. PP261); DAA (sub. PP292); Legal Aid NSW (sub. PP245); Mental Health Australia (sub. PP321); MND Australia (sub. PP255); Noah's Ark (sub. PP328); Neami National (sub. PP347); OPA (sub. PP241); Parkinson's Australia (sub. PP232); Speech Pathology Australia (sub. PP303); Summer Foundation (sub. PP293); Tandem (sub. PP212); Tasmanian Government (sub. PP247); VALID (sub. PP332); VCOSS (sub. PP264); Women with Disabilities Victoria (sub. PP282); and YPINH (sub. PP326).

> knowledge and understanding of these conditions and the support and care that is required. (sub. PP232, p. 9)

MND Australia (sub. PP255, p. 7) observed that planners specialising in progressive neurological conditions were used at Victorian trial sites for some time, and believed that this approach worked well.

It is the Commission's view that there is value in having specialised planning teams for some types of disability. This approach is in line with industry practice for insurance companies. For example, Allianz Australia Insurance (sub. 42, p. 6) submitted that, in the context of workers' compensation claims, it employs specific psychological claims teams, given the unique nature of mental health related claims.

The NDIA said that it is currently undertaking work to:

> … enhance workforce capability over the short, medium and longer term. This will include ensuring an enhanced understanding of a wider array of disabilities, as well as employing specialists to work with participants in areas such as intellectual and psychosocial disabilities and degenerative conditions. (sub. PP327, p. 27)

Specialised planning teams will require significant upfront investment, in terms of both the time and resources needed to upskill the planning workforce. However, specialised planning teams have the potential to improve the efficiency of the planning process and lower costs in the medium and long term (in terms of more appropriate supports for participants and fewer unexpected plan reviews from poor planning), especially if appropriate triage processes are put in place. Allianz Australia Insurance said:

> The personal injury sector manages [specialised planning teams] through expertise in triage processes which allow reasonable consideration for the allocation of resources and treatment for an injured claimant. For example, within personal injury claims, insurers may have a team to fast track the management of low touch, minor injuries or a specialist psychological team to streamline the management of resources in an efficient and effective manner … With proper application of triage, the NDIA will benefit from effective resource allocation … (sub. PP265, p. 5)

Matching scheme participants with planners who are suitably trained and knowledgeable about their support needs should also result in better outcomes for participants.

Leveraging industry knowledge

An alternative (or complementary) approach is to leverage expertise from the disability support sector, including specialist disability organisations and service providers. National Disability and Carer Alliance said:

> Consumer-led organisations that specialise in particular disabilities have invaluable experience and expertise that currently remains under-utilised by the NDIA. The NDIA should draw on this expertise in both the development and implementation of training for planners. But beyond planning, this experience could be invaluable in resolving implementation issues more generally

> — such as the development of reference packages, in the development [of] further guidance on reasonable and necessary in the operational guidelines, or in effective communication to particular groups of participants. (sub. PP344, p. 7)

And National Disability Services said:

> The quality of planning would improve if disability service organisations were involved. Providers of specialist supports have deep knowledge of disability — and they know their clients. Using this knowledge to inform planning would make sense. This is particularly true for people with complex needs … Planning partnerships between the NDIA and specialist providers should be extended. (2017a, pp. 6–7)

There are a number of ways that sector involvement could be incorporated into planning processes, including:

- having industry and peak bodies provide input or general advice during the planning process (AOPA, sub. PP294, p. 1; Tandem, sub. PP212, p. 9)
- engaging specialist organisations to conduct seminars for planners and NDIA staff about different disability types and supports (APC Prosthetics, sub. PP244, p. 3)
- contracting specialist disability organisations to conduct specialist disability assessments (Macular Disease Foundation Australia, sub. PP243, pp. 2–3)
- greater sector involvement in the development of planning templates or reference packages and the review of assessment tools (Alzheimer's Australia, sub. PP313, p. 5; AOPA, sub. PP294, p. 2).

Leveraging industry knowledge will be especially useful where it is not feasible or cost-effective for the NDIA to develop in-house specialist knowledge (APC Prosthetics, sub. PP244, p. 3; Macular Disease Foundation Australia, sub. 75, p. 5). Such an approach would also mean that the NDIA would not need to compete with others in an already thin market to recruit planners with specialist qualifications or experience.

However, some study participants said that the NDIA was reluctant to involve service providers in the planning process (Anglicare Australia, sub. 157, p. 8; VICSERV, sub. PP284, p. 4). One reason for this reluctance was potential conflicts of interest. For example, APC Prosthetics said that they:

> … offered their services to conduct, free of charge, a half-day seminar for NDIA staff during the Hunter Trial. The offer was not accepted on the grounds of a possible conflict of interest. (sub. PP244, p. 3)

Several study participants also emphasised the importance of ensuring that sound processes for identifying and managing conflicts of interest are in place (Vision Australia, sub. PP252, p. 8; Women with Disabilities Victoria, sub. PP282, p. 6).

It is the Commission's view that the NDIA could make greater use of industry knowledge and expertise. The NDIA should adopt risk-based strategies for leveraging industry knowledge and expertise. This means that measures taken to manage conflicts of interest

should be proportionate to the probability and impact of the risks associated with those conflicts materialising.

A risk-based approach requires a flexible and innovative approach to sector involvement. This might mean that, in some instances, sector involvement is limited — but it also means that bypassing sector involvement is not an appropriate default approach. The overarching consideration for whether and how the sector should be involved should be how it affects outcomes for scheme participants.

Leveraging industry knowledge is relatively common in comparable schemes, such as the Lifetime Care and Support Scheme in New South Wales and the implementation of the NDIS in Western Australia. In many instances, the risks arising from conflicts of interest could be managed by ensuring that the process for involving industry players is transparent and that final decision-making powers are retained by the NDIA.

Performance monitoring

Over the longer term, satisfaction with planners could also be improved through monitoring and assessing their performance (OTA, sub. 15, p. 5; PDA, sub. 38, p. 7). According to the NDIA (sub. 161, pp. 89–90), planner performance is currently monitored through:

- participant satisfaction measures
- complaints, accounting for the volume and substance of complaints
- the National Quality Framework, where monthly audits are conducted on planner records and feedback provided through coaching and supervision.

Regular and public reporting around planner performance could help increase the accountability of planners, and improve community confidence in planners and the planning process.

RECOMMENDATION 5.3

The National Disability Insurance Agency should ensure that planners have a general understanding about different types of disability. For types of disability that require specialist knowledge (such as psychosocial disability), there should be specialised planning teams and/or more use of industry knowledge and expertise.

6 Boundaries and interfaces with the NDIS

Key points

- Effective interfaces between the National Disability Insurance Scheme (NDIS), other disability services and mainstream services are essential for good outcomes for scheme participants and the sustainability of the scheme. To provide the right incentives, services available to people who just qualify for the NDIS, and those who just miss out, should be as seamless as possible. This requires coordination of services within and outside of the NDIS.
- The Information Linkages and Capacity Building (ILC) program — designed to connect people with disability to appropriate services — is a key component of the NDIS. It is a false economy to have too few resources for ILC activities, particularly during transition when it is critical that people with disability (including those not eligible for the NDIS) are connected to services.
- For people with disability previously receiving support who are not eligible for the NDIS, the Australian, State and Territory Governments have agreed to provide continuity of support. In practice, there is confusion and uncertainty about what services will continue to be provided and/or funded outside the NDIS. Governments need to be clearer about their approach on continuity of care, and what disability services they will provide for non-NDIS participants.
- The NDIS is meant to work alongside mainstream services, not replace them.
  - The Bilateral Agreements delineate responsibilities for services to be provided by the NDIS and mainstream services.
  - While it is still too early to identify service gaps, there are emerging issues in a number of areas, including justice, emergency, transport and mental health services.
  - Each COAG Council with responsibility for a service area that interfaces with the NDIS should have a standing item on their agenda to address how these services interface with NDIS services.
  - ILC and Local Area Coordinators can play a role in ensuring mainstream services are better informed about their roles and responsibilities.
- There are aspects of the design of the NDIS, and how it interfaces with the aged care system, that create incentives for people to stay in the NDIS after the age of 65 years, and encourage people nearing the age of 65 years to apply for the NDIS. This raises some issues that will need to be addressed, but given the complexity involved, this should be done with the benefit of data from experience at full scheme. It should be reviewed as part of the review of scheme costs in 2023.
- The National Injury Insurance Scheme (NIIS) was envisaged to cover the care needs of individuals who newly acquire a disability through a catastrophic injury or accident. Two of the four streams proposed have been implemented. The contributions by the States and Territories should reflect the cost to the NDIS of participants who were intended to be covered by the NIIS — these will grow over time from a small base.

People with disability, and their families and carers rely on a wide range of services — including mainstream services, specialist disability services and community supports — for their care needs and to maintain the quality of their lives. For the National Disability Insurance Scheme (NDIS) to work efficiently and effectively, the interface between the scheme and other services need to be as seamless as possible. By design, the NDIS is intended to complement these other supports, not replace them. A requirement of any supports provided through the NDIS is that they are most appropriately funded through the scheme and not by other services.

While NDIS funding recognises that previously funding for people with disability was inadequate, the NDIS is not expected to fill *all* of the large service gaps that existed before the scheme was established. Providing services to people with disability remains a shared responsibility between all levels of government.

The interface between all services for people with disability will take time to clarify, but until these interfaces are settled, it is important that governments do not prematurely withdraw from services, as any gaps that emerge will place added burdens on people with disability and their families.

As interface issues become clearer, it is essential that incentives do not exist for individuals to prefer one system over another. It is important that people with disability do not see the NDIS as an oasis of support, surrounded by a desert, where little or nothing is available. Should such a dynamic develop, the financial pressures on the NDIS could be unsustainable, particularly if people feel the need to test their ability to qualify for the scheme, and/or remain in the scheme for as long as possible.

There is still a lot of detail to be worked through. That said, establishing clear and robust boundaries is essential for the financial sustainability of the NDIS and other services. When people are accessing the services they need, the system as a whole should be providing supports at the most efficient and cost effective level.

This chapter first looks at bridging and capacity building services provided under the NDIS (section 6.1), then at how the NDIS interfaces with other disability services (section 6.2). The interface between the NDIS and mainstream services is examined in section 6.3. How the NDIS interfaces with the aged care sector (section 6.4) and the National Injury Insurance Scheme (section 6.5) are also examined.

6.1 Linking people to the right services

About the Information, Linkages and Capacity Building program

The NDIS is just one part of a wider disability system. While the NDIS will benefit all Australians, only a proportion of people with disability will become scheme participants. Of the estimated 4.3 million Australians with disability, about 475 000 (those people with a

'permanent and significant' disability) will receive individualised supports under the NDIS (chapter 1, figure 1.1). As the National Disability Insurance Agency (NDIA) said:

> The NDIS is intended to benefit a wide range of Australians, only a proportion of whom will become participants and receive an individualised plan. … short-term or light touch assistance from the NDIS, in collaboration with a capable and inclusive community and mainstream response, can help them better access mainstream supports, build connections into community supports and strengthen natural supports in order to achieve their outcomes. (sub. 161, p. 53)

The NDIS is just one part of a broader suite of services relevant to people with disability (others include health, housing, education, transport, employment and justice).

Information and referral services are therefore vital to people with disability, their families and carers. For this reason, in 2011, the Commission recommended a bridging and capacity building service, known as Tier 2 supports, to assist anyone with (or affected by) disability, to connect to relevant disability, community and mainstream services (PC 2011, pp. 163-165, 198).

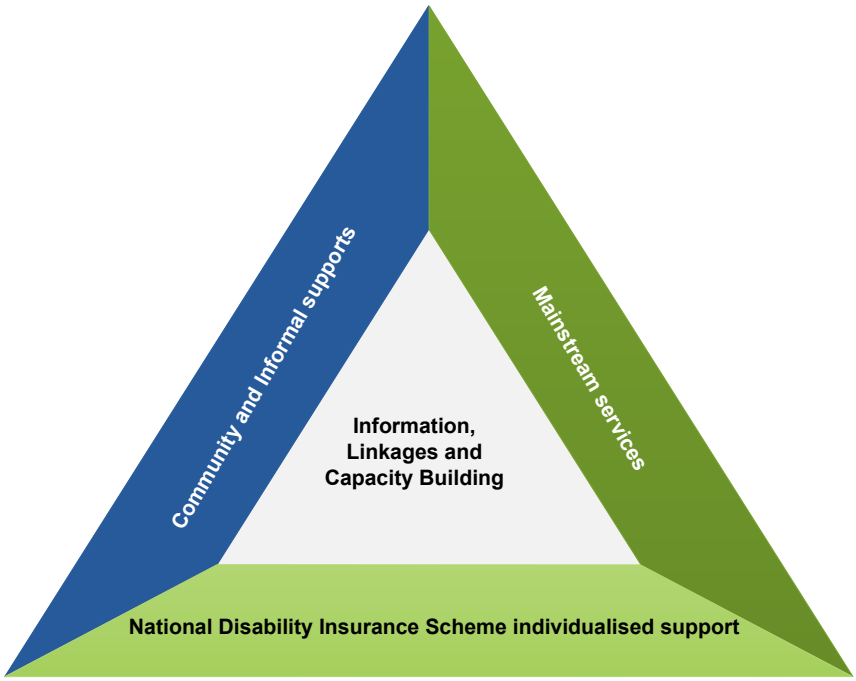
The main goal of Tier 2 supports was to strengthen the links between the community and people with disability. Some examples of Tier 2 supports envisaged by the Commission in 2011 included Local Area Coordinators (LAC) helping to link people with disabilities to local community groups (such as a sailing club), and web services to provide information and educate people about specific disabilities and where to seek help (PC 2011, pp. 13, 163-164).

In July 2017, the NDIA began rolling out the Information, Linkages and Capacity Building (ILC) program (effectively Tier 2 supports). ILC will provide information, linkages and referrals to people with disability, their families and carers, and help them connect with appropriate community and mainstream supports (NDIA 2017h). The focus of ILC is individual development and community inclusion. The NDIA said it is to:

> … build innovative ways to increase the independence, social and community participation of people with a disability. (2016d, p. 5)

ILC will also facilitate capacity building support and greater inclusivity by promoting collaboration and partnership with local communities and mainstream services (figure 6.1).

Figure 6.1 **Bridging services — Information, Linkages and Capacity Building**



Source: NDIA (2015a, p. 4).

ILC is designed to work with individualised supports. As the NDIS Community Inclusion and Capacity Development Program Guidelines put it:

> The NDIS has two parts:
>
> - Individualised NDIS plans for people with permanent disability has a significant impact on their ability to take part in everyday activities; and
> - Information, Linkages and Capacity Building (ILC).
>
> Both parts work together to support people with disability. It is important not to see ILC as something separate to the … success and sustainability of the NDIS. Ensuring people are connected into their communities, using the same services and participating in the same activities as everyone else will mean that, over time, people will rely less on specialist disability support. ILC also has an important role to play in supporting people with disability who do not have an NDIS plan. By providing appropriate support in the community, it will help make sure people only move into the scheme when necessary. (2016d, p. 4)

ILC is an important tenet of the NDIS insurance model, and is expected to reduce costs over time by:

- *reducing the demand for individualised supports* — ILC is a lever to divert people from needing to access individualised packages and instead connect them to the appropriate supports for their needs

- *reducing the need for supports through individualised supports* — ILC can maximise the ability of participants to access mainstream, community and informal supports, which in turn can reduce the need for funded supports (for example, targeted supports to assist a person to navigate the public transport system can reduce the need for funded taxi travel)
- *making supports more effective at helping people achieve their goals* — many supports are more effective in helping a participant achieve their goals when complemented by natural (informal) and community support (for example, a fitness goal is more likely to be achieved if funded support to use gym equipment is complemented by an inclusive gym community or a friend for companionship and motivation) (NDIA, sub. 161, p. 54).

In August 2015, COAG endorsed the ILC Policy Framework (NDIA 2015a). The framework describes five streams to achieve the objective of ILC.

- Information, Linkages and Referrals (activity 1) — connecting people with disability, their families and carers with appropriate disability, community and mainstream supports.
- Capacity building for mainstream services (activity 2) — ensuring people with disability connect with and access mainstream supports.
- Community awareness and capacity building (activity 3) — supporting organisations (such as not-for-profit organisations, local councils and businesses) and people within communities to be inclusive of people with disability, and understand the needs of families and carers.
- Individual capacity building (activity 4) — fostering the principle of choice and control, improving outcomes for people with disability, their families and carers.
- LAC (activity 5) — developing relationships between the NDIS, people with disability, their families and carers, and the local community (NDIA 2015a, pp. 9–13).

In November 2016, the NDIA released its ILC Commissioning Framework to provide guidance around the type of activities ILC will fund and how these will be funded (NDIA 2016f). The framework reflects the ILC Policy activities and identifies five focus areas which are deemed ‘priority areas’ for funding (table 6.1).

Table 6.1 **ILC Focus Areas**

Focus Area	*Definition*	*Example*
Specialist or expert delivery	Focus on activities that provide specific skills and knowledge in relation to disability — for example, diagnostic specific expertise or expertise in particular models of support or capacity building.	A comprehensive website that provides information about particular disabilities or conditions.
Cohort-focused delivery	Focus on activities for specific groups of people that require detailed cultural or other knowledge to be effective — for example, multilingual activities to assist Aboriginal and Torres Strait Islander peoples or people from culturally or linguistically diverse backgrounds.	A yarning circle (peer group) for Aboriginal women run by local Aboriginal organisations.
Multi-regional activities	Focus on activities that would be inefficient if delivered separately in different local areas — for example, advice or information that is not based on location and could be relevant anywhere.	A community awareness campaign to increase employment opportunities for people with disability.
Remote/rural delivery	Focus on ensuring activities are designed to address local needs, circumstances and conditions in rural and remote locations.	A project that connects young people with disability in a rural area with each other via multimedia or social media.
Delivery by people with disability, for people with disability	Focus on supporting organisations that are run and controlled by people with disability. These are sometimes called user-led organisations.	A telephone information service for people with disability, staffed by people with disability.

Source: NDIA (2016f, p. 18).

The ILC Commissioning Framework developed five strands of outcomes that programs funded through ILC will be measured against. They include the extent to which people with disability:

- participate in, and benefit from, the same community activities as everyone else
- use and benefit from the same mainstream services as everyone else
- have the skills and confidence to participate and contribute to the economy
- have the appropriate information so they can make informed decisions and choices
- contribute to, lead, shape and influence their community (NDIA 2016f, p. 10).

ILC funding

Funding for ILC is made through the Community Inclusion and Capacity Development (CICD) Program. The program consists of grants to support two types of activities:

- ILC Jurisdictional Based Grants — targeted at State and Territory level activities.

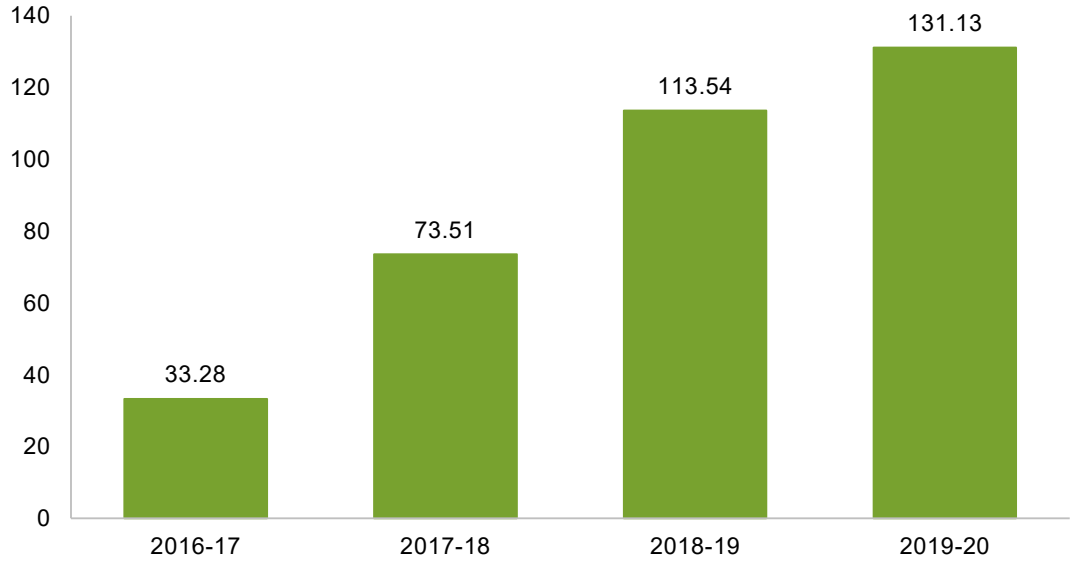
- ILC National Readiness Grants — targeted at activities that can be implemented in multiple jurisdictions or nationally. (NDIA 2016d, pp. 5–6)

The NDIA is taking a staged approach to providing grants in each jurisdiction (full funding across all jurisdictions will apply from 1 July 2019). As part of transitioning to ILC, the NDIA has worked with the Australian, State and Territory Governments to understand what activities currently untaken by the jurisdictions align with the ILC Policy.

Total funding for the CICD Program (which excludes the ILC stream provided by LACs) is $351 million over four years. The funding gradually increases over the transition period from $33 million in 2016-17 to $131 million in 2019-20 (figure 6.2).

Figure 6.2 **ILC Funding**[a]

$ million



[a] These numbers include funding for ILC activities in Western Australia (excluding Western Australia, the budget is about $119 million for 2019-20), but do not include LAC funding for ILC activities in any jurisdictions.

Sources: Australian Treasury (2017d, p. 140); NDIA (2016d, p. 7).

LACs (box 6.1 and chapter 5) are funded separately from the first four ILC activities (through the NDIS Partners in Community Program and with NDIA resources). It is expected about $100 million (or 20 per cent) of LAC funding each year will be for ILC activities.

Box 6.1 Local Area Coordinators

Local Area Coordinators (LACs) play a central role in the delivery of ILC by ensuring people with disability participate in and contribute to social and economic life, and that people with disability receive appropriate services. LACs connect across each of the first four streams of ILC.

LACs also provide support for people with disability to understand their plans and how changes in funding and or the scheme itself are likely to affect them. LACs can help people put their plan into action and help them build capacity to self-manage their plan.

LACs have three main roles:

- to work directly with people who have a NDIS plan by connecting them to mainstream services and community activities, or by helping them put their plans into action (chapter 5)
- provide some short-term assistance to non-NDIS participants and connect them into mainstream services and community activities
- work with the local community to ensure it is more accessible and inclusive for people with disability.

Agreements with LAC partners include that 20 per cent of their effort (and funding) is allocated to the delivery of ILC activities. This is to ensure anyone who approaches a LAC, whether they are eligible for the NDIS or not, are directed to appropriate services (a part of the 'no wrong door' approach, and individual development and community inclusion objectives).

Sources: NDIA (2015a, pp. 13–15, 2017n); NDIA (sub. 161, p. 56).

At the beginning of 1 July 2017, the activities to be funded by ILC Australia-wide and in the ACT were announced (NDIA 2017h, 2017k). The funding allocated to these activities was $14 million and $3 million respectively (NDIA 2017y, p. 45). Some of the successful grants in the ACT included:

- changing the ACT Health Care System to be more inclusive of people with impaired decision making ability
- educating Aboriginal and Torres Strait Islander people about what is meant by the term 'disability'
- establishing a peer support network for people with mild and borderline cognitive disability (NDIA 2017l).

Building the evidence base

As part of the ILC program, the organisations that receive grants — and the NDIA — are required to collect detailed data on ILC activities. This will be important for measuring how effective ILC activities are in achieving outcomes for people with disability. The data will be used by the NDIA to identify and address performance issues, and inform future decisions on the allocation of ILC funds.

Data collected will include: the outcomes and success of activities in the short, medium and long term; the quality and effectiveness of the activities; and performance over time. Data

will be both qualitative and quantitative (NDIA 2016f, p. 27). The data collected will also form part of the ongoing assessment of the broader delivery of NDIS and other disability services (chapter 13).

Is the funding of ILC adequate?

It is difficult to assess the adequacy of current ILC funding …

The adequacy of funding for ILC services was questioned by many study participants given the scope outlined in the ILC Commissioning Framework. For example:

> The PC should consider whether the one per cent cap (of scheme costs) on ILC expenditure should be adjusted to more flexibly accommodate investment in these areas that would generate better participant outcomes. (Victorian Government, sub. 174, p. 11)
>
> It is a widely reported view from the disability sector that there is a significant under-funding of the ILC in order to meet the needs of people with disability. (Speech Pathology Australia, sub. 136, p. 24)
>
> It appears that ILC is significantly underfunded and therefore will not deliver on rising community expectations. (Goldfields Individual & Family Support Association, sub. 13, p. 4)
>
> While some supports may be available through the Information, Linkage and Capacity Building (ILC) framework, it currently is not sufficiently resourced to meet the gaps. (Cohealth, sub. 50, p. 8)
>
> The total funding package for ILC at full roll out … when split across all types of disability is not adequate. (Mental Illness Fellowship of Australia sub. 122, p. 15)
>
> The implementation of the [ILC] framework … is dependent on adequate resourcing. Under full roll out, only $132 million is being allocated to the ILC. This is equivalent to approximately $30 to provide services to each person with a disability as well as to support mainstream services in capacity building. (Down Syndrome Australia, sub. 121, p. 12)
>
> Currently, only $132 million … has been allocated to the ILC. This is not sufficient and means that one of the key foundations on which the NDIS is being built is weak. (Bruce Bonyhady, sub. 100, p. 5)

Others said that the scope of ILC is too narrow to accommodate ILC's intended purpose (box 6.2), particularly in the context of what the Commission proposed would be covered under Tier 2 supports.

Box 6.2 Many participants said the scope of ILC is too narrow

Physical Disability Australia (PDA):

> … it is PDA's understanding that the original tier 2 of the NDIS (that the ILC program replaces) was supposed to boost all non-participants' capacity to access to mainstream services. For example, we envisioned this might involve an 'Access Fund' to support the building of ramps and accessible toilets in the community. As such, PDA finds the current scope of the ILC (and its proposed budget) to be somewhat disappointing. (sub. 38, p. 6)

Australian Blindness Forum:

> … the range and type of services initially promised to be funded under the ILC program has changed substantially. The original proposal was that ILC would reflect the 'Tier 2' programs including block funding and early intervention programs. The goal of this was to continue to provide disability services to those who were not eligible for the NDIS. Now, the way the ILC program has been developed, it is only tools and awareness programs, delivered by mainstream services for a limited time or on an ad hoc basis. (sub. 48, p. 7)

Belconnen Community Service Board:

> ILC does not appear to cover the apparent lack of low intensity early intervention services needed for people who are not eligible for an NDIS package. The limited amount of funding for ILC and the competitive nature of these resources means people living with low to moderate mental health/psychosocial disabilities will struggle to access the supports required to maintain good mental health. (sub. 39, p. 4)

Woden Community Service:

> For the ILC to be able to make meaningful referrals block funded programs will need to continue in parallel with individually funded arrangements. (sub. 159, p. 11)

Allied Health Professions Australia (AHPA):

> AHPA believes the range and types of services proposed for funding under the Information, Linkages and Capacity Building (ILC) program does not currently fit well with the goals of the NDIS, particularly the intention to create and support small and innovative programs. (sub. 37, p. 12)

Centre for Disability Research and Policy:

> The ILC will be an important tool in developing or enhancing services to meet the needs of people where services do not currently exist. This is particularly important in 'thin markets' and within rural and regional contexts. (sub. 55, p. 4)

Psychiatric Disability Services of Victoria:

> … there is no real benefit to mental health services from the ILC because the funding provided through the framework is so minimal; the ILC simply does not have the capacity to provide for the scope of what existing services deliver, whilst also responding to the needs of people who won't be eligible for the NDIS. (sub. 169, p. 9)

Vision Australia:

> The original proposal by the Productivity Commission for Tier 2 services was comprehensive, and offered a meaningful level of supports for people not eligible for the full NDIS. The current ILC program fails to meet this standard, and leaves major gaps in service delivery. One of the key intentions of the original proposal was to address the problems of 'thin markets' — remote, rural and regional areas, and in particular specialist services. (sub. PP210, p. 5)

Macular Disease Foundation Australia:

> … the ILC was intended to fund 'Tier 2' programs including block funding and early intervention programs. The goal of this was to provide access to disability and mainstream services for those who were ineligible for NDIS Individually Funded Packages. (sub. PP243, p 3)

In 2011, the Commission described Tier 2 supports as 'information and referral services (as distinct from funded support)', and said an important role for such supports would be 'to strengthen voluntary links between the community and people with disability — to stimulate 'social capital''[44] (PC 2011, pp. 12–13). The intention was that Tier 2 activities would increase, rather than crowd out existing formal and informal arrangements.

The Commission also said that it would be critical to provide any referral and information services cost-effectively, with strict cost limits, noting that 'the population of potential 'customers' would be very high, but that the overall costs would be small' (PC 2011, p. 12). The Commission suggested $200 million for capacity building (including Tier 1 and Tier 2[45] and Disability Support Organisation funding) (PC 2011, pp. 777, 788).

The question of whether the funding for ILC is adequate is difficult to answer for a number of reasons.

First, the program is still to be fully rolled out. The NDIA said that the timing of ILC funding (as determined by governments) has prevented it from investing in ILC activities and delayed the rollout of initiatives which would allow the infrastructure of a national ILC framework.

> The budget for ILC will increase over time and will reach a total budget of approximately A$131 million. This budget allocation severely hampers the NDIA's flexibility to use ILC at the time when the greatest impact could be realised. … The timing of payments means that the NDIA cannot apply ILC to assist the community or people with disability to prepare for the NDIS in advance of the NDIS rolling out in their area. … The timing of funding, linked to State and Territory contributions also prevents the NDIA from rolling out widespread national initiatives which would allow the infrastructure of a national ILC framework to be established. (sub. 161, pp. 54–55)

According to mapping undertaken by the NDIA of existing programs prior to the introduction of the NDIS, the Australian State and Territory Governments were funding an estimated $200 million of activities that align or mostly align with the ILC Policy. The mapping also showed that these 'legacy' programs were mainly concentrated in activity 1, with gaps in activities 2 to 4 (NDIA, pers. comm., 3 October 2017). Although the NDIA is not obligated to fund legacy programs, some ILC grants will be used to fund these programs. As the NDIA said:

> The effectiveness of ILC funding as an innovative means to increase inclusion of people with disability in the community is constrained by the need to also use this funding for legacy programs to ensure continuity of service delivery (i.e., the funding is also being used to provide transitional funding to States and Territories for existing ILC-like activities in each jurisdiction).

[44] Social capital relates to the social norms, networks and trusts that facilitate cooperation within or between groups. It can generate benefits to the whole community by reducing transaction costs, promoting cooperative behaviour, diffusing knowledge and innovations, and through enhancements to personal wellbeing and associated spillovers (PC 2011, p. 207).

[45] In 2011, the Commission referred to Tier 1 as covering all Australians (as the scheme provides insurances to everyone against the costs of supports in the event that they or a family member acquired significant disability). Tier 2 covered all Australians with, or affected by, disability (PC 2011, pp. 161–5).

> As a result, the full innovative benefits of ILC funding will take time to measure. (sub. PP327, p. 29)

Second, there do not appear to be any comparable programs, either within Australia or overseas, against which the volume of funding can be assessed. A report prepared by URBIS for the Department of Social Services said:

> The fact that the NDIS is a 'world first' model means there are limited learnings from other jurisdictions as to the level of funding required to achieve intended ILC outcomes. (URBIS 2017, p. 1)

Third, to date there is some uncertainty about exactly what activities are to be funded by ILC. As the New South Wales Government said:

> … there is still a gap in the information presented in relation to the Commissioning Framework not setting out what activities the NDIA will actually fund under the ILC budget for full scheme. (sub. 60, p. 18)

And fourth, there is little evidence on the extent to which ILC is effective in improving outcomes for people with disability who are not eligible for individualised supports, nor if ILC is effective in reducing demand for individually funded packages.

The New South Wales Government pointed to the NSW Ability Links program (box 6.3) as a 'successful, cost effective model of innovation, community based supports to assist people with disability to live independently of specialist supports' (sub. PP230, p 4).

Box 6.3 Ability Links NSW and Early Links NSW

Ability Links NSW (ALNSW) supports people with disability, their families and carers to connect with their local community, to achieve their goals and aspirations, and to live enriched and fulfilled lives. ALNSW 'aims to have a light touch on the people it has contact with, with the locus of control lying firmly with the person with disability'.

ALNSW commenced operation from 1 July 2013 in Hunter (NSW) to coincide with the launch of the NDIS, and was made available state wide from 1 July 2014. The NSW Government has committed funding for ALNSW until 30 June 2018.

Early Links NSW (ELNSW) supports families of children with disability up to eight years old. ELNSW was launched in 2009 (as the Early Start Diagnosis Support Program) and in 2013, steps were taken to align the ALNSW and ELNSW. ELNSW has similar components and objectives to ALNSW — in particular, both programs focus on local area coordination to improve outcomes for children with disability, their families and carers.

The latest URBIS benefit and costs analysis, commissioned by the NSW Government, found that over the 2015-16 period there were a number of economic benefits from ALNSW and ELNSW, including increased participation in education and employment (such as work experience and volunteering), new business activity, and increased welfare for carers through a reduction in carer hours required. URBIS also identified some social benefits (such as greater links to, and participation in the community, leading to improved self-esteem and social networks).

Source: (URBIS 2016).

Other evaluations of LAC programs (including in Western Australia, the United Kingdom, Scotland and New Zealand)[46] also found improvements for individuals and families in terms of access to information about services, ensuring people and families have the help and support they need, greater choice, capacity building and increased awareness of disability.

But the evidence base is very thin. With regard to ILC, upon reviewing the available evidence, Urbis concluded that:

> Due to the lack of a comparable case study which incorporates both individualised funding and ILC-type activities in the same system; it has not been possible to explore, in depth, the concept of ILC as a 'safety net' (for those who are not eligible for more intensive support). The evidence suggests that funding directed to Activity Areas 2 and 3 will further enhance outcomes for individuals. Over time, this may even reduce the required funding for Activity Area 5 (Local Area Coordination). (URBIS 2017, p. 6)

… but additional funding is critical in the short term

It is a false economy to have too few resources for ILC activities in the transition period. It is critical to have structures in place to ensure that people eligible for individualised supports can access the NDIS, and those not eligible can access supports outside the scheme. As the NSW Disability Network Forum said:

> … the level of resources allocated to the ILC is not commensurate with the demands on the ILC. Simultaneously, Local Area Coordinators are not fulfilling their community development functions due to the demands of planning work. … This approach will increase cost pressures on the NDIS as people who are unable to access information and capacity building in the ILC will need to include capacity building as part of reasonable and necessary support in their NDIS plan, thereby increasing package size. In addition, there is concern that the lack of widely available capacity building support to those who are not NDIS participants may ultimately lead to an increase in the number of people eligible to become NDIS participants. (sub. 18, p. 4)

The NDIS Independent Advisory Council also noted that:

> The risk for the sustainability of the Scheme is that the lack of capacity building opportunities through the ILC will spill over into increased demand for capacity building as part of reasonable and necessary support, thereby increasing package size. There is also concern that the lack of widely available capacity building support may ultimately lead to an increase in the number of participants eligible to become participants. (sub. 149, p. 10)

State and Territory Governments withdrawing from ILC type activities may have an impact on the supports available. In relation to ILC and LACs funding, the NDIA stated that:

> The success of this [ILC and LACs] strategy will … be heavily reliant on the quality and availability of such supports that largely remain the responsibility of state and territory governments to fund. The experience of trial is that this is not a certain or consistent base upon which the NDIS is building. (sub. 161, p. 53)

[46] See (Kingfishers 2015; Stalker et al. 2007; Western Australia Disability Services Commission 2003).

Although directing additional funds to ILC in transition could crowd out State and Territory 'ILC like' activities, the grants process by which organisations receive ILC funding means these activities can be targeted to where they are needed most. There could also be a risk of duplicating services, but the risk of service gaps appears a much more likely prospect under current arrangements, particularly as determining precisely what ILC should cover is unclear at the operational level.

In the position paper, the Commission recommended funding for ILC be increased to the full scheme amount of $131 million each year during transition. Many stakeholders supported this recommendation (box 6.4). The accelerated funding should be geared towards National ILC activities, to ensure that all people with disability have access to adequate information and are better equipped to gain access to disability services as the NDIS rolls out in their region.

Some study participants suggested greater flexibility around what ILC can fund. The National Mental Health Commission, for example, said:

> There are … concerns about the scope and function of the ILC as it is currently designed and deployed. If the ILC is to succeed in one of its key objectives — ie to reduce pressure on 'Tier 3' individually funded supports — it needs to have a much stronger role in funding services that provide outreach and engagement with people affected by disability … (sub. PP319, p. 3)

And the DSS said:

> The NDIA may require a greater degree of flexibility around how much of the current ILC and participant plan budget is spent on ILC to improve early outcomes for people with disability through an early intervention approach and reduce longer term Scheme costs. (sub. PP318, p. 9)

However, without an evidence base, it is hard to determine what ILC should fund. As the DSS pointed out:

> … ILC investment needs to be targeted to areas that have a strong evidence base for greatest effectiveness, while being careful not to replace mainstream services which are a State responsibility. (sub. PP318, p. 9)

An evidence base needs to be built and used to inform future decisions on the activities to be funded through ILC. The evidence base should provide information on how effective, and by how much, ILC activities improve the outcomes for people with disability and reduces their need for, or reliance on, individualised supports. This information can then be used to better fund activity areas where there is a shortfall in services, and where it is best value for money.

Box 6.4 Participants support increasing ILC funding in the transition period

South Australian Government:

> SA supports this draft recommendation [5.1], recognising the importance of Information, Linkages and Capacity Building (ILC) to Scheme sustainability over time and in promoting community inclusion and participation for all people with disability. Given that only 20% of LAC funding is for ILC activities, it is important that the other four ILC activity streams are adequately funded to build the capacity of people with disability, families, communities and mainstream services. (sub. PP354, p. 5)

The Department of Social Services:

> DSS agrees ILC is an important insurance element of the Scheme to assist all Australians with disability and their families and carers, including those people moving into the NDIS. Monitoring of the level of ILC funding required will continue as part of standard budget processes for the Commonwealth. (sub. PP318, p. 9)

National Disability Insurance Agency:

> … the NDIA supports the Commission's view that it is a 'false economy' to have too few resources for ILC activities during Transition. A well-functioning ILC program should help improve participant outcomes, while contributing to Scheme sustainability. (sub. PP327, p. 6)

Parkinson's Australia:

> An accelerated and enhanced rollout of the Information, Linkages and Capacity Building Program (ILC), including an increase to the full ILC amount of $131m, is strongly supported. (sub. PP232, p. 11)

Women with Disabilities Victoria:

> [Women with Disability Victoria] strongly endorses the Commission's view that ILC funding should be accelerated and maintained until the scheme is fully established and a proper review can take place. (sub. PP282, p. 7)

Early Childhood Intervention Australia:

> ECIA fully supports the recommendation that the ILC funding be increased to the full scheme amount of $131 million for each year during transition and form part of the next COAG review in five years time. (sub. PP249, p. 5)

Orygen:

> Orygen supports the Productivity Commissions Recommendation 5.1 that funding for the ILC should be increased to the full scheme amount during transition as this could potentially improve outcomes. (sub. PP254, p. 5)

The requirement for organisations to collect data as a condition of receiving an ILC grant will help build this evidence base. The NDIA said:

> While the evidence base for the choice of effective ILC intervention is still evolving, it is clear that the absence of ILC infrastructure poses a Scheme sustainability risk, and the NDIA is committed to ensuring this evidence is developed and reflected in future ILC expenditure decisions. (sub. PP327, pp. 29–30)

The agreed review of NDIS costs in 2023 — as outlined in the Heads of Agreement — provides an opportunity to review the effectiveness of the ILC program, including the scope of the ILC Policy and Commissioning Frameworks, and the magnitude of any benefits from increasing its funding. It is reasonable to expect that there will be more data on ILC by this

time, and that many transitional issues which may be exacerbating concerns about the adequacy of ILC funding will be resolved.

FINDING 6.1

It is a false economy to have too few resources for Information, Linkages and Capacity Building, particularly during the transition period when it is critical to have structures in place to ensure people with disability (both inside and outside the National Disability Insurance Scheme) are adequately connected with appropriate services.

RECOMMENDATION 6.1

Funding for Information, Linkages and Capacity Building (ILC) should be increased to the full scheme amount of $131 million for each year during the transition.

The effectiveness of the ILC program in improving outcomes for people with disability, the adequacy of its funding, and its impact on the sustainability of the National Disability Insurance Scheme should be reviewed as part of the next COAG agreed review of scheme costs in 2023. The ILC budget should be maintained at a minimum of $131 million per annum until results from this review are available.

6.2 The NDIS and other disability services

Prior to the NDIS, the delivery and funding of disability services was primarily governed by the National Disability Agreement (NDA). The NDA, of which the Australian Government and all State and Territory Governments are signatories, was established in 2009 and revised in 2012. It features clear roles and responsibilities for each level of government and nationally agreed objectives and outcomes for people with disability, their families and carers (COAG 2012c).

The NDA also establishes that the Australian Government is responsible for providing income support and employment services for people with disability. States and Territories are responsible for the delivery of specialist disability services such as supported accommodation, family support and community support services, therapy, early childhood interventions, life skills and case management (SCRGSP 2017, p. 15.3).

Other services available to people with disability, prior to the introduction of the NDIS, included (but were not limited to):

- home and community care
- residential aged care (provided to people under the age of 65 years)
- taxi and transport subsidy schemes
- psychiatric disability community supports.

While the scope of these services and their eligibility requirements varied by jurisdiction, they typically included programs that covered both people eligible and not eligible for individualised supports under the NDIS. Continuity of service and program interfaces are therefore critical to ensuring that people with disability do not 'fall between the cracks' when services are split between NDIS and non-NDIS provision.

How does the NDIS affect other disability services?

As individuals transition to the NDIS, many existing services will be defunded, with previous funds used to offset the cost of the NDIS. Funds transferred from these services to the NDIS are calculated on a predetermined per person basis. The funds move with the individual when they transition to the NDIS, as agreed in the Bilateral Agreements. However, not all individuals will meet the NDIS eligibility criteria and not all services will be funded by the NDIS. Consequently, some services provided under the NDA and other avenues will need to continue.

Unless agreed otherwise, the responsibility of governments to provide services under the NDA remains (part 2, subsection 16 of Bilateral Agreements). The Australian, State and Territory Governments have also agreed in the Bilateral Agreements to continuity of disability support services for:

- people who receive support but do not meet the access requirements outlined in the *National Disability Insurance Scheme Act 2013* (Cwlth) (NDIS Act), or are receiving supports that do not meet the definition of reasonable and necessary support in the NDIS Act
- funding for supports attributed to a program/service that will cease when the NDIS is introduced.

All State and Territory Governments agreed to provide continuity of support to people receiving state and territory administered disability programs/services. The Australian Government is responsible for providing Commonwealth administered disability programs/services (Bilateral Agreements schedule D). As part of annex E of the Continuity of Support Agreement (COAG 2013), the Australian, State and Territory Governments are also obliged to make clear their policy approach to providing continuity of support.

On the basis of the agreements that are in place, if the Australian, State and Territory Governments adhere to their responsibilities there should be few, if any, gaps in disability services for existing users (or at least the funding for these services). People previously receiving a disability service will continue to receive a similar level of service — either through the NDIS or from other services funded by the Australian, State and Territory Governments.

Continuity of support is less straightforward in practice

In practice, access to continuity of support varies.

Continuity of support for people shifting to the NDIS

Continuity of support means that people who meet the eligibility criteria for the NDIS will, at a minimum, continue to receive support that enables them to achieve the same outcomes as their previous support — this could be through the NDIS alone, or through a combination of the NDIS and other services.

However, the NDIS supports need to be reasonable and necessary (chapter 5). This means the supports that a scheme participant receives through the NDIS, and what they received prior to entering the scheme, may not necessarily 'match' one to one.

There is no continuity of support arrangements for new scheme participants (that is, those who were not receiving specialised disability services prior to the introduction of the NDIS), as they will be receiving disability care and support for the first time.

Continuity of support for people not in the NDIS

Where programs are transitioning into the NDIS and there are people on these programs not eligible for the NDIS, these clients should receive services under continuity of support arrangements. However, there is significant uncertainty about how continuity of support arrangements will operate in practice (box 6.5). And what supports will be available for people who newly require disability care and supports is even less clear. Further exacerbating the problem is that funds saved from transitioning services will be used to offset the costs of the NDIS, and so each jurisdiction's willingness, and/or capacity to provide additional services may be reduced.

Box 6.5 Participants point to uncertainty around continuity of support

Flourish Australia:

> People not eligible for the NDIS are already experiencing uncertainty and confusion. Continuity of support arrangements are still not finalised, so it is unclear whether they will be able to continue to access the services they currently receive, post full Scheme rollout. The concern is that if people currently accessing support in the community have this support 'switched off' at a future point, their needs and circumstances could be exacerbated, pushing up demand for the NDIS. (sub. 74, p. 9)

National Mental Health Commission:

> It is not clear how continuity of support for carers will be addressed through the NDIS. For example, the NDIS does not include direct provision of respite support for carers. Anecdotal evidence indicates that some applicants are being encouraged not to include family support in order to enhance their chances of getting a package. (sub. 153, p. 4)

Department of Health:

> The continuity of support commitment has been raised as a concern by service providers. It is currently unknown the proportion of program clients that will be deemed ineligible for the NDIS. Further information is needed of this cohort to inform continuity of support planning, such as the reasons for the ineligible access decision and the type of supports that individuals are currently accessing. (sub. 175, p. 5)

Mental Health Australia:

> All governments are nominally committed to providing continuity of support to clients of programs that are being rolled into the NDIS. Implementation of that commitment is impeded by a number of factors, including … a failure to recognise that many existing programs do not 'map' to the NDIS, … a lack of reliable and publicly available data on the number of clients affected in each program, at both levels of government … and a lack of transparency about funding flows as programs wind back (sub. PP321, p. 13).

There is varying detail on what disability support services will continue after the full rollout of the NDIS, and who will fund them. The New South Wales and ACT Governments — signalled that they intend to cease providing specialist disability services (ACT Government 2017; New South Wales Government nd).

Where it is clear that services will continue, the detail on what will be provided varies. For example:

- the Queensland Government said that they will continue providing some disability services (Queensland Government 2017)
- the Department of Social Services (DSS) stated publicly that 17 DSS and Department of Health programs will be affected by the introduction of the NDIS (DSS 2016g).

Rather than having a clear framework around the continuity of support, there seems to be some signs of brinkmanship, with governments holding off implementing policies (perhaps until other jurisdictions act, or waiting for gaps to emerge before engaging in renegotiations).

In addition to disability care and support, all individuals will continue to have access to mainstream services, regardless of which system they fall under. However, the interface between mainstream services and the NDIS must function well and this is often not the case. Boundary issues between the NDIS and mainstream services are discussed in section 6.3.

While the Commission heard concerns about the quantum and nature of supports that will be provided outside the NDIS across a number of areas, mental health is an area where concerns were particularly pronounced (box 6.6). In this case, the non-clinical supports that will be available for people with mental health disability who are not eligible for the NDIS is very unclear (box 6.6). State and Territory Governments have primary responsibility for mental health services — in 2014-15, state spending accounted for 83 per cent of all spending on community mental health services, with the Commonwealth accounting for 17 per cent (DSS, sub. 146, p. 16).

In March this year, the Disability Reform Council (DRC) agreed to focus on mental health to ensure mainstream systems are effectively supporting people with disability in Australia (DRC 2017a, p. 2). In the most recent budget, the Australian Government also allocated $80 million over four years for support services for people with mental health illnesses who do not qualify for the NDIS, contingent on State and Territory Governments matching this contribution (Australian Treasury 2017b, p. 120). This should go some way to addressing support gaps, but continual monitoring will be required to ensure that people with significant needs are not missing out because they do not satisfy the NDIS eligibility criteria. Through COAG, Health Ministers have also agreed to establish a working group to:

> … progress the Commonwealth's National Psychosocial Supports program. This will have the objective of developing bilateral agreements to support access to essential psychosocial supports for persons with severe mental illness resulting in psychosocial disability who are not eligible for the NDIS. (COAG Health Council 2017, pp. 2–3)

The Commission's recommendation to establish a psychosocial gateway (recommendation 4.4) seeks to provide both a dedicated entry pathway into the NDIS for those eligible for the scheme and to direct people who are not eligible to other relevant services. The gateway should also help to identify gaps in service provision that need to be addressed.

Box 6.6 Mental health — an area where uncertainty abounds

Many participants to this study raised concerns about people with severe mental illness missing out on services. In 2011, the Commission assumed that about 57 000 people with psychosocial disability would be eligible for individualised supports under the NDIS (PC 2011, p. 190). The NDIA has since revised this number to 64 000 people with a primary disability of psychosocial disability (NDIA 2016b, p. 26).

The National Mental Health Commission's report on Mental Health Programs and Services estimated that about 700 000 Australians experience severe mental illness in any one year (and there are estimated to be over three and a half million people in Australia (aged 16 to 85 years) with some sort of mental ill-health in any one year) (NMHC 2014, p. 5). The Department of Health (sub. 175, p. 4) submitted that through their internal modelling, about 282 000 people aged 0-64 years have severe psychosocial disability requiring supports, and about 92 000 (aged 18-64 years) would 'most closely align' with the NDIS (although this did not involve modelling against the NDIS eligibility criteria per se).

For people with psychosocial disability not eligible for an individualised package under the NDIS, it is intended that mainstream or other disability support will assist them. However, many submissions to this study pointed to current uncertainty around what services and supports will be provided to individuals with psychosocial disability outside the NDIS. For example, Mental Illness Fellowship of Australia said:

> While there have been assurances under the principle of continuity of service, in practice there is no clear indication of who and how the system will provide for those not eligible for the NDIS yet in existing programs, and more generally, those who were never Commonwealth clients to begin with. Members have reported emerging evidence of cost-shifting and ambiguities in responsibility, resulting in program uncertainty. (sub. 122, p. 12)

The National Mental Health Commission:

> A particular concern is that there seem to be many people in existing community mental health programs at the Commonwealth and the State and Territory level who are being found ineligible for the NDIS, and while governments' commitment to continuity of support for existing clients is welcome (subject to the details of how such support is to be provided into the future), there appears to be no clear strategy for dealing with future cohorts of people who would otherwise have accessed such programs but who are not eligible for the NDIS. (sub. 153, p. 6)

And the Mental Health Community Coalition of the ACT said:

> … there is a need for both the NDIS and a mental health system. One is not a substitute for the other. However, since the introduction of the NDIS, the intersection between these systems has become very unclear and difficult; as well as inconsistent between States and Territories.
>
> - States and Territories made different decisions about what was in and out of scope for the NDIS.
> - Further, these decisions were made very early in the process when detail of scheme design was limited — it's fair to say that in many cases decisions would now be different given how the scheme has evolved. (sub. 135, p. 15)

The DSS (sub. 146, p. 16) also noted that service gaps in this area have been known for some time. The implications of gaps are significant — uncertainty about what supports will be provided is distressing for people who rely on them and places an additional call on the generosity of informal support. Service gaps can also threaten the sustainability of the scheme by encouraging scope creep, or by forcing those who are unlikely to meet eligibility requirements to test their access.

Continuity of support arrangements need to be made public

The DSS called for the States and Territories to demonstrate that they are delivering on continuity of supports:

> As governments refocus significant proportions of their disability expenditure towards funding the NDIS, there is the potential for services that are expected to remain in the mainstream to be withdrawn, creating service gaps for people who are not eligible for the NDIS. The States need to demonstrate they are delivering their undertakings to provide continuity of support to clients not eligible for NDIS. (sub. 146, p. 27)

While the DSS recognised that measuring and reporting on service gaps is difficult, and that the agreed development of a new reporting framework for the *National Disability Strategy* could assist, it also argued for better cross-system reporting to make any moves away from services more obvious (and therefore more difficult to shift costs).

An important first step to ensuring an effective interface between the NDIS and other disability services is for governments to set out what disability services outside the NDIS they will fund, including the value of supports and number of people covered. Without this, it is impossible to understand where the gaps are and where any cost-shifting may be occurring.

In the position paper, the Commission proposed that a detailed schedule of continuity of support arrangements (including the value of supports and number of people covered) be included in the upcoming full scheme Bilateral Agreements. Responses to this proposed recommendation were mixed.

The Queensland Government considered it reasonable that information about continuity of support services be provided in the Bilateral Agreement for full scheme (sub. PP345, p. 11). The DSS also said that the disclosure of continuity of support arrangements will help people understand what governments will provide (sub. PP318, p. 9).

The South Australian Government argued that it is difficult to accurately quantify continuity of support requirements until existing clients' transition into the scheme (sub. PP354). Similarly, the Tasmanian Government said:

> [W]hether continuity of support is required outside the NDIS may be subject to the NDIA's decisions on reasonable and necessary supports and may not be able to be predicted before an individual accesses the scheme and undergoes planning. … It therefore may not be possible to fully describe or anticipate continuity of support arrangements in full scheme agreements as proposed by the [Productivity Commission], especially where interface issues are still being tested and detailed policy is yet to be determined. (sub. PP247, p. 7)

Arrangements for the continuity of supports need to be made clear by governments — and before the full rollout of the NDIS — to ensure there is certainty about supports for those not eligible for the NDIS. It is the Commission's view that high level commitment to the continuity of support arrangements should remain in the Bilateral Agreements for full scheme. However, rather than constrain the Australian, State and Territory Governments to

fixed values and supports, reporting at the operational level should sit outside the Bilateral Agreements. To ensure continuity of support arrangements are made public, and for a centralised discussion to occur, governments should report their operational level arrangements to DRC.

To assist in identifying gaps as they emerge or cost shifting behaviour occurring, there should also be better data collection at the operational level, and ongoing reporting and evaluation. The data will allow for analysis in trends and the ability to identify where future funds can most efficiently and effectively be allocated. Reporting of disability services at the operational level will encourage discussions between the NDIA, mainstream and disability service providers (including governments, local communities and businesses).

The Commission therefore recommends that the NDIA should collect and report regularly to DRC information on boundary issues. The Australian, State and Territory Governments should also collect data on, and publicly report to DRC, the number of people covered by their disability programs pre and post NDIS, and the value of these services (state and territory's responsibilities are further discussed in section 6.3 and recommendation 6.3). The data will form part of the broader collection of disability data across Australia (chapter 13).

ILC programs and LACs could also assist in identifying any gaps and report them to the NDIA, the Australian, State and Territory Governments and DRC.

In the position paper, the Commission recommended reporting of boundary issues be made quarterly to DRC, however the NDIA argued that annual reporting is more appropriate (sub. PP327, p. 31). The Commission does not have a strong view about whether reporting should be done on a quarterly or annual basis. What is more important is that the reporting is perpetual and made publicly available, and that the first series is made available as soon as reasonably practicable.

RECOMMENDATION 6.2

The Australian, State and Territory Governments should make public — through the COAG Disability Reform Council (DRC) — their approach to providing continuity of support and the services they intend to provide to all people with disability (including the value of supports and number of people covered), beyond supports provided through the National Disability Insurance Scheme. Arrangements for continuity of support should be made clear before full scheme implementation.

The National Disability Insurance Agency should report annually to the DRC on boundary issues as they are playing out on the ground, including identifying service gaps and actions to address barriers to accessing disability and mainstream services for people with disability. The reporting should be used for ongoing monitoring, evaluation and improvements.

6.3 The interface between NDIS and mainstream services

A key requirement of any support provided under the NDIS is that the support is most appropriately provided and funded by the scheme and not by another service or system.[47] The NDIS is not designed nor funded to replace mainstream services. For the NDIS to be successful and financially sustainable, there must be clear lines of responsibility between mainstream services and the scheme. Also, as people with disability can require supports across a number of service systems, it is essential that service systems work well together so that people receive the right services and achieve the best possible outcomes.

In theory, the boundary between the NDIS and mainstream services is clear. The *National Disability Strategy 2010–2020* sets out the guiding principles around the supports to be provided by mainstream services (box 6.7). The Strategy's Second Implementation Plan (Driving Action 2015–2018) states that:

> While the NDIS is a significant step forward for many people with disability, the strategy remains the key to achieving improvements in access to mainstream services and support for all people with disability, regardless of age or type and level of support required. (DSS 2016c, p. 6)

However, as the NDIA (sub. 161, p. 57) stated, 'the Strategy is an overarching framework rather than a binding agreement for action'. It does not include 'substantial commitments, key performance indicators or targets' and 'there are limited identifiable consequences for governments if there is a lack of action'.

The Australian Government has also entered into bilateral agreements with State and Territory Governments. These agreements delineate the types of support to be provided and funded by the NDIS and mainstream services (table 6.2). COAG has endorsed *Principles to Determine the Responsibilities of the NDIS and other service systems*, which are to be used to determine the funding and delivery responsibilities of the NDIS. The Principles provide guidance on decisions about what constitutes 'reasonable and necessary' by the NDIA by being incorporated in the *National Disability Insurance Scheme (Supports for Participants) Rules 2013* (Schedule 1).

[47] NDIS Act subsection 34(f).

Box 6.7 National Disability Strategy 2010–2020

The *National Disability Strategy 2010–2020* provides a ten-year national policy framework for improving the lives of Australians with disability, their families and carers. It represents a commitment by all levels of government, industry and the community to a unified, national approach to policy and program development. The vision of the Strategy is for 'an inclusive Australian society that enables people with disability to fulfil their potential as equal citizens' (COAG 2011, p. 8).

The Strategy was endorsed by the Council of Australian Governments in February 2011. It guides public policy across all level of government and aims to bring about change in mainstream services, specialist programs and services, and community infrastructure to meet the needs of people with disability, their families and carers. It is the first time the Australian, State and Territory Governments have agreed to such a wide range of policy directions for disability. The Strategy sets out six priority policy areas for action. They are:

- inclusive and accessible communities
- rights protection, justice and legislation
- economic security
- personal and community support
- learning and skills
- health and wellbeing.

The first implementation plan, *Laying the Groundwork 2011–2014*, established the foundation for reform in the planning and delivery of both mainstream and disability-specific programs and services. The Strategy's second implementation plan, *Driving Action 2015–18*, outlines new priority actions and builds on ongoing commitments to improving outcomes for people with disability across the Strategy's six policy outcome areas. Additional areas of national co-operation include: NDIS transition to full scheme; improving employment outcomes for people with disability; improving outcomes for Aboriginal and Torres Strait Islander people with disability; and communication activities to promote the intent of the Strategy throughout the community.

In September 2016, the Disability Reform Council reaffirmed its ongoing commitment to the *National Disability Strategy*.

Table 6.2 **What the NDIS covers and what mainstream services provide**

	What the NDIS covers	*What mainstream services provide / what the NDIS does not cover*
Health	Support to enable a person with disability to undertake daily activities, including 'maintenance' supports (from clinically trained or qualified health practitioners) directly associated with the person's disability.	Access to health services, such as diagnosis and clinical treatment of health condition, as required by National Healthcare Agreement and Commonwealth Disability Discrimination Act.
Mental Health	Non-clinical supports that focus on the person's functional ability to undertake daily living.	Clinical support related to mental health and any residential care and rehabilitative care.
Early childhood development	Individualised support or early intervention, specific to a child's disability or developmental delay, targeted at enhancing the child's functionality to engage in daily activities.	Early childhood education and care needs, health system, child and maternal health services and any supports clinical in nature.
Child protection and family support	Support for the child, family and carer as a direct result of the child's disability, to enable participation in the community.	Promoting the safety of children from abuse and neglect, and providing parenting programs, counselling and other supports for families.
School education	Supports related to the functional impact of a student's disability to undertake activities of daily living, such as personal care and transport to and from school.	Personalising learning and support related to educational attainment, including teaching, learning assistance, school building modifications and transport between school activities.
Higher education and vocational education and training	Functional support related to the student's disability to undertake daily activities, including personal care and transport to and from education.	Learning and support needs of students that primarily relate to their educational and training attainment, and transport between education, training and employment venues.
Employment	Assistance to take part in the workforce and support in the person's functional capacity to work, such as training in workplace relationships and communication skills.	Employment services to support people with disability to prepare for, find and maintain a job, and employers to hire people with disability in their workplace (e.g. workplace modification, training and funding assistance).
Housing and community infrastructure	Assist individuals with disability to live independently by building their capacity to maintain tenancy, such as home modifications for accessibility, specific to their disability.	Accommodation for people in need of housing assistance, access to housing and homelessness services and any previous infrastructure responsibilities.
Transport	Funding support to enable independent travel, including aids and equipment and training to use transport. Cover reasonable and necessary costs for those not able to travel independently.	Ensuring transport options are available to people with disability. Other parties are still responsible for transport infrastructure as part of universal service obligation, including managing disability parking.
Justice	Continue to fund the full NDIS support related to the person's disability impairment.	Meet the needs of people with disability in line with the *National Disability Strategy* and existing legal obligations, such as ensuring the system supports accessibility for people with disability and a secure environment for those in prison.
Aged care	Those under age 65 can choose to purchase support from an aged care provider and the NDIS will fully meet these 'reasonable and necessary' costs.	Responsible for access to quality and affordable aged care and carer support. Cater for individuals aged over 65 years, unless they qualify to remain in the NDIS.

Interfaces are not so clear at an operational level

At the operational level, the lines of responsibility between the NDIS and mainstream services are not clear. The NDIA reported that during trial and transition it faced three key challenges in relation to mainstream supports, including:

- lack of clarity around some interfaces
- different understanding of mainstream obligations, by each jurisdiction and the NDIA
- difficulty in holding mainstream services accountable (sub. 161, pp. 59–60).

State governments also pointed to the need for further work on achieving greater clarity. For example, the South Australian Government said:

> There remains a lack of clarity in relation to roles and responsibilities across the NDIS and mainstream services in some areas. South Australia believes that there is still extensive work to be done in defining mainstream interface boundaries. (sub. 203, p. 6)

The New South Wales Government said:

> Extensive further work is required by the States and the Commonwealth to scope, agree and communicate service boundaries. Any movement of boundaries (existing responsibilities) between the NDIS and other service systems should be implemented with associated resourcing considerations. (sub. 60, pp. 13–14)

A lack of clarity around responsibilities between the NDIS and mainstream services has the potential to impact on NDIS costs, and on the effectiveness and efficiency of service delivery in multiple ways, including: scope creep; cost shifting from mainstream services to the NDIS and vice-versa; gaps in service provision; inconsistent support access decisions; and duplication of services.

An added complexity is in-kind support arrangements (a program may have been agreed as in-kind but some people receiving the program may not be eligible for the NDIS and not all supports within the program may align with reasonable and necessary supports) (chapter 7).

Some emerging interface issues

Interface issues are starting to emerge. The NDIA reported instances of possible cost-shifting, scope creep and service gaps, including:

- providers trying to extend the amount of therapeutic (health) interventions through use of NDIS funding
- reports that mainstream services are refusing entry to people who are likely to be eligible for the NDIS
- issues around a lack of accessible public transport options, particularly in regional, rural and remote areas, which means NDIS participants seek transport funding through the

> NDIS despite having the capacity to travel independently where transport options are available (sub. 161, pp. 59–60).

State and Territory Governments also reported instances of cost shifting. The South Australian Government, for example, said:

> As policies and eligibility have been clarified over the trial/transition period, there are a number of emerging issues which are, or are expected to result in costs for the state in areas which were originally assumed to be part of the scheme. … South Australia is keen to ensure that all appropriate costs are met by the NDIS to avoid any potential of states effectively paying twice for services. (sub. 203, pp. 7)

The ACT Government also said:

> The ACT has experienced a cost pressure associated with the fact that what is 'in scope' for the NDIS has moved over time. (sub. 156, p. 9)

Some of the examples provided by the ACT Government include:

- a narrowing of the eligibility criteria for Early Intervention has meant that some children who were deemed eligible for the scheme and have not implemented plans are being reviewed by the NDIA and referred back to mainstream services
- the lack of clarity from the NDIA about what is considered as parental responsibility and what is reasonable and necessary to fund student transport means that a tightening of scope by the NDIA will shift costs to States and Territories
- the NDIA being insistent that supports for people with forensic disability[48] where their behaviour manifests as a public safety issue is the responsibility of mainstream services. The ACT Government did not anticipate that it would be required to meet such costs, given that they relate directly to the participant's ability to live in the community (sub. 159, pp. 9–16).

While many submissions to this study raised concerns about how the NDIS interface was working with mainstream services, particular concerns were raised in the areas of the justice system (box 6.8) emergency and health services (box 6.9) and transport (box 6.10).

[48] A forensic disability client is an individual who has an intellectual or cognitive disability who has been ordered to be detained for treatment or care (Forensic Disability Act 2011(Qld) s. 10).

Box 6.8 Interface between the NDIS and justice services: views of study participants

Participants to this study expressed a number of concerns about the interface between the NDIS and mainstream criminal justice disability services. While there are specific NDIS rules that deal with the interface with the justice system (NDIS (Supports for Participants) Rules), there are some concerns that these rules are not clearly defined and that differences in interpretation will create inconsistencies. The Office of the Public Advocate, for example, said:

> On the intersection with the justice system, the COAG principles outline that the NDIS 'will continue to fund the reasonable and necessary supports'; a statement that is vague and subject to differing interpretations. Moreover, some of the responsibilities accorded to the justice system in the COAG principles have seldom been available in the pre-NDIS environment; for example, 'specific interventions to reduce criminal behaviours' and intensive case coordination — both of which are attributed to mainstream services — are not currently provided by the justice system and it is unlikely that they will be under the NDIS. (sub. 46, p. 2)

Participants also expressed concern that delineation between the NDIS and State and Territory responsibilities is resulting in the withdrawal of some community justice programs and creating inconsistencies between jurisdictions and gaps in service provision. Disabled People's Organisations Australia submitted:

> There is an assumption that States and Territories are providing the appropriate supports to people with disability through the mainstream or their own specialist disability support systems. In some cases, States and Territories are entirely withdrawing funding and services for disability support while others are retaining a residual role in specialist supports. This creates inequity in programs within different jurisdictions. For example, NSW is ceasing its funding of specialist disability criminal justice programs based on the rationale that this should be the purview of the mainstream criminal justice system. (sub. 165, p. 11)

A further issue was the ability of people in custody to access NDIS support. Sisters Inside, for example, said:

> In our view, the unique and 'complex' needs of women in prison pose a significant challenge for the current NDIS model. We are concerned that most criminalised women will not be eligible for NDIS services. Even if eligible, many criminalised women can be expected to avoid the application process and services provided by mainstream (institutional charity) organisations. (sub. 16, p. 1)

In particular, access to disability services for people moving in and out custody is viewed as problematic. Neami National submitted that an:

> … issue occurs when participants move in/out of justice settings. For example, in preparation for discharge from a forensic mental health unit, extensive preparatory work and relationship building is provided through in-reach of community mental health disability support. This is not funded under the NDIS and will compromise the capacity of justice services to facilitate safe and timely discharge for people, again increasing overall cost pressures on the health and social care systems. (sub. 63, p. 9)

Similarly, Leanne Dowse, Melinda Paterson and Mike Sprange said:

> … as the NDIS implementation is only partially complete in NSW, it is hard to comment on how the interface between the NDIS and mainstream services has been working. What is clear has come from areas where trial implementations of the NDIS have occurred, such as in the Hunter region.
>
> In the area of Justice, there are some reports that the transition out of custodial sentences for people with disability who may be eligible for the NDIS, or even already in it, is problematic. It is likely that in relation to the mainstream area of Justice, many complex issues will arise in the interface. (sub. 114, p. 7)

Box 6.9 Emerging gaps in emergency and health services

Responsibility for funding emergency services

A gap in emergency response funding was identified by a number of study participants. For example, the ACT Government (sub. 156, p. 24) pointed out that there is currently no provision for emergency supports, such as accommodation, for:

- children with challenging behaviours who may not be able to live with their parents all of the time
- participants being discharged from a psychiatric inpatient unit
- participants unable to leave hospital without a modified or supported accommodation option.

It is unclear whether the NDIS or State and Territory Governments are responsible for funding this service. For example, in the ACT, the government has 'cashed out' on disability services related to emergency care (the ACT Government (2017) wound up 'Disability ACT' on 30 June 2017) under the expectation that the NDIS would fund these services. On the other hand, the NDIA has claimed that providing emergency accommodation falls under the State and Territory responsibility of child protection, public housing and health sector respectively.

Uncertainty in some health services

There are also cases where individuals are being turned away from specific state funded health services, and there seems to be uncertainty around who should provide these services.

- Audiologists report confusion around the funding of services for people experiencing tinnitus, with one practitioner being told that supports for tinnitus would no longer be funded by South Australia Health as this program would move over to the NDIS. However, young and adult clients with severe tinnitus are being advised that they are ineligible for the NDIS (Allied Health Professions Australia, sub. 37, p. 11).
- The Australian Physiotherapy Association (sub. 93, p. 10) reported feedback from consumers that rehabilitation services have 'closed their books' to NDIS package holders.
- The Australian Physiotherapy Association also noted cases of individuals being discharged early from hospitals:

  > … there are increasing incentives for 'early discharge' from public and private hospitals resulting from the introduction of the NDIS … There is little incentive, for example, for hospitals to ensure optimal pre-discharge functioning of a participant, compared with early hand-off and the transfer of the responsibility for achieving optimal functioning into the hands of the participant, their NDIS budget and community-based providers. (sub. 93, p. 10)

Box 6.10 Taxi subsidy scheme varies across jurisdictions

As part of the transition to the NDIS, some State and Territory Governments, such as South Australia, Tasmania and Queensland, have cashed out their taxi subsidy scheme for NDIS participants, on the expectation that transport requirements for people with disability will be covered by the scheme.

Since the rollout of the NDIS, some scheme participants have received less transport assistance than they did under the previous taxi subsidy scheme. Some State Governments argue that the NDIA is not providing sufficient transport support. As Queensland's Minister for Disability Services Coralee O'Rourke said:

> Together with other jurisdictions, we have been making representations to the Commonwealth Government since earlier this year, expressing concern that people are not getting sufficient provision for transport in their plans from the NDIA. (Bailey and O'Rourke 2017)

The South Australian and Tasmanian Governments have announced they will temporarily reinstate the taxi subsidy scheme for NDIS participant (Mullighan 2017; TDSG 2017), while continuing to provide a cash transfer to the NDIA. The Queensland government reinstated their taxi subsidy scheme for the remainder of the transition period. This will be treated as an in-kind contribution, replacing what was a cash contribution (Bailey and O'Rourke 2017).

There appears to be discrepancies in services received by individuals, depending on which jurisdiction they live in and how their government interprets their responsibilities – this is not desirable in a system striving to be nationally consistent.

While the Commission considers these interface concerns are highly significant, it is not in a position to review the boundaries per se (though it has devised a process to address these issues going forward — discussed below). As the New South Wales Government said:

> … at this early stage, NSW considers reviewing scheme boundaries by the PC to be of limited value given extensive work is still required by governments to define and agree boundaries. (sub. 60, p. 14)

A number of Administrative Appeals Tribunal (AAT) cases have tested the boundaries of the NDIS (box 6.11), but given the narrow focus of these cases to date, their use in defining boundaries between services is limited. As more decisions are tested through the AAT, it can be expected that boundaries may be clarified. Importantly, however, the fact that a support is ruled to be best provided by a mainstream service does not always mean that the support will necessarily be provided.

Box 6.11 **AAT Cases — whether a support is most appropriately funded by the NDIS**

The following are examples of Administrative Appeals Tribunal cases that look at whether the requested NDIS support item is most appropriately funded by the NDIS or mainstream services. The cases have generally focused on specific claims for medical equipment and disability care.

- *Young and the National Disability Insurance Agency* [2014] AATA 401 — Young applied for a portable oxygen concentrator and insulin pump to be funded through the NDIS. The AAT found that the oxygen concentrator and insulin pump were not clinical treatments, and are most appropriately provided by the health system.
- *McCutcheon and the National Disability Insurance Agency* [2015] AATA 624 — McCutcheon's NDIS support package did not include chiropractic care, which she appealed. The AAT found that the chiropractic treatment can amount to good practice for the purposes of NDIS Act s 34(1)(d). The AAT found that the chiropractic treatment was related to McCutcheon's ongoing functional impairment and was therefore most appropriately funded by the NDIS.
- *Fear by his mother Vanda Fear and National Disability Insurance Agency* [2015] AATA 706 — On behalf of Fear, his parents applied for certain equipment (pulse oximeter and oral suctioning machine) as part of his individual support package under the NDIS, but they were not included in his plan. The AAT found that the oximeter and oral suction machines are more closely related to clinical treatment for Mr Fear's health and were the responsibility of the health system.

Interface issues require ongoing action

While there are various governments involved in delivering services to people with disability, there will be interface issues. It will take considerable effort and goodwill to resolve these issues, and as programs for people with disability continue to evolve, interface issues will never be fully 'resolved'.

It is therefore essential that robust processes are in place to clarify interface issues between the NDIS and mainstream services before they appear (if possible — but some issues will only become apparent through experience), or as they arise. The Commission is aware that governments are undertaking substantial work to clarify these issues, but this is complex and will take time. A more formal process is therefore needed to maintain the momentum for this critical work.

The Commission considers that the most appropriate vehicle for the discussion and monitoring of NDIS and mainstream service interfaces is COAG. A standing item should be introduced for each COAG Council that is responsible for services that interface with the NDIS, so that there is a regular discussion, and actions devised, on how best to address the interface of mainstream services with the NDIS.

There were mixed reactions to this recommendation in the position paper. Some study participants were supportive, for example:

> … Victoria would support a standing item on the agenda of each COAG Council that interfaces with the NDIA (Draft Recommendation 5.3). A necessary first step is to put in place public reporting on how the scheme as a whole is progressing. This would identify whether there is a need for further reporting by the states that can be efficiently and effectively progressed through existing COAG avenues. (Victorian Government sub. PP298, p. 22)

> NDIS should be a standing item on the agenda of every COAG ministerial council that has responsibility for services that interface with the NDIS. This would help foster regular discussions to resolve uncertainties about service gaps, duplications and other boundary issues. (National Disability Services sub. PP295, p. 5)

The New South Wales Government, however, raised concerns about this resulting in fragmented decision making:

> NSW does not consider it appropriate for other COAG Councils to resolve boundary or interface issues with the NDIS. Devolving this responsibility to separate COAG Councils will potentially result in a fragmented approach to decision making, and decisions being made without reference to broader NDIS design/impacts. Rather, the Disability Reform Council should have responsibility for considering and agreeing NDIS boundary and interface issues in consultation with other COAG Councils. (sub. PP230, p. 5)

And the DSS suggested that the standing item agenda should be broadened to include a discussion on improving outcomes for people with disability:

> The COAG DRC now lists the NDS as a standing agenda item for its ordinary meetings, Should this option be more broadly pursued it would be important that the standing agenda item be extended to include a broader focus on improving outcomes for people with disability, consistent with the Strategy, to help drive improved outcomes for all people with disability, including those who will not be NDIS participants. (sub. PP318, p. 11)

The Commission agrees broadly with these views and recommends that the standing item for each COAG Council (that is responsible for services which interface with the NDIS) should put forward issues and proposed solutions to the DRC, rather than having each COAG Council resolve interface issues directly. The discussions on boundary issues should also consider how interactions between services affect outcomes for people with disability.

The DSS suggested specific disability reporting across COAG Councils:

> Monitoring and reporting through COAG infrastructure could be strengthened by specific disability reporting across relevant COAG Councils, specifically on the effectiveness of mainstream systems in supporting all people with disability; and improving the interfaces between mainstream services and the NDIS.
>
> DRC could consider proposing this through its regular reporting to COAG, starting with the three agreed priorities for the *National Disability Strategy*:
>
> - mental health services outside the NDIS
> - health services for people with disability

- over-representation and lack of support for people with disability in the criminal justice system. (sub. 146, p. 28)

The *National Disability Strategy* should be strengthened to improve government accountability. There should be more detailed reporting around the boundaries of the NDIS and the implications for mainstream service provision. Specific commitments, key performance targets and outcomes should be established. This should be pursued through review points of National Agreements and National Partnership Agreements under the Federal Financial Relations Intergovernmental Agreements.[49]

As the DSS said:

> Translating the National Disability Strategy into tangible results for people with disability, their families and carers is a major factor in successful implementation of the NDIS. (sub. 146, p. 5)

RECOMMENDATION 6.3

Each COAG Council with responsibility for a service area that interfaces with the National Disability Insurance Scheme (NDIS) should have a standing item on its agenda to address how these services interface with NDIS supports. The standing item should cover service gaps, duplication and other boundary issues, including ways to improve outcomes for people with disability. Each Council should put forward issues and proposed solutions to the Disability Reform Council for action.

At review points of National Agreements and National Partnership Agreements under the *Intergovernmental Agreement on Federal Financial Relations*, parties should agree to specific commitments and reporting obligations that are consistent with the *National Disability Strategy*. The Agreements should be strengthened to include more details around how boundary issues are being dealt with, including practical examples.

As the system evolves, and providers of services to people with disability better understand the NDIS and its interfaces, staff will be better able to work collaboratively, identify gaps or duplications and re-direct people with disability to the most appropriate services. A number of study participants said that cross-system co-ordination is poorly implemented and more needs to be done in this area (box 6.12).

Cross-system co-ordination differs to that of support co-ordination (chapter 10) — rather than connecting scheme participants with complex needs to appropriate services, cross-system co-ordination will ensure that service providers themselves are better equipped to work with one another, and that the best outcome is achieved for *all* people with disability.

Having better co-ordination can help, but of course only if responsibilities are clearly delineated. ILC and LAC can also play a role in ensuring mainstream services and the NDIS

[49] An important commitment by governments under the Disability Reform Strategy was to use the review points of National Agreements and National Partnerships as an opportunity to assess their consistency with the aims and objectives of the Strategy.

are better informed about their roles and responsibilities, and help identify problems and solutions.

Box 6.12 **A need for better cross-service co-ordination**

Victorian Healthcare Association:

> In some cases the roll out of the NDIS has led to fragmented management of care recipients by creating artificial barriers between 'health' needs and 'disability' needs — rather than treating clients holistically and providing integrated care. (sub. 172, p. 4)

Victorian Council of Social Services:

> To help people with disability achieve their aspirations, they need to be treated holistically and receive coordinated support. This is particularly the case for NDIS participants who face a range of complex issues such as experiencing chronic health conditions, homelessness, family violence, child and family services and substance abuse.
>
> There is a role for state and federal governments to better coordinate mainstream systems with the NDIS and to meet their commitment under the National Disability Strategy 2010–2020. (sub. 176, p. 25)

National Mental Health Commission:

> For people living with mental illness, the service landscape is complex and fragmented, as services are both cross-sectoral (health and disability, as well as other sectors such as housing) and cross-jurisdictional (Commonwealth and state/territory). To meet the needs of people with a psychosocial disability, coordination across these sectors and jurisdictions is required to ensure no gaps in services emerge from the implementation of the NDIS. (sub. 153, p. 7)

Flourish Australia:

> To ensure an integrated system that takes a holistic approach and is responsive to the differing needs of people with mental health issues, it is important that the NDIS has strong links to and collaborates with other parts of the system. From our perspective, it would appear that the priority at the moment is the rollout of the Scheme, not smooth transition, collaboration or integration with other relevant service systems. This is problematic. (sub. 74, p. 9)

6.4 Interface with aged care

An important issue in the design of the NDIS is the interface between the aged care and disability systems. As people with disability age, they are likely to experience age-related conditions, such as increasing frailty, or the onset of age-related neurological conditions (such as Alzheimer's). At the same time, a person may develop a non-age related disability later in life.

Under the NDIS, a scheme participant:

- under the age of 65 years can choose to purchase supports from an aged care provider and the NDIS will fully meet these 'reasonable and necessary' individualised support costs

- has the choice to stay in the NDIS, or transition to the aged care system, once they turn 65 years old
- ceases to be a participant when they enter a residential care service or start being provided with home based care on a permanent basis, but only after they turn 65 years old (DRC 2015b, p. 26).

There are aspects of the design of the NDIS, and how it interfaces with the aged care system, that create incentives for people to stay in the NDIS after the age of 65, and encourage people nearing the age of 65 to apply for NDIS access (and have their needs met through the scheme, rather than through the aged care system). For example, there are differences in the objectives, financial contributions, and the level of supports provided under the two systems (box 6.13).

Box 6.13 Incentives to remain in, or seek access to, the NDIS

Varying objectives

The NDIS is intended to support the independence of people with disability, provide reasonable and necessary support and has an insurance based focus of lifetime care for the participant. In contrast, the aged care system focuses on minimising a person's loss of autonomy, and acknowledges that 'if you live long enough, you will need some form of care and support because of frailty' (PC 2011b, p. 147).

This can result in different supports provided by the two systems.

Financial incentives

A NDIS participant is provided care and support at no cost, whereas a person accessing the aged care system may be subject to a means tested co-contribution. As noted by one participant (Name withheld, sub. 5, p. 1) as long as the market for providing services to NDIS participants is operating effectively, it is difficult to see why people would choose to transition from the NDIS to aged care.

Aged care is capped and rationed

The NDIS provides all eligible participants a package of supports which is uncapped, provided these supports are deemed to be reasonable and necessary. In contrast, the aged care system has a limited number of places, and packages have a capped amount of government funding. For example, an NDIS participant with a spinal cord injury has an annual average package of about $109 000 (excluding shared supported accommodation — chapter 2), whereas the largest Home Care and Residential Care packages (excluding supplements) are about $50 000 and $80 000 per year, respectively (Department of Health 2017a).

These incentives raise some issues that need to be addressed. However, given the infancy of the NDIS, and in the absence of adequate data on the characteristics of people aged 65 years and over in the scheme, it is too early to determine the best approach to take.

Some of the policy options that could be worth exploring (as more data become available) include:

- changing the NDIS entry cut-off age — possibly to align with changes in the age pension age (transitioning from 65 to 67 years by July 2023)
- removing the NDIS entry cut-off age altogether — some participants suggested that an age cut off is inequitable and discriminatory (Disabled People's Organisations Australia sub. 165, pp. 11–12 and Motor Neurone Disease Australia sub. 45, p. 7)
- introducing a co-contribution for people aged over 65 years in the NDIS (this was suggested by the PC in 2011)
- better aligning the aged care and NDIS systems.

The Commission considers that, in light of new information, the Australian Government should review the interface between the NDIS and the aged care system as part of the 2023 review of NDIS costs.

6.5 Interface with the National Injury Insurance Scheme

In 2011, the Productivity Commission also recommended that a National Injury Insurance Scheme (NIIS) be established and operate in parallel to the NDIS. At the time, the Commission considered it a priority to establish a no-fault lifetime care and support scheme for catastrophic injuries, as many Australians acquiring such injuries were receiving poor care and support because they were unable to find an at-fault party to sue. (PC 2011, pp. 851-854)

Under the model proposed by the Commission, the NIIS was to fully fund health, rehabilitation and care and support costs for all newly acquired catastrophic injuries. As such, lifetime care and support needs of people with newly acquired catastrophic injuries would be met through the NIIS and not the NDIS. However, the care and support needs of people with existing catastrophic injuries, and not covered under any no-fault arrangements, would be met through the NDIS.

The NIIS, as proposed by the Commission, was to operate as a federation of individual state-based no-fault insurance schemes. It was recommended that the NIIS be in full operation in 2015, or before the full rollout of the NDIS. This was on the basis that there were well-established schemes in place that could form the blueprint for the design of schemes and the number of people affected was relatively small (about 1000 people a year) (PC 2011, p. 863).

Implementation of the NIIS is overseen by the Australian Treasury (2017f) and has been investigated across four streams:

- motor vehicle accidents
- workplace accidents

- medical treatment injuries
- general accidents (occurring in the home or community).

Of the four streams, motor vehicle accidents is complete, and workplace accidents is in the process of being completed — a consultation Regulation Impact Statement has been released and progress is being made towards setting minimum benchmarks (Australian Treasury 2015).

Progress on the other two streams — medical accidents and general accidents — has been slower. In June 2017, COAG agreed not to proceed with the medical accident stream. COAG is also seeking advice from Treasurers, in consultation with the DRC, on a general accident stream of the NIIS (COAG 2017, p. 3).

As there is no agreement in place by the State and Territory Governments to commit to the funding for — or establishment of — the medical and general accident streams, anyone who acquires a catastrophic injury from a medical or general accident will receive supports through the NDIS. This will have a direct impact on NDIS costs.

A number of study participants pointed to the costs to the NDIS.

> Not proceeding with the medical or general streams of the NIIS will have a direct impact on the NDIS by increasing overall Scheme costs. … Any additional cost, not adequately funded by the States, is a risk to the Commonwealth. (DSS sub. 146, p. 26)
>
> The sustainability of the NDIS depends on a complete NIIS that, in providing no fault insurance for catastrophic injury, removes the significant cost drivers of these injuries from the NDIS. (Young People In Nursing Homes National Alliance, sub. 187. p. 4)
>
> Without the NIIS in place, further cost-pressure will be placed on the NDIS. (NDIA sub. 161, p. 113)

The DSS argued that the funding obligation should sit with State and Territory Governments:

> Contingencies are needed if the full NIIS is not delivered, as this would move costs onto the NDIS. … If the NDIS were to pick up responsibility the funding obligation would sit fully with the States, which have responsibility for implementing the NIIS. (sub. 146, p. 5)

And:

> The States should bear the consequential NDIS costs if the NIIS remains only partially implemented. This is consistent with the *Intergovernmental Agreement for the National Disability Insurance Scheme (NDIS) Launch* and the transition agreements between governments, reflecting the original intent of the NIIS to reduce the cost of the NDIS. (sub. PP318, p. 11)

However, a number of State Governments disagreed. For example, the Queensland Government said:

> The terms of Queensland's 2013 Heads of Agreement with the Australian Government do not require implementation of NIIS streams for medical or general accidents. The recent COAG

> decision to not proceed with a medical NIIS at this time should not put Queensland at risk for liabilities of NDIS participants who might otherwise have been covered by a NIIS. (sub. PP345, p. 12)

And the South Australian Government said:

> Negotiations regarding the establishment of a NIIS for medical and general injuries are occurring between the Commonwealth and the states and both levels of government have recommended to COAG that the medical NIIS not proceed at this time. … The NDIS cost implications arising from a failure to establish NIIS arrangements are not clearly a state responsibility, given states' lack of involvement in these fields of insurance, the joint decision making process underway between both levels of government to assess feasibility and the relatively stronger ability of the Commonwealth to raise revenue from efficient taxes. (sub. PP354, p. 7)

The cost implications to the scheme may be lessened by the NDIA's ability to seek compensation from other parties (chapter 5 of the NDIS Act).[50] The NDIA can seek a share of compensation from medical indemnity and public liability payouts related to disability care and support. The NDIA's CEO can also require a person take action to obtain compensation if another party is at fault.

The number of people entering the NDIS, who would otherwise be covered by the medical or general accident streams of the NIIS in any one year is expected to be relatively small — across both streams the Commission (PC 2011, p. 793) estimated there to be about 400 people.

But over time, as new people enter each year, there is a cumulative effect. To illustrate, modelling undertaken by the NDIA suggests that the cost to the NDIS of the medical and general schemes not operating would amount to about $23 million in 2018-19. But, would increase to about $226 million in 2025-26 and to about $1.3 billion in 2040-41 (table 6.3). These numbers take into account the NDIA seeking compensation.

[50] In Western Australia, the motor vehicle accident stream allows participants to take their benefits as a lump sum. This has raised some concerns about its potential impact on NDIS costs should Western Australia join the NDIS. For example, if a participant exhausts their lump sum they could access the NDIS. Queensland's motor vehicle NIIS contains provisions of similar effect to that of Western Australia, whereby a participant can seek a lump sum compensation through common law. However, *National Injury Insurance Scheme (Queensland) Act 2016* (Qld) s. 17(4) allows a person to further seek compensation from NIIS Queensland should they exhaust their funds after five years. This means there is minimal impact on NDIS costs. If Western Australia joins the NDIS, a similar provision of NIIS Queensland Act would need to be included in Western Australia's *Motor Vehicle (Catastrophic Injuries) Act 2016* (WA) to negate the impact on the NDIS costs.

Table 6.3 **Medical and general accidents costs to the NDIS**

Source: Commission estimates based on NDIA modelling.

One of the key goals of the NIIS is to deter high-risk behaviour and reduce local risks that can contribute to accidents. For this reason, in 2011 the Commission argued that premiums and State and Territory funding should be used to send price signals and encourage greater incentives for safety (PC 2011, p. 865).

The Commission acknowledged that the appropriate funding source for no-fault coverage of catastrophic injuries following medical treatment is more complex than for other accidents. A key consideration is to build on existing incentives to minimise risk by:

- motivating the systematic collection and analysis of data that may decrease risks
- varying premiums depending on whether practitioners (or the health sector more broadly) follow best practice protocols and have the appropriate training and credentials (PC 2011, p. 877).

For general injuries, accidents can have a range of causes, such as environmental factors (for example, maintenance of footpaths and safety of play grounds) and the nature of activity being undertaken (such as participating in riskier recreational activities). Local governments are in the best position to put in place incentives to minimise the risk of accidents (such as proper signage around dangerous areas) and to collect revenue to fund the NIIS (including, for example, a levy on local government rates).

Because the States and Territories have greater control over implementing risk reducing programs (and therefore, indirectly, the costs of the NIIS), they should bear the costs of the NIIS if it remains only partially rolled out for an extended period.

To provide incentives for State and Territory Governments to take steps to reduce the incidence of catastrophic accidents, the mechanism chosen to determine funding for the NDIS (to account for the NIIS being only partially operational) would need to ensure governments with lower rates of accidents pay less than governments with higher rates of accidents. Such a mechanism would be complex and it may be difficult to secure unanimous agreement to the parameters that would be involved. The NDIA provided a possible approach, including ways to collect data and apportion costs (box 6.14).

Alternatively, some kind of base adjustment could be made to the general contributions to the NDIS from the States and Territories. Under this approach, the adjustment should reflect

an estimate of the costs incurred by the NDIS in respect of each jurisdiction as a result of the NIIS not being fully operational. Such an adjustment would have the benefit of simplicity (the value of transparent funding arrangements is discussed in chapter 12), but the incentives for risk reduction by the States and Territories would be lost relative to the option discussed above.

Box 6.14 The NDIA's proposed approach to account for partial NIIS

The NDIA's proposed approach to recoup the costs of providing care to people who otherwise would be covered by a fully functioning NIIS involves three steps:

- *Collecting sufficient data:* appropriate data is required to calculate costs intended to be covered by the NIIS, such as past and new compensations as well as data on participants who enter the scheme with a catastrophic injury
- *Apportioning the costs*: using the data collected, the NDIA can apportion costs accordingly (such as accounting for compensation, the injury stream and which state they originate from), and project future injuries and the cost implication on the NDIS.
- *Paying the costs*: as the full scheme funding mechanism is yet to be determined by the Commonwealth, States and Territories, an additional annual or monthly amount could be paid to the NDIA (sub. PP327, pp. 33–34).

The funding mechanism to account for the cost impact on the NDIS of the NIIS not becoming fully operational will be a matter for negotiation between the Australian, State and Territory Governments.

RECOMMENDATION 6.4

If the medical and general accident streams of the National Injury Insurance Scheme are not implemented, then State and Territory Governments should bear the additional costs borne by the National Disability Insurance Scheme because of the absence of these streams.

7 Provider readiness

Key points

- Providers play an important role in meeting the needs and goals of National Disability Insurance Scheme (NDIS) participants, and improving their lives. However, the transition to a market-based system means that providers need to change the way they provide disability supports. To survive in this new environment, providers need to become more efficient, innovative and responsive to participants.
- Scheme costs are affected by the supply of disability supports. Insufficient supply will mean scheme costs are lower in the short term because participants' supports are underutilised, but higher in the longer term because timely supports can reduce participants' costs of care over their lifetimes.
- While the market-based approach will increase providers' incentives to deliver supports in areas previously undersupplied, there will continue to be 'thin markets' where there are few, if any, providers. Arrangements to deal with thin markets (including Provider of Last Resort arrangements) need timely and considered attention because shortages, less competition and poorer participant outcomes may persist.
- Given the individualised needs of participants and specific circumstances that can lead to thin markets, no approach (including block-funding) should be ruled out by the National Disability Insurance Agency (NDIA) when seeking to address situations where the market is not supplying reasonable and necessary supports. Ongoing public reporting, monitoring and evaluation of thin markets are also crucial.
- Services provided 'in-kind' by the Australian, State and Territory Governments can hinder market development, and reduce choice and control for participants. However, some in-kind services are necessary for continuity of support. Careful, cooperative and consistent approaches between the NDIA and governments are needed to end in-kind services as quickly as practicable.
- Study participants pointed to barriers to providing NDIS supports, including: the cost of moving to fee-for-service; the administrative burden of the NDIS; and the risk of less collaboration between providers. While these are likely to be transitional issues, ongoing monitoring can ensure that they do not become entrenched or systemic issues.

National Disability Insurance Scheme (NDIS) costs are affected by the supply of disability supports. If there are not enough providers and workers to deliver the supports allocated by the National Disability Insurance Agency (NDIA) to participants, this will lead to underutilisation of supports, lower than expected costs to the scheme in the short term, but poorer outcomes for participants and their families.

Costs should be considered from a long-term perspective. When reasonable and necessary supports are allocated to participants under the NDIS's insurance-based approach, the

package of supports should minimise the long-term cost of care to the community. If supports are not available, the costs of supporting participants may be higher in the long term — because of more services demanded through the NDIS, through other government services, or through informal carers. There are also costs to participants and their families from reduced wellbeing.

The impact on the wellbeing of a person with disability from not being able to access supports will vary by support type. For example, not being able to find a carer to provide core supports (like an attendant carer to provide assistance to get out of bed and with personal daily activities) is likely to impose a higher cost on a person with disability than not being able to find a provider for community-engagement activities. The use of the community-engagement support is also likely to be contingent on being able to find someone to provide core supports, and vice versa.

The focus of chapters 7–10 is on how ready the market (providers, workers and participants) is, and how this will affect scheme costs. This chapter looks at how existing and new providers are responding to the increased demand for supports under the NDIS.

- Section 7.1 provides a snapshot of the current state of the disability support sector and the expected growth required to meet the demands of the NDIS.
- Section 7.2 looks at where the market supply for disability supports could be limited and result in 'thin markets'.
- Section 7.3 examines the effect of in-kind services.
- Section 7.4 discusses other transitional matters affecting provider readiness.
- Chapter 8 considers the pricing of disability supports.

7.1 The changing disability support market

People with disability have different wants and needs (including personal care, therapy, community participation, and assistance with cleaning and household chores), which require a variety of supports. And the cost of providing supports varies by region and the degree of competition. This means that there are a number of submarkets within the aggregate disability support market. As explained by one provider, there are particular characteristics of the disability support market that distinguish it from a conventional market.

> The disability support 'market' is not a normal or 'perfect' market in classical economic terms. It is about providing a range of customised supports, human and technological, paid and unpaid, to meet complex and often poorly-defined human needs and wants. Outcomes are often hard to measure and report. Information is unbalanced. Regional, rural and remote markets are 'thin'. The 'buyers' of services and their local situations are diverse and heterogeneous, not homogeneous. Many are vulnerable. (House With No Steps, sub. 104, p. 1)

It is within this context that the NDIS is driving market-based competition between disability support providers, at a time when the size of the aggregate disability support market needs to significantly increase to meet NDIS demand. These changes include:

- a shift away from a block-funded, welfare model of support to a fee-for-service, market-based approach
- an increase in funding for the sector from about $8 billion in 2015-16 to at least $22 billion by 2019-20 (SCRGSP 2017; chapter 12)
- assessing and meeting the reasonable and necessary needs of about 475 000 people by 2019-20 (chapter 2)
- about 70 000 additional workers (or about 20 per cent of all new jobs created in Australia) in the three-year transition period to full scheme (Bonyhady 2016, p. 5; chapter 9).

As the NDIA said:

> In the first year [of transition], to meet projected Scheme demand, growth in supply needs to be around eight per cent. By the second and third year respectively, growth must reach 30-40 per cent, although … the supply needed to meet funded participant demand varies depending on location. (2016i, p. 8)

The market for disability supports is diverse and difficult to characterise in general terms. Some providers specialise in providing supports for those with specific disability, while others specialise in providing particular types of supports (such as accommodation or therapeutic supports). Others provide a much more general service.

The data on disability support providers are patchy. The most comprehensive data were collected by Martin and Healy (2010). More recent work by National Disability Services (NDS) and Curtin University's Not-for-profit Initiative contains data on provider characteristics and financial performance.[51] Notwithstanding the data limitations, the data provide some insights.

- Many providers are small.
  - About 40 per cent of disability service outlets employed 10 or fewer disability workers (Martin and Healy 2010, p. 122).
  - The NDS estimated that about 58 per cent of providers are either small or very small (with a turnover of less than $5 million) (Gilchrist and Knight 2017a, p. 10).
- Most disability providers (about 80 per cent of survey respondents) are not-for-profit (NDS 2016, p. 7).

[51] The National Disability Services' (NDS) State of the Disability Sector Report 2016 is based on the fourth wave of the National Business Confidence Survey of 549 disability service providers, of whom 486 were NDS members and 63 were non-members (NDS 2016, p. 7). The NDS has also undertaken a financial benchmarking project for disability services (NDS nd). This work was commenced by Curtin University and is now being done in partnership with the University of Western Australia (Gilchrist and Knight 2017b).

- Most providers do not just provide disability services.
  - About 57 per cent of providers surveyed by the NDS provided services in other areas, such as aged care, mental health and homelessness (NDS 2016, p. 13).

How will the sector need to change under the NDIS?

While a lack of data prevents a comprehensive evaluation of the current state of the sector, envisioning how the future disability sector will look under the NDIS is even more difficult. Some of the supports required by participants will be provided by existing providers who expand, while others will be provided by new entrants. However, what is not certain is:

- how many providers will be needed — and the proportion of new and existing providers
- what the proportion of for-profits, not-for-profits and government service providers will be
- whether there will be greater specialisation by disability, type of support, or both
- how long it will take for these changes to occur.

This uncertainty is reflected in estimates on the number of providers needed under the NDIS. The Australian National Audit Office (2016, p. 68) estimated that between 13 500 and 40 000 providers will be needed by the end of the transition period in 2020. Understanding how existing providers are responding to, and whether new providers are entering, the NDIS market is therefore important.

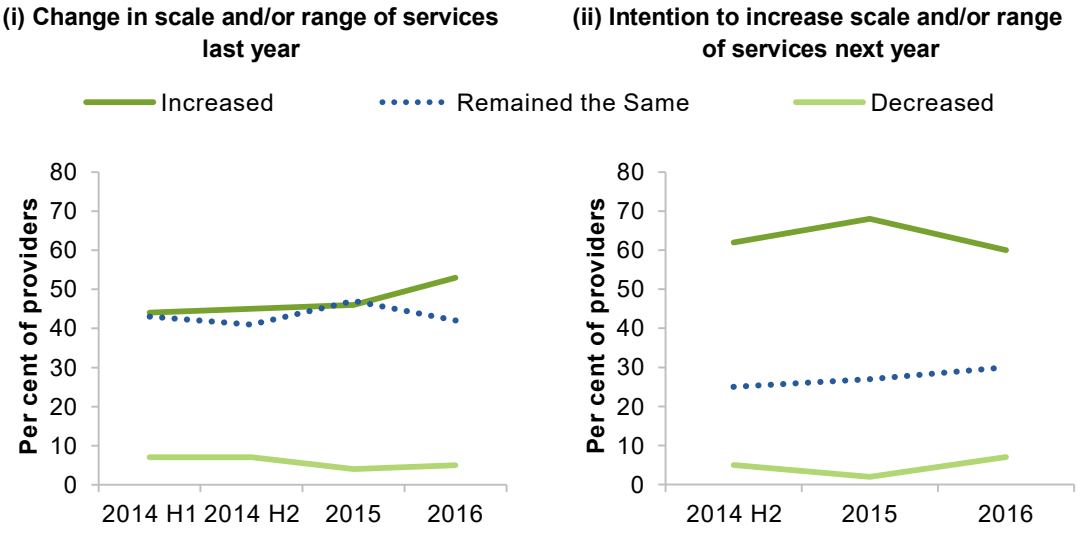
The NDS survey of providers gives some insight on how existing providers are responding. The majority of providers surveyed in September 2016 reported that they had expanded their services last year, and that they intended to expand in 2017 (figure 7.1). Providers reported increasing their services, particularly in the areas of therapy, early intervention, and planning and coordination supports (NDS 2016, p. 11), but the amount of additional supports is unclear.

However, some providers reported plans to reduce or stop supplying services in other areas, and that they are entering new markets (outside of the disability support sector) (NDS 2016, pp. 12–13). The financial position of providers is also variable, and in turn, the strength of existing supply (NDS 2016, pp. 14–15).

It is more difficult to determine the size, scope and number of new providers who are entering the market in response to the NDIS. Data are available on the number of providers *registered* with the NDIA to provide supports under the scheme, which includes both existing and new providers (figure 7.2).

While registrations increased by about 30 per cent between the March 2017 and June 2017 quarters, about 54 per cent of registered providers are not yet active, and the largest 25 per cent of active registered providers currently account for about 80–90 per cent of the value of payments made by the NDIA for participant supports (NDIA 2017y, p. 41).

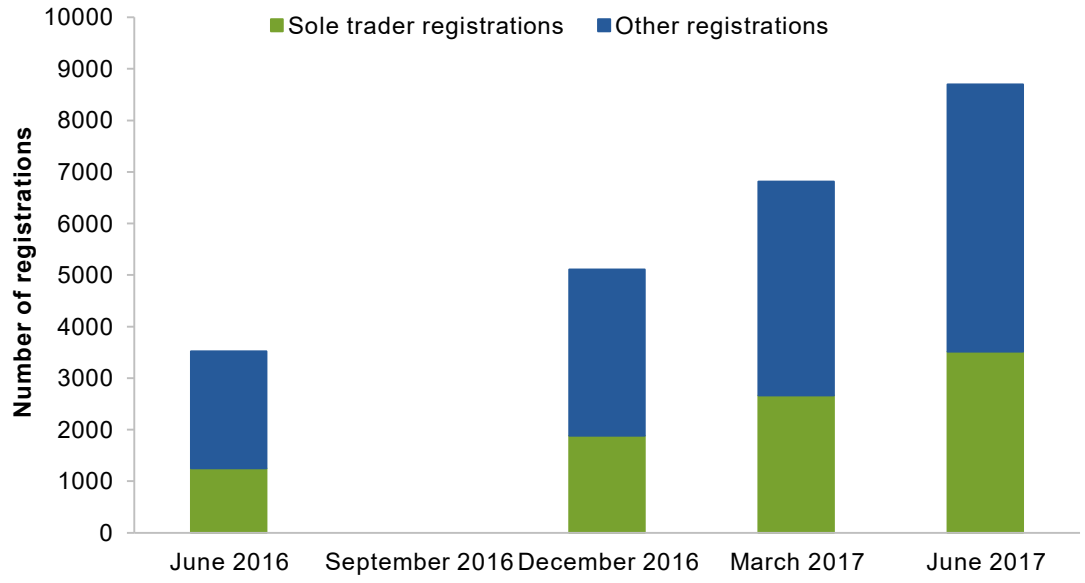
Figure 7.1 **Providers' response and intention to increase supply[a]**



[a] H1 and H2 refer to the first half and second half of the calendar year respectively.

Source: Gilchrist and Knight (2017a, p. 16), who surveyed 492 respondents.

Figure 7.2 **Cumulative number of NDIA-registered providers by quarter[a]**



[a] Data for September 2016 are unavailable.

Sources: Commission estimates based on NDIA (2016p, 2016q, 2017y, 2017z).

This is consistent with NDS data, where 77 per cent of providers surveyed had registered, but only about half had provided services under the NDIS (Gilchrist and Knight 2017a, p. 5).

One explanation could be that some providers are registering to provide services ahead of the NDIS rollout in their location (NDIA 2017y, p. 43; DSS, sub. 146, p. 36).

Growth in registrations of those providing therapy supports — usually allied health professionals — has been strong. In the quarter ending 30 June 2017, allied health professionals accounted for about half (48 per cent) of the increase in registrations (NDIA 2017y, p. 43).

While the scale of market growth to date is uncertain, many providers who made submissions to this study identified the main challenges to developing the market for disability supports as:

- the effect of price controls for supports set by the NDIA (chapter 8)
- concerns that some markets will be too small to be profitable
- government-provided disability services
- other transitional issues affecting provider readiness.

7.2 Thin markets and the Provider of Last Resort

The market-based model for disability supports under the NDIS is designed to encourage greater supply of the supports that people with disability want and need compared with previous arrangements (PC 2011, pp. 111–156). However, there continue to be cases when the disability support market remains too small (in terms of the number of providers or participants) to support the competitive provision of services. This outcome is known as a 'thin market'.

There are a number of negative consequences of thin markets. Insufficient supply may lead to higher prices, less variety, lower quality services and unmet demand. In the disability support sector, thin markets can result in poor participant outcomes, increased demand for mainstream services, and greater pressure on informal carers. Scheme costs are also affected — while they may be lower in the short term (due to underutilisation of supports), they may be higher in the long term if participants are not receiving the right supports at the right time. For these reasons, governments often need to — and do — intervene in thin markets to ensure the supply of disability supports for people with disability.

When will thin markets arise under the NDIS?

Thin markets can arise in places or for particular disability supports when demand is limited and the cost of supply is high. Some have noted that thin markets are most likely to occur in rural, regional and remote areas, for Indigenous and culturally and linguistically diverse (CALD) cohorts, and for specialised supports, such as aids and equipment (DRC 2015a,

p. 19; NDIA 2016i, p. 15). Study participants also identified access problems for particular groups of people with disability, including for some participants:

- living in outer regional, remote or very remote areas[52]
- with complex, specialised or high intensity needs, or very challenging behaviours, such as those with psychosocial disability or who require 24-hour care[53]
- from CALD backgrounds (ECCV, sub. 31)
- who are Aboriginal and Torres Strait Islander Australians[54]
- who have an acute and immediate need (crisis care and accommodation).[55]

Given the early stage of the transition, it is difficult to tell *where* thin markets are under the NDIS, and whether they are diminishing, persisting or growing. And where there are thin markets, it is not necessarily the case that they are occurring because of the NDIS. Thin markets were a feature of the previous disability support arrangements, and are a feature of many other human services (PC 2011, pp. 115–156, 2017b). What is important is that the policies are put in place in a timely manner to minimise their incidence and impact on participants and providers. This is especially the case as the interface with other mainstream services evolves (chapter 6). Thin markets will remain a feature of some disability supports under the NDIS (box 7.1).

52 For example: the AFDO (sub. 180); APC Prosthetics (sub. PP244); Australian Red Cross (sub. PP258); The Benevolent Society (sub. PP334); Cheryl McDonnell (sub. 79); Commonwealth Ombudsman (sub. 137); CTO (sub. PP280); Deaf Australia (sub. 183); EACH (sub. PP276); ECIA NSW/ACT (sub. 190); GIFSA (sub. 13); MAV (sub. PP343); Mental Health and NDIS Facebook Support Group (sub. 8); MND Australia (sub. PP255); MTHCS (subs. 6 and PP222); Northern Territory Government (sub. 205); OPA Victoria (sub. 46); OPG (sub. 143); QAI (sub. 115); Quality Living Options Bendigo (sub. PP220); Queensland Government (sub. PP345); RDAMR (subs. 12 and PP231); and South Australian Government (sub. 203).

53 For example: ABF (sub. PP263); Carers Australia Victoria (sub. 131); Cohealth (sub. PP261); Department of Health (sub. 175); DSA (subs. 9 and PP256); Leadership Plus (sub. 128); Legal Aid NSW (sub. PP245); MHCSA (sub. PP308); Neami National (sub. PP347); NSWCID (sub. PP234); PWSAA (sub. PP228); Tandem (sub. PP212), VALID (sub. PP332); Vision Australia (sub. PP252); Women with Disabilities Victoria (sub. PP282); and Youngcare (sub. PP253).

54 For example: Anglicare NT (sub. PP340); First Peoples Disability Network Australia (sub. PP355); Flourish Australia (sub. PP246); GIFSA (sub. 13); Northern Territory Government (sub. 205); MJD Foundation (sub. PP233); OPG (sub. 143) and VACCHO (subs. 162 and PP223).

55 For example: Anglicare Tasmania (sub. 145, pp. 46–47); DSA (sub. PP256, p. 3); MS Australia (sub. PP283, p. 8); and Youngcare (sub. PP253, p. 2).

Box 7.1 Evidence of thin markets under the NDIS

Thin markets for disability supports have long been an issue for some groups and in some regions. The structure of these thin markets means that many will persist under the National Disability Insurance Scheme (NDIS). For example, the DSS (sub. 146, p. 37) said that there was early anecdotal evidence of thin markets for personal care supports, supports for participants with complex needs, early childhood supports and employment supports. In particular, thin markets are likely to exist for people with disability who live in rural and remote areas, which appears to be confirmed by early evidence from the scheme.

- The NDIA (2016c, p. 34) deemed the supply risks for therapy supports (a specialised support) to be more acute in regional areas in southern New South Wales.
- A National Institute of Labour Studies survey found that unmet demand was experienced more by NDIS participants living in rural and remote areas in the Victorian trial site and by older NDIS participants, particularly by those living in regional areas (Mavromaras, Moskos and Mahuteau 2016, p. xi). These findings were similar to those of a survey of participants living in the Victorian trial site by the Melbourne Social Equity Institute. It found that underutilisation of supports was particularly evident among participants living in regional areas, or those needing highly specialised services and supports (Warr et al. 2017, pp. 30–31).
- In some service regions, the increase in the value of support packages is forecast to grow more quickly than the growth in participants (NDIA 2016l, pp. 10–12, 2016x, pp. 10–12). This could reflect a lack of supports and more unmet demand for these participants.
- In South Australia, almost one-third of NDIS participants are expected to reside outside of Adelaide (NDIA 2016u, p. 25); however, the NDIA observed that there was a lack of provider choice in remote and very remote areas in South Australia, with participants often dependent on a key support worker (NDIA 2016u, p. 26).
- Participants in the Barkly region in the Northern Territory had the third highest level of unutilised funding — 41 per cent of committed supports in 2014-15, and 64 per cent in 2015-16 (NDIA 2017v, p. 29). However, underutilisation may be due to a number of factors other than unmet demand (chapter 2).
- In the Northern Territory, there appears to be a shortage of supports for physical disabilities. At the end of June 2016, only one per cent of active registered providers in the Northern Territory provided physical wellbeing services, but 27 per cent of participants with an approved plan in the Barkly trial region were identified as having 'other physical disabilities' (NDIA 2017v, pp. 10, 22). The NDIA noted that:

  > Given the much higher level of physical disability in the Territory as compared to … [Victoria and New South Wales], the number of providers registered to provide physical wellbeing supports appears to be low. (2017v, p. 21)

How should thin markets be addressed?

One of the challenges of addressing thin markets is that while they share some common characteristics, often they have very specific and different causes. A 'one-size-fits-all' approach will not to be feasible or effective. A more tailored response that considers the complexities of dealing with the wide variety of thin markets is required, taking into account issues such as the presence of CALD and Aboriginal and Torres Strait Islander communities,

quality of infrastructure, weather events and population density.[56] In practice, it means that standardised approaches to pricing may not be effective to encourage supply in some thin markets. This is reflected in the diversity of options that can be used to address thin markets (box 7.2).

However, there are costs associated with government intervention to minimise underprovision of disability supports in thin markets. To address thin markets, it is necessary to balance the trade-off between providing services that are not only cost-effective, but also as flexible as possible to enable participant choice and control. For example, the NDIA's Rural and Remote Strategy (NDIA 2016t), and Aboriginal and Torres Strait Islander Engagement Strategy (NDIA 2017b) both reflect the need to provide disability supports in a way that allows for as much choice and control for participants as possible, and to encourage innovative methods of service delivery.

Such an approach is also reflected in the Bilateral Agreement between the Northern Territory and Australian Governments on the transition to the NDIS, as the Northern Territory has historically faced particular challenges in providing human services due to thin markets (PC 2017b). It was agreed that the Northern Territory's approach to the transition would be guided by the following principles:

- place-based, tailored solutions to planning, market development, access to services and risk management
- a coordinated, client-centred, and tailored approach to the operating model in remote communities, informed by existing effective frameworks that maximise access, engagement and management of risk for individuals
- culturally competent engagement and professional practices
- local planning, market development and risk management strategies informed by timely and appropriate data (Australian Government and Northern Territory Government 2016, p. 4).

It is too early to assess how these principles have been implemented in practice, how effective they have been in addressing thin markets, and whether such approaches are appropriate for other jurisdictions. The NDIS Evaluation Consolidated Report, which is to be released in the latter half of 2017, may provide useful guidance on this issue (Mavromaras, Moskos and Mahuteau 2016, p. 18).

[56] For example, scheme participant density in the Northern Territory (except the Darwin urban service region) in 2020 is expected to be less than five participants per 100 square kilometres (NDIA 2017v, p. 14). Despite remoteness price loadings, some providers in Queensland also reported to the NDIA that recent new providers were concentrated in major population centres such as Townsville, Cairns and Mackay (NDIA 2016s, p. 33). The Commonwealth Ombudsman (sub. 137, p. 16) also noted that some existing providers who specialise in providing services for people with disability who are CALD and Aboriginal and Torres Strait Islander Australians may not be able to make the transition, due to registration barriers and insufficient cash reserves to transition to fee-for-service.

Box 7.2 Different approaches to address thin markets

There are a number of measures that could be used to mitigate the risks of thin markets.

- Partial or full block-funding to commission or procure services (PC 2011, pp. 521–523). Goldfields Individual and Family Support Association (sub. 13, p. 12) said that removing block-funding would likely result in an 'almost complete loss of … services on the very remote Lands'. Many study participants said that block-funding is the most efficient way to ensure that needs are met (Centacare Brisbane, sub. 44; Australian Blindness Forum, sub. 48; Cohealth, sub. 50; Anglicare Tasmania, sub. 145; and Department of Health, sub. PP360).
- Sharing infrastructure, knowledge, skills and experience among providers.
- Facilitating bulk-purchasing arrangements by participants — for example, by pooling participants' funds (Mallee Track Health and Community Service, sub. 6; PC 2017b).
- More collaboration, coordination and integration of services, particularly with existing local and mainstream service providers, community organisations (including Indigenous organisations) — to avoid supply gaps or duplication (CADR 2014, p. 15; RACGP, sub. 200). Providing more hours of support coordination in participants' packages should also be considered, particularly for those with complex needs (Alzheimer's Australia, sub. 10, pp. 9–10). Brain Injury SA (sub. 116, p. 14) and the First Peoples Disability Network Australia (sub. PP355, p. 10) emphasised the need for effective coordination of services among the Australian, State, Territory and local Governments.
- Use of community- or place-based services (PC 2017b) — including greater employment and training of the local workforce where possible. Aboriginal community controlled organisations could also have a role in building community capacity in delivering disability services for Aboriginal and Torres Strait Islander participants living in rural and remote locations (VACCHO, sub. 162, PP223; AMSANT, sub. PP336; JSCNDIS 2017c, p. 46).
- Greater use of information technology — including videoconferencing, telehealth and other technologies, particularly for therapeutic supports (NDIA 2016w, p. 28; APA, sub. 93; Amaze, sub. 160; Livecare Australia, sub. PP217).
- The NDIA providing more detailed and frequent information on market demand (and unmet demand) to encourage providers to enter thin markets. The NSW Government (sub. PP230, p. 7) said that more information on location, type and quantum of demand is required.
- Cultural training, education and awareness programs (Brain Injury SA, sub. 116; Commonwealth Ombudsman, sub. 137) — including greater funding of translators and interpreters (GIFSA, sub. 13; Cohealth, sub. 50; SDN Children's Services, sub. 73; and Companion House, sub. 84).
- More support and respite care for informal carers (chapter 9).
- Greater engagement with the local community to build trust and relationships — including consideration of community feedback on provider performance (PC 2017b) and the development of community plans (First Peoples Disability Network Australia, sub. PP355, p. 9).

What is being done to address thin markets?

Based on the experience of the NDIS trial sites (particularly the Barkly trial in the Northern Territory), the NDIA said that it would consider a range of approaches to mitigate the risk of thin markets, including:

- active and deliberate cross-government collaboration — including the use of locally-based workers, and educating the community about the interface between health services and disability supports
- leveraging established community organisations (such as those already operating in health, aged and community care sectors) that may also deliver disability services
- supporting providers to access supports from business councils, Indigenous Business Australia, or any other organisation in the Aboriginal and Torres Strait Islander business capacity-building sector
- using the hub and spoke model (also known as scaffolded support) — where generalist providers provide support in the rural or remote community, and where needed, can collaborate or seek oversight from an advanced practitioner or specialist centre, either through a visiting clinic or telepresence
- working with existing mainstream providers to expand their services to better meet the needs of participants — such as plan management services by local accounting services and re-purposing underutilised infrastructure (sub. 161, pp. 105–106).

These approaches rely heavily on the commercial decisions of providers (such as the type of workforce, the decision to deliver disability services, and service delivery business models). They also reflect an attempt to make the market-based, consumer-driven approach succeed where possible — with more interventionist alternatives a last resort (such as directly commissioning or providing supports). The NDIA (sub. 161, p. 106) noted that 'some providers are thinking creatively about supply in thin markets', including by diversifying into associated areas to provide additional business income, and forming business relationships between urban and remote businesses.

Study participants had mixed views on the NDIA's proposed approaches, particularly in relation to greater reliance on mainstream providers.

- The NSW Government (sub. PP230, pp. 6–7) cautiously supported the idea of using mainstream providers, but emphasised that 'mainstream government service providers should be the exception, not the norm', as it could stifle the development of a competitive market. It argued that there needed to be a clear strategy and actions to encourage non-government providers to supply services to people with disability.
- Vision Australia (sub. PP252, p. 11) agreed that reliance on mainstream services may be practical and cost-effective. However, it noted that ensuring quality of service would be challenging and that funding through Information, Linkages and Capacity building grants to provide training and support for mainstream providers may be a useful trial.

- Inclusion Australia (sub. PP357, p. 21) was also sceptical about the responsiveness of mainstream providers to the needs of people with disability, given their 'poor track record' in responding to these needs.
- The MJD Foundation (sub. PP233, p. 10) argued that the reliance on mainstream providers has so far not been achievable, and that cross-government collaboration has generally not been successful to improve outcomes for Aboriginal and Torres Strait Islander participants in remote communities.

While the details of how providers are to be encouraged to supply thin markets are not yet clear, the NDIA and DSS are jointly developing a more detailed Market Intervention Framework to address thin markets, which is being negotiated with each jurisdiction (NDIA 2016i, p. 15, 2016t, p. 26). The Commission understands that the NDIA is developing a more detailed Market Intervention Strategy to support the establishment of a more developed NDIA market monitoring system and to facilitate the NDIA's decision-making on market interventions (DSS and NDIA, pers. comm., 4 October 2017). This strategy is expected to be completed in late 2017 (DSS and NDIA, pers. comm., 4 October 2017).

Given that the NDIS is already more than 12 months into the transition phase, there is a risk that thin markets will persist or worsen in the absence of clear and timely strategies and intervention by the NDIA. The NDIA needs to clarify and implement practical measures to mitigate the risks to participants associated with thin markets, particularly with the withdrawal of government-provided disability services (DSS, sub. 146, p. 37; NSWCID, sub. PP234, p. 5). As the Victorian Government said:

> Greater certainty surrounding market intervention and provider of last resort arrangements is also required as thin markets and provider viability could compromise the scheme's capacity to deliver choice to participants … The NDIA is ultimately the market steward: there are significant risks to participants, providers and states if its capability to identify and intervene in thin markets is not in place by full scheme. (sub. PP298, p. 15)

While acknowledging the NDIA's Rural and Remote Strategy, the Joint Standing Committee on the NDIS recommended that:

> … the NDIA in collaboration with the Australian, State and Territory Governments develops a strategy to address the service gaps that exist for rural and remote communities. (2017c, p. 50)

Interventions also need to be tailored to the specific circumstances of each case — such as user characteristics, the broader service landscape, resource constraints and effects on the wider community (PC 2017b). The diversity of user needs means that a 'one-size-fits-all' solution will not be effective to address access issues. And it is inappropriate to automatically default to block-funding, direct commissioning or mainstream services (particularly health and aged care services) unless it is necessary. While it is likely that block-funding will be needed in some cases (PC 2011, pp. 521–523) — such as for services that benefit many people with disability and when isolating the individual cost is difficult (National Mental Health Commission, sub. PP319, p. 12) — care must be taken to avoid crowding out competition.

There is a need for collaboration between the Australian and State and Territory Governments, given the latter's knowledge and experience as funders and providers of disability services. Anglicare South Australia noted that the Exceptional Needs Unit in the Disability SA division of the SA Government Department for Communities and Social Inclusion was a practical example of when block funding, specialisation and government collaboration were appropriate for one thin market — people with disability who have complex needs and comorbidities in South Australia (Anglicare Australia, sub. PP339, p. 7).

Addressing thin markets requires a whole-of-government approach and community involvement, but some experiences to date suggest that this is not occurring in some instances (Anglicare Australia, sub. PP339, p. 9). For example, Anglicare NT reported a lack of collaboration between government departments in aged care and disability, even though in some remote communities they may be the same providers and the same workers.

> The further one moves out from any regional centre into a remote community in Central Australia or the Top End, the greater is the probability that the services for people with a disability and older people will be provided by the same service provider and indeed the same staff! Yet there is little interface between the two Commonwealth Departments that are responsible for funding these services and driving these reforms. Clearly a place based whole of government approach that works to build up a community's capacity is what is required at this time. (sub. PP340, p. 4)

Government and community collaboration are important to provide services in remote Indigenous communities (MJD Foundation, sub. PP233, p. 10; PC 2017b). The Steering Committee for the Review of Government Service Provision's most recent report on *Overcoming Indigenous Disadvantage* noted that the set of 'success factors' include:

- cooperative approaches between Aboriginal and Torres Strait Islander Australians and government — often with the non-profit and private sectors as well
- community involvement in program design and decision-making — a 'bottom-up' rather than a 'top-down' approach
- good governance — at organisation, community and government levels
- ongoing government support — including human, financial and physical resources (2016a, p. 3.18).

The MJD Foundation said that:

> The way forward is to build on established community organisations that have a successful track record in delivering services and who have existing good relationships with families and communities in the remote areas. Collaboration and not control should be the focus (sub. PP233, p. 10).

It will not always be possible to match the price, quality and range of services in the major cities (PC 2011, p. 529). Some participants may need to travel (and in some cases, move) to metropolitan areas to access highly specialised services. This highlights the need for complementary services, such as transport to access specialised disability care, to be provided either in a participant's plan or outside of the NDIS where appropriate (chapter 6).

Improving access to supports for participants in thin markets is a key objective of the NDIS, but it is an ongoing task requiring constant vigilance, monitoring and evaluation (box 7.3).

Box 7.3 Addressing thin markets requires data and ongoing reporting

Mitigating the effects of thin markets (and informing associated funding arrangements) requires more transparent identification, reporting and evaluation of thin markets. Planning, evaluation, monitoring and feedback systems (as well as commissioning practices) are discussed in the Commission's current inquiry on Human Services (PC 2017b). Specific key performance targets and indicators (both outputs and outcomes) need to be developed, and the relevant data collected, to ensure the equity, effectiveness and efficiency of disability supports and thin market strategies. This was recognised by the Joint Standing Committee on the NDIS for services in rural and remote areas. The Committee recommended that:

> … all options to develop a market that provides choice and control for participants in rural and remote areas be explored, and that any additional funding for disability in the Northern Territory to any provider is conditional on measureable increases in service provision. (2015, p. 76)

The Northern Territory Government also emphasised the need for more granular data.

> The availability of more granular data is particularly important to enable monitoring of the Scheme's roll out in remote regions and thin markets — where the NDIS market-based model is most challenging to implement. Detailed regional level data is also important to inform service providers to enable localised market growth and development (e.g. client base, size of market, and service provider gaps). (sub. 205, p. 3)

Information on thin markets (including through Local Area Coordinators and current feedback mechanisms in the NDIS) could supplement current reporting to the DRC under the National Disability Strategy. In particular, reporting in each thin market could better reflect similar measures reported by the Commission as part of the National Disability Agreement, including:

- participation rates — such as the number of eligible participants; the severity and nature of disabilities; and other participant characteristics (as well as their trends and drivers). The Joint Standing Committee on the NDIS (2015, pp. 62–67) noted a lack of data for participants who are from CALD backgrounds, as well as for Aboriginal and Torres Strait Islander Australians
- access or support use by participants — this would map use of existing and future services, such as: plan activation; the frequency and scope of plan reviews; utilisation rates; the number of providers, workers and supports; as well as market concentration
- appropriateness of supports — for example, whether supports were delivered in a culturally and linguistically respectful manner in accordance with the NDIA's Aboriginal and Torres Strait Islander Engagement Strategy
- quality of services — such as reporting the satisfaction rate of participants and carers, and any complaints under the NDIS Quality and Safeguarding Framework (and State and Territory Government quality and safeguard regulations in the interim)
- cost per unit of output — including government and NDIA contribution per participant, and forecasts of future costs per participant (this is consistent with an insurance-based approach)
- participant outcomes — such as choice and control, economic or social participation, and use of other services by people with disability (including mainstream services and informal supports) (SCRGSP 2017, p. 15.1–15.39).

Timely and ongoing data collection is particularly important as the NDIA's online platform (eMarketPlace) is still being developed (chapter 10).

Regardless of the approach taken, it is clear that there is an need for strong market stewardship by governments, as well as a consistent framework against which actions are taken to mitigate thin markets (PC 2017b; NSW Government, sub. PP230, p. 7; chapter 10).

FINDING 7.1

In a market-based model for disability supports, thin markets will persist for some groups, including some participants:

- living in outer regional, remote and very remote areas
- with complex, specialised or high intensity needs, or very challenging behaviours
- from culturally and linguistically diverse backgrounds
- who are Aboriginal and Torres Strait Islander Australians
- who have an acute and immediate need (crisis care and accommodation).

In the absence of effective government intervention, such market failure will result in greater shortages, less competition and ultimately poorer participant outcomes.

What if there is no market? The Provider of Last Resort

The NDIA does not directly supply individualised supports to participants, but there are times when it may take a direct role to ensure that services are provided (for example, by providing or commissioning services). This might occur in very specific and exceptional circumstances when providers are unwilling or unable to supply disability supports under NDIS policy settings, such as when:

- participants cannot access disability supports — there is no provider, or the only external provider is likely to fail in circumstances that would leave participants at risk (such as in remote locations)
- supports are not available at reasonable prices — this might be true for participants with highly complex needs or challenging behaviours, or in emergency situations when supports are needed at short notice
- it is difficult to verify that external providers are genuinely achieving good quality outcomes for participants or their carers
- there are significant economies of scope from combining or coordinating several services together, and when the government has an advantage in supplying the package of services — this might apply to participants who are Aboriginal and Torres Strait Islander Australians, where governments might have to deal with multiple levels of disadvantage (income, housing, health, education, urban amenity, employment, transport and disability) (NDIA 2016i, pp. 26–27; PC 2011, p. 409).

The principles that should govern provider of last resort (POLR) arrangements were considered by the Commission in 2011. The Commission said that the POLR should be subject to the same regulatory oversight and monitoring as other providers in the scheme,

and that block-funding of providers should only be used when fee-for-service was proven to be infeasible to ensure the supply of supports (PC 2011, pp. 523–526).

The Commission also emphasised the need for the POLR arrangements to be contestable and at arm's length from the commissioning body. And, when block-funding is judged to be the preferred method, that the NDIA should develop standardised tendering, contracting, reporting and acquittal requirements in order to reduce compliance costs (PC 2011, pp. 523, 528). It is not the role of the NDIA to support failing providers in thin markets, but to ensure that disability supports for participants are provided in the most effective and efficient way. The overriding aim of the POLR arrangements is to ensure continuity of support and to protect the wellbeing of participants.

The POLR arrangements for the NDIS are still being developed by the NDIA and DSS, but appear broadly consistent with the Commission's views in 2011 (box 7.4). The Commission understands that the NDIA is currently developing participant-centred operational processes to replace the previous POLR system of grants and programs for complex or very complex NDIS participants (DSS and NDIA, pers. comm., 4 October 2017). The NDIA is working with States and Territories to deliver position statements to replace existing POLR arrangements. This phase of the project is due to be completed in December 2017 (DSS and NDIA, pers. comm., 4 October 2017). However, the delay in formalising these arrangements is resulting in some uncertainty for participants, providers and governments. For example:

- The Tasmanian Government (sub. PP247, p. 8) said that the NDIA's POLR arrangements have not yet been negotiated for Tasmania.
- The Victorian Government (sub. PP298, p. 15) reported that work has commenced to construct a range of NDIS market risk scenarios to inform how market risks and crises will be managed under the POLR framework and broader Market Intervention Framework. However, the operational details for Victoria are yet to be worked out.
- The ACT Government (sub. PP312, p. 7) noted that to date, the issue of the POLR had not been addressed in the ACT. In its view, the NDIA had taken an individualised, rather than a systematic, approach to concerns it had raised, particularly in relation to participants with very high needs and challenging behaviours that concern all elements of the human services system.

The NDS stated that the POLR arrangements under the NDIS are:

> … currently poorly articulated and are inadequate. This needs to be addressed, ideally through the NDIA establishing emergency response agreements with a number of disability support providers across the country. (sub. 51, p. 16)

More recently, the Joint Standing Committee on the NDIS emphasised the importance of continuity of support for participants, and recommended that:

> … the NDIA provides details how it is ensuring a provider of last resort is available for all NDIS participants unable to find a suitable service provider, regardless of their location, circumstances and types of approved supports. (2017c, p. 50)

Box 7.4 The NDIA's Provider of Last Resort arrangements

What is the Provider of Last Resort (POLR)?

As a market steward, the NDIA is responsible for the POLR arrangements. When there is a significant risk of insufficient market supply; when no provider is available; or in the event of provider failure (for example, if the *only* local provider for a range of disability support services in a remote community goes into administration), the NDIA may directly commission and procure disability supports for scheme participants. As the NDIA said:

> If local providers are not available, the NDIA may enter into agreements (and at times contracts) with specific providers for provision of services to more remote regions. The contract with a service provider [will] specify how the cost of travel and any other associated expenses in these areas. (2017q, p. 16)
>
> The NDIA is prepared to act to reinforce thin markets where intervention is necessary to ensure market supply, and to act as a Provider of Last Resort where the market fails to provide this supply. (sub. PP327, p. 40)

Triggers are likely to include:

- insufficient, volatile or uneven supply — in a particular geography, market segment or service type, potentially due to lack of scale or lack of providers being active in that market
- evidence of inappropriate use of market power — for example, constraints to competition or lack of consumers exercising choice
- insufficient quality at a reasonable price
- benefits for greater return on investment from arrangements other than individual commissioning.

A provider contracted as a POLR will need to meet agreed quality standards and ensure that services are delivered in an appropriate and culturally competent way. The provider may also need to leverage existing infrastructure. The NDIA considers the POLR policy to be a highly interventionist form of market intervention.

Who is responsible for the POLR?

As the transition leads to full scheme, the NDIA will lead an integrated response jointly with the States and Territories. In the interim, the States and Territories lead as the POLR, and will continue to do so for providers who they fund during transition (except for the Northern Territory, where the NDIA is responsible for ensuring the POLR services even in the transition period pursuant to Schedule K of the Northern Territory Bilateral Agreement). The Agency noted that identification and response to such market failure will require collaboration among all NDIS stakeholders.

What does the POLR involve?

The POLR framework forms part of the NDIA's broader Market Intervention Framework. Both are currently being developed by the NDIA and DSS, and negotiated with each jurisdiction. It was expected that in 2016-17, the NDIA would agree to the POLR processes, and that by 2018-19, there will be a maturity of the POLR capabilities to potentially include a range of response options (such as panels in relevant jurisdictions or sub-markets capable of providing emergency capabilities at extremely short notice) (NDIA 2016i, p. 15, 2016t, p. 26).

Sources: NDIA (2016i, 2016t, 2017q, p. 16).

There is some guidance about the POLR arrangements for scheme participants in the Northern Territory. In the Bilateral Agreement between the Australian and the Northern

Territory Governments on the transition to the NDIS, it was agreed that the NDIA would be responsible for ensuring that the POLR services are in place for all participants in the Northern Territory (Australian Government and Northern Territory Government 2016, Schedule K).

The Bilateral Agreement also includes principles on how these arrangements are to work where there is a 'significant risk of service failure' (Australian Government and Northern Territory Government 2016, Schedule K). These principles include considering risk, transparency, a person-centred approach, non-exclusivity, barriers to entry, supply of services and end of service arrangements. It also stated that 'solutions will be established to avoid inappropriate default to the acute medical system as the provider of last resort' (Australian Government and Northern Territory Government 2016, p. 2, Schedule K).

Some study participants commented that this detail is not sufficient to ensure that the POLR arrangements are in place (nor what they would mean in practice).

> The State Committee is further concerned the POLR commitment is behind in its conceptual and operational planning in line with the rollout schedule and ambiguous to members on what these provisions mean in terms of their own business planning and existing services. We ask that urgent attention be given to clarify the POLR aspect of the NT Bilateral Agreement so as to further mitigate the risk of market failure. (TEAMhealth, sub. 102, p. 22)

> In January 2017, participants in the East Arnhem region commenced transition to the NDIS. It is concerning that the rollout commenced without a clear framework for the Provider of Last Resort (POLR) … Schedule K does not define what constitutes 'service failure' or how it will be recognized or measured by the NDIA, nor when it is necessary for the Provider of Last Resort (POLR) arrangement to be put in place … in 2014–2015 participants in the Barkly region in the NT had the third highest level of unutilised funding – 41 percent. At what point is this recognized as service failure and the need for market intervention? (Anglicare NT, sub. PP340, pp. 1–2)

The Northern Territory Government (sub. PP359, p. 15) said that it is working with the NDIA to develop the POLR framework, which once developed, could have broader application nationally. The Northern Territory Government (sub. PP359, p. 4) also recommended that the POLR include a panel of emergency service providers, and options for short-term block or direct funding arrangements until more permanent arrangements can be established.

There is an increasing need for greater clarity on how the POLR and thin market arrangements more generally are to be put into practice, particularly as governments change their involvement in providing disability and mainstream supports (section 7.3 and chapter 6).

It is critical for the NDIA to clarify how the POLR arrangements are to operate, and how the Agency intends to intervene in the market more generally, by publishing the relevant policies and strategies immediately.

RECOMMENDATION 7.1

The National Disability Insurance Agency should address thin markets by:

- considering a range of approaches, including block-funding
- publicly releasing its Provider of Last Resort (POLR) policy and Market Intervention Framework discussed in the *NDIS Market Approach: Statement of Opportunity and Intent* as a matter of urgency
- collecting and making publicly available disaggregated data, feedback and reports on thin markets, including when POLR arrangements are used.

7.3 In-kind services

Under Bilateral Agreements between the Australian and State and Territory Governments, government funding of the NDIS is a combination of 'in-kind' services and cash contributions, with the proportion differing by jurisdiction. In-kind services are Australian, State and Territory Government programs under existing block-funding arrangements that continue to exist to ensure continuity of support in the short term, and may also partly reflect the long-term contracts involved.

In practice, this means that governments may continue to remain a service provider, or block-fund a provider to deliver services. Under the Bilateral Agreements, most in-kind services will be phased out during transition and replaced by cash contributions where possible, though the timing of this varies by jurisdiction. At the commencement of transition, in-kind contributions accounted for about 19 per cent of total package costs, and at commencement of full scheme, they are expected to account for about 10 per cent (DSS, sub. 146, pp. 22–23).

The withdrawal of in-kind services is consistent with the NDIS objective of a more competitive, consumer-driven and market-based system, with services to be delivered by a wider range of private providers. Governments will no longer provide or procure disability services except in limited circumstances, such as in thin markets and under the POLR arrangements (section 7.2).

In–kind services have many disadvantages …

There are concerns that the continuation of in-kind services may adversely affect:

- the transition by existing providers
- market entry (PC 2017b)
- the quality of supports (PDA, sub. 38, p. 13)
- overall scheme costs.

Providers may delay adapting to the fee-for-service model due to ongoing block-funding under in-kind service arrangements (Mavromaras, Moskos and Mahuteau 2016, p. 45; NDIA, sub. 161, p. 102). In addition, providers may have less incentive to provide or increase services if they are effectively prevented from providing supports to participants where there are in-kind services (NDIA 2016i, p. 7).

The risk of deterring private providers may be higher in regional or remote areas, and other thin markets, where governments may be the main provider with few actual or potential competitors.

> Mr Croker from Keep Moving, was concerned that because the NT Government was the only entity that was able to provide services across all of the region, this left his organisation effectively in competition with the NT Government and begged the question of 'How do you compete as a private enterprise against government departments?'. (JSCNDIS 2015, p. 68)

In-kind services can also hinder innovation and restrict participants' choice and control, as these services must be used where they are provided and available to participants (NDIA, sub. 161, p. 47; *National Disability Insurance Scheme (Plan Management) Rules 2013* (Cwlth), rr. 6.8-6.9). Some in-kind services also cannot be bundled by the NDIA and can only be priced as individual line items (JSCNDIS 2015, p. 33), often at prices higher than the NDIA's price caps (NDIA, sub. 161, p. 101). This limits the potential efficiencies and pro-competitive benefits of allowing providers to bundle supports due to economies of scale or scope. As the NDIA said:

> The NDIA considers that in-kind funding arrangements are limiting choice and control for participants, imposing additional burdens on the NDIA, and may also be limiting growth in certain parts of the market. (sub. PP327, p. 67)

In-kind services also raise broader funding issues, including cost- and risk-shifting between the Australian and State and Territory governments (chapter 12). Funding issues are compounded by a lack of data and transparency on the true, like-for-like cost of providing in-kind services between government and private providers.[57]

… but in-kind services may be necessary in some circumstances

While in-kind services have drawbacks in terms of market development and participant choice, some argued that in-kind services are necessary — in some cases beyond transition — to ensure continuity of support to people with disability. This is particularly the case for those in thin markets and with complex needs. Some study participants, particularly State and Territory Governments, argued that in-kind services may need to persist in a range of circumstances, including where:

[57] Bilateral Agreements between the Australian and State and Territory Governments contain estimates of a jurisdiction's in-kind contribution, and a requirement that in-kind contributions during transition be based on the current cost of delivering services. The price and value of any in-kind contributions at full scheme will be separately agreed by June 2018.

- there is no provider (especially for participants with complex needs)
- the cost of in-kind services reflect economies of scale, or higher quality supports (based on greater supervision, lower casualisation and better training) than what can be supplied in the market
- in-kind services can complement other services to be provided in the scheme, which encourages entry by new providers of those services. (For example, where government housing (provided in-kind) and attendant care (provided by the market) combine to provide supported independent living for participants under the scheme.)
- in-kind services support other people with disability (who are not NDIS participants), or are not easily separated from other service systems
- the administrative costs of dismantling in-kind services are large.[58]

However, some of these arguments are not good reasons to continue in-kind services. Providing services to non-scheme participants is important (chapter 6), but should not be cost-shifted to the scheme through in-kind funding arrangements. Nor should in-kind funding arrangements be used to unnecessarily preserve the high — and potentially inefficient — administrative costs of such services.

The lack of a market, and the nature of the in-kind service provided compared to what is provided in the market, are more complicated — and arguably valid — reasons to continue in-kind supports. This is more likely to be an issue 'in the eye of the beholder', as governments and the NDIA may not agree on whether the market can provide the quality and quantity of supports that are being provided in-kind. The lack of a POLR policy adds complexity about whether governments can phase out in-kind services with confidence that there is continuity of support for participants.

The pace of the rollout is also contributing to concerns about whether the market can supply enough supports while in-kind services are withdrawn. This concern has apparently led the NDIA, in some cases, to request that governments slow down their withdrawal of in-kind services, such as transport and personal care services provided in schools (Tasmanian Government, sub. PP247, p. 11; Queensland Government, sub. PP345, p. 27). The Queensland Government also argued that in-kind services need to continue when the NDIS is unable to manage the transition of a service due to a range of factors, including market and workforce issues in the NDIS.

> … it is important to acknowledge that in some instances in-kind may be required as an extended interim option to maintain services post-transition while longer term and more permanent solutions are being developed and complexities are being addressed. (sub. PP345, p. 27)

[58] HSU (sub. PP316, pp. 9–10); New South Wales Government (sub. PP230, pp. 12–13); NMHC (sub. PP319, p. 17); Northern Territory Government (sub. PP359, pp. 8–9); Queensland Government (sub. PP345, p. 27); South Australian Government (sub. 203, p. 16) and Tasmanian Government (sub. PP247, p. 11).

In-kind services need to be phased out carefully

There are strong grounds to phase out in-kind services, but the phasing out must be done with care and cooperation.

- Care must be taken to ensure continuity of support for participants currently using in-kind services, and that there are arrangements to transfer participants to private providers (in consultation with participants, their families and providers).
- Cooperation between governments and the NDIA is necessary to identify where in-kind services can be safely withdrawn (in the context of a market with sufficient supply to meet participants' needs).

The Commission recommends that in-kind services be phased out as quickly as possible, subject to the following considerations.

- Where there are services that need to be provided in-kind to assure continuity of support, there should be greater public reporting and transparency of the costs and use of these services.
- Governments should publicly report on the cost and quality of services being provided in-kind, publish their reasons and provide evidence on why in-kind services cannot be provided by the market, and a timetable for when in-kind services will end.
- The NDIA should also closely monitor in-kind services and co-operate with governments where the Agency's market intelligence indicates that in-kind services can be 'cashed out' where market supply is available.

RECOMMENDATION 7.2

Bilateral agreements regarding the full rollout of the National Disability Insurance Scheme should only include in-kind funding arrangements for services that are required to ensure continuity of support for existing clients. For in-kind services that persist past transition, a timetable for when they will be 'cashed out' should be included in bilateral agreements.

7.4 Other factors affecting provider readiness in transition

As the NDIS is a new system and is creating a new market, there are several transitional issues affecting the sector's supply response. These include:

- challenges faced by providers who were previously block-funded
- administrative burdens associated with the scheme
- the scheme's effect on collaboration among providers.

Moving from block-funding to fee-for-service

Prior to the NDIS, providers received government funding *before* providing certain supports in 'bulk' to participants (table 1.1). This usually took the form of lump sum payments for each participant under annual contracts that were paid three months in advance (AONSW 2017, p. 7). Providers now claim reimbursement from the NDIA *after* providing individualised supports to scheme participants, unless the NDIA has given prior written approval for prepayments.[59] The majority of support items are based on per hour, or per instance of service provided (NDIA 2017q, 2017r, 2017s, 2017t). This affects the capacity of providers to deliver disability supports under the NDIS.

Providers face significant challenges to adapt to the new fee-for-service model, and some may not be able to make the transition. The shift to the competitive provision of disability services may create upward pressure on production costs for a wide variety of reasons. Providers bear increased financial risk (such as from non-payment and late payment), and in turn, may have a greater need for cash reserves, making it harder to maintain liquidity and solvency (DSS, sub. 146, p. 37). The NDS (2015, p. 17) stated that 'the majority of not-for-profit disability service providers report insufficient cash flow required to transition to the NDIS'. Providers will incur fixed costs to restructure and adapt their business to the NDIS market. Costs may relate to unit pricing, ICT, accounting, advertising, the provision of individualised supports, labour and other input costs.

While these production costs are likely to be significant given the scale and nature of the required changes (particularly for small providers, of which there are many in the disability support sector (box 7.5)), they are better addressed by the price received for supports than the payment method (PC 2011, p. 520).

In general, the need to cover fixed costs is not a reason for government intervention (PC 2011, p. 523). Fixed costs are also likely to be a transitional issue for a number of reasons, and be offset against any eventual gain in efficiency.

- The introduction of innovative payment systems by some financial intermediaries may reduce some of the financial risks of the fee-for-service model and help providers adapt to the new system (Eyers 2017).
- Price deregulation will help providers recover their fixed costs in the longer term, as prices will more accurately reflect the cost of supply, and fixed costs will be driven by consumer preferences (PC 2011, p. 520).
- Providers may be able to use different pricing methods to efficiently recover fixed costs (such as discounts for regular users, or for periods when demand is lower) (PC 2011, p. 521).

[59] Prepayment will only occur in exceptional circumstances such as home modifications and remote area servicing. The NDIA may also approve prepayment for certain assistive technologies where this has been agreed by the participant (NDIA 2017q, pp. 11, 18, 2017r, pp. 12, 19, 2017s, pp. 12, 19, 2017t, pp. 12, 19).

- The experience of providers in adjacent sectors in the economy (including aged care) that moved from block-funding to fee-for-service as part of consumer-directed care reforms also suggests that adjustment can and will take place in the medium to long term (although differences between disability and other sectors make direct comparisons difficult). As the NDIA observed:

  > … aged care providers are undergoing their own reforms related to consumer-directed-care and many businesses are leveraging this experience to build services and products relevant for the disability market. (2016x, p. 5)

Box 7.5 Small providers can face big challenges to transition

A feature of the disability support sector is that many providers are small (Martin and Healy 2010, p. 122). National Disability Services estimated that about 58 per cent of providers are either small or very small (with a turnover of $5 million or less) (Gilchrist and Knight 2017a, p. 10). About 40 per cent of NDIA-registered providers are individuals or sole traders (NDIA 2017y, p. 42). Small providers may have less capacity to make the transition to the NDIS than larger providers. For example, they face challenges from:

- proportionately higher fixed costs of operating in the NDIS, especially as they must incur new marketing and systems costs
- achieving economies of scale or scope, with total costs spread more thinly across fewer hours of support, particularly with the shift to more individualised or tailored supports
- potentially lower and variable revenue from the fee-for-service model, which may require providers to diversify their revenue sources (such as public contributions in the form of volunteering, donations and sponsorships), or services. For example, Riding for the Disabled of the ACT (Pegasus — a provider of horse therapy and equestrian services for people with disability) said that in 2016-17, it received about $18 000 in NDIS revenue. This compared with about $250 000 in annual block-funding from the ACT Government in previous years. As a result, under the NDIS, Pegasus has become more reliant on donations and sponsorship support. Pegasus is also planning on expanding their services to new cohorts (Connery 2017; Riding for the Disabled of the ACT (Pegasus), pers. comm., 28 September 2017).

The scale of these challenges may be inferred by the amount of merger and acquisition activity in response to the challenges of being a small provider. Merger activity and restructuring in the sector provides some indication that this may be the case (NDS 2016, p. 17), although it is unclear whether this consolidation has led to an actual increase in services or substantially reduced competition.

The Commission heard that uncertainty and lack of clarity — particularly about the timing of price deregulation and the withdrawal of in-kind services (ANAO 2016, p. 32) — are causing some providers to delay (or be discouraged from) making changes to their business model, planning and investment. About 75 per cent of providers surveyed by the NDS felt that 'the policy environment is uncertain' (NDS 2016, p. 19). One provider who was surveyed by the NDS commented that:

> The uncertainty around 'how much we will be able to receive' once NDIS is implemented in our region means that the climate for any investment is too uncertain, because we cannot make a reliable business plan. (NDS 2016, p. 10)

The Office of Best Practice Regulation also noted that:

> … ongoing engagement with providers when developing reference prices and maximum prices, particularly for key supports, should help providers during the transition to a fee-for-service based system of disability care. (2015, p. 49)

Better information and communication by the NDIA would assist, as will independent price monitoring and regulation (recommendations 8.2 and 8.3). That said, there are still risks that some existing providers may be unable to transition to a fee-for-service model without some additional assistance in the short term. There could be merit in the NDIA or governments providing short-term targeted assistance where the risks of providers exiting (and a resulting lack of supply) could lead to greater costs to the scheme and participants over the longer term.

Administrative burdens

There is a range of regulatory and other costs to provide NDIS supports. As the NDIA (2016i, p. 9) noted, there are 'high costs to enter the marketplace'. Regulatory costs include the cost of registering with the NDIA, and costs associated with ensuring quality and safety of supports for people with disability. These include:

- professional registration (in the case of specialised services, like therapeutic supports)
- working with children checks
- third-party verification (such as for the safety of new specialist disability accommodation)
- police checks.

These costs are necessary to ensure safe and high quality supports for NDIS participants. The recently developed NDIS Quality and Safeguarding Framework (which will largely only apply to NDIA-registered providers) aims to provide a nationally consistent set of regulations on what providers need to do to provide disability supports (chapter 11). Increased regulatory consistency across jurisdictions should mean lower compliance costs for some providers than under previous arrangements.

Concerns were also raised by a number of study participants about the NDIA's online payment system and communication issues with the NDIA. As Catholic Social Services Australia said:

> Though CSSA [Catholic Social Services Australia] member agencies have been preparing for transition to the NDIS for a long time, the dysfunctionality and un-preparedness of the NDIA has severely affected its capacity to deliver sustainable services through the NDIS. Complex and ongoing issues with the portal (including the system being taken down for weeks at a time with very little notice) means that providers are finding it very difficult to access the funds for services provided. These cash flow issues have restricted providers' ability to invest, innovate and even operate (for example one agency providing significant disability services in a trial site had

> $1 million 'stuck' in the portal in December 2016). This has led to cash flow issues and providers withdrawing due directly to pricing or lack of payment. (sub. 166, p. 9)

The problems associated with the online portal have already been examined in some depth by others (ANAO 2016, pp. 62–71; Conifer and McKinnon 2017; PwC 2016), and were acknowledged by the NDIA (sub. 161, p. 119). The Agency indicated that it is reforming its processes to improve the 'provider pathway', including registration and payment arrangements, and is also delivering tailored information sessions for providers.

> The NDIA is working to improve the quality and amount of information available to providers in all elements of the provider pathway (awareness, commercial assessment, registration process (including the impacts of the move to the national arrangements being led by DSS), service planning and delivery, payment and claiming outcomes) so that providers are better placed to meet expectations and develop their service offer under the NDIS. (sub. 161, p. 102)

Payments to providers need to be timely so that innovation, entry and the supply of disability supports are not hampered. Equally important is for the Agency to maintain open and clear lines of communication with providers to minimise the administrative burden on them. Other schemes, such as NSW Lifetime Care and Support (now part of icare), take a collaborative approach to dealing with providers. This includes: regularly seeking feedback from providers through meetings; workshops and forums; proactive management of provider issues; and having designated staff who deal with any specific problems that arise (icare, pers. comm., 28 September 2017). A relationship of mutual trust, respect and cooperation between providers and the NDIA is needed for the effective operation of the scheme.

Collaboration in the disability support sector

Some disability supports are provided using collaborative and cooperative arrangements, often to ensure better outcomes for people with disability. Some providers were concerned that the increased competitive pressures of a market-based system will reduce collaborative activity (and the associated benefits), and therefore lead to a potential erosion of 'social capital'[60] (Alzheimer's Australia, sub. 10, p. 15; Anglicare Australia, sub. 157, p. 13; and CMHA, sub. 11, p. 14). This could increase provider costs and lead to the withdrawal of some services.

A National Institute of Labour Studies survey found that the introduction of the NDIS had made providers more guarded and that less information was shared due to commercial considerations (which may undermine provider networks), although some collaboration among providers was continuing to occur. One provider who was surveyed commented that:

> I think that's been a sad sort of aspect of the NDIA. When you create a competitive marketplace it's very hard, you know, those old networks that we would have been a part of and shared ideas and things like that have kind of broken down a little bit. (Mavromaras, Moskos and Mahuteau 2016, p. 45)

[60] The relationships and trust that underpin the functioning of society (PC 2010, p. XIX).

A study participant said that:

> There is absolutely no cooperation between providers anymore. They kick out complex clients, saying they do not support clients like that. They do not talk to each other, saying it is not their problem. (Belinda Jane, sub. 80, p. 10)

At the same time, not-for-profit providers may experience lower volunteering and fundraising contributions, due to public perception of their perceived greater 'commercial' focus and competitive behaviour, and that the NDIS is fully-funded (ABF, sub. 48, p. 14; Scope Australia, sub. 72, p. 25). The NDS said that:

> Providers are beginning to report that fundraising revenue is dropping as donors believe that the NDIS will provide all people with disability with all the supports they need. This is clearly a misunderstanding but seems to be becoming more pervasive. (sub. 51, p. 14)

While these contributions may be retained within the disability sector (either redirected to other providers or spread more thinly across all providers), they could also be transferred to other human service sectors, and be lost from the disability support sector.

Conversely, providers may have greater incentives for collaboration in order to increase flexibility and responsiveness to participant demand in an increasingly competitive funding environment (NDS and CADR 2015, p. 13). Collaboration may allow providers to offer services at a greater range of times and locations, and achieve economies of scale or scope that would otherwise be difficult to achieve (particularly in thin markets and for small providers). Market stewards (and regulators) need to monitor such arrangements closely to ensure that collaboration does not reduce competition, choice, efficiency and participant wellbeing.

The NDS data indicate that in 2015-16, the majority of providers surveyed collaborated to advocate for the sector (68 per cent) or for clients (62 per cent), and had agreements to refer or provide services to clients (55 per cent), despite increased competition for both workers and clients (NDS 2016, p. 17). This appears to be broadly in line with previous results, where providers reported that they were forming alliances and joint working relationships with other organisations to offer services at a greater range of times and locations (NDS 2015, p. 38; NDS and CADR 2015, p. 13).

Collaboration is also consistent with the objectives and mission of not-for-profit providers, which typically promote the interests and wellbeing of people with disability. As noted by Centacare Brisbane (sub. 44, p. 3), the degree of collaboration and cooperation between providers under the NDIS will depend on the maturity, interests and skills of each party.

On balance, collaboration is a voluntary and valuable activity undertaken by not-for-profit providers that produces intangible benefits, but has tangible costs when removed. The mixed evidence on the degree of and incentives for collaboration in a more competitive environment suggests that the net effect will depend on whether the increased efficiency of providers offsets the higher costs associated with reduced social capital. The Commission

has previously noted that for the not-for-profit sector, efficiency and effectiveness are central to maximising community wellbeing (PC 2010, p. 18).

While is difficult at this early stage to know how many collaborative arrangements will end and form, the available evidence suggests that some provider collaboration will continue to exist in the NDIS, and is likely to be primarily determined by provider efficiency. Uncertainty about the degree of provider collaboration in the future (and its effect on participant outcomes) highlights the need for strong governance of the NDIA (chapter 11), policy-relevant data collection (chapter 13), monitoring and effective market stewardship (chapter 10).

8 Pricing of disability supports

Key points

- In a mature market, participants' choice and control will determine the price of disability supports. However, temporary price controls are needed to ensure that participants have access to affordable disability supports in the transition period, when the supply of supports is still growing to meet increased demand.
- The National Disability Insurance Agency (NDIA) currently sets the maximum price of disability supports that can be charged by NDIA-registered providers. The NDIA's 2017-18 price review recently concluded. The Agency has also commissioned McKinsey & Company to review its pricing methodology, which will report to the NDIA Board by the end of 2017.
- The NDIA's approach to setting price caps to date has hindered market development and resulted in providers withdrawing from the market for some disability supports. In some cases, the price caps have led to poor participant outcomes, especially for people with complex needs. The benefits of the National Disability Insurance Scheme (NDIS) will not be fully realised if the Agency continues with its current pricing approach.
- NDIS price caps should be set by a body that has relevant capability and necessary resources, and in a manner that is transparent, evidence-based, supported by clear and limited legislative authority, independent and timely.
- To better reflect these pricing principles and ensure that market development receives the necessary attention over the longer term, the Commission recommends that NDIS price caps be deregulated in three stages by:
  - mandating that the NDIS Quality and Safeguards Commission (QSC), when it commences in July 2018, act as an independent price monitor. This will be a 'check and balance' on the NDIA's pricing decisions over the transition period, and should assist with the transparency of pricing — a problem that the NDIA has only partially addressed to date
  - transferring the NDIA's pricing power to the QSC by no later than July 2020. The QSC would also be responsible for determining when supports would no longer be subject to price caps
  - continuing independent price monitoring by the QSC following price deregulation.

Prices of disability supports are a key part of the National Disability Insurance Scheme (NDIS).

- Prices reflect the preferences and relative value that participants place on different supports, which in turn signal to providers the supports to supply. Put another way, prices are signals that are sent to the market when participants exercise choice and control over their packages of individualised supports. Prices affect participant choice, competition, quality, variety, efficiency and innovation.

- Prices affect the purchasing power of participants — the higher the price, the fewer supports participants can purchase using a given package (unless participants can substitute for lower cost supports for a given support type).
- Prices affect the total costs of the NDIS and therefore its financial sustainability.

Prices also affect the allocation of scarce resources and efficiency in the economy — the higher the NDIS price relative to other sectors, the more the NDIS will attract resources from these sectors. Prices can also have spillover effects by driving efficiencies, innovation and growth in the broader economy.

How prices are determined under the NDIS therefore has a direct bearing on participants' (and their families') welfare, provider profitability, scheme costs and the wellbeing of the community.

The National Disability Insurance Agency (NDIA) currently determines 'price caps' or maximum prices that can be charged by registered providers for many NDIS supports.

This chapter examines how prices affect market development, and the choice that participants have over their supports. It focuses on how existing and new providers are responding to the NDIS price of disability supports. Section 8.1 looks at how the NDIA currently sets price caps. Section 8.2 examines the effect of these price caps on the supply of disability supports. Section 8.3 considers whether the NDIA should continue to set prices. Section 8.4 concludes with a discussion of how NDIS pricing could be improved to benefit participants and their families, providers and the wider community.

8.1 How does the NDIA set prices?

The price of disability supports directly affects the supply of quality supports to scheme participants. In a mature market, the choice and control that participants exercise will, and should increasingly, be the main factor determining the price of disability supports. Allowing the market to determine the price of supports is an important feature of the NDIS, as prices affect participant outcomes and the financial sustainability of the scheme. However, temporary regulation of prices in the disability support sector is necessary, and was one of the Commission's recommendations in its 2011 *Disability Care and Support* inquiry (box 8.1).

Box 8.1 Why regulate the price of disability supports?

Governments have historically regulated the price of human services (PC 2016, p. 35), including disability care and support services, on the grounds of equity and efficiency. Without price regulation, the supply of disability supports may be below socially optimal levels for a number of reasons, including ineffective competition and abuse of market power (NDIA 2017a, p. 5).

In particular, there may be too few providers in the market. This is a real risk in the disability support sector. Early data indicate a market concentration of more than 80 per cent in some disability service sub-markets (NDIA 2016l, p. 32, 2016s, p. 29, 2016x, p. 38; DSS, sub. 146, p. 38). This may result in prices that are too high, and limited access to services for some disadvantaged groups. Others have noted the need to maintain price controls in the foreseeable future, as it may take at least a decade for the new market for National Disability Insurance Scheme (NDIS) disability supports to develop (ANAO 2016, p. 54; AONSW 2017, p. 5; DSS, sub. 146, p. 39).

In 2011, the Commission recommended that an early — albeit temporary — task for the National Disability Insurance Scheme Agency (NDIA) would be to set efficient prices to allow providers to recover the costs of providing services (including adequate returns for capital investment), and in turn, ensure the supply of disability supports (PC 2011, pp. 51, 412–414).

While the NDIA has set prices since the beginning of the NDIS trials in July 2013, the Agency said that it does not plan to do so in the long term.

> During transition, the market stewardship role of the Agency will be more active; to facilitate development of the marketplace and as a catalyst for basic market infrastructure. This includes … setting prices and pricing policy …
>
> The setting and reviewing of NDIS prices is a significant market-intervention initiative … for most submarkets it [the NDIA] sees this [price-setting] as a temporary measure to support the marketplace. In the long-term, the NDIA will not set prices to the extent it does now and will instead allow the marketplace to determine the price of supports. (2016i, pp. 18, 26)

An important principle of price regulation is that it should not be distortionary — that is, it should not persist unnecessarily, have excessive scope, or shape the market — such as by benefiting some providers or participants over others.

Given that at least 84 per cent of participants have supports that are subject to NDIS price caps (NDIA 2017y, p. 21), these price controls affect market development. The NDIA acknowledged that it walks a fine line when setting prices.

> The NDIA risks unnecessarily disrupting existing markets through setting prices inaccurately. If price limits are set too high (relative to an efficient benchmark) providers will not face adequate incentives to review practices and operations in an effort to be more efficient. As a result, participants, and the Scheme in general, would not get value for money from expenditure on supports. On the other hand, if price limits were set too low, providers would be unable to recover even efficient costs. This could result in a significant share of providers leaving the sector and/or a lack of new investment in disability services. (2016n, p. 10)

This is reflected in the rationale of price caps, which is to:

- ensure ‘value for money’ for participants — as the price of supports may be bid up too quickly in the absence of price caps in the period after funding is allocated to participants,

but before the disability support sector has grown sufficiently to meet the increased demand

- encourage the market supply of disability supports by giving providers sufficient incentive to grow and enter the NDIS market (NDIA 2016o).

There are also trade-offs with price controls. Fixing prices could mean lower scheme costs in the short term, but also slower market development and support shortages. On the other hand, deregulating prices could mean higher short-term costs, but faster market growth. In the short term, the trade-off is between potential shortages and disability support price inflation.

The price cap for attendant care is particularly important because attendant care is one of the most common supports used by participants in the scheme. The NDIA currently sets price caps for attendant care using its 'Hourly Rate Model' (HRM).[61] The model seeks to 'define the direct cost elements at a rate that is sufficient to cover the efficient costs of a reasonable quality support provider at a point of time' (NDIA 2014a, p. 2). Prices are intended to reflect an estimate of what the long-term 'efficient' price would be in a competitive, deregulated market, plus an additional margin to reflect both the cost and time needed for existing providers to transition to a market-based system, and to entice new providers to enter the disability support market (transitional pricing). To do this, the HRM makes a number of assumptions about the cost of providing supports, which vary by support (box 8.2).

Prices are currently set by annual reviews conducted by the NDIA. The most recent review was completed in June 2017.

The NDIA's 2017-18 Price Review

The most recent price review was undertaken by the NDIA in the first half of 2017. This was the first price review to include a discussion paper that invited feedback from the public on the validity of the assumptions used in the HRM to calculate prices. The NDIA also considered submissions to this study for the price review.[62] While the NDIA intended to publish the updated price guides in late May 2017 (NDIA 2017a, p. 18), they were released on 28 June 2017, just three days before they took effect.

[61] This model is also referred to as the 'Hourly Return Model' (Bowen 2017a). It was previously called the 'Reasonable Cost Model' (RCM) (NDIA 2014a). Many study participants provided submissions that refer to it under these different names, and as the underlying assumptions of the model appear to have remained largely unchanged, the names are largely interchangeable.

[62] A number of confidential submissions were made to this study that had a direct bearing on pricing, including detailed arguments and analysis about the validity of price assumptions. As these submissions were not public, they were not used by the NDIA in its deliberations.

Box 8.2 The NDIA's Hourly Rate Model

The hourly rate model (HRM) uses a range of assumptions to determine the price cap for a given support type under the National Disability Insurance Scheme (NDIS). The price caps are meant to inform providers about the efficiency levels that should be targeted under the market-based system. To date, price caps have included an additional premium to reflect the costs of transitioning existing providers into the scheme, and to give new providers an incentive to enter the sector.

One support subject to a price cap is the cost of an hour of attendant care — one of the most common supports provided under the NDIS. The HRM assumes the following conditions for an hour of attendant care provided in 2017-18:

- the hourly rate of pay is based on the Social, Community, Home Care and Disability Services Industry Award 2010 pay point 2.3 for employees and 3.2 for managers or supervisors. Pay rates depend on whether the hour worked is on a weekday (6am-8pm or 8pm-12am), Saturday, Sunday, or a public holiday
- employees are employed on a full-time or permanent part-time basis. No allowance for shift work or other allowances are included. Leave entitlements are ten days of paid personal leave; four weeks of paid annual leave at 17.5 per cent leave loading; and 17.98 per cent of employees achieve long service leave of 8.67 weeks.

In terms of other costs, including 'on-costs', the HRM assumes:

- loadings for location (20 and 25 per cent for remote and very remote areas respectively) and the intensity of client needs (about 6 per cent)
- that carers spend 95 per cent of paid time with clients, and that managers spend 90 per cent of time with clients, or dealing with client matters. A manager is expected to supervise 15 employees (for standard needs clients)
- that providers operate with a corporate overhead equal to 15 per cent of total salary, management and non-client facing expenses. There is an additional payment for provider travel costs for travelling between clients (maximum 20 minutes)
- superannuation is 9.5 per cent of total salary costs, and workers' compensation insurance is 4 per cent of total salary costs
- a profit margin of 5 per cent of total costs, as well as an additional margin for the transition pricing period.

The HRM, under these assumptions, results in a price cap of about $45 for an hour of attendant daytime weekday care in metropolitan New South Wales, Victoria, Queensland and Tasmania, and about $46 in metropolitan ACT, Northern Territory, South Australia and Western Australia. About a third of this price is for on-costs.

Most of the assumptions and methodology of the model were initially developed in consultation with National Disability Services; however, the parties did not agree on what assumptions were appropriate for the future efficient price. Many providers who made submissions to this study (and to the National Disability Insurance Scheme Agency's (NDIA) 2017-18 price review) argued that the price caps resulting from the HRM are too low to provide quality supports. The HRM was to be reviewed by the NDIA in the 2017-18 price review. The model is being reviewed by McKinsey & Company (who will report to the NDIA Board by the end of 2017).

Sources: Bowen (2017a); NDIA (2017a, 2017q, 2017r, 2017s, 2017t); NDIA and NDS (2014, p. 16).

The prices announced were designed to keep the price caps of most supports in line with inflation.[63] However, other tasks that the pricing review was to undertake were not completed, such as examining the evidence, assumptions and methodology used to set prices, with a focus on attendant care (NDIA 2017a, p. 8).

Instead, the NDIA announced that it had commissioned a pricing review by McKinsey & Company to gain a better understanding of pricing, including the pathway to deregulation. The review commenced in June 2017, with the final report to the NDIA Board due by the end of 2017 (Bowen 2017a). The review's terms of reference directs McKinsey & Company to:

- Provide recommendations in relations to improved pricing effectiveness, including but not limited to:
  - National versus regional pricing;
  - Pricing of services with different levels of complexity;
  - Pricing of short stay support, and for emergency and crisis supports;
  - Thin and undersupplied markets, particularly in regional and remote areas;
  - Relative provider efficiencies (including overheads);
  - Adequacy of provider returns; and
  - Effectiveness of the Hourly Return approach used to set prices.
- Provide recommendations in relation to the potential early de-regulation of price in more mature sub-markets and the glide path for the eventual de-regulation of price more generally. (Bowen 2017a)

8.2 What is the effect of the NDIA's prices on the market?

Regulating prices is always difficult — regulating a market that is transitioning, still developing and undergoing significant change is even harder, as the past offers little guidance to regulators, and there is an increased risk of disruption caused by regulated prices. Prices are also only one of many factors affecting the willingness and ability of providers to supply disability supports.

63 The outcomes from the 2017-18 price review included: increasing the price of supports for personal care and community participation by 4.5 per cent to reflect both wage and consumer price inflation; increasing the price of other supports (including those related to capacity building) by 1.94 per cent to account for wage inflation; increasing the price of capital-related supports by 2.1 per cent to account for consumer price inflation; and increasing loadings for remote and very remote areas by 2 percentage points to 20 and 25 per cent respectively (consistent with the loading changes made by the Independent Hospital Pricing Authority). There was no change in the price of therapy services, as data from competing sectors examined by the NDIA indicated that no change was required. However, the NDIA changed the cancellation policy to allow providers of therapy services to charge for up to two participant cancellations per year, when it was previously prohibited (Bowen 2017a; NDIA 2016o, 2017ac).

As mentioned earlier, there are trade-offs with price controls. Allowing participants' wants and needs to drive prices, and therefore the supply of supports, is important for participant choice and control, and ultimately, participant outcomes. However, without price controls, a lack of supply could put upward pressure on prices, erode participant's packages and have adverse consequences for participants. Therefore, prices should only be regulated where the benefits outweigh the costs.

Many submissions to this study raised concerns about the prices set by the NDIA. Most concerns were about the assumptions of the model used by the Agency. The NDIA's assumptions around complexity of needs, attendant care and short-term accommodation ranked high among the concerns raised. The Commission heard that the price caps in these areas were creating perverse incentives for providers, and leading to poor outcomes for participants.

The cost of supports for people with complex needs is not well reflected in prices

Under the NDIA's price caps, there is single loading when providing attendant care to participants with complex needs (people who have or are likely to have multiple, episodic or high support needs over their lifetime).

Many study participants commented that people with complex needs are struggling to find providers willing and able to provide services to them (box 8.3).[64] A number of providers also said that they could not provide services to participants with complex needs at the prices derived from the HRM (Anglicare Australia, sub. 157, pp. 11–12, 19; CMHA, sub. 11, pp. 5, 13; Leadership Plus, sub. 128, pp. 3–4; NDS 2017b, p. 4; United Voice, sub. 118, p. 12; VCOSS, sub. 176, pp. 20–21). And this was a consequence of the single complexity loading, base salary rate and supervisory requirements. As the Brotherhood of St Laurence said:

> The existing fixed pricing structures pose some problems for both participants and service providers because they fail to take into account the circumstances of activities. By setting a single price, the provider does not have the option to charge less or more for a tailored service. This has the unintended consequence of reducing the choice and control of people with disability. (sub. 189, p. 20)

[64] Including: ACT Government (sub. 156); Anglicare Australia (sub. 157); Belinda Jane (sub. 80); Disability Services Australia (sub. 9); Disability Services Commissioner Victoria (sub. 35); National Disability Services (sub. 51); Scope Australia (sub. 72); and Victorian Government (sub. 174).

Box 8.3 Study participants' concerns about the complexity loading

Victorian Council of Social Services:

> VCOSS members report pricing limitations are particularly inadequate to meet the costs of delivering services to participants with complex and high support needs … Without adequate resourcing, the NDIS risks creat[ing] disincentives for providers to assist participants with complex needs. This could mean services 'cherry pick' participants and leave some people with disability without services. (sub. 176, pp. 20–21)

Disability Services Australia:

> The premium for complexity is insufficient, and there is a strong risk of market failure in the area of service delivery for complex customers — this includes those with challenging behaviours, and those that require centre-based services. (sub. 9, p. 10)

The ACT Government:

> Providers have also reported 'cherry picking' of service types which are better paid and have 'easier' clients, which opens up market gaps for other services.
>
> These pricing issues are very serious … particularly in the areas of … intensive personal support and support for participants with complex needs … The risk to participants in the ACT from providers who currently support people with complex needs withdrawing from the market is high. (sub. 156, p. 30)

Anglicare Australia:

> … The system is designed with low level personal care as the basis for the pricing and consequently the higher skill and responsibility levels for staff who need to care for those with [psychosocial] disabilities is essentially ignored. (sub. 157, p. 12)

Belinda Jane:

> They [providers] kick out complex clients, saying they do not support clients like that. (sub. 80, p. 10)

National Disability Services:

> Providers are also reporting a growing reluctance to support people with complex conditions (in all service types). The NDIS has some higher prices for complexity but they are inadequate. Without a price increase, a high needs group of participants will increasingly not get the supports they need. (sub. 51, p. 12)

Mental Health Australia:

> Since rollout commenced, mental health providers have repeatedly highlighted that the price of supports is set well below the hourly rate for psychosocial support work currently delivered by suitably qualified people. There is no hourly price for psychosocial support services in the NDIS Price Guide … (sub. PP321, p. 37)

This appears to be especially the case for providers that deliver supports to people with psychosocial disability. Many study participants (including CMHA, sub. 11, pp. 4–5; Mental Health Australia, sub. PP321, p. 37; National Mental Health Commission, sub. PP319, pp. 10–11) argued that the single complexity loading did not sufficiently accommodate the different degrees of complexity of need for people with psychosocial disability, and the need

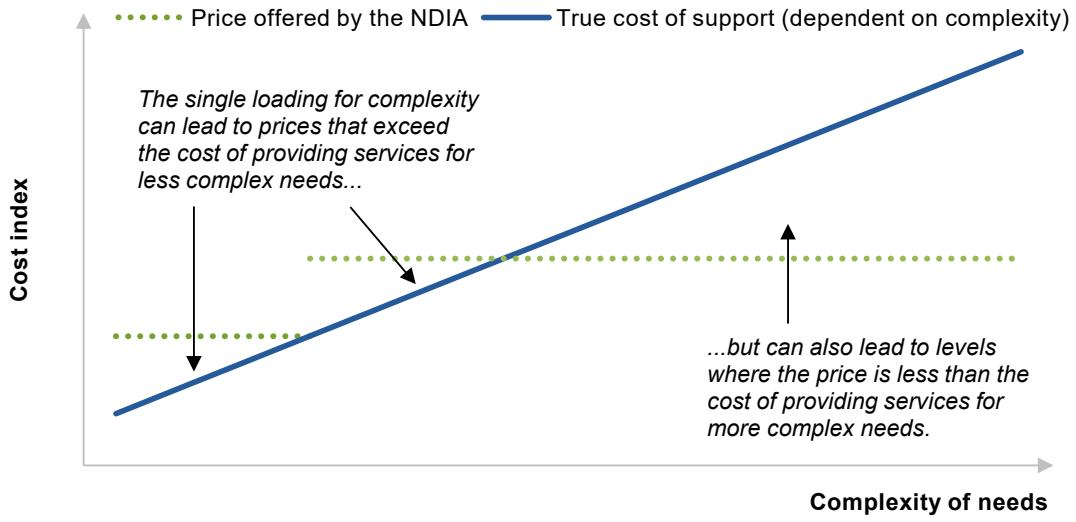
for quality services provided by skilled and qualified mental health workers. For example, the Mental Health Coalition of South Australia said that:

> The cohort for psychosocial disability are at the most complex end of need, yet the Reasonable Cost Model is based on level 2.3 of the SACS award. Skilled mental health peer and support workers attract at least level 3 and often 4. (sub. PP308, p. 3)

It is the bluntness of the single complexity loading that can cause these problems, as it is based on the average, rather than the actual, cost of services. Figure 8.1 shows that as the complexity of needs rises, the actual cost of supplying the support also increases. Yet the price of supports is fixed at two levels — one that includes the complexity loading and one that does not. This creates incentives for providers to provide supports for participants with less complex needs, but a strong disincentive to provide supports to those with more complex needs — resulting in a shortage of supports for these participants.

Given that the cost of supplying supports increases with complexity of needs, a 'one-size-fits-all' approach is not appropriate in the pricing of services for participants with complex needs. A single loading approach is also not consistent with the approaches taken in some other human services, including aged care and public hospital services (box 8.4).

Figure 8.1 **A stylised representation of a single complexity loading**



Box 8.4 Measuring the complexity of human services user needs

Users of human services have needs of varying complexity and intensity. In turn, the cost of delivering services to users will differ depending on the complexity of their needs.

In the aged care sector, the Australian Government pays approved providers a residential care subsidy for each care recipient. The basic subsidy amount is determined by the Aged Care Funding Instrument (ACFI), which consists of 12 questions about assessed care needs, some of which are supported by specified assessment tools and two diagnostic sections (Department of Health 2017b). These questions are rated by the aged care home on a four-point scale of A, B, C or D, which are then used to determine an individual's ACFI rating (Department of Health 2017b). The ACFI consists of three funding categories: activities of daily living, behaviour and complex health care (DHS 2017). Funding in each of these domains is provided at four levels — nil, low, medium or high. This means that there are 55 different rates corresponding to different ACFI classifications (DHS 2017).

The Australian Government also funds public hospital services, jointly with State and Territory Governments. Major determinants of the level of funding are the National Efficient Price (NEP) and National Efficient Cost (NEC) as determined by the Independent Hospital Pricing Authority (IHPA). The NEP also provides a price signal or benchmark for the efficient cost of providing public hospital services (IHPA 2017a). The NEP Determination is used to calculate activity-based funding for in-scope public hospital services, while the NEC Determination covers block-funded services (IHPA 2017c, p. 7). In practice, NEC is higher than NEP, because NEC is for hospitals with activity levels that are too low to be suitable for funding on an activity basis, such as small rural hospitals (IHPA 2017c, p. 34).

In determining the NEP, the IHPA uses classification systems to classify types of patients, their treatment and associated costs. The IHPA then groups patients who have similar conditions and cost similar amounts per episode together (IHPA 2017c, p. 13). Currently, there are six patient service categories — admitted acute care, subacute and non-acute care, non-admitted care, mental health care, emergency care, and teaching, training and research (IHPA 2017c, pp. 13-19). For example, admitted acute care is classified according to the Australian Refined Diagnosis Related Group (AR-DRG) patient classification system. The AR-DRG consists of about 800 patient classes with each patient being classified based on their diagnoses, interventions and other routinely collected data (IHPA 2017b).

Attendant care price caps may be too low to achieve safe and quality outcomes

Many providers presented anecdotal evidence to this study about NDIS price caps for an hour of attendant care being too low. Estimates of the shortfall between what was needed and what the cap offered (as a percentage of the current price cap) varied considerably. For example:

- House with No Steps (sub. 104, p. 3) said that there was a shortfall of about 10 per cent against what it considered to be a more sustainable price cap. This is equivalent to a shortfall of about 11 per cent against the current price cap
- Belconnen Community Service Board (sub. 39, p. 1) suggested a shortfall of between 10.5 and 16 per cent

- Cohealth (sub. 50, p. 11) said that there was a shortfall of 49 per cent for those with mental health needs.

While there is a wide range of views on the pricing of attendant care, more thorough analysis of the assumptions underpinning the HRM highlight the challenges faced by providers to supply supports.[65]

- The Samaritans Foundation applied alternative assumptions that they considered were more reflective of existing practices and the efficiency gains that they believed could be realised in the disability care sector. It found that the price cap on an hour of attendant care would have to increase by between 13 and 25 per cent for providers to continue to provide reasonable quality care (Samaritans Foundation, in Anglicare Australia, sub. 157, att. 4, p. 1).
- A survey of 129 registered NDIS providers and 738 disability support workers examined how the pricing model affected disability support workers. It found that the NDIS price of attendant care under the NDIA's Reasonable Cost Model did not enable minimum Award conditions to be met, and prevented employers who offer above-Award conditions from meeting their legal obligations. The researchers found that the pricing model under-classified support workers and supervisors; underestimated the time needed to deliver quality and safe services to NDIS participants, especially to participants with complex needs; and underestimated a range of other costs that providers must incur to develop and maintain quality staff and services (Cortis et al. 2017).

Short-term accommodation is another area of concern

Short-term accommodation is a core support that provides integrated support for self-care, accommodation, food and activities in a centre or group residence, for people with disability for short periods (NDIA 2017q, pp. 27, 40). It can involve irregular days and may include funding to provide substitute support 'respite' in a group-based facility or in-home support.[66] As respite is important to maintain the ability of informal carers to provide support to participants (chapter 9), short-term accommodation for people with disability is vital to participants, their carers, and the financial sustainability of the scheme. Currently, the price cap for short-term accommodation applies on a flat day rate, which includes all expenses in a 24-hour period with no additional loading (NDIA 2017a, p. 16).

[65] The Commission did not make any findings or recommendations on the prices of particular supports, though some study participants suggested that there would be merit in the Commission doing so (for example, HSU, sub. PP316, p. 6 and Victorian Government, sub. PP298, p. 23). The NDIA provided the Commission's study with a copy of its HRM, but it was provided too late for the study to examine in detail. That said, many of the assumptions in the HRM that was provided to the Commission appear similar or identical to those stated in the NDIA's Price Controls Review 2017 Discussion Paper and 2017-18 Price Guide.

[66] Some participants in this study said that the term 'respite' is pejorative and preferred the term 'family care'. The Commission is sensitive to this issue, but has used the term 'respite' for clarity — both because it is included in the NDIS Price Guide (NDIA 2017q, p. 28) and most study participants, including people with disability, used the term in their submissions.

Some study participants argued that the price of short-term accommodation has several flaws. These include: the flat daily rate that does not allow for any complexity loading or penalty rates for weekends or public holidays; and the NDIA's assumptions about the occupancy rate (NDS, sub. PP295, pp. 8–9; Cerebral Palsy Alliance, sub. 163, att. 1, p. 4).

These assumptions are beginning to shape market supply responses.

- The CSSA (sub. PP278, p. 5) reported members not opening on public holidays; long wait times; large providers withdrawing services; and cherry picking participants — leaving vulnerable participants with complex needs without adequate and timely support.
- According to the NDS (sub. PP295, pp. 8–9), some providers are considering shutting down these services (and converting them to Specialist Disability Accommodation). An emerging risk is that more participants will move into full-time Supported Independent Living (a more expensive option) or Specialist Disability Accommodation.
- The HSU (sub. PP316) said that it had received reports of providers refusing to provide services on weekends and public holidays.
- Some providers are reducing or closing down their respite services in response to NDIS price caps. For example:
  - Marymead, an ACT provider, initially announced that from 26 October 2017, it would significantly reduce its overnight respite services to young people with disability with high needs (Bourchier 2017; Groch 2017a, 2017b). On 3 October 2017, Marymead announced that an agreement had been reached with the NDIA, with the support of the ACT Office of Disability, to allow Marymead to charge for its respite services at a price higher than the NDIS price cap for the next six months (Groch 2017c). As a result, Marymead (2017) said that it would continue to provide these services to scheme participants.
  - Disability Trust, the last remaining provider of overnight respite care for young people with disability in the ACT, indicated that it was reviewing its services, and could not guarantee respite services after Christmas (Groch 2017a)
  - CatholicCare Sydney is no longer providing respite care and short-term accommodation because in its view, the NDIS flat daily rate does not reflect penalty rates and other costs (Morton 2017).

The view more broadly

Most, if not all, of the concerns about pricing raised by study participants related to the assumptions of the HRM,[67] and the limited opportunity for providers (and participants) to have input to the pricing process.

[67] The Commission also had access to 46 of the 84 submissions to the NDIA's 2017-18 Price Review. These submissions expressed similar concerns about the assumptions in the NDIA's price model, as did many of the submissions made to this study.

In response, the NDIA said that:

> Some providers have raised concerns that NDIS price levels are too low, particularly for personal care and community supports, but have generally not supported these arguments with clear evidence. Other providers have suggested that current price levels are appropriate. These contradictory views within the provider population might be evidence that some are struggling to adjust to a funding model that is based on market principles. There is also evidence of a wide variation in operating costs under pre-NDIS approaches where efficiency was not a key consideration. It also might reflect changes in volume as well as the extent of cross-subsidisation of services that previously existed.
>
> The NDIA effort to set maximum prices has incorrectly been taken by many in the sector to authorise an 'NDIS price' for their services, which is often inflated above actual costs. (sub. 161, p. 101)

The NDIA acknowledged that there remain divergent views on pricing.

> More generally, divergent facts and views were presented. Some providers argued that existing prices do not allow adequate recovery of their costs, impeding their ability to make a return and acting as a barrier to market growth. On the other hand, some participants argued that providers are overpricing supports in some categories. More detailed work is required to gain a deeper understanding of these divergent perspectives. (Bowen 2017a)

While further work is required to arrive at an appropriate pricing model, it is clear that some prices are having a negative effect on the sector. A survey by the NDS, in partnership with Curtin University (now conducted with the University of Western Australia), found that:

- 67 per cent of respondents were worried that they would not be able to provide services at the prices being offered under the NDIS
- 46 per cent said that to provide services at the prices being offered by the NDIA, they would have to reduce the quality of service (NDS 2016, p. 20).

While 55 per cent of disability support organisations reported making a profit in 2015-16, only 40 per cent of respondents budgeted to make a profit in 2016-17 (NDS 2016, p. 14).

Evidence presented to this study also suggests that other care sectors are beginning to look more attractive than the disability support sector. For example, the ACT Government said that:

> The current Fixed Pricing Structure for NDIS services has affected the overall development of sustainable business models. There appear to be services that are not, or are perceived to not be financially viable. … others have begun to diversify and others have made decisions about withdrawing from (or not entering) the disability services market. ACT providers have also expressed concern that fixed pricing is compounded by the extensive administrative burden and delays when dealing with the NDIA. Some providers have made a decision to leave disability service provision and will instead focus on aged care. (sub. PP312, pp. 7–8)

The Commonwealth Ombudsman also reported that:

> … at a recent consultation a provider told us they could bill around $10 per hour more for providing in home domestic assistance for aged care clients than they could for providing the same service to an NDIS participant. They suggested it was difficult to understand the rationale for this difference and said it created a risk that service providers would focus their service provision on areas that were more financially sustainable, leaving NDIS participants with even fewer choices. (sub. 137, p. 14)

The NDS called for the NDIA to immediately review its prices, and not wait for the McKinsey & Company review.

> Providers are making these decisions now, to get out of certain disability services, and the (NDIA) needs to respond now rather than wait for that review. (Baker in Morton 2017)

This sentiment was echoed by the Victorian Government, which called for the NDIA to urgently review its prices.

> Victoria considers that there is also an immediate need to consider areas where NDIS pricing may be inhibiting market growth or risking provider failure (particularly in areas or services in which there are thin markets). In some areas, the NDIA appears to have applied flawed assumptions to its calculation of prices. Examples include low allowances to train, supervise and recruit direct support staff, unrealistic assumptions around the amount of time staff need to spend undertaking non-client facing functions, and low assumptions around the proportion of overall costs devoted to overheads (particularly during the transition period). Victoria considers that these areas should be corrected as soon as possible. (sub. PP298, p. 3)

Divergent perspectives on the adequacy of prices are currently leading to uncertainty and low confidence within the sector. This is not conducive to the scale and scope of market development (and increase in provider capacity) that is needed to provide supports for NDIS participants.

There is a serious risk that both existing and potential disability support providers will choose to provide their services elsewhere. Some providers in the ACT have said that they have deregistered with the NDIA (or are considering doing so) as a result of the NDIA's price caps (Hermant 2017). Some participants with particularly complex needs may not be catered for under the scheme. This may result in an inappropriate increased reliance on carers, Provider of Last Resort services (including crisis supports), in-kind services and other mainstream services. Under the NDIA's current pricing approach, the benefits of the NDIS scheme will not be fully realised.

FINDING 8.1

The National Disability Insurance Agency's approach to setting price caps to date has hindered market development by discouraging the provision of some disability supports. In some cases, it has led to poor participant outcomes, especially for those with complex needs. The benefits of the National Disability Insurance Scheme will not be fully realised if the Agency continues with its current pricing approach.

8.3 How should price caps be set?

Prices must send a clear signal to the market to encourage the supply of supports, promote competition and innovation. Without this, many of the problems experienced under the previous system — unmet demand, unclear decision-making and unfair allocations of supports — will continue or reoccur, and lead to poor participant outcomes. In the context of the NDIS, the challenge for the price regulator is to find the right balance between market development, the financial sustainability of the scheme and participant outcomes. It is this balance that the NDIA currently aspires to in setting price caps (NDIA, sub. PP327, pp. 36-7).

The Commission's concern is that the NDIA has not achieved the right balance. Comments by the NDIA (sub. PP327, p. 36) that price setting is inseparable from financial sustainability, and by the former Chair of the Agency (Bonyhady, sub. PP333, p. 13) that 'the NDIA's 'efficient prices' … are calibrated to the expected full costs of the NDIS of $22 billion', suggest that financial sustainability could be prioritised over other objectives.

If the financial sustainability of the scheme is given priority over the other objectives of market development and participant outcomes, then the scheme's objectives will not be achieved. As pointed out by Victorian Legal Aid (sub. PP367, p. 3), 'the scheme cannot function predictably, transparently or fairly if financial sustainability looms large over every decision', and it is difficult to reconcile such a position with the scheme's objective to provide reasonable and necessary supports for participants.

Others suggested that one body attempting to achieve this balance of multiple objectives through pricing is not possible or desirable. For example, both the Harper Competition Review and the OECD emphasised the value of having regulators — including price regulators — being at arm's length from other decision-making and functions (Harper et al. 2015, pp. 227–229; OECD 2014, p. 47). Many State and Territory Governments[68] — funders of the scheme — also suggested that price-setting should be more independent than is presently the case. The Department of Social Services (DSS) (sub. 146, p. 39) also indicated that there could be merit in moving price regulation to an independent body, albeit not immediately. The Australian National Audit Office (ANAO) (2016, pp. 30–31) raised the concern that the NDIA could be conflicted in its dual market roles as both price-setter and purchaser of supports.

Regardless of whether there is a conflict, or how a balance is to be achieved, it is clear that the current pricing approach needs to be improved quickly.

At its heart, pricing policy should reflect the objectives of the scheme and address the concern that without price regulation for a period, participants will be adversely affected by unaffordable support costs. Value for money for participants needs to be considered with financial sustainability of the scheme in the short term, but with an eye to market

[68] See for example: Northern Territory Government (sub. PP359, p. 2); Queensland Government (sub. PP345, p. 13); Tasmanian Government (sub. PP247, p. 8); and Victorian Government (sub. PP298, pp. 3, 22–4).

development to render price controls unnecessary over the longer term. If price caps are set inappropriately, there is a risk that pricing decisions will distort or 'make the market', rather than allowing the market to develop in a way that reflects the needs (and goals) of participants.

To realise the benefits of the scheme for participants, NDIS price caps should be legislated to be evidence-based, set transparently, and determined independently (box 8.5).

Box 8.5 Best practice principles for price regulators

The UK National Audit Office observed that government authorities setting prices for public services in markets should adhere to eight principles for value for money. They should:

- understand national supply and demand and intervene to remedy problems
  - this includes: the patterns of regional variation (including levels of spare capacity); the likely impact of policy reforms; and possible future scenarios
- understand the national market structure and intervene in the event of market failure
  - this understanding should include: market size and concentration (including 'difficult to replace' providers); degree of exposure to publicly funded users; and price and quality variations and trends
- understand the role of, and work with, the competition authorities and relevant quality and sector regulators to raise awareness, standards and enforce rules and the right market behaviour
- understand the authority's impact on local public and private markets as a purchaser of services, and how to encourage the right market behaviour
- know the costs of service provision
- ensure the price sustains supply at acceptable levels
- ensure quality is acceptable
- ensure users are well informed about quality (NAO 2013).

More generally, the OECD's seven principles for good governance of regulators are:

- role clarity
- preventing undue influence and maintaining trust
- decision making and governing body structure for independent regulators
- accountability and transparency
- engagement
- funding
- performance evaluation (OECD 2014).

Evidence and transparency are essential, but lacking

As the NDIS disability support market is still developing, the data and information needed to determine the appropriate price controls are limited. This is reflected in the NDIA's approach, which includes consulting with the disability support sector.

> In the roll-out phase of the NDIS, the NDIA is adopting a cautious approach to price controls in the absence of information on the competitiveness of markets for supports. (NDIA 2017a, p. 5)

> Price control decisions are informed by significant input from market stakeholders through regional forums, targeted workshops, individual discussions and responses to discussion papers. (NDIA, sub. 161, p. 100)

This approach is consistent with the Office of Best Practice Regulation's recommendation that the NDIA should:

> … continue to make its decisions about the setting of reference prices transparent, continue to work with the NDS to collect information on the costs of providing supports, and continue to monitor the impacts of reference prices on existing providers. (2015, p. 43)

There is some evidence that the NDIA has responded to market circumstances and feedback. For example, the NDIA increased price caps for personal care and community supports by about 10 per cent in 2014 and 2015 at some NDIS trial sites (ANAO 2016, p. 47). However, some providers argued that to date, they have not had any real opportunity to provide feedback on pricing decisions.

House with No Steps (sub. 104, p. 4) said that there was a 'lack of real consultation by the NDIA with service providers', and that (prior to the 2017-18 price review) they had never been formally consulted on any matter (including prices), despite being one of the largest providers nationally.

> Our frustration is that this pricing is relatively easily and transparently modelled in an Award environment. Such modelling, if publicly shared, would move the discussion from the inadequacy of a 'black box' number to an informed discussion around cost drivers such as staffing mix, management spans of control and overhead levels. We understand such modelling has been carried out by the NDIA and independent actuaries and, if so, do not understand why the output of those modelling exercises has not been made public or reflected in NDIA pricing. (sub. 104, p. 3)

Similarly, Interaction Disability Services was concerned about the Agency's lack of engagement with providers on pricing issues.

> Our most significant concern is that the NDIA has developed non-contextual pricing. In our view, this has happened because of what we believe is a failure to engage wholly with service providers on planning and pricing. This is a misplaced philosophical position based on assumptions that service providers will inflate prices. These assumptions have never been tested. (sub. PP213, p. 1)

These frustrations extend to a lack of usable information about prices needed to provide meaningful feedback.

> The NDIA's process for pricing services of various kinds has been difficult for non-government stakeholders to understand or contribute to … Providers have also been largely unable to provide detailed advice in response to any consultations either during or subsequent to the RCM's [Reasonable Cost Model] development. To build the NDIA's evidence base for 'a market price' for psychosocial services, Mental Health Australia asked the NDIA to check the assumptions in the model with providers, but to our knowledge this did not occur. (Mental Health Australia, sub. 155, p. 22)

The lack of transparency has also led some providers to question the NDIA's independence. For example, Autism Association of Western Australia said that:

> Given the lack of transparency and evidence surrounding the populating of the RCM [Reasonable Cost Model], it is more accurate to describe it as a funding tool rather than a pricing tool with all that this would imply in relation to market-based evidence. (sub. PP219, p. 3)

Concerns about a lack of transparency and consultation were shared by many others (not just providers) — including the HSU (sub. 132, p. 10), the ACT Government (sub. 156, p. 27) and the ANAO (2016, p. 13). For example, the DSS said that:

> … greater transparency, appropriate benchmarking and independence are required in price regulation under the Scheme. Better communication is required to improve stakeholder understanding and provide greater market certainty, particularly about the pre-conditions for price deregulation. (sub. PP318, p. 14)

As part of its most recent price review, the NDIA said that it had received feedback from stakeholders that there was:

> … a lack of transparency on the assumptions and methodology used to calculate price controls (which could affect discussion about how price arrangements relate to other parts of the NDIS, as well as debate about the price controls themselves). (2017a, p. 7)

To address this lack of transparency, the NDIA (2017a) released additional information about pricing as part of the latest pricing review. The NDIA Board also commissioned a pricing review by McKinsey & Company.

> Reflecting the NDIA's market stewardship role, the NDIA has also commissioned McKinsey and Company to undertake an independent Price Review which will provide the evidence and transparency to ensure that any future price settings for supports and services underpin the critical objectives of the NDIS. (Bowen 2017b)

That said, the NDIA's price-setting process remains largely opaque. Submissions to the price review are not made public, nor is it clear how the material is used or assessed. And details about the operation of the HRM are not in the public domain.

The lack of transparency around prices is at odds with the practice of independent price regulators and authorities in other sectors.[69] It is also inconsistent with the Commission's 2011 recommendation that the NDIA's recommendations to change prices should be transparent, if the Agency is to set prices (PC 2011, p. 412).

As a first step to improve transparency, the NDIA should make public a summary of the McKinsey & Company price review, once it is completed. The NDIA should also use existing work, such as the provider benchmarking study currently being run by the NDS and the University of Western Australia.

Transparent price controls are important to impose discipline and public accountability in setting prices, as well as to increase credibility and certainty of price signals, which assists with forward planning, investment and entry by providers. There are reports that some new providers (including aged care providers) may be delaying entry to the sector because of ongoing uncertainty regarding price deregulation and profitability (Whyte 2017).

A number of State and Territory Governments agreed that independent, transparent and evidence-based price controls are necessary to facilitate market development (for example, Tasmanian Government, sub. PP247, p. 8). As the NSW Government pointed out:

> A well-functioning market requires a robust and transparent pricing framework. This provides certainty in relation to revenue potential for providers, which, in turn, provides an incentive for investment in service offerings (if prices are set at the right level). This work must be prioritised. (sub. PP230, p. 5)

Transparent price controls are particularly important for providers of Specialist Disability Accommodation, as large upfront capital investment ('patient capital') is required, which may be debt-funded and is usually recovered over a 20-year investment period (NDIA 2016v, p. 19; NSW Government, sub. PP230, p. 5). Transparency around price controls also extends to disseminating relevant market information ('non-price signals') to complement and improve the effectiveness of price signals. Power Housing Australia commented on the lack of data on disability housing demand from NDIS participants across Australia.

> … there is little transparency about where people with disabilities and those needing Specialist Disability Accommodation tend to live, and what types of disability housing are needed across Australia … To ensure affordable housing with appropriate modifications are available into the future, information about current and future projections around the location, types of disability, and housing required for NDIS participants is recommended … (sub. 139, p. 6)

Transparency creates greater incentives for new providers to enter the disability support market, and helps build community trust and confidence that the prices for supports are fair

[69] For example, aged care (Aged Care Pricing Commissioner and Aged Care Financing Authority), electricity and telecommunications (Australian Competition and Consumer Commission), energy (Australian Energy Regulator), minimum wages (Fair Work Commission), public hospitals (Independent Hospital Pricing Authority), and the Independent Pricing and Regulatory Tribunal NSW.

and reasonable for providers, participants and taxpayers. A lack of transparency can erode this confidence, and put the scheme at risk.

Clear and limited statutory authority to regulate prices

Transparent price regulation also requires that the legal authority for price regulation is clearly defined and stated in legislation. Having clearly specified objectives ensures that the regulator has 'sufficient context to establish priorities, processes and boundaries for its work' (OECD 2014, p. 31). In other words, clearly defined statutory limits are necessary for pricing powers to be exercised transparently, predictably, independently and fairly.

Clearly defined roles for price regulation also promote public accountability and the rule of law, by ensuring that regulators only operate within the scope of powers given to them by the legislature. This means that the regulator's objectives, functions and powers should be made clear to the regulator's staff, regulated entities, citizens and other stakeholders (ideally through principle-based legislation) — with regulators not being assigned competing or conflicting objectives or functions (OECD 2014, pp. 32–38). A regulator with clear roles is more effective in achieving desired policy objectives, and fosters public trust and confidence in its decision making, resulting in greater certainty and stability. A lack of clarity can impair a regulator's performance and lead to poor community outcomes.

Currently, the NDIA's power to set prices is not expressly specified in the NDIS legislative framework (the *National Disability Insurance Scheme Act 2013* (Cwlth) and NDIS Rules). Nor are the objectives or functions of its price regulation powers clearly stated in the legislation (making administrative review of its decisions difficult). This is notably different to the legislative arrangements for other price regulators.[70]

Without clear limits set on price regulation, there is a risk that the NDIA could exercise its pricing powers inappropriately (for example, constraining scheme costs to the detriment of market development). Unless pricing functions, powers and objectives are clearly specified, the Agency may also have less incentive to act transparently, particularly if it is not empowered or required by law to act transparently in the exercise of these functions.

Strong support for independent price regulation

The transition period of the scheme provides an opportunity to consider a number of issues, including any concerns around how the NDIA balances different objectives of the scheme, the lack of transparency in how price caps are set, as well as the need to define the price-setting role in legislation. It is also an opportunity to provide greater certainty to

[70] For example, the Independent Hospital Pricing Authority's objectives, functions and powers (including matters that the Authority must consider) to determine the national efficient cost and price for health care services provided by public hospitals are specified in the *National Health Reform Amendment (Independent Hospital Pricing Authority) Act 2011* (Cwlth).

providers about how and when price deregulation will occur, which is a key milestone in moving to a market-driven approach.

Most study participants agreed with the need for an independent price regulator (box 8.6).

There was support across a range of stakeholders, including people with disability, providers, community organisations and governments.[71]

However, the NDIA (sub. PP327, pp. 35–9) argued that an independent price regulator would put the scheme at risk. The Agency (sub. PP327, pp. 35–6) perceived its situation not as a conflict of interest, but a 'necessary and deliberate' tension between promoting participant outcomes, market development and financial sustainability.

Balancing the objectives of the scheme, including market development and financial sustainability is important, but does not preclude moving to an independent price regulator. Just as in other price-regulated industries, and like any other stakeholder, the NDIA would be able to make public submissions to a regulator on how price changes could affect the scheme's financial sustainability and other scheme objectives (and include any confidential market data held by the NDIA about relative efficiencies and benchmark costs of service provision), and be able to recommend its own set of prices to the regulator to inform the latter's decision making.

The NDIA (sub. PP327, pp. 36–7) also said that if its pricing powers were moved to an independent price regulator, the Agency would no longer be able to perform its market stewardship role effectively. But the responsibility for effective market stewardship and the management of market risks is already shared among a number of governments (and does not always require price controls). The Agency would still be able to influence market development by providing information and other resources to the market. Delivering better quality plans (chapter 5), supporting participants to navigate the market, and achieving the outcomes of the proposed eMarketPlace (chapter 10) will shape demand, and in turn, the supply response in the disability support sector.

Box 8.6 Many study participants support independent price regulation

Autism Association of Western Australia:

> For the sake of the sustainability of the Scheme, and the quality of services delivered to participants, pricing needs to be undertaken by an independent umpire who is not conflicted in their approach; and who has no other interest but to set objective prices based on true market conditions for the work under consideration. Only in this way will the Scheme be scalable and sustainable. (sub. PP219, p. 6)

Flourish Australia:

> Integral to the long-term success of the NDIS is the need to get pricing right. Available evidence suggests that a significant number of providers are struggling under the current regime. In the lead-up to deregulation, the price setting process requires specialist expertise, a robust methodology, independence and transparency, and comprehensive consultation with and input from service providers. (sub. PP246, p. 7)

Australian Federation of Disability Organisations:

> … would like to see independence and transparency for such issues as setting the pricing cap that an independent pricing regulator would enable. This is vital in the context of providing a degree of financial certainty … which may allow for more providers to enter the marketplace or existing providers to develop sustainable business models … AFDO is aware of sector wide concern that the financial realities of disability service provision are not given the weight they should. (sub. PP325, p. 17)

Australian Unity:

> … supports the establishment of an independent pricing regulator … Australian Unity is concerned that the current pricing formula does not sufficiently recognise the core costs associated with providing services under the NDIS. We agree that the establishment of an independent pricing regulator is likely to enhance current arrangements, and will ensure that the pricing arrangements for the NDIS align with other parts of the human services sector. (sub. PP273, p. 2)

National Mental Health Commission:

> … acknowledges that the NDIA has been given an extremely difficult task. Implementing a reform of the scale and nature of the NDIS was always going to be challenging; implementing it with a curtailed timetable, reduced resourcing and under shared accountability arrangements where different governments have different expectations. For these reasons the NMHC supports … the separation of the pricing function from the Agency. (sub. PP319, p. 5)

Queensland Government:

> There is merit in introducing an independent price regulator to avoid a potential conflict of interest with the NDIA both setting prices and being responsible for the financial sustainability of the scheme. (sub. PP345, p. 13)

Catholic Social Services Australia:

> … strongly supports … the establishment of an independent price monitor to conduct an immediate review of NDIA price caps, transitioning to an independent price regulator … (sub. PP278, p. 4).

Victorian Government:

> More confidence in NDIA pricing is required as soon as possible to encourage growth in supply and incentivise market transition. Victoria welcomes the recommendation to move to an independent price regulator … (sub. PP298, p. 22).

The NDIA (sub. PP327, p. 38) argued that a new body would result in additional costs, increased fragmentation and inefficiency, and any regulator would hold less useful data and information than the Agency. On access to data, there do not appear to be any significant

barriers to the data sharing between the Agency and the private firms engaged to assist the Agency with its pricing response (for example, the McKinsey & Company price review). The Agency also shared data and information with the Commission for this study. And in terms of additional costs, these will be minimised if the NDIA's pricing powers are transferred to an existing body, particularly if pricing functions are relevant and complementary to its existing functions relating to the NDIS.

Moving towards independent price regulation

As with any price regulator, there are costs and benefits to its operation, and the need for open channels of communication between the regulator, regulated firms, consumers and others affected by such regulations. There is a compelling case to legislate for an independent price regulator that can set price caps independently, transparently and in an evidence-based manner. This will give providers and the community greater certainty (and participants certainty that they will receive the services that they need), and in turn, encourage new and existing providers to supply disability supports. The ultimate objective is for the supply of supports, innovation and efficiency to be driven by price signals that reflect participants' wants and needs through the exercise of their choice and control.

To achieve this, the Commission recommends that price deregulation should occur in three stages (figure 8.2).

In the first stage, the NDIA would temporarily maintain its role of price regulator (given that it is not possible to set up a new price regulator immediately), but an independent price monitor would be introduced with responsibilities, including to:

- examine how the market is responding to price caps set by the NDIA
- review the NDIA's price caps based on the available evidence, including submissions made to the NDIA's price reviews, and making comparisons with prices in other care sectors (including aged care)
- report publicly on its assessment of the NDIA's price controls with regard to market development and participant outcomes.

This monitor should be put in place quickly to serve as a 'check and balance' on the NDIA's pricing decisions over the transition period. The monitor will improve transparency around how price caps are set, and in turn, lead to greater accountability to participants, providers and the wider community.

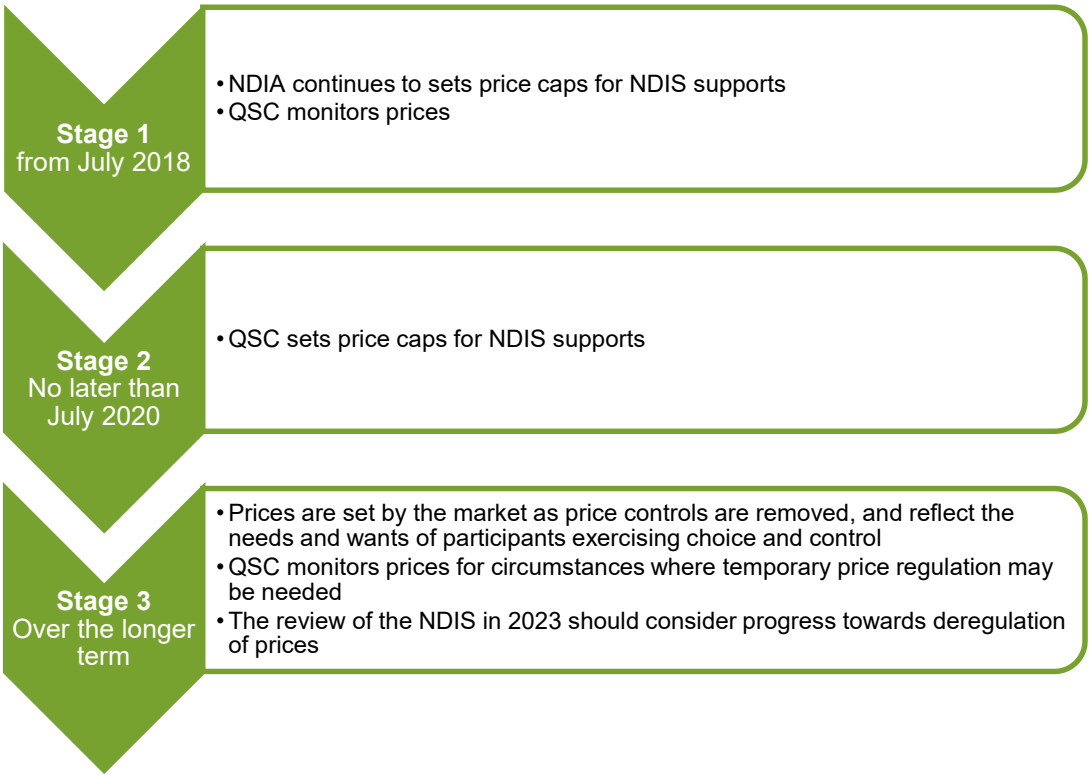
The Commission considers that the NDIS Quality and Safeguards Commission (QSC) (box 8.7) is an appropriate body to *monitor* NDIS prices in the first stage. The QSC's role will include the assessment and enforcement of quality and safety standards to protect participants — which itself will have a strong bearing on prices. Put simply, price and quality are intertwined in the NDIS. The QSC will also have regular communication with

stakeholders, including providers and the NDIA, as part of its provider registration, quality and safety regulation functions.

The QSC should begin price monitoring when it commences in July 2018 to enhance the transparency of the NDIA's price setting over the short term. The full report of the McKinsey & Company price review should be provided to the QSC when it is completed.

The second stage is to transfer the NDIA's price-setting powers to the QSC in July 2020. This would allow the NDIA to focus on its core responsibilities of delivering and administering the NDIS, and remove any concerns about a conflict of interest or how the Agency balances its objectives. It will also help address concerns about a lack of transparency in price regulation. Given the expectation for price regulation to persist for at least the next decade (ANAO 2016, p. 54), it will be necessary to place increasing emphasis on market development to deliver safe and quality supports — a role that the QSC is best placed to undertake, rather than the NDIA. The benefit of having an independent price regulator is that it would provide a credible, independent and transparent evidence base upon which pricing decisions could be made. The QSC would consult with, and accept submissions from all interested parties on its pricing decisions, including the NDIA.

Figure 8.2 **The PC's recommended path for NDIS price deregulation**



Box 8.7 The NDIS Quality and Safeguards Commission

The Australian Government announced that it will establish the National Disability Insurance Scheme (NDIS) Quality and Safeguards Commission (QSC) to oversee quality and safeguards for all scheme participants, and set standards for NDIS providers. It is expected to commence operations in July 2018, with its enabling legislation currently before Parliament.

The Productivity Commission considers that the QSC is best placed to act as a price monitor in the short term, and to act as a price regulator for NDIS supports over the longer term, because its functions are consistent with the Commission's proposed pricing principles.

The QSC is to be evidence-based and transparent

The QSC is to be evidence-based in its legislated role and use its best endeavours to support and maintain a diverse and sustainable NDIS market. By law, the Commissioner will be required to:

- contribute to the National Disability Insurance Scheme Agency's provider benchmarking and to provider quality ratings, as well as monitor, review and report on the effectiveness of the NDIS, including market trends and the quality of outcomes achieved
- actively monitor those providers who would be 'hard to replace' if they ceased trading, including prudential oversight of financial viability
- form a national perspective on markets, using data and information generated by consumers and providers to identify trends in provider practice and wider market responses that may require action
- engage in, promote and coordinate the sharing of information to achieve the objectives of the NDIS Act.

The QSC is also to be transparent in its dealings with the community. The Commissioner is to have powers to initiate inquiries into systemic issues connected with supports or services provided under the NDIS. The Bill also makes clear that the Commissioner may consult and co-operate with a broad range of people, organisations and governments, including people with disability. Further, one of the Commissioner's core functions is to provide advice or recommendations to the National Disability Insurance Agency (or its Board) in relation to the performance of the Agency's functions — a function consistent with a price monitoring role.

The QSC is to be independent and well resourced

The QSC is to be an independent statutory body, with the Commissioner to hold broad-ranging powers in the exercise of his or her functions, and be accountable to the Australian Parliament. While the Minister for Social Services may give the Commissioner general directions in the exercise of their functions, the Minister is prevented from giving specific directions about particular providers, groups or individuals. The Australian Government has allocated $209 million between 2017-18 to 2020-21 to establish the QSC with about 300 staff. To support the Commissioner, the QSC is envisioned to have subordinate members including the NDIS Registrar (responsible for registering NDIS providers) and a Complaints Commissioner (responsible for complaints and reportable incidents). Adding a Pricing Adviser to assist the Commissioner in price regulation roles could be a sound approach to transfer pricing responsibilities from the National Disability Insurance Agency to the QSC.

Sources: Australian Treasury (2017b, p. 154); DSS (2016d, 2017f); National Disability Insurance Scheme Amendment (Quality and Safeguards Commission and Other Measures) Bill 2017 (Cwlth); Porter (2017); and Porter et al. (2017).

Across both stages, the body tasked with price regulation for scheme supports should have relevant capability and necessary resources[72] to perform its functions, including to:

- collect and publicly report data on providers' characteristics and costs — public reporting of this data would provide a benchmark for providers, inform public debate about prices, and facilitate relevant research by external parties
- communicate with disability support providers, participants and the NDIA to transparently set prices at regular intervals, with sufficient time for providers to phase in price changes. Providers (and participants) should be given at least 60 days' notice of price changes before they are to take effect
- periodically review and publish its price model for transitional and efficient prices in a transparent and comprehensive manner
- send granular and targeted price signals — that is, provide prices at the state and territory level, with an expectation that prices could be set at a more disaggregated regional level where possible. This would include the timely provision of supporting market information on all States and Territories (to date, the NDIA has not produced a market position statement for Western Australia (NDIA 2017p)), as well as more disaggregated data on committed supports where possible
- determine — on the basis of transparent consultation and evidence — when prices for particular NDIS supports in each region should be deregulated, and evaluate whether there is a need for price controls. To enable efficiencies to be driven by the market wherever possible, the price regulator should presume that it is appropriate for prices to be deregulated — that is, to only have price controls when there is clear evidence that unregulated prices are likely to lead to inflation that would harm participants. The review of the NDIS costs in 2023 should consider the state of market development, including progress towards price deregulation.

The third stage of deregulation will occur when the price of a given disability support is deregulated, but is still subject to subsequent monitoring. The QSC would maintain an ongoing watch on pricing, collect data, and publicly report on emerging market issues that affect the purchasing power of scheme participants. The QSC's pricing role would gradually diminish (and revert to a price monitoring role) as the market develops over time.

[72] For example, as at 30 June 2016, the Independent Pricing and Regulatory Tribunal NSW had 133 full-time equivalent employees (IPART 2016, p. 7) and the Independent Hospital Pricing Authority had 51 employees (IHPA 2016, p. 37). The NDIA had a total of 1505 employees (NDIA 2016b, p. 85), but data on how many employees were in the Markets and Pricing division are not publicly available.

RECOMMENDATION 8.1

The body responsible for regulating the price of supports under the National Disability Insurance Scheme should have relevant capabilities and the necessary resources to set price caps in a manner that is:

- transparent, with wide public consultation and publicly available information, including all assumptions used in any pricing models
- evidence-based
- supported by clear and limited legislative authority
- independent
- timely, particularly in giving providers sufficient time to phase in changes and be responsive to market conditions.

RECOMMENDATION 8.2

The Australian Government should amend the *National Disability Insurance Scheme Act 2013* (Cwlth) to require the National Disability Insurance Scheme Quality and Safeguards Commission (QSC), upon its commencement in 2018, to monitor, review and report on the price caps for scheme supports set by the National Disability Insurance Agency (NDIA). This should include appropriate funding for the QSC to undertake price monitoring of scheme supports, and to continue the business characteristics and benchmarking study currently undertaken by National Disability Services and the University of Western Australia.

The Act should require the NDIA to provide any relevant data and information that is required by the QSC in its price monitoring functions. The NDIA should make public a summary of the report of the 2017 McKinsey & Company price review upon completion, and provide the full report to the QSC.

RECOMMENDATION 8.3

The Australian Government should amend the *National Disability Insurance Scheme Act 2013* (Cwlth) to transfer the National Disability Insurance Agency's (NDIA) power to set price caps for scheme supports to the National Disability Insurance Scheme Quality and Safeguards Commission (QSC) by no later than 1 July 2020. The Act should require the NDIA to provide any relevant data and information that is required by the QSC in its price regulation functions.

Prices should only be regulated as narrowly and for as short a time as possible. As part of its price regulation functions, the QSC should:

- collect, de-identify and publicly release data on providers' characteristics, including the price, profits, costs and quality of services
- set price caps for supports at least at a state and territory level, which should be made public no less than 60 days before prices take effect
- comprehensively review and make public its price model on at least an annual basis. This review should be transparent, have wide public consultation, be evidence-based and evaluate the effectiveness of prices in meeting clearly defined objectives
- determine when to deregulate prices for supports, with particular regard to the type of support and region.

Progress towards price deregulation should be considered by the independent review of scheme costs in 2023.

9 Workforce readiness

Key points

- The disability care workforce will need to roughly double from its 2014-15 level to meet the increased demand for National Disability Insurance Scheme (NDIS) supports. This will mean that about 1 in 5 new jobs (net) forecast to be created in Australia over the transition period will need to be in disability care. While the disability care workforce has already grown considerably, it is unlikely to meet this target under current policy settings.
- There are a number of challenges to growing the disability care workforce. These include: the effect of price caps for NDIS supports on wage growth; finding carers to meet high participant demand at particular times of the day; ensuring that there are enough qualified carers to provide a reasonable quality of care (including allied health professionals); and increasing rates of retirement of workers from the sector as they age. There are also regional challenges — the workforce will need to triple or even more to meet demand in some areas.
- Policy changes that would help to address some of the workforce shortages over the transition period include:
  - taking advantage of the preference of many workers in the disability care sector to work more hours
  - using a targeted approach to immigration to address persistent skill shortages
  - trialling different approaches to help fund volunteer organisations to provide participant supports.
- Over the longer term, there needs to be a clearer delineation of roles and responsibilities for developing workforce policy for a more coordinated response to meeting the workforce needs of the NDIS. Building the evidence base on the number of workers in the sector, and their conditions and working arrangements, would be a sound investment to develop more effective workforce policies in the future.
- The way respite services are provided under the NDIS — participants are required to include it in their plans, and there are caps on the amount of respite — could be creating a disincentive for providers to supply these services. This may reduce the ability of participants' family members and friends to provide informal care. A lack of respite and informal care will increase demand for formal carers and scheme costs.

The state of the disability care market's readiness to deliver National Disability Insurance Scheme (NDIS) supports will affect scheme costs. Market readiness depends on, among other things, whether there are enough workers to provide NDIS supports.

As recognised by the National Disability Insurance Agency (NDIA), any workforce shortages are a risk to the scheme.

> A major concern for the NDIA is that the speed in growth of demand cannot be met by a commensurate speed in growth of supply. The availability of workforce is a significant factor in the ability of the market to supply the needs of people with disability. (sub. 161, p. 95)

While workforce shortages will have a direct effect on scheme costs, the NDIA's pricing policies will also affect workforce growth and scheme costs. For example, without price regulation (in the short term), increased competition for care workers could bid up wages and increase scheme costs. However, with price regulation, the workforce may not grow quickly enough. This could lead to unmet demand for participants, which will put a brake on scheme costs, but could also undermine the objectives of the scheme by restricting access to reasonable and necessary supports.

This chapter examines the question — can the disability care workforce grow quickly enough to supply the increasing demand for services under the NDIS?

Section 9.1 looks at the current state and characteristics of the disability care workforce. Section 9.2 discusses the size and scope of the workforce that will be needed when the NDIS is fully rolled out. Section 9.3 examines policy options for developing the workforce, and ways to reduce the number of workers required to provide NDIS supports. Section 9.4 examines policies for informal carers that may reduce calls on the formal care workforce.

9.1 The disability care workforce

The disability care and support workforce is diverse. It includes disability support workers that provide daily care and allied health professionals that provide specialised care. As the NDIS is rolled out, the size and scope of the workforce will increase — both to cater for more participants, and to embrace new roles driven by the market-based system as participants exercise greater choice over their supports.

To understand how the workforce will need to change requires an understanding of what it looks like now. It is difficult to measure the disability care workforce as it is usually classified in the same category with aged care workers in regularly published statistics (box 9.1). With this in mind, a number of broad conclusions about the disability (and aged care) workforce can be drawn.

- Disability care workers are older than the workforce in general (figure 9.1) — about 22 per cent of workers are aged 55 years and older (NDS, sub. 51, p. 9).
- About 80 per cent of employees in the disability care sector are women (compared with about 46 per cent of employees for all occupations).[73]

[73] Commission estimates based on ABS (*TableBuilder*, Education and Work, May 2016).

- About 60 per cent of employees in the disability care sector work part time (compared with about 30 per cent of employees for all occupations).[74]
- The majority of workers in the disability care sector hold a certificate-level qualification (figure 9.2).

Box 9.1 Measurement issues: the disability care workforce

Data on workers in Australia are collected regularly by the Australian Bureau of Statistics based on the industry of employment (the Australia-New Zealand Standard Industry Classification (ANZSIC)) and the occupation of the worker (using the Australia-New Zealand Standard Classification of Occupations (ANZSCO)) (ABS 2006, 2013). However, neither of these classifications are well suited to identifying those working in the disability care sector, or those working in disability care roles.

For example, the most disaggregated — that is, the level of finest detail — ANZSIC classification that includes disability carers is '8790 Other Social Assistance Services', which also includes aged care assistance services, marriage guidance services, and the operation of soup kitchens. In ANZSCO it is '4231 Aged or Disabled Carer', which again combines aged and disability carers together. Neither of these are ideal for analysing the state of the disability care workforce.

Allied health professionals who work in the disability support sector are similarly hard to identify, as it is difficult to distinguish between those that may provide services occasionally or those that provide them full time to people with disability. The classification of allied health professionals is also contentious and subject to revision.

> There is no one definition which prescribes the disciplines considered as allied health. At the meeting of the Council of Australian Governments in July 2006, agreement was reached to establish NRAS [the National Registration and Accreditation Scheme] for health professionals, beginning with the ten professional groups registered in all jurisdictions, of which seven fall under the allied health banner: chiropractic care, optometry, osteopathy, pharmacy, physiotherapy, podiatry, and psychology. … A further four allied health professions joined NRAS on 1 July 2012: Aboriginal and Torres Strait Islander health practitioners, Chinese medicine practitioners, medical radiation practitioners and occupational therapists. … Other allied health professions that are not included under NRAS, but are considered in the Commonwealth's health workforce policy planning, include: Audiologists, Counsellors, Dieticians, Exercise physiologists, Music therapists, Nutritionists, Pathologists, Social workers, Sonographers, Speech pathologists. (Department of Health and Ageing 2013)

Other studies, including the Commission's inquiry into *Disability Care and Support* (PC 2011), relied on 'one-off' surveys and alternative data sources to better understand the disability care workforce. This included a detailed survey by Martin and Healy (2010). This survey remains the most specialised data source for the disability care sector workforce, though is now becoming dated. A more recent survey on the disability care workforce (Cortis 2017) provides an update to some of the matters examined by Martin and Healy.

[74] Commission estimates based on ABS (*TableBuilder*, Education and Work, May 2016).

9.2 What workforce will be needed?

While estimates of the number of workers required to deliver supports allocated through the NDIS vary, the consensus is that the workforce will need to increase by between 60 000-90 000 full-time equivalent employees (FTE) — or roughly double in size.

> The workforce will need to increase from approximately 73 600 full-time equivalent (FTE) workers, to an estimated 162 000 FTE workers. (DRC 2015a, p. 19).
>
> The workforce opportunities and challenges as a result of the introduction of the NDIS are very significant. It is expected that the NDIS will generate between 60 000 and 70 000 new jobs on a full-time equivalent basis over the next three years. This represents about 20 per cent of the total number of new jobs forecast to be created in Australia over this period. (Bonyhady 2016, p. 5)

The NDIA's market position statements suggest that about an additional 70 000 FTE workers will be needed from 2015-16 to 2019-20 (NDIA 2016c, 2016l, 2016s, 2016u, 2016w, 2016x, 2017v).

The evidence to date — at the early stage of transition — is that the workforce is growing quickly, but not fast enough to meet the overall growth target. About 18 per cent growth in FTE employees is required to meet the expected workforce needed for the scheme.[75] Data collected on the workforce by National Disability Services (NDS), a peak body for disability care providers, indicate that the number of FTE workers in the sector is growing at a rate of about 6 per cent each year (Alcorso 2017, p. 3). Data from the NDS's Financial Benchmarking Project (in partnership with the University of Western Australia) indicate annual growth of FTE workers of about 12 per cent (Gilchrist and Knight 2017b, p. 47). The ABS Labour Force data indicate growth of about 13 per cent for the most recent year.[76] Each of these indicate that workforce growth is less than what is needed.

Data on allied health professionals, albeit patchy and reported in a period early in the trial phase, also indicate that growth rates in FTE employees are slow (table 9.1). Clearly, there are considerable challenges emerging in scaling up the workforce to meet the needs of NDIS participants.

[75] Commission estimates based on NDIA (2016c, 2016l, 2016s, 2016u, 2016w, 2016x, 2017v).

[76] Commission estimates based on ABS (*TableBuilder*, Education and Work, May 2015 and May 2016) indicate the number of people employed in aged and disability care occupations increased by about 27 per cent between 2015 and 2016 according to ABS Labour Force data. Based on the proportion of part-time to full-time positions, halving the rates of reported 'headcount' growth allows for a rough approximation of the FTE growth targets.

Table 9.1 **The number of registered allied health professionals[a]**
2014

Allied Health Category	*Number registered*	*Average hours worked per week*	*FTE equivalent per 100 000 population*	*Average annual growth rate in FTE per 100 000 population (%)*
Psychologists	31 489	32.7	87.4	1.3[b]
Physiotherapists	27 011	34.7	83.3	2.1[b]
Occupational therapists	16 757	33.1	52.2	3.2[c]
Chiropractors	4 902	32.8	15.8	1.3[b]
Podiatrists	4 314	36.2	16.1	4.0[b]
Dental prosthetists	1 223	38.8	4.9	-2.6[b]
Aboriginal and Torres Strait Islander health practitioners	322	40.7	1.2[d]	4-5[e]

[a] Only selected allied health professions shown from National Registration and Accreditation Scheme data (box 9.1). No data are available for speech therapists and dieticians. The data for 2015 were recently released (Department of Health 2017c), but are not reported in a form that can be easily compared with the above. [b] 2011 to 2014. [c] 2013 to 2014. [d] 76.4 based on Aboriginal and Torres Strait Islander population. [e] 2012 to 2014. A range is presented given the low precision in which the data are reported.

Challenges to reaching the workforce target

While estimates of FTE employees are helpful for providing an overview of the growth required, they mask a wider variation in supply and demand at a more disaggregated level. There are many different workforces that will provide services for NDIS participants, and the challenges and policy responses to each will vary. A better way is to consider the disability care workforce across 'role and region'.

- Role covers the types of workers needed to fulfil a NDIS participant's needs, which in turn will depend on individual choice, disability and other family circumstances. This translates to the skill mix of workers needed, and in turn, the mix of general carers, allied health professionals, and other workers required.
- Region covers the different number and growth in workers required in different locations.

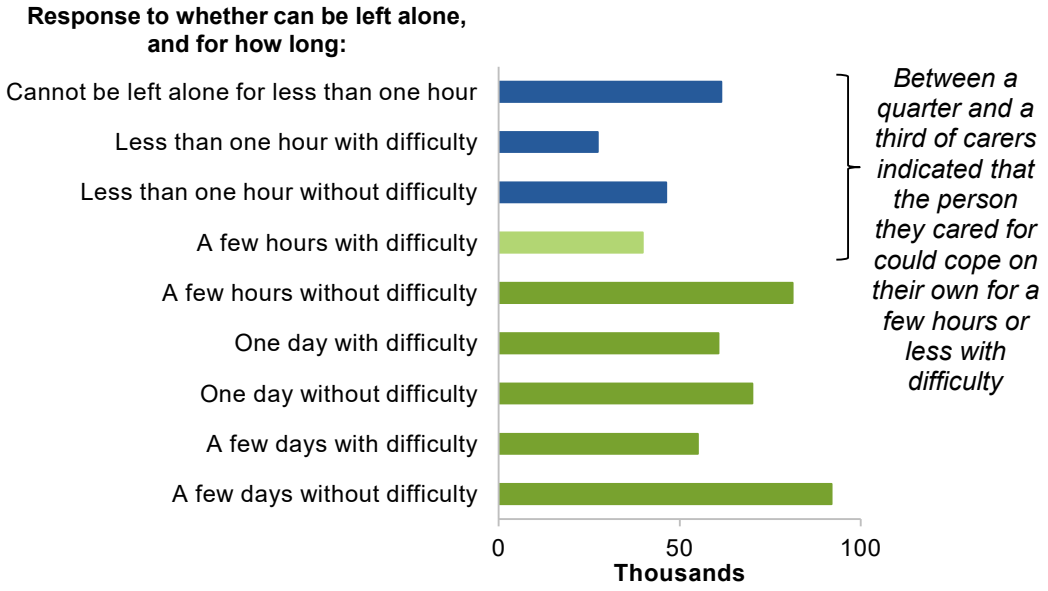
Role challenges

Peak hours

Disability carers are often required for only a few hours each day at 'peak times' — there is high demand for carers in early mornings and evenings to help people with disability get in

or out of bed, showered and fed (Physical Disability Australia, sub. 38, p. 11). This is reflected in the Survey of Disability, Ageing and Carers, which indicates that about three-quarters of people with severe or profound disability require attendant care for a few hours a day before encountering difficulties (figure 9.3).

Figure 9.3 **Amount of care required before recipient has difficulties[a]**
2015



[a] Based on the response by the carer for those with severe or profound disability aged 15 years or more.

Sources: Commission estimates based on ABS (*Disability, Ageing and Carers Australia: Summary of Findings, 2015,* Cat. no. 4430.0, table 42).

This means that there are times of the day when more carers are needed than the average would suggest, which would require a greater headcount than the FTE figures suggest. This has implications for how 'flexible' the workforce needs to be. As the NDIA said:

> Participant demand for care often occurs at 'peak times' or high demand periods which may include 7-9am (breakfast) and 4-8pm (bathing and mealtime) with less demand at late morning or mid-afternoon. This poses challenges for the sector to develop more mature rostering and staff management practices which are emerging in some areas. (sub. 161, p. 98)

Making greater use of a more casualised workforce could provide the labour needed in those hours of greatest demand. However, there are also some impediments, including:

- minimum shift requirements under the Social, Community, Home Care and Disability Services Industry Award, and the cost of casual loadings and penalty rates for working less desirable hours (such as those outside ordinary hours of work)
- quality concerns, such as whether NDIS participants want a different carer for each instance of care, and issues of reliability of casual labour (Cortis 2017, p. 6)

- whether there is the supply of casual labour to allow such an approach.
  - This includes the attractiveness to work on a casual basis for prospective workers, and the risk that more experienced and better qualified workers may seek permanent jobs elsewhere given the disincentives associated with less secure work (AAWA, sub. PP219, p. 8; Independent Inquiry into Insecure Work in Australia 2012, pp. 55-58).
  - Potential changes to casual employment in modern awards may also affect the supply of casual workers (box 9.2).

Box 9.2 Changes that may affect casual employment in the future

The Fair Work Commission (FWC) completed its four-yearly review of modern awards in July 2017. One of the matters it examined was the growing trend of casual employment, and the possibility that more casual workers were employed in patterns of work consistent with permanent employees. Some participants in the FWC review raised concerns that such employees were denied the benefits of being permanent employees, such as some entitlements under the National Employment Standards. The FWC noted:

> Although the casual loading for which modern awards provide notionally compensates for the financial benefits of those [National Employment Standards] entitlements which are not applicable to casuals, this does not take into account the detriments which the evidence has demonstrated may attach to the absence of such benefits, particularly for adult long-term casuals who are financially dependent on their casual employment. These include attending work while sick, not taking recreational leave because of concerns about whether any absence from work will endanger future employment, the incapacity to properly balance work and attending to personal and caring responsibilities and commitments, changes in working hours without notice, and potential for the sudden loss of what had been regular work without any proper notice or adjustment payment. Additionally there are other detriments associated with casual employment of this nature, including the lack of a career path, diminished access to training and workplace participation, poorer health and safety outcomes and the inability to obtain loans from financial institutions. (2017, para. 7)

In response, the FWC developed a draft model 'casual conversion' clause that provides a mechanism to allow those employed as casuals on a 'permanent' basis to achieve permanent employment. The draft clause allows:

- casual employees that have been working for a period of 12 months or longer in a pattern of hours on an ongoing basis consistent with the full-time or part-time provisions of the relevant award to request for conversion to a permanent position
- employers to only refuse the request for reasons including that:
  - to do so would require a significant adjustment to the casual employee's hours of work
  - it is reasonably foreseeable that the casual employee's position will cease to exist.

(continued next page)

Box 9.2 (continued)

The draft model clause is yet to be implemented, and subject to further consultation by the FWC.

A casual conversion clause as presently drafted by the FWC could have ramifications for the National Disability Insurance Scheme (NDIS) workforce and scheme sustainability. Much of the scheme's settings rely on a significant increase in casual employees who would work fairly consistent and predictable hours. If these workers took up the option to convert to permanency, then this could reduce the flexibility of employers to respond to demand from scheme participants (and could require adjustment to the assumptions used in the National Disability Insurance Agency's pricing approach). What is unclear is how many employees might opt to use a casual conversion clause. While some employees may be attracted to more secure employment, it would come at the cost of loading attached to casual employment.

One incentive such a clause could create is for employers to keep the number of hours worked by employees low to avoid the risk of a casual conversion occurring. This would, all else being equal, increase the number of workers required to provide NDIS supports, as the same number of hours would be spread across a larger number of shorter shifts. More data on the work patterns of those working in disability care and support roles in the NDIS is needed to understand how the introduction of the clause may affect providers, employees and the sustainability of the scheme.

Sources: FWC (2017) and Pallot et al. (2017).

Qualified staff in general

The quality of care provided to NDIS participants will depend in large part on the quality and skills of the workers providing disability supports. For many roles, formal qualifications are important, if not mandatory, to provide supports. For other roles, formal qualifications are less important. The available evidence suggests that the 'average' level of formal skills in the disability care workforce will decline over the transition period of the NDIS (box 9.3).

This raises the question — is a formal qualification the most important or necessary characteristic to secure employment as a disability support carer?

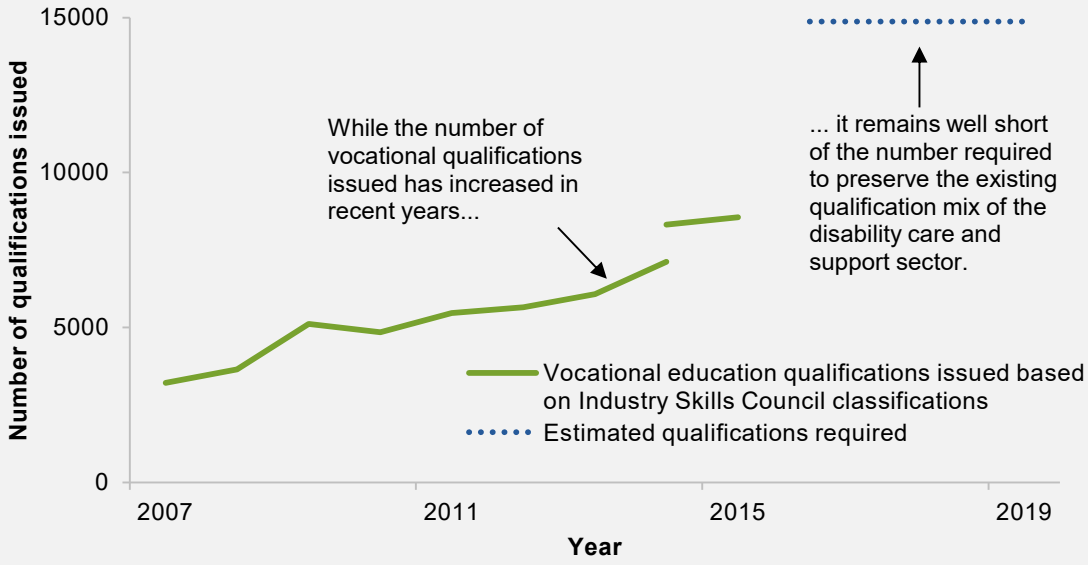
A survey of firms specialising in disability support by the Department of Employment (2014, pp. 2, 5) found the evidence to be mixed.

- 89 per cent of providers said that 'personal qualities' were 'important or very important' in terms of the characteristics sought, compared to 70 per cent for 'relevant experience' and 47 per cent for 'relevant qualifications'.
- 89 per cent of firms said that their minimum requirement for employment was a certificate-level qualification. However, 26 per cent of firms indicated that they regularly employed unqualified workers, suggesting this requirement was not a binding constraint for some firms.

Box 9.3 Not enough new trainees to maintain formal qualifications[a]

People employed in aged and disability care roles are more likely to hold a formal qualification than the workforce in general. The most common level of qualification for disability and aged care workers is a certificate III or IV. The number of people completing a qualification against expected workforce targets provides a measure of how the qualification mix of the workforce may look by the end of the National Disability Insurance Scheme transition.

The National Centre for Vocational Education Research dataset on vocational education outcomes (VOCSTATS) indicates that, if workforce targets are met, there will be a smaller proportion (than currently) of workers holding a certificate-level qualification. The figure below shows that about 50 000 certificate or diploma level qualifications were issued in the nine years between 2007 and 2015, while about another 60 000 qualifications would be necessary in the four years between 2016 and 2019 to preserve the same distribution of qualifications observed in the 2011 census.



This indicates that the proportion of workers holding certificate-level qualifications in disability care related studies will fall over the transition period. However, it is not clear what mix of qualifications will be necessary for all National Disability Insurance Scheme participants.

[a] Estimate is derived by subtracting the expected and current midpoint estimates of FTE disability care and support workers from the NDIA's market position statements and multiplying by a scaling factor of 0.85 to apply the proportion of full-time equivalent workers with a certificate or diploma qualification. This yields a result of 59 500 additional qualified workers, which when apportioned over 4 years requires 14 875 new qualified workers per year. Vocational qualifications are identified using Industry Skills Council classifications that include the term 'disability' in their title (specifically, codes CHC20599, CHC30302, CHC30408, CHC30799, CHC40202, CHC40302, CHC40308, CHC40312, CHC40799, CHC50102, CHC50108, CHC50799, CHC60102, CHC60108, CHC60112, CHC60799). The HSU (sub. PP316, p. 8) suggested that 'Certificate III in Individual Support' (CHC33015) be included — it is not included because the qualification can be aged care specific, and that there are concerns about the relevance of the qualification to disability care in general (ACT Government, sub. PP312, p. 13). Note that these data are presented in terms of qualifications awarded rather than qualifications used on a FTE basis. The break in series reflects changes in concordance between previously offered qualifications and current qualifications.

Sources: Commission estimates based on ABS (*TableBuilder,* Education and Work, May 2016) and NCVER (*VOCSTATS*, March 2017).

This inconsistent story was also reflected in evidence provided to the Commission's 2011 inquiry into *Disability Care and Support*. While some providers argued that a minimum standard or qualification should be mandated for disability support staff, others said that formal qualifications sometimes fell short of providing 'work ready' employees, and that on-the-job training was far more important (PC 2011, p. 740).

In practice, the benefits of a formal qualification depend on the role that a disability care worker is employed in, and the client's needs. The NDIS will also mean that many workers will need to learn additional skills in the market-based environment for disability supports.

> The NDIS differs considerably from previous reforms as it moves away from 'block funding' programs to a 'fee for service' model. Earlier reforms had little effect on frontline workers. But now workforce models are changing. Frontline workers need to have an understanding of sales, customer service and the ability to work within financial constraints as well [as] being able to adapt and customise service delivery in a person centred model.
>
> Conversations are being held in the sector regarding formal qualifications and whether they are necessary. Some organisations are recruiting workers with no experience and no formal qualifications, with new staff undergoing customised organisational training only. For other organisations, formal qualifications are a pre-requisite. This brings opportunities for a diverse workforce. (Queensland Alliance for Mental Health, in VICSERV & CMHA 2017, p. 46)

It seems reasonable to conclude that the lack of certificate-qualified workers will affect some firms and present a challenge to meeting the workforce target of the NDIS, but the evidence is too limited to say which areas will be most disadvantaged. Also, participants may prioritise attitude and aptitude, and choose to employ less qualified staff who better suit their needs.

Qualified allied health professionals

Allied health roles are very different to attendant care roles. Allied health professionals specialise in a range of different areas, and hold higher level qualifications relative to the disability support workforce in general.

> Allied health professionals are generally educated in the university sector with bachelor degrees, usually three to four years duration. However, in a development common to other health professions, there is an increasing move to postgraduate degrees, for example an initial generic undergraduate science degree followed by a Masters in an individual discipline. (Department of Health and Ageing 2013)

Formal qualifications are almost always a requirement for allied health professionals to practice, which means building up qualified staff can take much longer than for other roles. Constraints in this regard were recognised as part of the *Integrated Market, Sector and Workforce Strategy*.

> It is estimated that the highest rate of increase in the demand for disability workers will be for allied health professionals. The disability sector will need to work closely with related community service sectors, particularly health and aged care, to ensure the demand for allied health professionals is met.

> To support the sector and enhance the supply of allied health professionals to the disability sector, the Commonwealth and jurisdictions will work with the sector, education authorities, and professional bodies to ensure that professional education prepares graduates adequately to work in the NDIS. At the same time, to encourage allied health professionals to choose the disability sector, the Commonwealth will work with these same stakeholders to strengthen the sector's capacity to provide high-quality placements and support continuing professional development for allied health workers. (DRC 2015a, p. 20)

If the allied health professional workforce does not build quickly enough, this could lead to unmet demand for participants and a substitution away from using professional carers to using more general workers instead. There is some evidence that this is already occurring.

> A perception was expressed in the wave 1 interviews that the pricing structure of the NDIS would bring change to the role of allied health professionals through encouraging the increased use of non-professional staff. By wave 2 a de-professionalisation of the disability workforce was more commonly being reported, with increasing numbers of allied health assistants in the sector. Concerns were raised about the ability and skills of these workers to provide more complex supports and the impact this could have on the quality of care and outcomes for participants. (Mavromaras, Moskos and Mahuteau 2016, p. 48)

And one of the providers interviewed in the evaluation said:

> We have employed a number of inexperienced people, but I believe that's starting to backfire … Just the inexperience and the lack of knowledge on how to work with behaviours or understand confidentiality, or things like professional distance and all those types of things. And we're sending inexperienced people out to work individually with people with disabilities. (Mavromaras, Moskos and Mahuteau 2016, p. 48)

Evidence presented to the Commission provides another inconsistent story about supply and demand for allied health workers in the NDIS. On the one hand, the number of providers registered to deliver allied health services to NDIS participants has grown strongly (NDIA 2016r, p. 43), and in line with the expected number needed by the end of the transition period. However, many who have registered are not yet providing services to scheme participants. This makes it difficult to determine if they are registering in advance of the NDIS rollout or have changed their mind about delivering services.

Many disability service providers pointed to a number of allied health roles that are moderately or extremely difficult to fill. For example, more than half of the firms surveyed by National Disability Services said that they had experienced difficulties recruiting speech therapists and occupational therapists (NDS 2016, p. 38). The *Intermediate Review of the NDIS* also identified persistent shortages in the areas of speech pathology, occupational therapy and psychology supports (Mavromaras, Moskos and Mahuteau 2016, p. 32), although supply to those who needed such services had increased.

As one staff member of the NDIA in the Intermediate Review put it:

> The NDIS has worked twofold. It's increased the amount of service available so people can see other OTs [Occupational Therapists] outside of what they would have been able to. But there's

> an increased demand. The increased demand is way above the increase of services. (Mavromaras, Moskos and Mahuteau 2016, p. 54)

Some service providers and peak bodies expressed concerns about whether there will be enough allied health providers for NDIS participants, and the consequences for sectors (box 9.4).

A lack of allied health professionals represents a risk that supports of appropriate (and necessary) quality may not be available to some NDIS participants. The time it takes to train an allied health worker — both in terms of formal qualifications and on-the-job training — means that it may be too late to prepare the necessary allied health workforce without either diverting them from other caring sectors, or to seek skilled migrants to fill the workforce gap in the short term. Both approaches involve costs.

Box 9.4 Finding allied health workers can be difficult

Matt Burrows:

> The workforce is a wicked problem. … To think that we, as service providers, can just advertise for and employ that many qualified staff (eg therapists) in such a short time is just misguided. Let alone the considerations of balancing a commercial and compassionate culture during this transition time.
>
> At entry to the NDIS in 2012-13 the employment market for therapists relied heavily on internationals supported to work domestically on 457 visas. By 2016-17 the training institutions had geared up and graduates now make up a steady portion of the new recruits. But there remains a gap and that gap is being filled from the full employment market being accessed elsewhere. Australia only has so many therapists and their entry into the NDIS employment field means they are exiting elsewhere. (sub. 7, pp. 3–4)

Disability Services Australia:

> Professional staff, in particular Psychologists and Speech Pathologists are generally difficult to attract (especially in Regional areas) in a very competitive marketplace. This has driven the need to implement creative sourcing strategies such as the hiring of interns for a short term solution. We have also seen significant wages growth in the allied health professions due to labour shortages. (sub. 9, p. 9)

Australian Physiotherapy Association:

> Our members have suggested that increasing the NDIS workforce to that which is projected as being required will not be possible in the current policy settings. They have advised us that demand for services has already stripped supply of providers. (sub. 93, p. 16)

Allied Health Professions Australia:

> Current demand for services is already exceeding the available supply of allied health providers and there is no evidence of short term changes to this workforce shortage. (sub. 37, p. 16)

An ageing workforce and population presents a greater challenge

Australia has an ageing population, and this is reflected in the increasing average age of:

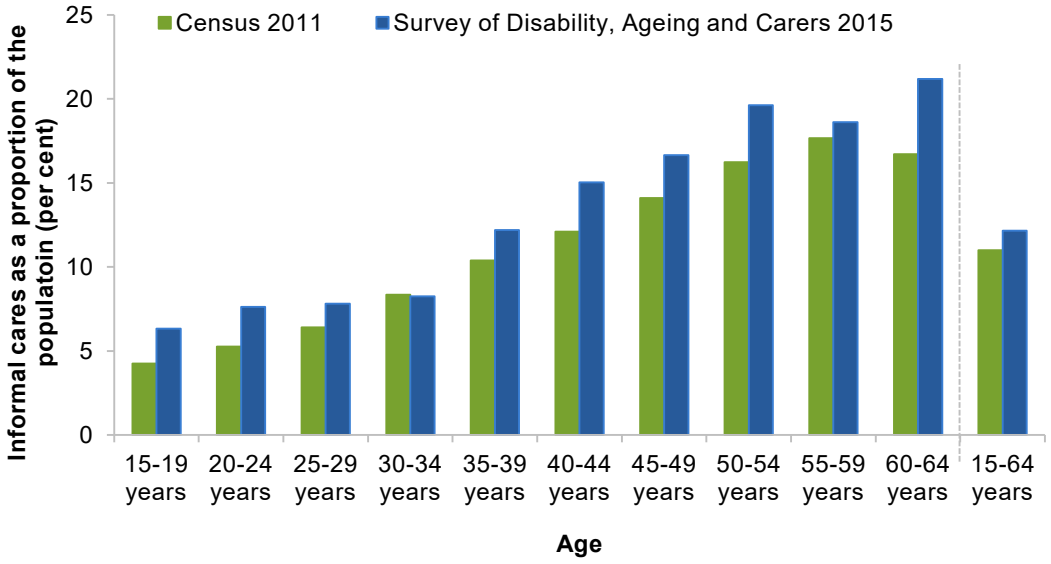
- formal carers employed to look after people with disability (figure 9.4)
- informal carers who look after friends and family with disability

- the general population, which will affect the on demand for carers more broadly.

As noted above, the average age of carers employed in the aged and disability care workforce is higher than for the general workforce. The average age of people employed in aged and disability care is about 47 years, and about a quarter are above the age of 55 years (figure 9.4).[77] An increasing proportion of the care workforce is likely to retire in the coming years, with the average retirement age of those employed in the personal care and assistance occupations about 55 years in 2014-15.[78] Only about half of those working in disability care intend to still be working in the sector in five years' time, with a further third unsure (Cortis 2017, p. 24).

Informal carers are also ageing. The trend since the 2011 Census is an increasing proportion of people aged 50-64 years providing care for others (figure 9.4). The ability of informal carers to continue providing this care as they age is likely to diminish. As the degree of informal care a NDIS participant receives affects the amount of formal care supports that they are allocated, this suggests that as informal carers age, there will be greater calls on the NDIS to provide more supports and this will require a larger formal workforce.

Figure 9.4 **Informal carers are growing older**



Sources: Commission estimates based on ABS (*TableBuilder Basic,* 2011 Census; *TableBuilder,* Survey of Disability, Ageing and Carers 2015, Cat. no. 4430.0).

The ageing population also means there will be more intensive demand for carers. While aged care workers are not perfect substitutes for disability care workers, there are some roles

77 Commission estimates based on ABS (*TableBuilder Basic,* 2011 Census).

78 Commission estimates based on ABS (*Retirement and Retirement Intentions, Australia, July 2014 to June 2015,* Cat. no. 6238.0, unpublished data).

that cross over, and about one-fifth of disability care providers are intending to enter the aged care sector (NDS 2016, p. 13). This means that even if new carers are trained, they may not be attracted to the disability care sector as the aged care sector expands. As Disability Services Australia said:

> There is no doubt that as Baby Boomers retire from full time work there will be an overall impact on a range of employment sectors. Whilst there may be some potential for retirees to take on casual disability support or mentoring roles, the ageing population will also create an increase in demand for aged care workers, in direct competition with the recruitment for workers in to disability roles. (sub. 9, p. 9)

And even if the disability sector can attract workers from the aged care sector, there could still be implications for scheme costs. For example, if the quality of aged care services falls because of workforce shortages, there could be a stronger incentive for NDIS participants to remain in the scheme past the age of 65 years.

The role of wages in growing the workforce

Most of the payments from the NDIS will be spent on wages, given the labour-intensive nature of disability care. While price caps will have an impact (chapter 8), this is likely to mean more money will be available for workers. From a policy perspective, the question is whether this money will be sufficient to induce more workers to provide disability supports. This depends on how competitive the disability care market is, how responsive care workers are to wages, and in turn, why people work in the disability care sector.

Analysis conducted prior to the introduction of the NDIS suggests that pay is one of many motivations to work in disability care. For example, a study of community service employees undertaken in 2009 found that only 16 per cent of employees were attracted to work in the disability services sector primarily for the pay (Martin and Healy 2010, p. 135). A desire to help others and a desire to do something worthwhile were far more important motivations (nominated by 76 and 68 per cent of workers, respectively) (Martin and Healy 2010, p. 135). As one disability support worker said:

> I love this industry. It's not about coming into work, doing an 8 hour shift and leaving. It's so much more than that. For some people we can be their eyes, their ears or their hands. (United Voice, sub. 118, p. 2)

However, there is also evidence that higher rates of pay can help retain workers in disability care roles and attract new workers to the sector. Just over half of employees who left a disability support provider surveyed by the Department of Employment (2014, p. 17) said that they left for a position that had 'better pay and conditions', and about 60 per cent of firms used increased remuneration as a means to improve retention. Given the ageing workforce, higher wages could be used to keep workers from retiring, to the extent that wages can increase under the NDIA's price caps.

Overcoming the perception that caring jobs do not lead to fulfilling careers may be necessary to have enough workers to provide NDIS supports. As noted in the Integrated Market, Sector and Workforce Strategy:

> To meet the increased demand for disability workers, including allied health professionals, it will be necessary to assist suppliers to promote the disability sector nationally as a career. (DRC 2015a, p. 20)

A number of study participants noted that caring roles are seen as unattractive due to the nature and remuneration of the work.

> The nature of the work of disability support staff may not in itself be attractive enough to appeal to many school leavers and those looking for a career change in later life. The work itself can be highly complex and carry significant risk, especially when supporting people with severe challenging behaviours or people with complex medical support needs. Greater provision for training support staff is vitally important at present, providers are limited in the amount of training that can be provided due to cost pressures. (Macarthur Disability Services, sub. 57, p. 8)

> The NDIA has observed over the course of trial and transition that caring jobs are often poorly valued. Common reasons cited for a lack of retention (Department of Employment survey of Personal Care Workers 2014, National Aged Care Workforce Census and Survey) include the low conditions of work and physical and emotional toll of the job. This is regrettable. (NDIA, sub. 161, p. 97)

> That caring roles are poorly [valued] is not perception, it is reality. Caring jobs are poorly valued. Pay rates are mostly minimal. Good or exceptional performance of the role is rarely valued financially. (Autism Aspergers Advocacy Australia, sub. 178, p. 26)

> Low prices also militate against the sector creating additional jobs that would be useful in alleviating professional shortages, such as allied health assistants and peer workers. (NDS, sub. 51, p. 9)

How labour will respond to conditions under the NDIS over the longer term is hard to assess. The data make it difficult to understand the number and hours worked by employees of disability care providers. The unprecedented scale of workforce growth required, combined with a new market-based approach, also mean that historical data on wages and work patterns are less useful to estimate the future. The interaction with other care sectors — especially aged care — will also be important. More data will need to be collected to make meaningful wage policy when it comes to NDIS workers.

Regional challenges

The disability care workforce needs to double in aggregate, but the scale of growth required in individual regions varies between as little as 5 to over 300 per cent (figure 9.5).[79] Most regions will need to grow their disability care workforce between 50 and 150 per cent. While some of the percentage increases are large, many are based on a very low number of workers

[79] Regions are groups of local government areas, which are the geographical basis for the NDIA's market position statements.

to start with. This is especially the case in rural or remote areas where a few workers can represent a doubling of the disability care workforce.

Some of the challenges with thin markets in remote areas are discussed in chapter 7, but it is worth noting that there are several regions within metropolitan areas where the required growth is about 200 per cent:

- South Western Sydney, where about an additional 5800 FTE workers are needed (growth of 215 per cent)
- Southern Melbourne, where about an additional 2500 FTE workers are needed (growth of 211 per cent)
- Beenleigh, where about an additional 2300 FTE workers are needed (growth of 190 per cent)
- Brimbank Melton, where about an additional 1700 FTE workers are needed (growth of 197 per cent).

Figure 9.5 **Variation in growth required in different regions**[a]

Each dot represents the growth in the amount of FTE employees needed relative to the current situation, both in terms of the number and proportion, between 2015-16 and 2019-20.

[a] The NDIA's market position statements provide a range of estimates for the number of FTE disability workers at present and what will be needed in the future. To derive these estimates for growth, the midpoints of each range are used. No data are available for Western Australia. Regions are groups of local government areas.

Sources: Commission estimates based on NDIA (2016c, 2016l, 2016s, 2016u, 2016w, 2016x, 2017v).

These data, as published, do not capture the mix of roles within the FTE positions. For example, they do not distinguish between the hours of care provided by an in-home carer as opposed to those provided by an allied health professional. All of this emphasises the need for policies that seek to mitigate workforce shortages to have a focus at a regional level, where different policy responses may be more appropriate across different regions and roles.

The bottom line?

The scale of workforce growth required, combined with challenges of worker roles and regional variation, means that the NDIS workforce targets are unlikely to be met by 2020. As both the Intermediate Review of the NDIS and the former Chair of the NDIA noted:

> While the NDIS had led to an increase in the supply of disability supports, the Scheme had also led to an increase in a demand for services (and particularly therapy services); NDIA staff concluded that overall, demand now exceeded supply. (Mavromaras, Moskos and Mahuteau 2016, p. 54)

> The Bilateral Agreements imply that in the current fiscal year of 2017-18 demand for disability services will increase by 40 per cent. The lack of progress on workforce readiness for the NDIS means that shortages and, potentially, significant shortages will appear in many areas within the next 12 months. This means that the transition to the full NDIS by mid-2019 is not achievable. (Bruce Bonyhady, sub. PP333, p. 17)

The trends to date show that providers are already responding to workforce shortages by using less skilled labour. In some cases, this may compromise the quality of care received by participants and could become more widespread as the NDIS is fully rolled out. This, in turn, will reduce the effectiveness of the NDIS, compromise its insurance principles (and increase long-term costs), and in some cases, be a risk to participants' wellbeing.

It is more difficult to make an assessment about how far the workforce will develop beyond the transition given the uncertainties about how yet-to-be implemented policies will affect the supply and demand for workers (such as the implementation of the NDIS Quality and Safeguarding Framework, outcomes of future price reviews, and the implications of the NDIA's Market Intervention Framework).

FINDING 9.1

The disability care workforce will not be sufficient to deliver the supports expected to be allocated by the National Disability Insurance Agency by 2020.

9.3 What can be done to improve workforce readiness?

The challenges confronting the readiness of the workforce, if left unaddressed, could create short-term and long-term risks to the sustainability of the scheme and the wellbeing of participants. In the short term, a lack of qualified workers may mean that less qualified staff are used to deliver supports, or there will be unmet demand. This, in turn, erodes the benefits of the insurance approach over the longer term, meaning that the costs to support participants will be higher than necessary. However, some of these challenges can be addressed relatively quickly, or alternative arrangements employed to mitigate their effects.

Getting the right balance between strategy and action

The responsibility for funding sector and workforce development was allocated to the Australian Government as part of the 2012 Intergovernmental Agreement for the National Disability Insurance Scheme Launch (ANAO 2016, p. 16). The Department of Social Services (DSS) is responsible for many of the roles developing the disability care workforce to meet the needs of the NDIS, including: coordinating and facilitating responses to workforce shortages; coordinating with other Australian Government agencies to build workforce supply; and developing a coordinated response in particularly challenging areas — such as the demand for allied health professionals (Kruk 2016).

Australian Government initiatives to foster disability care workforce readiness are focused primarily on frameworks and principles developed in consultation with the NDIA (table 9.2). These are designed to provide guidance on how the workforce is to develop.

Such a strategic approach to developing a market — especially one so ground-breaking as the NDIS — was appropriate for the trial period. However, as the scheme begins to build up over the transition period, practical implementation of the strategic objectives is required, particularly to develop the workforce. Relying on strategic policies alone is leading to uncertainty among providers.

> Several strategies have been published (Assistive Technology, Rural and Remote, Market and Workforce). They provide directions but are light on implementation detail. For these strategies to inform the planning and investment decisions of service providers, they need to be underpinned by clear publicly-available plans. (NDS in ANAO 2016, p. 32)

Table 9.2 **Many strategies affect workforce development**

Entity	*Strategy*
NDIA (2013, 2017e)	2013–16 Strategic Plan and 2017–21 Corporate Plan
NDIA (2015c)	Assistive Technology Strategy
NDIA (2016i)	NDIA Market Approach — Statement of Opportunity and Intent
NDIA (2016t)	Rural and Remote Strategy
NDIA (2017b)	Aboriginal and Torres Strait Islander Strategy
NDIA (forthcoming)	Provider of Last Resort Strategy
NDIA (forthcoming)	Market Intervention Framework
DRC (DSS 2016d)	Quality and Safeguards Framework
DRC (2015a)	Integrated Market, Sector and Workforce Strategy
DRC (DSS 2017d)	National Disability Strategy 2010-2020
DSS (2015c)	Sector Development Fund Strategy and Operational Guidelines
DSS (2017b)	Integrated Plan for Carer Support Services

The Australian National Audit Office (ANAO), looking at the market transition under the NDIS, found that the Integrated Market, Sector and Workforce Strategy lacked the details necessary for the transition.

> While establishing a national approach to the market transition, the Strategy does not provide a clear basis for coordinated actions, as it does not commit jurisdictions to specific deliverables, with agreed timeframes, accountabilities and milestones. DSS advised the ANAO that 'detailed timeframes and accountabilities will likely be captured in a bilateral context going forward, recognising the unique characteristics in each jurisdiction in terms of the market and workforce.'
> …
>
> Further detail about how the Strategy is to be operationalised, including specific actions and timeframes, would assist stakeholders, particularly service providers who need to make investment decisions. In July 2016, DSS advised the ANAO that it intends to develop a Strategy 'action plan' for 2016-17 and into the future. Publishing this action plan, including key priorities and initiatives, timeframes and milestones, may help to address stakeholder concerns. (ANAO 2016, p. 32)

The Sector Development Fund (SDF), which is funded by the Australian Government with $146 million to support the NDIS market transition between 2012-13 and 2017-18, includes workforce development as one of its objectives. The DSS administers the SDF by allocating grants to organisations and governments to address areas of identified need. However, in its evaluation of the SDF, the ANAO (2016, p. 34) found that there was limited evidence of the Commonwealth adopting a strategic approach to grant-making, and that a more strategic approach is warranted, informed by evaluation of funded projects.

More recently, most Australian Governments have taken action in response to concerns about workforce shortages (table 9.3), but have done so with different approaches and priorities. There is a risk that fragmented workforce policies will lead to duplication or

unnecessary programs at a time when the scheme can least afford it. As a union that represents many disability carers said:

> Unclear delineation of market development and stewardship responsibilities between the National Disability Insurance Agency (NDIA), the Commonwealth Department of Social Services (DSS) and the States and Territories has resulted in no substantive progress on a workforce development strategy focusing on attraction, retention, skills or quality. (Health Services Union, sub. 132, p. 4)

More recently, the DSS has made efforts to lead workforce developments among NDIS stakeholders, though this is still a work in progress.

> Significant workforce growth is needed to meet demand at full Scheme. DSS has been working with state governments, the NDIA, and the sector to support disability workforce development. This includes working directly with jurisdictions to leverage their expertise in the delivery of disability services to identify and address workforce gaps and to develop workforce plans. (DSS 2017h, p. 12)

While the COAG Disability Reform Council and the DSS have taken steps to clarify responsibilities, further refinement — and speed — is necessary. The 'big tent' approach to workforce development remains appropriate, but the responsibilities of different parties should be made public — a point agreed by the DSS (sub. PP318, p. 16).

- State and Territory Governments should have more responsibility for workforce development issues over the transition period. They know the history of unmet need and the best approaches for solving workforce issues in particular jurisdictions.
- The Australian Government should retain oversight of the scheme, and focus on areas that affect the supply and demand of care workers from an economy-wide perspective, including the interaction of the NDIS with other care sectors, including aged care and monitoring trends in the supply of skilled workers through tertiary and vocational education.
  - The Australian Government should use immigration to address workforce shortages (discussed below).
- The NDIA is best placed to provide more information to governments in the form of actuarial and scheme data collected to provide more granular detail on where supply gaps are emerging, or likely to emerge.
- Providers should also be regularly consulted by governments about emerging workforce policy issues, such as where the incentives of the scheme may be affected by other laws and regulations, like minimum standards, conditions of State, Territory and Australian Government awards, and training and development.

Table 9.3 **Some of the initiatives to build the NDIS workforce undertaken by Australian governments**

Jurisdiction	*Initiatives*
New South Wales	The New South Wales Government spent $5 million to supplement its 'industry development fund', which provides a range of resources for firms to transition to the NDIS and includes materials regarding workforce development (Nucleus Group 2015, pp. 2–3). The New South Wales Government is 'also investing in vocational education and training to create a workforce pipeline of specialist capabilities to meet the needs of the NDIS' (sub. PP230, p. 7).
Victoria	The Victorian Government (sub. 174, p. 18) spent about $26 million (supplemented in part by the Sector Development Fund (SDF)) on its Keeping Our Sector Strong policy, which has the goal of 'developing and growing the disability workforce over the transition to full scheme'.
Queensland	The Queensland Government has committed $2.8 million to establish the WorkAbility program, which is a consortium of four Queensland industry peak bodies aimed at driving 'expansion and diversification of the Queensland workforce over the transition years, engaging, attracting and connecting people to jobs in the sector' (sub. PP345, p. 16).
Western Australia	The Western Australian Government is considering a workforce development plan for the state to ensure that 'the 9 000 to 10 000 additional jobs over the next decade can be filled with properly qualified workers' (WA CCI 2017).
South Australia	The South Australian Government has sought independent advice about likely workforce needs at a more detailed level, and has provided grants as part of its Provider Readiness Program (SA DCSI 2017). It has also provided $4 million to fund 'Disability Workforce Hubs' that aim to 'connect job seekers with local employers, training providers and employment agencies to help fill local job opportunities in the growing disability sector' (SA DCSI 2016; South Australian Government 2017).
Tasmania	The Tasmanian Government 'is investing more than $8 million over six years in skills development to increase the disability workforce in Tasmania' (sub. PP247, p. 9), and has also funded a workforce development plan for the state (Petrusma 2016).
Australian Capital Territory	The ACT Government has invested in market development, and made a number of direct grants to provider organisations, including some using SDF monies (ACT Government 2016, pp. 33–35) .
Australian Government	In addition to the SDF, the Australian Government committed an additional $33 million over three years in the 2017-18 Budget to 'assist service providers in rural, regional and outer suburban areas to provide the workforce required to meet the expected growth in the disability and aged care sectors arising from the introduction of the National Disability Insurance Scheme and an ageing population' (Australian Treasury 2017b, p. 145).The Department of Education and Training has previously provided about $3.5 million in funding to help providers be NDIS ready by helping them plan workforce needs and identify the skills they will require (Department of Education and Training 2017a, p. 13).

The workforce development responsibilities of State and Territory Governments should reduce as the NDIS fully rolls out and replaces their existing disability support programs. However, State and Territory Governments should remain 'in the tent' when it comes to workforce policymaking given the interaction between the NDIS and other mainstream services.

RECOMMENDATION 9.1

The roles and responsibilities of different parties to develop the National Disability Insurance Scheme (NDIS) workforce should be clarified and made public by the beginning of 2018.

- State and Territory Governments should rely on their previous experience in administering disability care and support services to play a greater role in identifying workforce gaps and remedies tailored to their jurisdiction.
- The Australian Government should retain oversight of workforce development, including how tertiary education and aged care policy interact and affect the development of the workforce.
- The National Disability Insurance Agency should provide State and Territory Governments with data and analyses held by the Agency to enable those jurisdictions to make effective workforce development policy.
- Providers of disability supports should have access to a clear and consistent mechanism to alert the National Disability Insurance Agency, the NDIS Quality and Safeguards Commission, and the Australian, State and Territory Governments about emerging and persistent workforce gaps.

An evidence-based approach to workforce policy is needed

A lack of data makes it difficult for policymakers and market stewards to properly exercise direction and support to the sector for it to develop sustainably. The existing data do not allow for measurements of specialisation, or differentiation of caring roles (such as between aged and disability care). Nor is it straightforward to examine labour supply and wage outcomes. This means that tasks that are simple for other industries — like identifying the response in labour supply to an increase in wages — are impossible to undertake with any degree of certainty. As the DSS said:

> A significant limitation to assessing the NDIS market readiness is the availability of market and workforce data. DRC has agreed Market Key Performance Indicators to monitor NDIS market performance and identify emerging market risks and, as the Scheme matures, will assist the NDIA with identifying risk requiring intervention. (sub. 146, p. 34)

These key performance indicators will be drawn from scheme data, which will provide a richer dataset on providers and participants. However, the nature of the data means that it will be less suited for measuring workforce growth and gaps over the transition period and over the longer term. The evidence base on the NDIS workforce needs to be commensurate

with the importance of the scheme itself, and shared broadly among stakeholders. As the Victorian Government said:

> Victoria considers that greater sharing of data and information between the NDIA, the Commonwealth and providers is needed to ensure that workforce development strategies are aligned. (2017b, p. 19)

More data need to be collected on the supply and demand of disability care workers. On the demand side, the NDIA's market position statements provide the necessary information on when and where workers will be needed, and should be updated regularly. On the supply side, the Australian Bureau of Statistics should be funded to collect policy-relevant data on the disability care workforce.

RECOMMENDATION 9.2

The National Disability Insurance Agency should publish more detailed market position statements on an annual basis. These should include information on the number of participants, committed supports (disaggregated at a level of detail consistent with the guides used to set price caps), existing providers and previous actual expenditure by local government area.

The Australian Government should provide funding to the Australian Bureau of Statistics to regularly collect and publish information on the qualifications, age, hours of work and incomes of those working in disability care roles, including allied health professionals.

There is some scope to expand the supply of carers in the short term

One short-term policy to bolster the workforce is to make better use of existing disability carers. About 20 per cent of current aged and disability care workers express a desire to work more hours, and half of these want to work fulltime (figure 9.6). This confirms what Martin and Healy (2010, p. 146) observed — that frontline disability care workers 'generally wanted a substantial increase of 10 or more hours' on their weekly workload.

However, workers' desire to work more hours cannot be realised if policy settings and workers' preferences do not align. As the South Australian Government said:

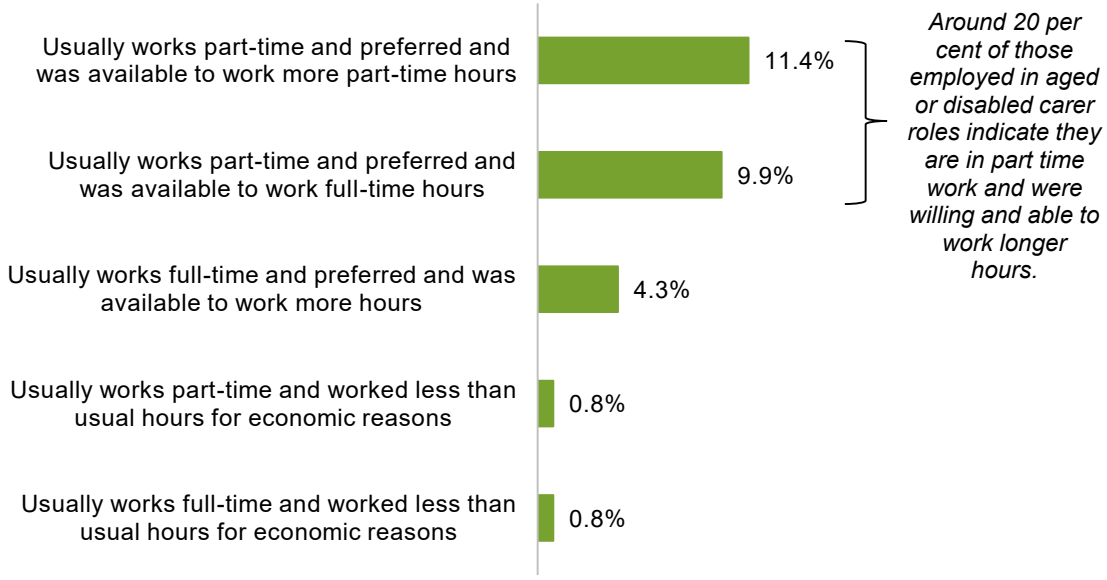
> Offering additional hours and more full time positions is an effective strategy to increase the size of the workforce, capitalising on the use of existing skilled workers and potentially offering greater security for some, particularly in the short term. However, this should also be balanced with being an employer of choice and offering flexible work arrangements to retain skilled workers in the sector. SA would therefore be interested in analysis being conducted on what level of inducement is provided by the flexibility of work arrangements that part time employment provides. (sub. 203, p. 14)

The Commission agrees, and considers that building the evidence base is key to identifying and addressing further impediments to making the most of the existing workforce. There

may also be impediments to working additional hours arising from the price caps set by the NDIA. This is an issue that the independent pricing monitor and pricing regulator should assess and respond to, if necessary (chapter 8).

Figure 9.6 **Aged and disability carers express a desire to work longer hours[a]**

Per cent of aged and disability carers, based on ANZSCO definitions, 2016



[a] Residual are those who are not underemployed (about 72 per cent of aged and disabled carers). 'Economic reasons' include being stood down or there not being enough work available.

Source: Commission estimates based on ABS (*TableBuilder,* Education and Work, May 2016).

Greater use of skilled migration should be used to address shortages

While reducing underemployment for general care workers may bolster supply of some workers, there is almost no underemployment in allied health professions.[80] The long lead time to train these workers also means that shortages could persist over the shorter term, and potentially beyond the end of the NDIS transition period.

An option to meet a shortfall in the short term is to make greater use of skilled migrants. This was proposed by the Commission in its 2011 *Disability Care and Support* inquiry (2011, pp. 720–721). The Commission considers that the existing policies and regulations for using skilled migrants are appropriate to meet the needs of the NDIS over the transition

[80] Commission estimates based on ABS (*TableBuilder*, Education and Work, May 2016).

period, if required.[81] The flexibility of using staff employed on visas over a few years is also of value to the scheme, as participants may have changing preferences over a similar time period.

That said, using skilled migrants is not an immediate solution. Like any new worker, there is a period of on-the-job training required to become proficient in providing services, and in the case of allied health, it will still be necessary for sufficient mentoring to occur. These issues touch directly on setting the appropriate prices for supports over the transition period to enable a sufficient margin for such training to occur — an issue for the independent price regulator discussed in chapter 8.

Some participants to this study disagreed that greater reliance on skilled migration is an appropriate approach to workforce shortages. For example, Allied Health Professions Australia, while agreeing that skilled migration is one way to increase the number of qualified allied health professionals, said that the time spent to acclimatise skilled migrants to Australian conditions was as intensive as training someone locally.

> … skilled migrants are unlikely to be familiar with local health and social systems and services and may not have specialised skills as required to provide appropriate support to many participants. As a result these skilled migrants are likely to have skills and knowledge at a level that is closer to entry level allied health professionals and requiring mentoring and support. Experience suggests that significant time is required for overseas-trained graduates to learn to navigate the complex interaction of systems and understand the various parties involved in providing support. These factors mean that there will need to be significant investment to ensure that skill[ed] migrants can provide services of equivalent quality and AHPA [Allied Health Professions Australia] submits that it may be more effective to pursue alternatives such as incentivisation of Australian graduates and other workers. (sub. 37, p. 18)

However, the time to train someone to understand Australian conditions should be shorter than the time to achieve the formal qualifications to practice.

The precarious nature of skilled migration visas was also raised by study participants, with some stating that 457 visas should not be viewed as a substitute for training local workers.

As the Australian Services Union and the Disabled People's Organisations Australia said:

> Any migrant worker scheme for the NDIS should provide permanent migration and only be considered after there has been local labour market testing. The NDIS provides a significant opportunity to address high levels of unemployment for many people, including people with

[81] Commission estimates based on ABS Census data from 2011 indicate that about 10 per cent of those working in a group of allied health professional occupations (based on the ANZSCO classes relating to dieticians, optometrists and orthoptists, health therapy professionals (not further defined), occupational therapists, physiotherapists, podiatrists, speech professionals and audiologists) were born overseas and arrived in Australia after 2000, suggesting that avenues for skilled migration are possible. Analysis by the ABS found that the second most commonly reported industries of Skilled Program migrants' employment was in the Health Care and Social Assistance industry division, which includes carers and some allied health professionals (ABS 2010). It is too early to tell if recently announced changes to skilled migration visas (Dutton and Turnbull 2017) will impact on this flexibility.

> disability. While we do not support a precarious, exploitative 457-style visa scheme for NDIS workers, we do support the development of a comprehensive workforce plan to retain and attract new workers locally. (sub. 198, p. 2)

Skilled migration is a policy response that should focus on meeting the shortfall in specific roles (rather than as a general measure to address all shortages), and more clearly delineating workforce development responsibilities among governments will provide a better platform to train and develop local workers. However, given the risk of shortages in the transition period, greater use of skilled migration is likely to have more benefits than costs in this period. As previously put by the Commission:

> Overall, the role of immigration as a source of labour must balance the impacts on wages and other strategies for eliciting domestic supply of workers, and the reality that significant labour shortages are still likely, especially during the rapid growth in disability supports during the establishment phase of the NDIS. In that vein, immigration should mainly address acute and persistent shortages. (2011, p. 720)

And by the DSS:

> Migration programs, such as labour agreements, have been used in the aged care sector to meet workforce demand. A similar program could be considered for the disability sector if actions to grow the domestic workforce do not meet demand. (sub. PP318, pp. 17–18)

What remains to be seen is whether the shortfalls persist over the longer term, which is when further review and consideration should be given to changes to workforce development and immigration policies. This could be facilitated as part of the expected future reviews of the NDIS, including the regular reviews by the Joint Standing Committee on the NDIS.

RECOMMENDATION 9.3

The Australian Government should adjust immigration policies where necessary to address National Disability Insurance Scheme workforce shortages.

New technology may reduce demand for workers

Greater use of technology could reduce the need for some disability care workers, and mitigate a potential workforce shortfall. Understanding the extent that technology could be 'labour-saving' is difficult: the market for disability supports is undergoing major change, and what NDIS participants will demand is still unclear. That said, there is a range of emerging technologies that could reduce the need for workers. Some examples highlighted by the NDIA (sub. 161, pp. 98–99) as promising include:

- 'smart' alert and monitoring systems that reduce reliance on person-to-person supports in specialist disability accommodation and for participants with at-risk behaviours
- innovative transport services, such as accessible car-sharing

- telepresence technologies that allow informal carers to maintain and develop their care, and to seek readier access to assistance when needed. Telepresence can also allow for some therapy services to be provided over a distance, which can alleviate the need for providers in rural and remote areas. Such an approach was also endorsed by Allied Health Professions Australia (sub. 37, p. 17), The Shepherd Centre (sub. 107, pp. 14–15) and Speech Pathology Australia (sub. 136, pp. 47–48).

Given the scheme is in the early period of transition, it is difficult to tell what technologies will emerge, what effects they will have on the need for workers, and what the implications for scheme costs may be. The impact of technological advances are not taken into account in the NDIA's long-run costs modelling. Given the uncertainties involved, this is appropriate, and removes any risk of overstating cost savings.

Using volunteers

The number of volunteers, and the amount of volunteering they undertake, affects the workforce needed for the NDIS. Inclusion Melbourne (sub. PP207) and Volunteering Australia (sub. PP274) highlighted the cost savings and beneficial impact on workforce pressures, as well as other benefits of volunteers. These benefits stem from the strength and inclusion of genuine relationships that form between people with disability and volunteers that want to spend time with them (as opposed to being there as part of a paid relationship). As the NDIA said:

> Using services designed to match volunteers with participants can help to build informal networks and facilitate greater independence and social inclusion. Over time, this can reduce the reliance on or preference for paid supports among some participants. These programs involve rigorous on-boarding and carefully match participants and volunteers to increase the likelihood of a relationship forming. There are a number of existing services that connect volunteers with participants, such as Volunteering and Contact ACT, and Inclusion Melbourne. (sub. PP327, p. 47)

While volunteers supply their time for free, the use of volunteer-staffed supports is not costless. There are 'fixed' or up-front costs (including legally required checks and screening) and ongoing costs incurred by volunteers in meeting their volunteer role. Organisations that match volunteers with people with disability also have ongoing costs such as insurance, overheads and the administrative costs of managing volunteers.

The sources of funding for volunteer organisations are changing under the NDIS. Volunteer organisations use private fundraising and philanthropy, as well as government grants to meet the costs of providing volunteers. But as governments shift disability funding into the NDIS (chapter 12), direct grants to volunteer organisations are diminishing. Other sources of funding are available for volunteer organisations to use, such as Information, Linkage and Capacity Building (ILC) grants, but these grants target activities more broadly compared with the previous grants (chapter 6). There is also a capacity–building support that

participants could have included in their plans to initiate a connection with volunteer organisations (NDIA 2017q, p. 57).

The cost of providing volunteer supports under the NDIS have changed too, with the person-centred approach meaning that volunteer organisations need to better match volunteers with the characteristics, goals and other supports of participants. Greater coordination between volunteer and participant is necessary to ensure that the supports provided by volunteers align with others from the NDIS and mainstream services.

Within this context, some volunteer organisations are struggling to adapt to the scheme. This is putting the benefits they provide at risk. As Inclusion Melbourne said:

> It is unclear how and if volunteer based services […] are to be funded under the NDIS. The lack of inclusion of volunteering in the foundational philosophy of the NDIS and the exclusion of line items for volunteer management in the NDIS Price Guide are very concerning and represent a real danger for loss of social capital. … There is a danger of losing thousands of volunteers and hundreds of thousands of hours of support to people with disabilities unless this situation is resolved. (sub. PP207, p. 8)

A recent analysis by Extended Families Australia, Interchange Incorporated, People Outdoors and Inclusion Melbourne found that many volunteer organisations want to provide services to NDIS participants, but are not preparing to do so. Some consider this a risk to participants, their families and the broader community.

> This statistic is very concerning and represents a real danger for loss of social capital. It undoubtedly reflects the lack of information and government policy regarding how volunteering programs will fit and be funded under the NDIS. With no clear pathways for transition, this leaves organisations floundering and without clear messages to give people with a disability and their families currently supported by volunteers. There is a widespread concern from organisations about the impact of failure or delayed transition of programs into the NDIS where volunteers directly support people with a disability into the NDIS. (Inclusion Melbourne 2016, p. 14)

How should funding of volunteer organisations be considered?
